AUBURN

MODEL 6-80 (1929), SERIAL NUMBERS 2,981,851 UP
MODEL 6-85 (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—U.S.L. Type XY-13X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 90 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under front seat on right side.

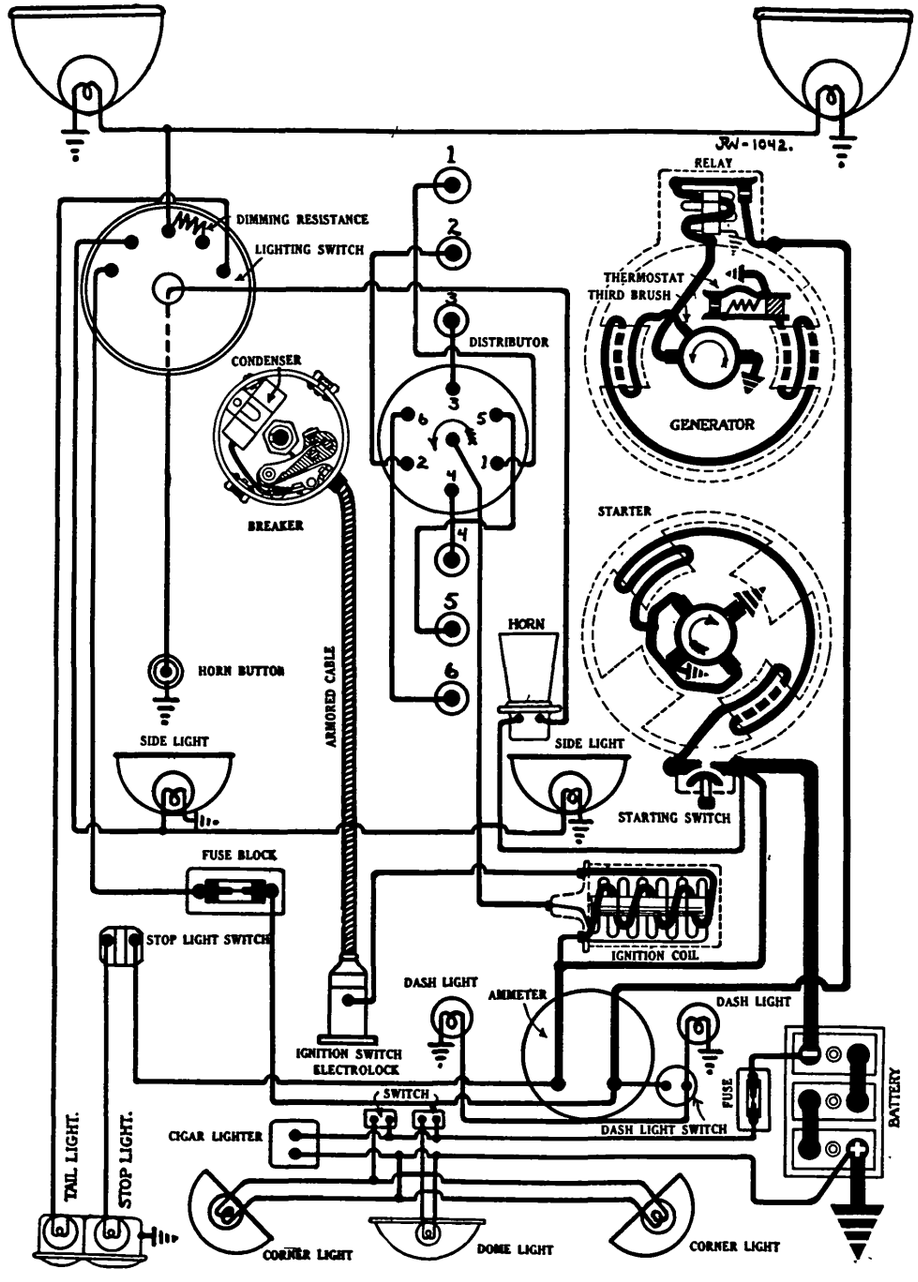
IGNITION:—Coil Model 528-C. Coil is mounted under the cowl. Ignition current is 4 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped.

Distributor Model 641-F. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until proper gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degreees (engine). Maximum automatic advance is 22 degrees. Ignition switch is an Electrolock. Electrolock must be removed as a unit with the distributor.

Mounting:—Distributor is mounted on the cylinder head and must be removed from the right side. To remove distributor, remove Electrolock from dash, disconnect manual advance rod and remove head with cable intact. Then loosen set screw in side of shaft housing and pry up on distributor until it can be lifted from place.

Oiling:—Fill the grease cup with medium grease and turn down one turn every month or each 1000 miles. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 6 degrees (on the flywheel) past top dead center with the spark control lever in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark lever. Continue to crank engine until piston reaches a position 6 degrees past top dead center when the flywheel mark '1-6DC' will be three teeth past the indicator on the flywheel housing. Loosen the advance arm clamp screw and rotate the distributor until contacts begin to separate. Tighten the clamp screw and connect the spark plug in cylinder No. 1 to the terminal directly opposite the rotor. Connect the remaining spark plugs in order 5-3-6-2-4 counterclockwise around the distributor head.



Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, .3425-.341 inch. Stem length, 5¼ inches. Valve lift, 11/32 inch. Spring pressure, 47 pounds (valve closed). Tappet clearance, .006 inch (hot). Inlet valves open at top dead center and close 45 degrees after lower dead center on 1929 cars and open 5 degrees before top dead center and close 40 degrees after lower dead center on 1930 cars.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, .3425 .341 inch. Stem length, 5¼ inches. Valve lift, 11/32 inch. Spring pressure, 47 pounds (valve closed). Tappet clearance, .008 inch (hot). Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. The flywheel is marked '1-6DC' for inlet opening. Valve stem guides are removable. Oversize valves are made.

To Check Valve Timing:—Turn engine over until No. 1 piston is at top

AUBURN

MODEL 6-80 (1929), SERIAL NUMBERS 2,981,851 UP
MODEL 6-85 (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Turn engine over one complete revolution and stop with piston at top dead center when dead center mark '1-6.DC' is opposite the indicator on the housing. The No. 1 inlet valve should begin to open at this point.

To Set Valve Timing:—Mesh chain so there are 12 links between marks on camshaft sprocket and crankshaft sprocket.

STARTER:—Model 716-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 90 R.P.M. drawing 150 amperes at 6 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	70
15 "	Lock	3.7	450

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless. Every six months remove the plug in the gear compartment and pack gears with graphite grease.

GENERATOR:—Model 955-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 175°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust charging rate, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 21 amperes (cold) reached at 1550 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1550	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted on special swinging bracket at right of engine and is belt driven from the crankshaft. The water pump is mounted directly on the rear of the generator and is driven by the generator shaft. To remove generator, first drain radiator and remove water pump hose connections. Then loosen adjustment clamp bolt and swing generator toward the engine. Slip off the drive belt. Then remove two bolts in the bracket under the generator and lift generator from place. The water pump can be removed by taking out the cap screws on the generator bosses.

Belt Adjustment:—To adjust belt tension, loosen the adjustment clamp bolt and swing the generator away from the engine until the correct belt tension is secured. Tighten the clamp bolt. Do not make the drive belt too tight or it will crowd the generator bearings.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. when the generator voltage reaches 6.75 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 360-A. Switch is mounted at lower end of steering column. Dimming is through a resistance mounted on the switch. Headlights are 6-8 volt, 21 cp. S.C. Mazda 1129. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, tail, dome and corner lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

FUSE:—Lighting fuse on block on dash is 20 ampere capacity.

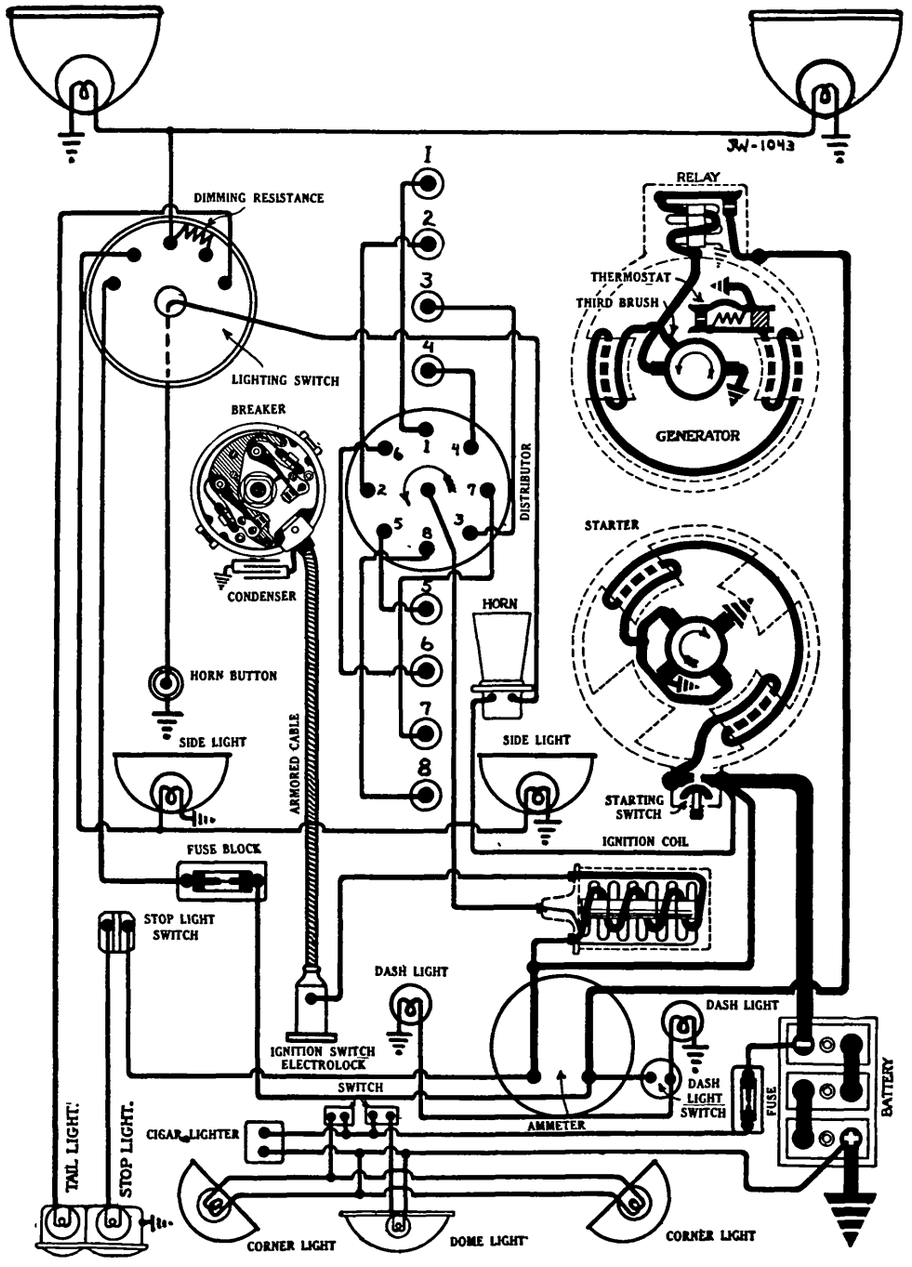
AUBURN

MODEL 8-90 (1929), SERIAL NUMBERS 2,971,829 UP
MODEL 8-95 (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—U.S.L. Type XY-13X-6A, 6 volt. The positive (+ terminal is grounded. Starting capacity (20 minute rate) is 90 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under front seat on right side.

IGNITION:—Coil Model 528-C. Coil is mounted under the cowl. Ignition current is 4 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped.

Distributor Model 657-M & P. Breaker contact gap is .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until proper gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Breaker has two sets of contacts on a four sided cam. Contacts open alternately at intervals of 45 degrees (equal to 90 degrees of crankshaft rotation). Contacts must be synchronized to secure this result for correct engine performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 15 degrees. Maximum automatic advance is 15 degrees. The ignition switch is an Electrolock.



Mounting:—Distributor is mounted on the cylinder head. The Electrolock must be removed as a unit with the distributor. To remove distributor, disconnect Electrolock from dash, disconnect manual advance rod and remove distributor head with cables intact. Then remove set screw in side of shaft housing and pry up distributor until it can be lifted from place.

Oiling:—Fill the grease cup on the side of the shaft with medium grease and turn down one turn every month or each 1000 miles. Remove the head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam every 1000 miles.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (6 degrees or 3 teeth on the flywheel past top dead center). If the second set of contacts are not beginning to open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine:—Breaker contacts separate when the piston entering power stroke reaches a position 6 degrees or 3 teeth on the flywheel past top dead center with the spark control lever in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark lever. Continue to crank engine until a point on the flywheel 3 teeth past the dead center mark '1-8DC' is opposite the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and connect the terminal opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, .3425-341 inch. Stem length, 5¼ inches. Valve lift, 11/32 inch. Spring pressure, 47 pounds (valve closed). Tappet clearance, .006 inch (hot). Inlet valves open at top dead center and close 45 degrees after lower dead center on 1929 cars and open 5 degrees before top dead center and close 40 degrees after lower dead center on 1930 cars.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, .3425-341 inch. Stem length, 5¼ inches. Valve lift, 11/32 inch. Spring pressure, 47 pounds (valve closed). Tappet clearance, .008 inch (hot). Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. The flywheel is marked '1-8DC' for inlet opening. Valve stem guides are removable. Oversize valves are made.

To Check Valve Timing. Turn engine over until piston No. 1 reaches top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Crank engine over one complete revolution and stop when piston reaches top dead center with the dead center mark on the flywheel opposite the indicator on the housing. The No. 1 inlet valve should open at this point.

To Set Valve Timing:—Mesh chain so there are 12 links between marks on camshaft sprocket and crankshaft sprocket.

STARTER:—Model 716-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 90 R.P.M. drawing 150 amperes at 6 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	70
15 "	Lock	3.7	450

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. Every six months remove the grease plug in the reduction gear case and pack gears with graphite grease.

GENERATOR:—Model 955-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 175°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 21 amperes (cold) reached at 1550 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1550	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted on special swinging bracket at right of engine and is belt driven from the crankshaft. The water pump is mounted directly on the rear of the generator and is driven by the generator shaft. To remove generator, first drain radiator and remove water pump hose connections. Then loosen adjustment clamp bolt and swing generator toward the engine. Slip off drive belt. Then remove two bolts mounting generator on bracket and lift generator from place.

Belt Adjustment:—To adjust belt tension, loosen bracket bolts and adjustment clamp bolt and swing generator away from the engine until the proper belt tension is secured. Tighten the bolts. Do not get too much belt tension or it will crowd the generator bearings.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. when the generator voltage reaches 6.75 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 360-A. Switch is mounted at lower end of steering column. Dimming is by resistance mounted on switch. Headlights are 6-8 volt, 21 cp. S.C. Mazda 1129. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, dome, corner and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Some cars in 1929 used a double filament 21-2 cp. bulb Mazda 1158 in the headlights.

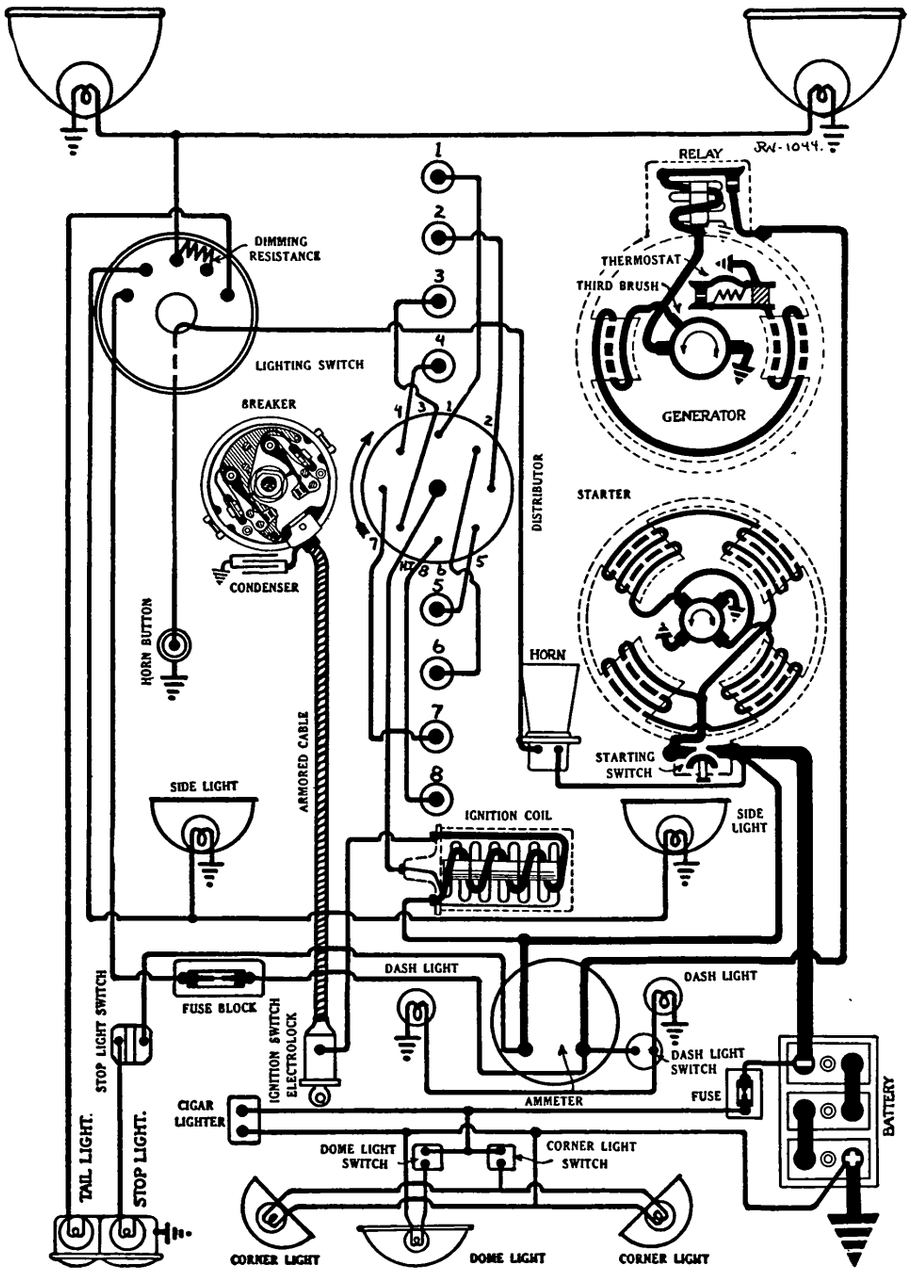
FUSES:—Lighting fuse mounted on block on dash is 20 ampere capacity.

AUBURN

MODEL 120 (1929), SERIAL NUMBERS 2,950,502 UP
MODEL 125 (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—U.S.L. Type XY-15X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted under front seat on right side.

IGNITION:—Coil Model 528-C. Coil is mounted under the cowl. Ignition current is 4 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped.



Distributor Model 657-L, N. Breaker contacts separate .022 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Breaker has two sets of contacts on a four sided cam. Contacts open alternately at intervals of 45 degrees (equal to 90 degrees of crankshaft rotation). Contacts must be synchronized to secure this result, for correct engine performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 15 degrees. Maximum automatic advance is 18 degrees. The ignition switch is an Electrolock.

Mounting:—Distributor is mounted on the cylinder head and can be removed from the right side. The Electrolock must be removed as a unit with the distributor. To remove distributor, disconnect Electrolock at dash, disconnect manual advance rod and remove distributor head with cables intact. Then remove set screw in side of shaft housing and pry distributor up until it can be lifted from place.

Oiling:—Fill the grease cup on the side of the shaft with medium grease and turn down one turn every month or each 1000 miles. At the same time, remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contact. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. Contacts can be synchronized without use of tool after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (3 teeth on the flywheel past top dead center with fully retarded spark). If the second set of contacts do not open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 6 degrees or 3 teeth on the flywheel past top dead center with the spark lever fully retarded. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark lever. Continue to crank engine until a point on the flywheel 3 teeth past the dead center mark '1-8DC' is opposite the indicator on the flywheel housing. Then loosen advance arm clamp screw and rotate distributor until one set of contacts begins to separate. Tighten the clamp screw and connect the terminal opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs as shown on the diagram.

AUBURN

MODEL 120 (1929), SERIAL NUMBERS 2,950,502 UP
MODEL 125 (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 5/8 inches. Stem diameter, .3425-.341 inch. Stem length, 4 7/8 inches. Valve lift, 11/32 inch. Spring pressure, 45.5 pounds (valve closed). Tappet clearance, .006 inch (hot). Inlet valves open 5 degrees before top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .3425-.341 inch. Stem length, 4 7/8 inches. Valve lift, 11/32 inch. Spring pressure, 45.5 pounds (valve closed). Tappet clearance, .008 inch (hot). Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valves are made.

To Check Valve Timing. Crank engine over until piston No. 1 reaches top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Crank engine over one complete revolution and stop when piston is on top dead center with the dead center mark on the flywheel opposite the indicator on the housing. The No. 1 inlet valve should begin to open at this point.

To Set valve Timing:—Turn crankshaft and camshaft so that punch mark on crankshaft sprocket is directly opposite and midway between two marks on camshaft sprocket (use a straightedge across the shaft centers). Mesh chain without disturbing position of shafts.

STARTER:—**Model 718-A.** Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 100 R.P.M. drawing 200 amperes at 6 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

GENERATOR:—**Model 955-J, K, 959-V.** The direction of rotation is counter-clockwise, viewed from the commutator end. Current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 175°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard setting, maximum charging rate is 21 amperes (cold) at 8.5 volts reached at 1450 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and take off plate on front of chain case. Take out cap screws in generator flange, lift off drive chain and hang up in gear case with wire so that it can not slip off camshaft sprocket. Then pull generator to rear and lift from place.

Chain Adjustment. To take up timing chain, loosen the generator mounting screws and shift generator away from the engine until the chain begins to hum with the engine running. Then back off adjustment until chain runs noiselessly and tighten mounting screws.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay contacts close at 600 R.P.M. when the generator voltage reaches 6.75 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—**Soreng-Manegold Switch, Model 360-A.** Switch is mounted at lower end of steering column. Dimming is by resistance on switch. Headlights are 6-8 volt, 21 cp. S.C. Mazda 1129. Side or cowl lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, dome, corner and tail lights are each 6-8 volt, 3 cp. S. C. Mazda 63.

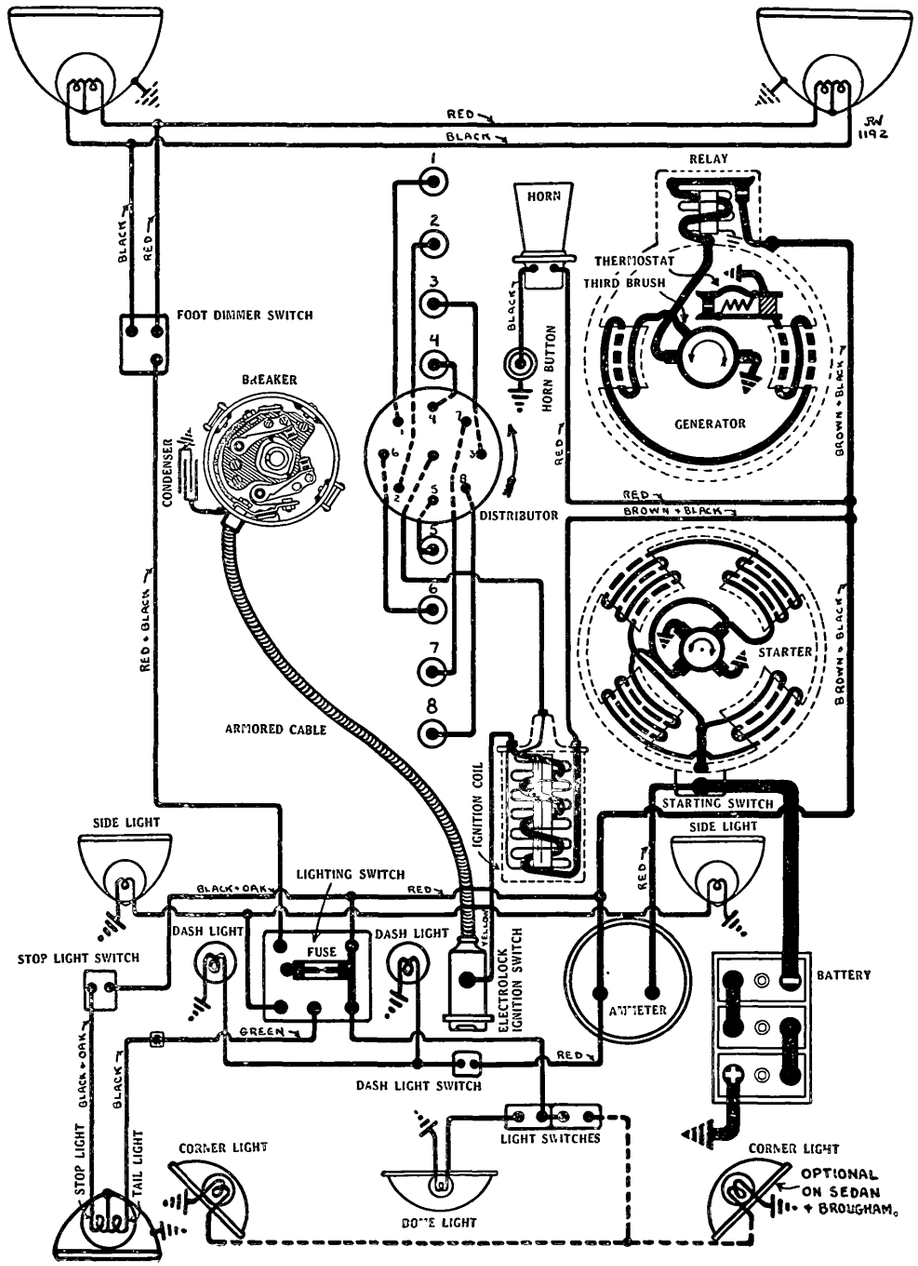
FUSES:—Lighting fuse on block on dash is 20 ampere capacity.

AUBURN

MODEL 8-98 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—U.S.L. Type XY-15X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted under the cowl. Ignition current is .6-3 amperes with engine idling and 4.6 amperes at 6 volts with engine stopped. The ignition switch is a Type 14-A Electrolock.



Distributor Model 660-Z. Breaker contacts separate .018-.025 inch. Set contact gap by loosening lock screw on stationary contact mounting plate (directly behind breaker arm) and turning eccentric adjusting screw until breaker gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees. Automatic advance begins at 400 R.P.M. of the engine. Maximum automatic advance is 26.5 degrees reached at 2600 R.P.M. of the engine. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized to secure this firing interval for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head. The Electrolock must be removed as a unit with the distributor whenever the distributor is taken off the car. A complete description of the Electrolock and full directions on removing the Electrolock from the distributor will be found in the Equipment Section. To remove distributor, free Electrolock at dash, disconnect manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft housing with medium cup grease and turn down one turn each month or every 1000 miles of operation. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pins. Coat the breaker arm cam with a light film of vaseline.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section to synchronize contacts. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 90 degrees when piston No. 6 will reach firing position (3½ teeth on the flywheel before top dead center with manual spark control full advanced). Then loosen the lock screws on the movable sub-plate (on which the second set of contacts are mounted) and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap with the breaker arm on the lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization. The first method of synchronization using special Delco-Remy tool is recommended.

Timing of Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 13 degrees or 3½ teeth on the flywheel before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully

AUBURN

MODEL 8-98 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

advance the manual spark control and see that the distributor is rotated counter-clockwise as far as possible. Then turn engine over until piston reaches a position 13 degrees or 3½ teeth (measured on the flywheel) before top dead center. Loosen the advance arm clamp screw and rotate the distributor slightly until the first set of contacts (mounted directly on the breaker plate) begin to open. Tighten the the clamp screw and connect the spark plugs as shown on the diagram. The second set of contacts (mounted on the movable sub-plate) open 45 degrees after this point when piston No. 6 reaches firing position.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Champion Type C-4. Gaps are .020-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 7/16 inches. Stem diameter, .3410-.3425 inch. Stem length, 5¼ inches. Valve lift, 11/32 inch. Spring pressure, 46-51 pounds (valve closed—spring length, 2 3/16 inches) and 87-82 pounds (valve open—spring length, 1 27/32 inches). Tappet clearance, .006-.008 inch hot (operating) and .010 inch (for timing). Inlet valves open 5 degrees before top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, .3410-.3425 inch. Stem length, 5¼ inches. Valve lift, 11/32 inch. Spring pressure, 46-51 pounds (valve closed—spring length, 2 3/16 inches) and 87-92 pounds (valve open—spring length, 1 27/32 inches). Tappet clearance, .006-.008 inch hot (operating) and .010 inch (for timing). Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are made for replacement.

To Set Valve Timing:—Mesh chain with camshaft sprocket and crankshaft sprocket turned so that marks are adjacent to and line up with a straightedge across the shaft centers.

STARTER:—Model 722-F. Starter is connected to the engine through a set of reduction gears and an Outboard Bendix drive. The direction of rotation (armature shaft) is clockwise, viewed from the commutator end. Starter cranks the engine at 134 R.P.M. (normal speed) drawing 175 amperes. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5	70
11 "	1200	5	175
22 "	Lock	3	600

Mounting:—Starter is flange mounted at the right of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and starting switch control and take out three flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearings are fitted with oilless bushings. Every six months repack the reduction gears with graphite grease.

GENERATOR:—Model 955-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance which is connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 21 amperes (cold) at 8.5 volts reached at 1550 R.P.M. of the generator armature or 20 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
21	8.5	1550	12	7.5	2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted on special swinging bracket at right of the engine and is belt driven from the crankshaft. The water pump is mounted directly on the commutator end of the generator and is driven by an extension of the armature shaft. To remove generator first drain radiator and remove water pump hose connections. Then loosen adjustment clamp bolt and swing generator toward engine. Slip off drive belt. Then remove two bolts forming generator bracket hinge and lift generator from place. The water pump can then be removed by taking out the capscrews which mount the pump on the generator end plate bosses.

Belt Adjustment. To adjust drive belt, loosen bracket bolts and adjustment clamp bolt and swing generator away from engine until proper belt tension is secured. The belt tension should be just sufficient to drive the generator and water pump without slipping.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator field frame. Relay contacts close at 600 R.P.M. (generator armature) or 8.3 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 1-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Soreng-Manegold Lighting Switch. Delco-Remy Dimmer Switch. Lighting switch is mounted on the instrument panel. Dimmer switch is mounted on the toeboard. Headlights are equipped with double filament bulbs. Head lights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Cowl lights instrument light are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light and side lights (optional on Sedan and Brougham) are each 6-8 volt, 6 cp. S.C. Mazda 81. Stop light and tail light are 6-8 volt, 21-2 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead (black) must be connected to the 2 cp. filament.

Switches:—Lighting switch is Model 5670-A.

FUSES:—Lighting fuse mounted on back of lighting switch is 20 ampere capacity.

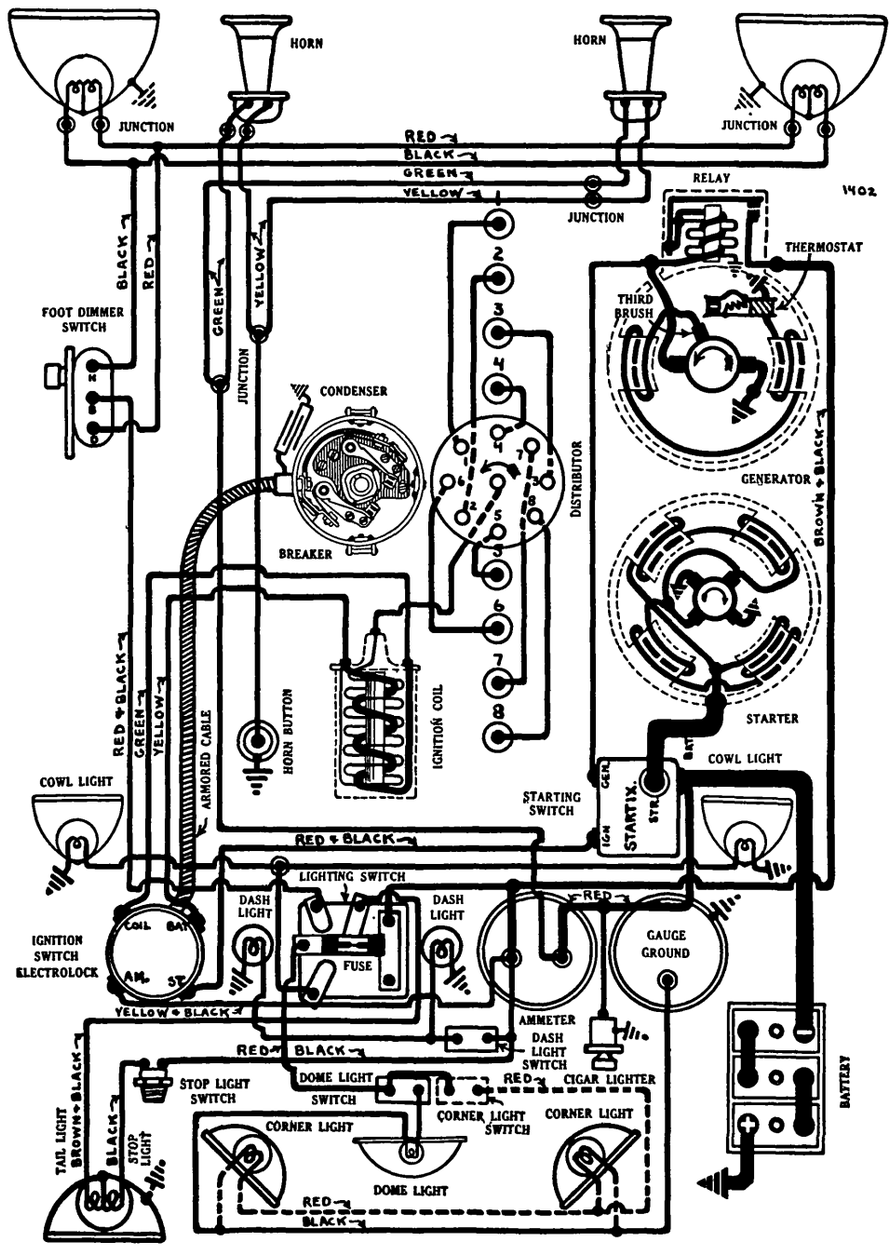
STANDARD EIGHT MODEL 8-101 (1933), SERIAL NUMBERS 8-101-1001 UP
SALON EIGHT MODEL 8-105 (1933), SERIAL NUMBERS 8-105-1001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on right hand body sill at front door.
ENGINE NUMBER:—Stamped on front of crankcase at left hand side.

ENGINE:—Lycoming, Model GU, 8 cylinder, 'L' head type, 3x4¾" bore and stroke, 268.6 cubic inch displacement, rated at 28.8 H.P., develops 100 H.P. at 3200 R.P.M. Standard compression ratio 5.26-1. Optional high compression ratio 5.75-1. A special ignition setting is used for each type engine (see Timing).

BATTERY:—**U.S.L., Type XY-15X-6A,** 6 volt, 15 plate, 104 ampere hour capacity (5 ampere rate). Starting capacity 119 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—Battery mounted under right hand front seat.
Dimensions:—Width, 7/14". Length, 10¼". Height, 8⅝".

IGNITION:—**Coil Model 528-C.** Coil is mounted on the dash.
Ignition Current:—.6-3 amperes at 6 volts (engine running), 4.6 amperes at 6 volts (engine stopped).
Ignition Switch:—Type 15-S Electrolock. Switch is assembled as unit with distributor with breaker lead protected by armored cable. Switch has two 'on' positions. First 'on' position with key turned to left is timing position with ignition on and Startix inoperative. Second 'on' position with key turned to right is regular running position with Startix operative.



Distributor Model 669-Z. Two breaker arm, 4 lobe cam type with semi-automatic advance. Breaker contacts open alternately at 45 degree intervals corresponding to 90 degree firing interval of engine. Contacts must be synchronized—see Timing. Breaker contact gap set at .018-.024 inch. To set gap, loosen lockscrew on stationary contact mounting plate and turn eccentric adjusting screw, tighten locking screw.
Manual Advance:—15° (engine) maximum.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Cam Angles—Closed 34°, open 11° (distributor) when synchronized.

Distributor		Automatic Advance		Engine
Degrees	R.P.M.	Degrees		R.P.M.
Start	250	2.5		500
13.25	1300	26.5		2600

Mounting:—Distributor is mounted on the cylinder head. Electrolock must be removed as a unit with distributor whenever distributor is taken off the car. See Equipment Section for complete details on removing Electrolock. To remove distributor, disconnect all wires and free Electrolock at dash, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**1000 Miles.** Turn down grease cup under distributor head one full turn. Keep cup filled with medium cup grease. Take off distributor cap and rotor, fill wick oiler in center of shaft with light engine oil, put one drop oil on breaker arm pivot pins, apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting 12½ degrees or 3¼ teeth on flywheel (.070 inch piston travel) before top dead center (standard compression engines), 8½° or 2¼ teeth on flywheel (.0326" piston travel) before top dead center (optional high compression engines). To set ignition timing, fully advance manual spark control, see that distributor is rotated clockwise to full extent of advance arm slot. With No. 1 piston on compression stroke turn engine over until a point on the flywheel 3 1/4 teeth before the top

dead center mark for pistons 1 and 8 is directly opposite indicator on flywheel housing. Loosen advance arm clamp screw, rotate distributor until first set of contacts (mounted directly on breaker plate) begin to open, tighten clamp screw, connect spark plugs as indicated on diagram. Use test lamp to determine contact opening.

Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section. Contacts can be synchronized after distributor has been timed to engine by turning engine over 90° to firing position of piston No. 6 (3 1/4 teeth before top dead center), then loosen lockscrews on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten lockscrews, check contact gap. If outside limits of .018-.024 inch, reset at .022 inch, repeat synchronization.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—7/8-18 SAE. Champion Type C-4. Set gaps at .020-.025 inch.

VALVE TIMING:—Camshaft Setting. Two-sprocket non-adjustable chain drive. Mesh chain with camshaft and crankshaft sprockets turned so that marks are adjacent to and in line with a straightedge across the shaft centers.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010 inch (cold). With No. 8 piston on compression turn engine over until piston is slightly before top dead center with a point on the flywheel approximately 1.35 teeth before the top dead center mark is opposite the indicator on housing. No. 1 intake valve should begin to open at this point.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 7/16"	.3410-.3425"	5¼"	30°	11/32"
Exhaust	1 13/32"	.3410-.3425"	5¼"	45°	11/32"

Tappet Clearance

Intake .006-.008" (hot)-.010" (cold)
Exhaust .006-.008" (hot)-.010" (cold)

Spring Pressure

Open ..... 87-92 pounds

Timing

Intake Valves	Exhaust Valves
Open—5° before top dead center.	Open—50° before lower dead center.
Close—40° after lower dead center.	Close—10° after top dead center.

CARBURETION:—Stromberg Model URO-2 Updraft Carburetor (8-100, 8-101) or Model EX-3 Downdraft Carburetor (Model 8-105) (see Carburetor Section for complete data).

Fuel Pump:—Stewart-Warner mechanical type fuel pump operated by eccentric on camshaft (see Carburetion Section).

Gasoline Gauge:—K-S Telegauge, hydrostatic type (see Carburetion Section).

STARTER:—Model 722-F, 722-Q (Model 8-100, 101), 736-E (8-105). Starter drive—Through reduction gears and a Bendix drive. Rotation of armature shaft is clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 134 R.P.M. (normal speed) drawing 175 amperes.

Model 722-F—Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3500	5.0	70
22 " "	Lock	3.0	600

Model 722-Q, 736-E—Starter Data

0 " "	6000	5.0	65
15 " "	Lock	3.15	570

Startix:—This model equipped with Startix automatic starting switch. Not necessary to disconnect Startix when timing engine if special timing position of Electrolock ignition switch is used (turn ignition key to left).

Mounting:—Starter is flange mounted on forward face of flywheel housing at right of engine. To remove, disconnect cable and starting switch control, take out three flange mounting capscrews, pull starter forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end of armature shaft.

Six Months. Take out grease plug in reduction gear case. Repack gears with graphite grease.

GENERATOR:—Model 955-H. Third brush regulation, thermostat control. Thermostat operates at 165° F. (contacts open—cuts in resistance) reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 19-21 amperes (cold) at 8.0 volts reached at 1550 R.P.M. or approximately 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on endplate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1550	9-12	7.35-7.65	1800-2000

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—4.0-6.1 amperes at 6 volts across field terminals.

Motoring:—Approximately 5.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at right front of engine. Belt driven from the crankshaft. The water pump is mounted on the commutator end of the generator and is driven by the armature shaft extension. To remove generator, disconnect lead, drain radiator, disconnect water pump hose connections, loosen adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge under generator, lift generator and water pump out. Water pump can be removed by taking out capscrews in generator end plate bosses.

Belt Adjustment. To take up drive belt, loosen adjustment clamp bolt and bracket hinge bolts, pull generator away from engine, tighten clamp bolt and mounting bolts. The belt tension should be just enough to drive generator and water pump without slipping.

RELAY:—Model 265-B. Relay is mounted on generator field frame. Relay contacts close at 600 R.P.M. (generator) with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Soreng Manegold Switch Model 5670-A. Delco-Remy Dimmer Switch Model 465-W, 465-C (R. H. D.). Lighting switch mounted on back of instrument board controlled by push-pull button on instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated dimmer switch on toeboard.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	32-32	D.C.	1000
Cowl lights	6-8	3	SC	63
Instrument lights	6-8	3	SC	63
Stop and tail light	6-8	21-2	DC	1158
Dome and corner lights	6-8	6	SC	81

Note:—Stop and tail light is a special double filament bulb. The tail light lead (Brown and Black wire) must be connected to the 2 cp. filament.

FUSES:—20 ampere capacity Type 4AG. fuse mounted on back of lighting switch.

HORNS:—Klaxon vibrator type horn mounted under engine hood (Model 8-101), Model K-31, Type 1396 (low note), Type 1370 (high note) matched tone twin horns mounted under headlights (Model 8-105). Current draw 4.0-6.5 amperes at 6 volts.

SALON MODEL 12-165 (1933), SERIAL NUMBERS 12-165-1001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate right hand body sill at front door.
ENGINE NUMBER:—Stamped on right side of crankcase midway of engine.
ENGINE:—Lycoming, Model BB, twelve cylinder, 45 degree 'V' type, modified 'L' head with valves mounted horizontally. Bore and stroke 3⅛x4¼", 391.16 cubic inch displacement, rated at 46.87 H.P., develops 160 H.P. at 3500 R.P.M. Standard compression ratio 5.75-1. Optional low compression ratio 5.5-1.
BATTERY:—U.S.L., Type XY-17A, 6 volt, 17 plate, 121 ampere hour capacity (5 ampere rate). Starting capacity 136 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—On outside of right hand frame side rail under front fender.
Dimensions:—Width, 7¼". Length, 11 5/16. Height, 8⅝".
IGNITION:—Coil Model 528-C (2 used). Coils mounted on bracket on chain case at right hand front corner of engine block.
Ignition Current:—.6-3 amperes (engine idling), 4.6 amperes at 6 volts (engine stopped) for each coil.
Ignition Switch:—Type 15-SD Electrolock. Assembled as unit with distributor with both breaker leads protected by an armored cable (see Equipment Section). Switch has two 'on' positions. First 'on' position with key turned to left is timing position with Startix inoperative. Second 'on' position with key turned to right is regular running position with Startix operative.
Distributor Model 667-Z. Two-breaker arm, 6-lobe cam type with semi-automatic advance. Breaker contacts open alternately at 22½ and 37½ degree intervals (corresponding to engine firing intervals of 45 and 75 degrees —engine has blocks set at 45 degree angle and fires at unequal intervals). Contacts must be synchronized (see Timing).
Manual Advance:—25° (engine) maximum.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Cam Angles—Closed 37°, open 23° (distributor) each set independently.

Distributor		Automatic Advance		Engine
Degrees	R.P.M.	Degrees		R.P.M.
Start	300	2		600
11	1600	22		3200

Mounting:—Distributor mounted at right front of engine between cylinder banks. Electrolock must be removed with distributor as a unit (see Equipment Section for directions on disconnecting Electrolock). To remove distributor, disconnect ignition wires and free Electrolock at dash, take off distributor cap, take out hold-down screw in advance arm, lift out distributor and Electrolock.
Oiling:—1000 Miles. Turn down grease cup on side of shaft housing one turn.
IGNITION TIMING:—Standard setting 11° or 3.21 teeth (on flywheel) before top dead center with manual spark control fully advanced. To set timing, remove cover plate over inspection hole in flywheel housing, fully advance manual spark control. With No. 1 piston (right hand block) on compression stroke, turn engine over until a point on flywheel 3.21 teeth before the top dead center mark for piston No. 1R is directly opposite indicator on flywheel housing. Take off distributor cap, loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp). Tighten clamp bolt, connect spark plugs as indicated on diagram.
Synchronization of Contacts—first method as part of timing operation. After timing distributor (above), turn crankshaft over 45° to firing position of piston No. 6L (no marks are provided for synchronization but firing position can be determined by counting off 14 teeth on the flywheel from firing position of piston No. 1R), loosen lock screws on movable sub-plate

DELCO-REMY SYSTEM

(carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten lock screws, check contact gap.

Second Method. Synchronize contacts on a rotary spark gap, setting intervals so that movable contacts open 22½ degrees after fixed contacts, with fixed contacts opening again after a 37½ degree interval.

Firing Order:—1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with cylinder banks right (R) and left (L) as viewed from driver's seat. No. 1 cylinder nearest the radiator. Connect spark plugs as shown on diagram.

Spark Plugs:—18 MM. Champion Type C-7. Set gap at .025 inch.

VALVE TIMING:—Valves mounted horizontally between cylinder banks operated through vertical rocker arms from single camshaft directly above crankshaft. Tappet adjustment on upper end of rocker arm. Valves may be removed by taking off secondary plate on head carrying spark plugs without disturbing main cylinder head. Camshaft chain driven from crankshaft in tandem with generator sprocket. Chain adjusted manually by shifting generator (see Generator Mounting).

To Check Valve Timing. Set tappet clearance intake valve No. 1 cylinder, right hand bank, at .015" (cold). With No. 6 piston right hand bank on compression stroke, turn engine over until piston reaches top dead center with flywheel mark for pistons 1R and 6R at indicator on flywheel housing. No. 1R intake valve should open at this point. Reset tappet clearance at .006-.008" with engine hot.

To Set Valve Timing:—Mesh chain with camshaft and crankshaft sprockets turned so that marks are adjacent to and in line with a straightedge across the shaft centers.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift

Timing	Intake Valves	Exhaust Valves
	Open—at top dead center.	Open—50° before lower dead center.
	Close—45° after lower dead center.	Close—10° after top dead center.

CARBURETION:—Stromberg Downdraft Carburetor, Model EX-2. One carburetor is used for each engine bank and carburetor throttles are interconnected (see Carburetor Section for complete data).

Fuel Pump:—Stewart-Warner mechanical type fuel pump mounted at left hand front of engine driven by eccentric on camshaft (see Carburetion Section for complete data).

Gasoline Gauge:—K-S Telegauge, hydrostatic type (see Carburetion Section).

STARTER:—**Model 543,6.** Starter drives engine through reduction gears and Bendix drive. Rotation (armature shaft) clockwise at commutator end. Brush spring tension 36-40 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2200	5.7	70
35 "	Lock	3.0	600

Startix:—This model equipped with Startix automatic starting switch (see Equipment Section for complete article on Startix). Not necessary to disconnect Startix when timing engine if special timing position of ignition switch is used (turn ignition key to left).

Mounting:—Starter flange mounted at right of engine on front face flywheel housing. To remove, disconnect cable, take out flange mounting screws, pull starter forward to clear Bendix, lift from place.

Oiling:—**1000 Miles.** Put 8-10 drops light engine oil in drive end bearing oiler.

GENERATOR:—**Model 931-E, F.** Third brush regulation, thermostat control. Thermostat operates at 165°F. (contacts open, cuts in resistance) reducing output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 22 amperes (cold) at 8.6 volts reached at 1400 R.P.M.

Charging Rate Adjustment. Loosen locking screw on endplate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
21-23	8.4-8.8	1400	13.5-16.5	7.7-8.1	1600-1800

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—3.5-4.0 amperes at 6 volts across field terminals.

NOTE:—Model 931-F generator is fitted with tachometer drive.

Mounting:—Generator flange mounted at right of engine on rear face of timing chain case. To remove, disconnect lead, take off nuts on 3 flange mounting bolts, pull generator out, being careful not to disturb intermediate plate carrying generator sprocket.

Chain Adjustment. Loosen flange mounting bolts, pull generator away from engine, tighten mounting bolts. With correct adjustment chain should operate noiselessly. If chain hums, back off adjustment slightly.

Oiling:—**1000 Miles.** Put 4-5 drops light engine oil in each oiler (2 oilers).

RELAY:—**Model 265-G.** Mounted on generator. Relay contacts close with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—**Soreng-Manegold Switch, Model 5670-A.** Lighting switch mounted on back of instrument board controlled by push-pull button on lower left center instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated dimmer switch. Dimmer switch is Delco-Remy Model 465-W.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Side (cowl) Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158
Dome and Corner Light	6-8	6	S.C.	81

NOTE:—Stop and tail light is combination double filament bulb. Connect tail light lead (brown and black) wire to 2 cp. filament.

FUSES:—20 ampere capacity Type 4AG fuse mounted on back of lighting switch.

HORNS:—Klaxon Model K-26, Type 1393 (low note), Type 1394 (high note), matched tone twin horns are standard equipment. Current draw 6.0-8.5 amperes at 6.0 volts (Type 1393), 5.0-6.5 amperes at 6.0 volts (Type 1394).

SERIAL NUMBER:—First number (652X) 652X1001, (652Y) 652Y1001. Located on right hand side of cowl under hood. Letter following serial number designates body type.

COMPRESSION:—**Ratio**—Std. 6.2-1. No optional ratios. **Pressure**—Approximately 105 lbs. at cranking pseed.

VACUUM READING:—Gauge should show steady reading of 20" with engine idling at 7-8 M.P.H.

IGNITION:—**Coil Model IG-4065.** Mounted on right hand side engine block.
Ignition Current—2.5 amperes (idling), 4.5-5.5 amperes (stopped).
Ignition Switch—Oakes 'Hershey' type co-incidental ignition switch and steering post lock. Switch used on 6-52Y (with Startix) has two 'on' positions. Lower position of lever 'STX' is normal running position with Startix operative. Use top position 'IGN' to check timing or whenever automatic cranking is not desired.

Distributor Model IGB-4318. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—.018-.020" (.020-.024" first 1000 miles with new contacts).

Breaker Arm Spring Tension—16-22 ounces.

Cam Angles—Closed 34°. Open 26° (distributor).

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	540	4	1080
4	780	8	1560
6	1020	12	2040
8	1260	16	2520
10	1500	20	3000

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....3° or 1 tooth BTDC..... .0042" BTDC.
Timing:—Crank engine with #1 piston on compression until piston is 3° or approximately 1 tooth on flywheel before top dead center, stop when flywheel mark '3—' (first 53 cars), or '/' (later cars) lines up with indicator in inspection hole in flywheel housing. These marks are 3° or approximately 1 tooth before top dead center mark '1/6'. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

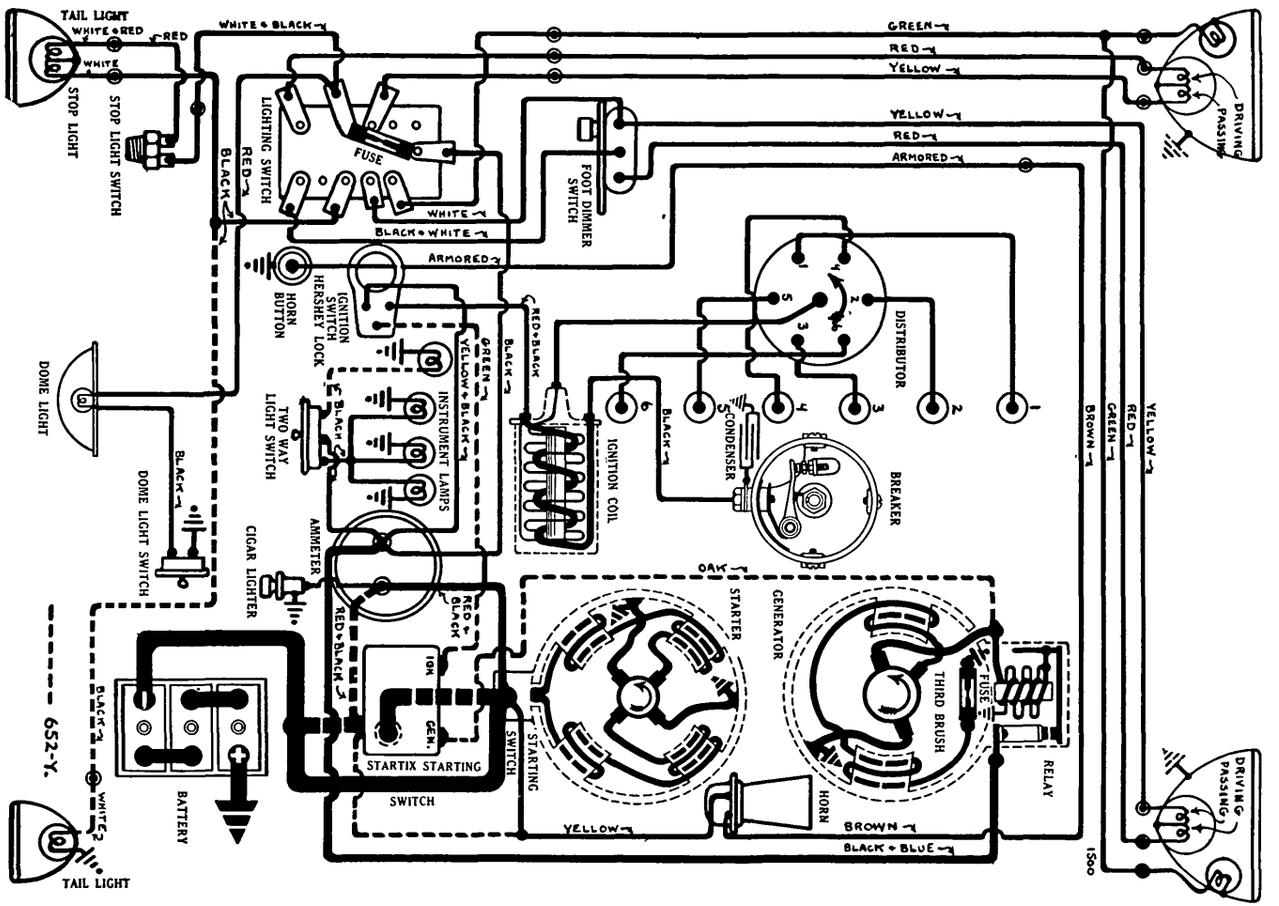
Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion, Type J-6. 14 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Carter, Model 288-S, 1¼" plain tube, downdraft type.

Fuel Pump:—Stewart-Warner, Type 708-A.



Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 .0113" before top dead center when flywheel mark '1/6' (dead center mark) is approximately 1.53 teeth before the indicator on the flywheel housing. Reset tappet clearance at .006-.008" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.006-.008" all valves—engine hot.

Valve Spring Pressure:—42-47 lbs. at 2 3/16" (valve closed). 88-94 lbs. at 1 27/32" (valve open).

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—15 lbs. (idling), 40 lbs. (maximum R.P.M.) warm.

Oil Pressure Relief Valve—Operates at 30 lbs. Located on left hand side of crankcase. Adjustable by adding or removing shims behind relief valve spring.

Capacity and Oil—6 qts. Use SAE. #30 (summer—first 3000 miles with new engine), #40 (summer—after 3000 miles), #20 (winter).

BATTERY:—U.S.L., Type RN-15A, 6 volt, 15 plate, 90 A.H. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On right hand side under front seat.

STARTER:—Model MAJ-4032 (652X), MAJ-4033 (652Y). Model MAJ-4035 (Export). Armature No. MAJ2006.
Starter Drive—Outboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ounces (new brushes).
Cranking Performance—155 R.P.M. (1705 R.P.M. armature), 170 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4100	5.5	67
.3 "	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.0 "	Lock	3.0	550
17.0 "	Lock	4.0	750

Starting Switch:—(MAJ-4032—On 652X). Type SW-3737-S. Mounted on starter field frame operated through flexible cable by pull button on instrument board.

MAJ-4033—On 652Y. Startix automatic starting controlled by ignition switch. See Equipment Section for complete data.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out three flange mounting cap screws.

GENERATOR:—Model GAR-4603-3, 4603-5 (Export). Armature No. GAR-2077. Third brush control type.
Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.
Maximum Charging Rate—20 amperes (cold), 2050-2250 R.P.M., 25 M.P.H.

Performance Data—GAR-4603-3

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—3.70-4.10 amperes at 6.0 volts.
Field Fuse—7½ ampere on field frame.
Motoring Current—4.65-5.15 amperes at 6.0 volts.

Mounting:—Pivot mounted at right front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.
Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator away from engine, tighten mounting bolts. Belt tension should be just enough to drive generator without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—6.75-7.5 volts, 800 R.P.M.
Cuts out—.5-2.5 ampere discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Soreng-Manegold Switch, Model B-5640-A. Delco-Remy Foot Control Switch, Model 465-W. Foot control switch provides assymetrical passing beam (lower beam right hand headlight, upper beam left hand headlight). Headlight beams are crossed with left hand headlight lighting right hand side of road.

Bulb Specifications

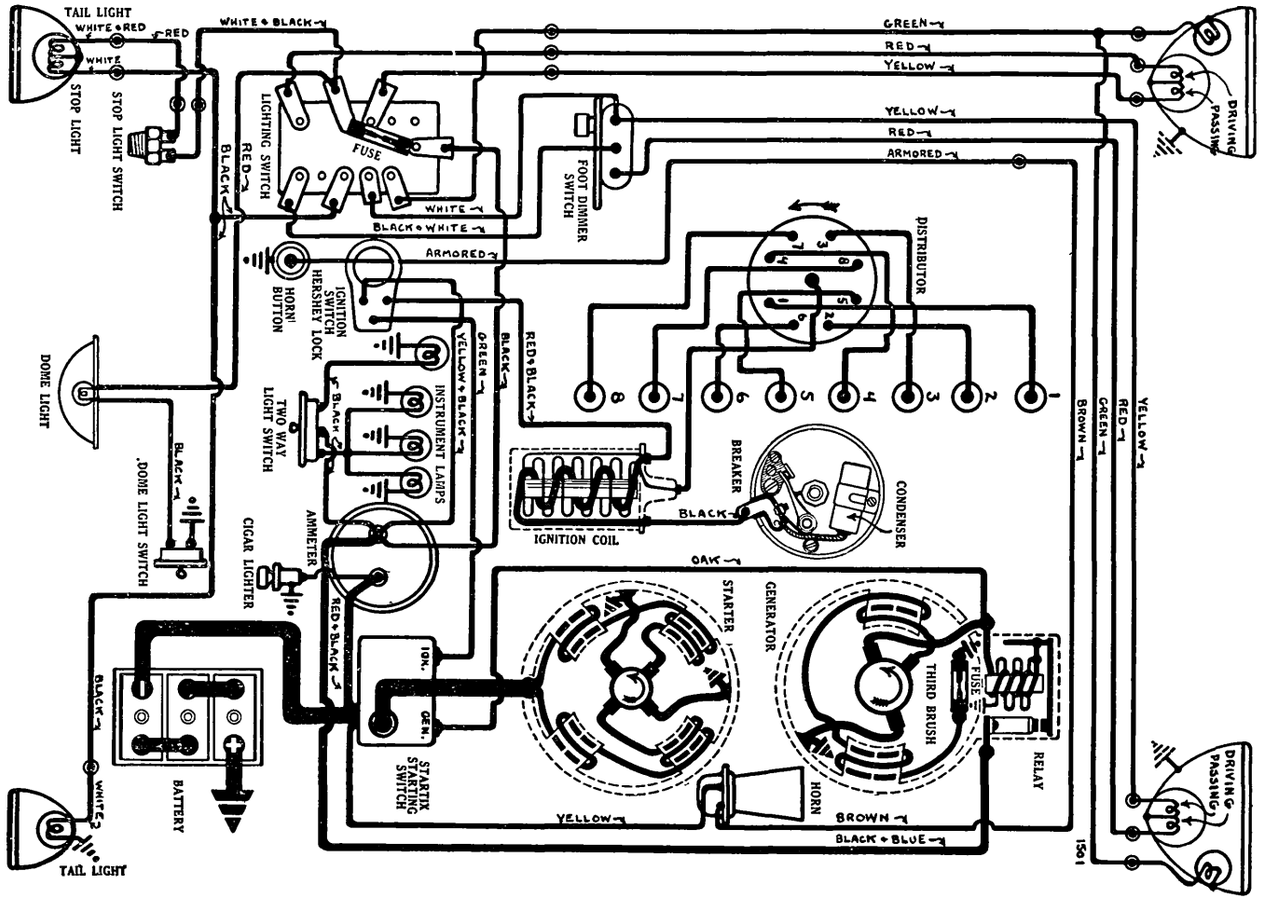
IGNITION TIMING:— Flywheel Degs. Piston Position All Engines .....3° or 1 tooth BTDC. .....0042" BTDC.
Timing:—Crank engine with #1 piston on compression until piston is 3° or approximately 1 tooth on flywheel before top dead center, stop when flywheel mark '3—' (first 470 cars) or '/' (later cars) lines up with indicator in inspection hole in flywheel housing. These marks are 3° or approximately 1 tooth before top dead center mark '⅛'. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).
Motor Gauge—Weidenhoff Adapter #105, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).



Spark Plugs:—Champion, Type C-7. 18 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor: — Stromberg, Model EX-32, 1½" plain tube, downdraft type.
Fuel Pump:—Stewart-Warner, Type 706-D.
Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—Set tappet clearand #1 intake valve at .012". This valve should open with #1 piston 5° (.0113") before top dead center when a point on the flywheel 1.528 teeth before top dead center mark '1/8' lines up with indicator in inspection hole in flywheel housing. Reset tappet clearance at .006-.008" with engine hot.
Motor Gauge—Weidenhoff Adapter #105, Rod #5.
Tappet Clearance:—.006-.008" all valves—engine hot.
Valve Spring Pressure:—42-47 lbs. at 2 3/16" (valve closed). 88-94 lbs. at 1 27/32" (valve open).

LUBRICATION:—Crankcase Capacity—8 quarts.
Normal Oil Pressure—15 lbs. (idling), 40 lbs. (maximum R.P.M.) warm.

BATTERY:—U.S.L., Type XY-15A, 6 volt, 15 plate, 104 A.H. capacity (20 hour rate).

Starting Capacity—119 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On right hand side under front seat.

STARTER:—Model MAB-4063. Armature No. MAB-2006.

Starter drive—Outboard Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ounces (new brushes).

Cranking Performance — 140 R.P.M. (1540 R.P.M. armature), 160 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes

Field Current—3.70-4.10 amperes at 6.0 volts.

Field Fuse—7½ amperes on field frame.

Motoring Current—4.65-5.15 amperes at 6.0 volts.

Mounting:—Pivot mounted at right front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator away from engine, tighten mounting bolts. Belt tension should be just enough to drive generator without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—6.75-7.5 volts, 800 R.P.M.
Cuts out—.5-2.5 ampere discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Soreng-Manegold Switch, Model A-5640-A. Delco-Remy Foot Control Switch Model 465-W. Beam Control Switch. Headlight bulbs are turned on and off by lighting switch. Beam control switch on instrument board provides three distinct beams (high, intermediate, low) to compensate for road and load conditions. Foot control switch deflects headlight beams to right (for all positions of beam control switch).

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32	1000
Stop and Tail (L.H.)	21-2	1158
Tail (R.H.)	3	63
Dome	6	81
All others	3	63

FUSES:—Lighting—20 amperes on lighting switch.
Generator Field—7½ amperes under cover on generator.

HORNS:—Schwartze. Vibrator type.

SERIAL NUMBER:—First number, 653-1001. On right hand side of cowl under hood. Letter following serial number designates body type.

COMPRESSION:—Ratio—6.2-1 Std. aluminum head. **Presssure**—Approximately 105 lbs at crank'g speed.

VACUUM READING:—Gauge should show steady reading of 20" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model IG-4065. Mounted on right side of engine block.

Ignition Current—2.5 amperes idling, 4.5-5.5 amperes at 6.0 volts with engine stopped.

Ignition Switch:—Oakes-Hershey co-incidental ignition switch and steering post lock. Switch used on cars with Startix has two 'on' position. Lower or 'STX' position of lever is normal running position with Startix operative. Upper or 'IGN' position should be used to check ignition or whenever automatic cranking is not desired.

Distributor Model IGB-4318. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—.020-.024" (first 1000 miles with new points), .018-.020" (after first 1000 miles).
Breaker Arm Spring Tension—16-22 ozs.

Cam Angles—Closed 34°. Open 26° (distributor).

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	540	4	1080
4	780	8	1560
6	1020	12	2040
8	1260	16	2520
10	1500	20	3000

Removal:—Mounted on cylinder head. To remove, take out hold-down screw in advance arm, lift distributor out.

IGNITION TIMING:—

Flywheel Degs.	Piston Position
All engines 3° BTDC	.0042" BTDC.

Timing:—With #1 piston on compression, turn engine over until piston is 3° before top dead center, stop when flywheel mark '/' lines up with indicator in inspection hole in flywheel housing. This mark is 3° or approximately 1 tooth before top dead center mark '1/6'. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Motor Gauge—Weidenhoff Adapter #114, Rod # 2.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion, Type J-6. 14 MM. Metric.

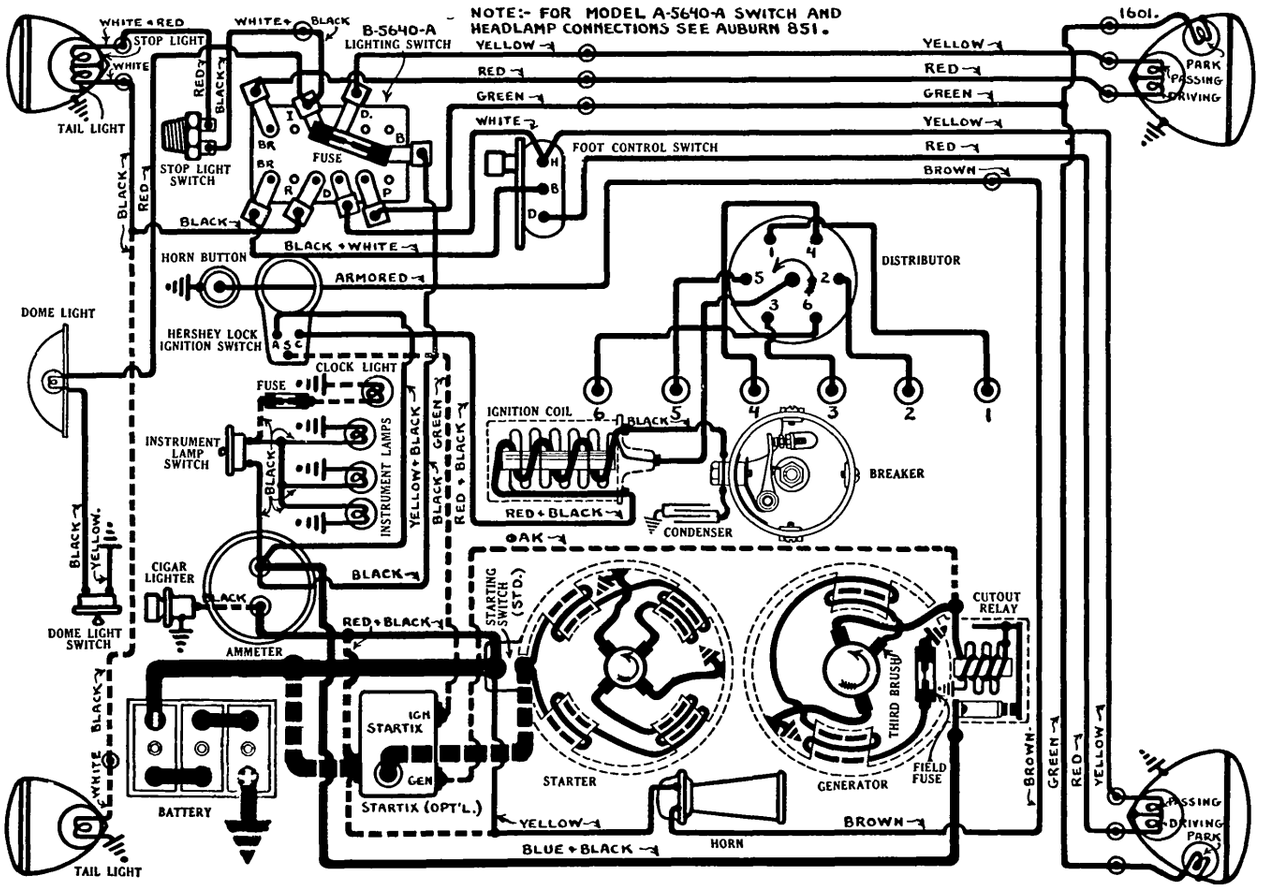
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Carter Model 307-S (before Serial No. 653-3036), Stromberg Model EX-22 (after Serial No. 653-3037), 1¼", downdraft type.

Fuel Pump:—Stewart-Warner, Type 708-A (first series), A.C., Type B-1521814 (second series).

Gasoline Gauge:—K-S Telegauge, hydrostatic type.



VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 slightly before top dead center when flywheel mark '1/6' (dead center mark) is approximately 1.53 teeth (first 3034 cars), or 2.29 teeth (after 3034 cars) before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter # 114, Rod #42. Piston position .0113" (first cars), .0253" (later cars) BTDC.

Tappet Clearance:—.008-.010" all valves engine hot.

Valve Spring Pressure:—42-47 lbs. at 2 3/16" (valve closed), 88-94 lbs. at 1⅞" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts (refill).

Normal Oil Pressure—15 lbs. idling, 40 lbs. maximum engine R.P.M. with warm oil.

BATTERY:—U.S.L., Type RN-15-A, 6 volt, 15 plate, 90 A.H. capacity (20 hour rate).

Starting Capacity—115 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under right front seat.

STARTER:—Model MAJ-4032 (Std.). MAJ-4033 (with Startix Optl.). Armature No. MAJ-2006.

Starter Drive—Outboard Bendix, Type R11FX-10.

Cranking Performance—155 R.P.M. (engine), 1705 R.P.M. (armature), 170 amperes.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4100	5.5	57
.3 "	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.0 "	Lock	3.0	550
17.0 "	Lock	4.0	750

Starting Switch:—(MAJ-4032) Type SW-3737-S. Mounted on starter field frame and operated by flexible cable control from instrument panel. (MAJ-4033) Startix automatic starting switch controlled by ignition switch. See Equipment Section for complete data.

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out 3 flange mounting cap screws.

GENERATOR:—Model GAR-4603-5. Armature GAR-2077. Air-cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band. Shift third brush by hand by prying on brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate—20 amperes (cold), 16 amperes (hot), 2300 R.P.M. or 25 M.P.H.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. (new brushes).

Motoring—4.65-5.15 amperes at 6.0 volts.

Field Current—3.70-4.10 amperes at 6.0 volts.

Field Fuse—5 ampere capacity.

Removal:—Pivot mounted at right front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Adjusted in usual manner by swinging generator away from engine. Tension should be just sufficient to drive generator and pump without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts In—6.75-7.5 volts, 800 R.P.M.
Cuts Out—.5-2.5 amperes discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model B-5640-A (4 pos.), A-5640-A (3 pos). Delco-Remy Foot Control Switch, Model 465-W. Two distinct lighting systems used as follows: **Controlled Beam (A-5640-A Switch).** Upper and lower beams controlled by foot switch. **Assymetrical Passing Beam (B-5640-A Switch).** Upper and lower beams controlled by lighting switch. Foot control switch provides assymetrical passing beam composed of lower beam (right hand headlamp) and upper beam (left hand headlamp). Headlamp beams are crossed with left hand headlamp illuminating right hand side of road.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights (B-5640-A switch)	32-21	2320-C
Headlights (A-5640-A switch)	32-32	1000
Parking, Instrument, Clock	3	63
Stop and Tail	21-2	1158
Tail (right—optl.)	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on back of switch
Clock Light—10 ampere on clock case.
Generator Field Fuse—5 ampere under cover on

SERIAL NUMBER:—First number, 851-1001. On right hand side of cowl under hood. Letter following serial number designates body type.

COMPRESSION:—Ratio—6.2-1 Std. aluminum head. **Pressure**—Approximately 105 lbs. at crank'g speed.

VACUUM READING:—Gauge should show steady reading of 20" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model CE-4001. On right side of engine block.

Ignition Current—3 amperes idling, 4½-5½ amperes at 6 volts stopped.

Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock. Switch has two 'on' positions. Lower or 'STX' position of lever is normal running position with Startix operative. Upper or 'IGN' position should be used to check ignition or whenever automatic cranking is not desired.

Distributor Model IGP-4002. Single breaker, 8 lobe cam, full automatic advance type.

Breaker Gap—.013-.017" (.015-.019" first 1000 miles with new contacts).

Breaker Arm Spring Tension—18 ozs., minimum, 20 ozs. maximum.

Cam Angles—Closed 27.5°. Open 17.5° (distributor).

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	540	4	1080
4	780	8	1560
6	1020	12	2040
8	1260	16	2520
10	1500	20	3000

Removal:—Distributor mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....3° BTDC. ..... .0042" BTDC.
Timing—With #1 piston on compression, turn engine over until piston is 3° before top dead center, stop when flywheel mark '/' lines up with indicator in inspection hole in flywheel housing. This mark is 3° or approximately 1 tooth before top dead center mark '⅛'. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Motor Gauge—Weidenhoff Adapter #105, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion, Type J-6. 14 MM. Metric.

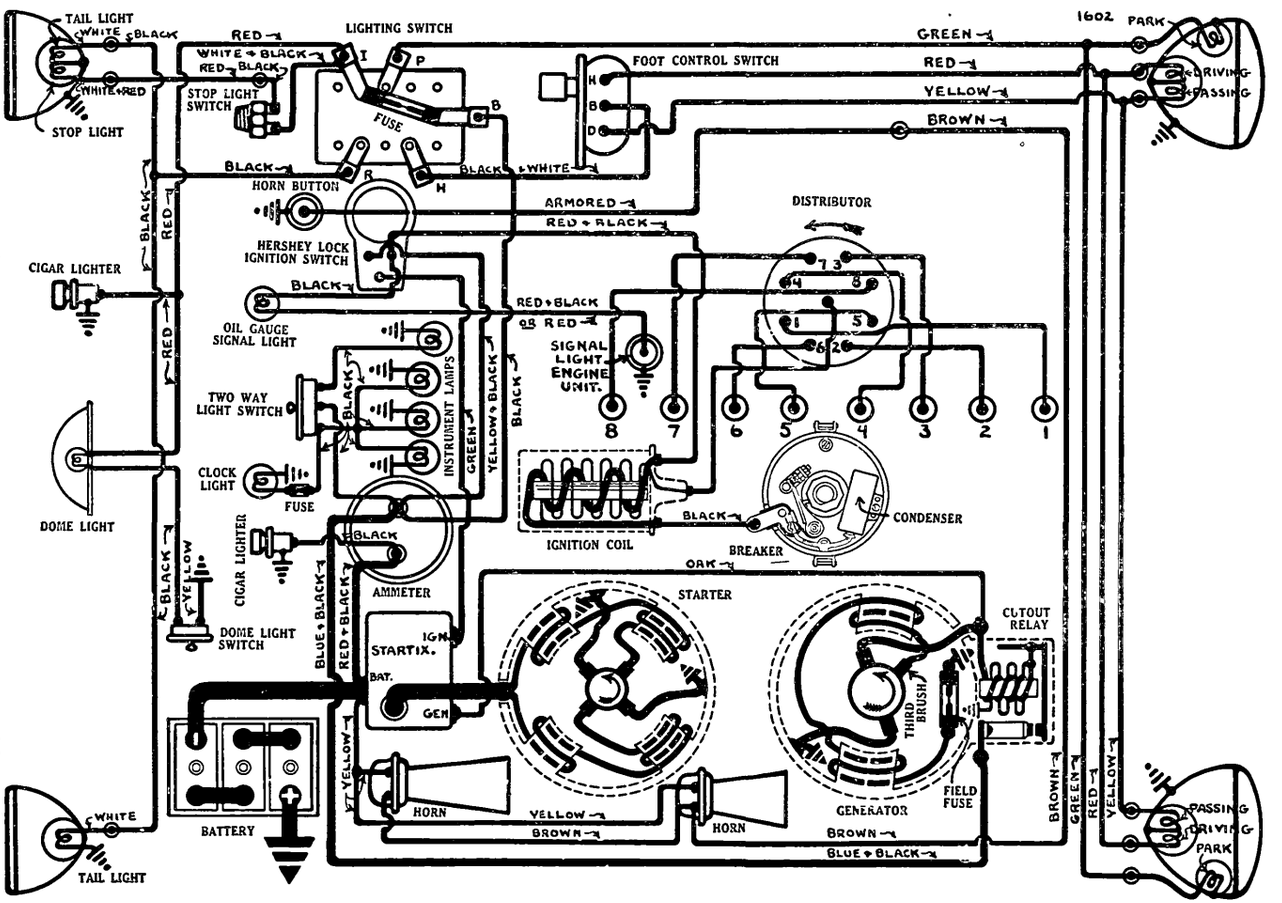
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-1. 1" dual, downdraft type.

Fuel Pump:—Stewart-Warner, Type 706-D (first cars), A.C., Type B-1522146 (later cars). Diaphragm type.

Gasoline Gauge:—K-S Telegauge, hydrostatic type.



VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 slightly before top dead center when flywheel mark '1/8' (dead center mark) is approximately 1.53 teeth (first 5169 cars) or 2.29 teeth (after 5169 cars) before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter #105, Rod #5. Piston position .0113" (first cars), .0253" later cars) BTDC.

Tappet Clearance:—.008-.010" all valves—running clearance with engine hot.

Valve Spring Pressure:—42-47 lbs. at 2 3/16" (valve closed), 88-94 lbs. at 1⅞" (valve open).

LUBRICATION:—Crankcase Capacity—8 qts. (refill). **Normal Oil Pressure**—15 lbs. idling, 40 lbs. maximum engine R.P.M. with warm oil.

BATTERY:—U.S.L., Type XY-15A. 6 volt, 15 plate, 105 A.H. capacity (20 hour rate).

Starting Capacity—119 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under right front seat.

STARTER:—Model MAB-4063. Armature No. MAB-2006.

Starter Drive—Outboard Bendix Type R11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ounces with new brushes.

Cranking Performance—140 R.P.M. (engine), 1540 R.P.M. (armature), 160 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	575
22.5 "	Lock	4.0	750

Starting Switch:—Startix automatic starting controlled by ignition switch. See Equipment Section for complete data.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out three flange mounting screws.

GENERATOR:—Model GAR-4603-5. Armature GAR-2077. Air-cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band. Shift third brush by hand by prying on brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate Setting—20 amperes (cold), 16 amperes (hot), 2300 R.P.M. or 25 M.P.H.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ounces with new brushes.

Motoring Current—4.65-5.15 amperes at 6.0 volts.

Field Current—3.70-4.10 amperes at 6.0 volts.

Field Fuse—7½ amperes under cover on top of generator field frame.

Removal:—Pivot mounted at right front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Belt adjusted in usual manner by swinging generator away from engine. Tension should be just sufficient to drive generator without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator.
Cuts In—6.75-7.5 volts, 800 R.P.M.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING: — Soreng-Manegold Switch, Model A-5640-A. Delco-Remy Foot Control Switch, Model 465-W. Foot switch on toeboard controls headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Inst., Clock	3	63
Tail (right side)	3	63
Stop and Tail (left)	21-2	1158
Dome	6	81

FUSES:—Lighting—20 ampere on back of switch.
Clock Light—10 ampere on clock case.
Generator Field—7½ ampere on generator.

SERIAL NUMBER:—First number, 851-1001. On right hand side of cowl under hood. Letter following serial number designates body type.

COMPRESSION:—Ratio—6.5-1 Std. aluminum head. **Pressure**—Approximately 106 lbs. at crank'g speed.

VACUUM READING:—Gauge should show steady reading of 20" with engine idling.

IGNITION:—Coil Model CE-4001. On right side of engine block.

Ignition Current—3 amperes idling, 4½-5½ amperes at 6.0 volts stopped.

Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock. Switch has two 'on' positions. Lower or 'STX' position of lever is normal running position with Startix operative. Upper or 'IGN' position should be used to check ignition or whenever automatic cranking is not desired.

Distributor Model IGH-4027. Double breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine and must be synchronized (see Timing).

Breaker Gap—.018-.020".

Breaker Arm Spring Tension—16-20 ounces.

Cam Angles—Closed 32°. Open 13° (distributor). Both sets together when properly synchronized.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
1	700	2	1400
2	990	4	1980
3	1280	6	2560
4	1560	8	3120
5.5	2000	11	4000

Removal:—Distributor mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....3-4° BTDC. ..... .0042" BTDC.
Timing (Stationary Contacts)—With #1 piston on compression, turn engine over until piston is 3-4° before top dead center, stop when flywheel mark '/' lines up with indicator in inspection hole in right front face of flywheel housing. This mark is approximately 1½ teeth before the top dead center mark '⅛'. Then loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.
Synchronization (Movable Contacts)—Manufacturer recommends use of a Winn Synchrometer to synchronize contacts. No flywheel marks are provided and some type of equipment must be used for this purpose. Change position of movable sub-plate carrying second set of contacts by loosening two lockscrews and shifting plate until movable contacts open exactly 45° after stationary set. Distributor firing intervals are regular 45-45-45 distributor degrees.

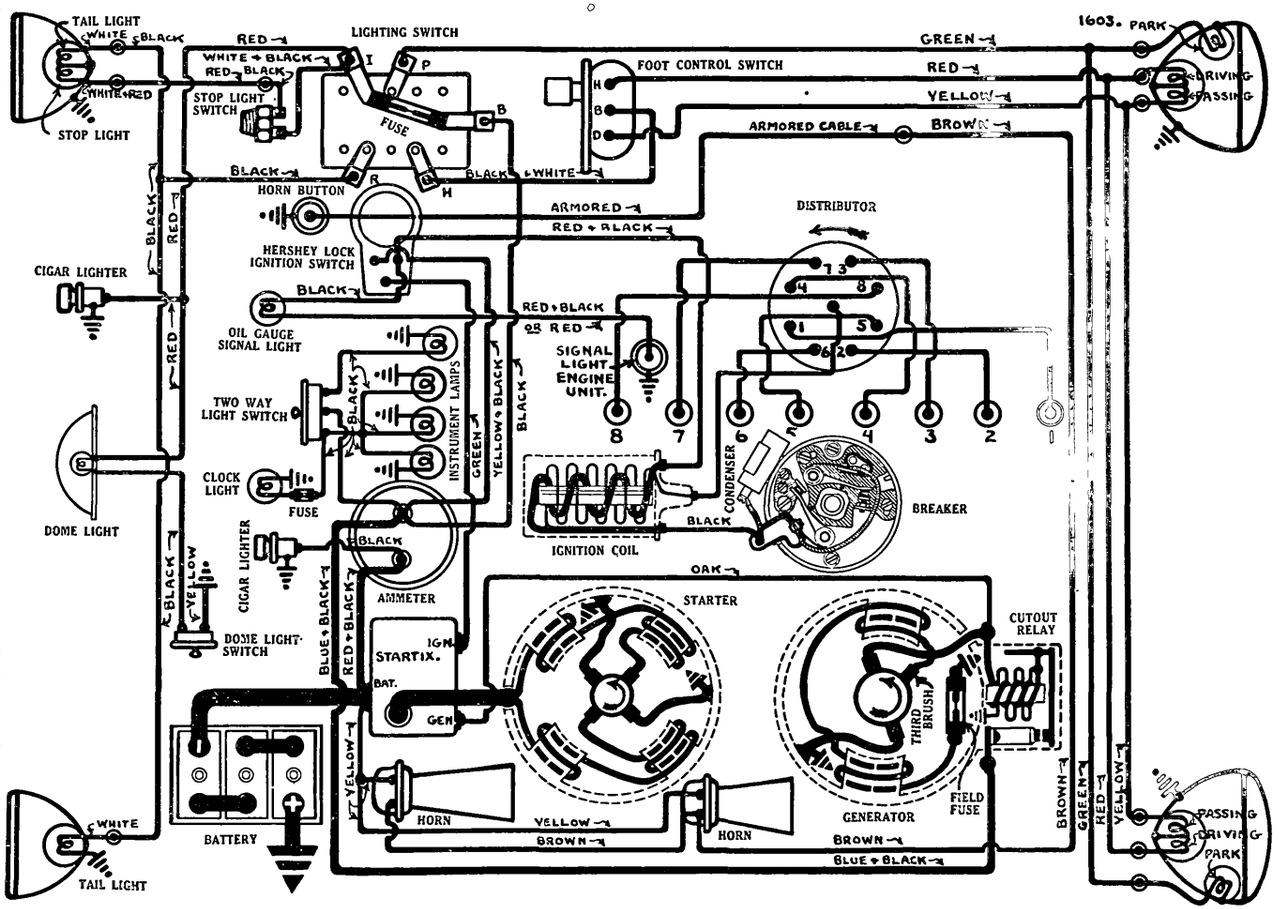
Auto-Lite Synchronizing Tool ST-206—See Equipment Section for complete directions on synchronizing distributor with this tool (old Part No. IGH-1). Used in connection with 45-degree marks on rotor fantail.

NOTE—Manufacturer recommends use of a Neon Timing Light in setting ignition. See Equipment Section for complete directions.

Motor Gauge—Weidenhoff Adapter #105, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion Type J-9B. 14 MM. Metric.
Spark Plug Gaps—Set at .025".



CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-32, 1½" plain tube, downdraft type mounted on Supercharger.

Fuel Pump: — Stewart-Warner Type 706-D (first cars), A.C., Type B-1522146 (later cars). Diaphragm type.

Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 .0253" before top dead center

when flywheel mark '1/8' (dead center mark) is approximately 2.29 teeth before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter #105, Rod #5.

Tappet Clearance:—.008-.010" all valves with engine hot.

Valve Spring Pressure:—42-47 lbs. at 2 3/16" (valve closed), 88-94 lbs. at 1 27/32" (valve open).

LUBRICATION:—Crankcase Capacity—8 qts. (refill).
Normal Oil Pressure—15 lbs. idling, 40 lbs. at maximum engine R.P.M. with warm oil.

BATTERY:—U.S.L., Type XY-15A. 6 volt, 15 plate, 105 A.H. capacity (20 hour rate).
Starting Capacity—119 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right front seat.

STARTER:—Model MAB-4063. Armature No. MAB-2006.
Starter Drive—Outboard Bendix Type R11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ounces with new brushes.
Cranking Performance—140 R.P.M. (engine), 1540 R.P.M. (armature), 160 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	575
22.5 "	Lock	4.0	750

Starting Switch:—Startix automatic starting controlled by ignition switch. See Equipment Section for complete data.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out three flange mounting screws.

GENERATOR:—Model GAR-4603-5. Armature GAR-2077. Air-cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band. Shift third brush by hand by prying on brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate Setting—20 amperes (cold), 16 amperes (hot), 2300 R.P.M. or 25 M.P.H.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ounces with new brushes.

Motoring Current—4.65-5.15 amperes at 6.0 volts.

Field Current—3.70-4.10 amperes at 6.0 volts.

Field Fuse—7½ amperes under cover on top of generator field frame.

Removal:—Pivot mounted at right front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Belt adjusted in usual manner by swinging generator away from engine. Tension should be just sufficient to drive generator without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator.
Cuts In—6.75-7.5 volts, 800 R.P.M.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING: — Soreng-Manegold Switch, Model A-5640-A. Delco-Remy Foot Control Switch, Model 465-W. Foot switch on toeboard controls headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Inst., Clock	3	63
Tail (right side)	3	63
Stop and Tail (left)	21-2	1158
Dome	6	81

FUSES:—Lighting—20 ampere on back of switch.
Clock Light—10 ampere on clock case.
Generator Field—7½ ampere on generator.

SERIAL NUMBER:—First number—654-6501. On right hand side of cowl under engine hood. Letter following serial number indicates body type.

COMPRESSION:—Ratio—6.2-1. Std. aluminum head.
Pressure—Approximately 105 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 20" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model IG-4065. Mounted on right side of engine block.

Ignition Current—2.5 amperes idling, 4.5-5.5 amperes at 6.0 volts with engine stopped.

Ignition Switch:—Oakes-Hershey co-incidental ignition switch and steering post lock. Switch used on cars with Startix has two 'on' positions. Lower or 'STX' position of lever is normal running position with Startix operative. Upper or 'IGN' position should be used to check ignition or whenever automatic cranking is not desired.

Distributor Model IGB-4318. Single breaker, 6 lobe cam, full automatic advance.

Breaker Gap—.020-.024" (first 1000 miles with new points), .018-.020" (after first 1000 miles).

Cam Angle or Dwell—Closed 34°, Open 26° (distributor).

Condenser—Part No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	540	4	1080
4	780	8	1560
6	1020	12	2040
8	1260	16	2520
10	1500	20	3000

Distributor Removal:—Mounted on cylinder head. To remove, take out hold-down screw in advance arm, lift distributor out.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....3° BTDC.....0042" BTDC

To Set Timing—With #1 piston on compression, turn engine over until piston is 3° before top dead center, stop when flywheel mark '/' lines up with indicator in inspection hole in flywheel housing. This mark is 3° or approximately 1 tooth before top dead center mark '1/6'. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Motor Gauge—Weidenhoff #114 Adapter, #42 Rod.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion, Type J-6. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—Carburetor—Stromberg Model EX-22. 1¼" downdraft type with manual choke control.

NOTE—Do not adjust cabruretor until engine is warmed up so that engine will idle at hot or slow idling speed.

Idle Adjustment—With engine hot and choke valve fully released (choke button in against dash), set throttle stopscrew to idle engine at 7-8 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever has two holes for pump link engagement. Set as follows:
Outer hole (Max. stroke)—Winter temperatures.
Inner Hole (Min. stroke)—Summer temperatures.

Throttle Cracking:—No adjustment required.

Air Cleaner:—AC. #1525997 oil-wetted type standard, heavy duty oil bath type optional.

Fuel Pump:—AC. Type B #1521814. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—K-S Telegauge hydrostatic type. K-S Part No. 5297 (dash unit), 5310 (tank unit). See article in Carburetion Section.

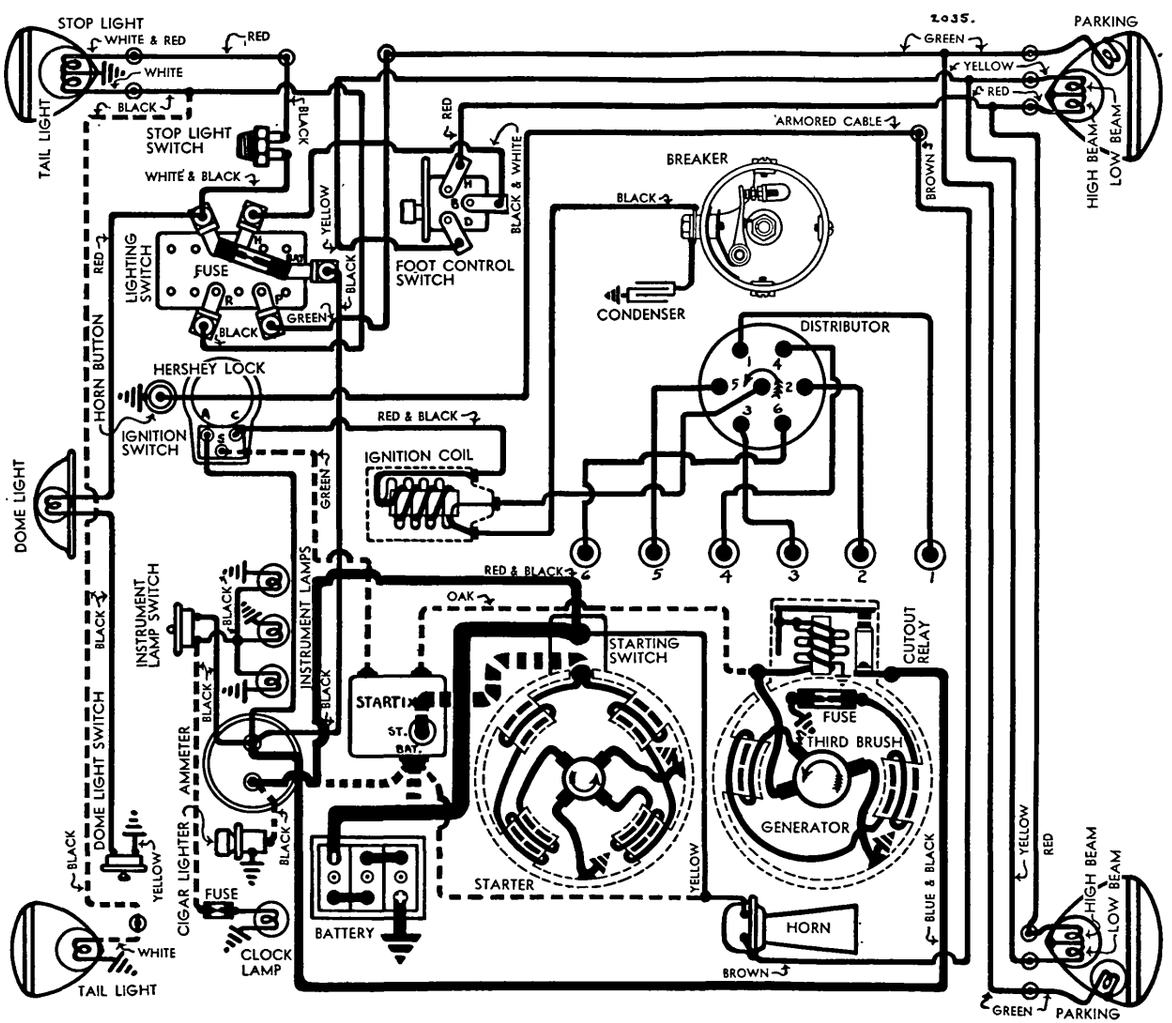
VALVE TIMING:—Tappet Clearance—.008-.010" all valves engine hot.

Valve Spring Pressure—42-47 lbs. at 2 3/16" (valve closed), 88-94 lbs. at 1⅞" (valve open).

To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 .0253" before top dead center when flywheel mark '1/6' (dead center mark) is approximately 2.29 teeth before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Crankcase capacity—6 qts. (refill).



Normal Oil Pressure—15 lbs. idling, 40 lbs. maximum engine R.P.M. with warm oil.

BATTERY:—U.S.L. Type RN-15A. 6 volt, 90 ampere hour capacity (20 hour rate).

Starting Capacity—115 amperes for 20 minutes.

Zero Capacity—300 amperes for 2.9 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under right hand front seat.

STARTER:—Model MAJ-4032 (Std.), MAJ-4035 (RHD), MAJ-4033 (with Startix). Armature No. MAJ-2006.

Drive—Inboard Bendix Type R11FX-10.

Cranking Engine—155 R.P.M. 170 amperes at 5.2 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (MAJ-4032, 33), 31-42 ozs. (MAJ-4035) with new brushes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4100	5.5	57
.3 "	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.0 "	Lock	3.0	550
17.0 "	Lock	4.0	750

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out 3 flange mounting screws.

Starting Switch:—(MAJ-4032,35) SW-3737S. Mounted on starter and operated through pull cable by button on instrument panel. Pull required to close switch contacts must be 2.3 lbs. minimum measured at end of lever.

(MAJ-4033). Startix Type D. Automatic starting controlled by ignition switch. See article in Equipment Section.

GENERATOR:—Model GAR-4603-5. Armature No. GAR-2077. Air-cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate Setting—20 amperes (cold), 16 amperes (hot), 2300 R.P.M. or 25 M.P.H.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. (new brushes).

Field Current—3.70-4.10 amperes at 6.0 volts.

Field Fuse—5 ampere under cover on generator field frame near cutout relay.

Motoring Current—4.65-5.15 amperes at 6.0 volts.

Removal:—Pivot mounted at right front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Adjusted in usual mannner by swinging generator out. Belt tension should be just sufficient to drive generator and water pump without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator. See article in Equipment Section for complete data.

Cuts In—6.75-7.5 volts, 800 R.P.M.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Headlamps aimed straight ahead. Upper and lower beams controlled by foot selector switch on toeboard.

Switches

Lighting—Soreng-Manegold Model A-5640-A.

Foot Selector—Delco-Remy.

Stop Light—Motometer No. 58012 hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking, Instrmt., Clock	3	63
Stop and Tail	21-3	1158
Dome	6	81

FUSES:—Lighting—20 ampere on lighting switch.
Clock Lamp—10 ampere on clock.

HORNS:—Schwarze Vibrator type. Current draw 6 amp.

SERIAL NUMBER:—First number (852) 4501, (Schgd. 852) 34501. On right hand side of cowl under engine hood. Letter following serial number indicates body type.

COMPRESSION:—Ratio—6.2-1 Std. aluminum head.
Pressure—Approximately 105 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 20" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model CE-4001G (852), CE-4001 (Schgd. 852). Mounted on right side of engine blk.

Ignition Current—3 amperes idling, 4.5-5.5 amperes at 6.0 volts stopped.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock. Switch has two 'on' positions. Lower or 'STX' position of lever is normal running position with Startix operative. Upper or 'IGN' position should be used to check ignition or whenever automatic cranking is not desired.

Distributor (852) Model IGP-4002. Single breaker, 8 lobe cam, full automatic advance type. No synchronization.

Breaker Gap—.013-.017" (.015-.019" for first 1000 miles with new points).

Cam Angle or Dwell—Closed 27.5°. Open 17.5° with .017" breaker gap.

Breaker Arm Spring Tension—18 ozs. min., 20 ozs. max.

Condenser—Part No. IG-2671. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	540	4	1080
4	780	8	1560
6	1020	12	2040
8	1260	16	2520
10	1500	20	3000

Distributor (Schgd. 852) Model IGH-4027. Double breaker, 4 lobe cam, full automatic advance type. Breaker contacts open alternately at 45° intervals corresponding to 90° engine firing intervals. Contacts must be synchronized (see Timing).

Breaker Gap—.018-.020".

Cam Angle or Dwell—Closed 32°. Open 13° with .020" gap (both sets together when synchronized).

Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IGB-1025C. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
1	700	2	1400
2	990	4	1980
3	1280	6	2560
4	1560	8	3120
5.5	2000	11	4000

Distributor Removal:—Mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines (Eight)..... 3° BTDC.....0042" BTDC
All engines (SChgd)....3-4° BTDC.....0042" BTDC

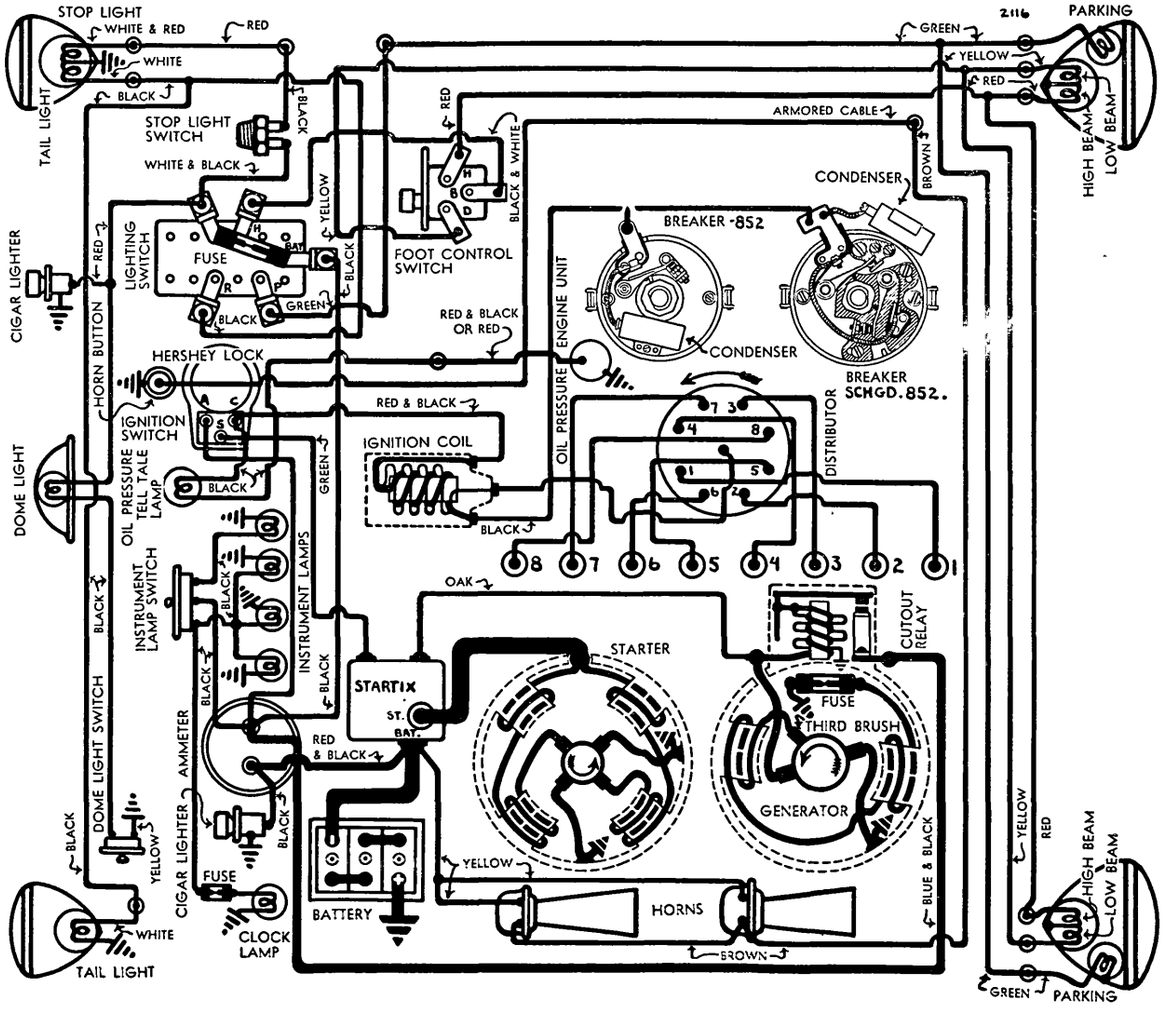
NOTE—No synchronization necessary on distributor model IGP-4002 (Eight).

Timing—With #1 piston on compression, turn engine over until piston is 3-4° before top dead center, stop when flywheel mark '/' lines up with indicator in inspection hole in right front face of flywheel housing. This mark is approximately 1-1½ teeth before the top dead center mark '1/8'. Then loosen advance arm clamp bolt, rotate distributor until contacts (stationary—mounted directly on breaker plate, on IGH-4027 distributor) begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Synchronization (Movable Contacts)—Manufacturer recommends use of a Winn Synchrometer to synchronize contacts. No flywheel marks are provided and some type of equipment must be used for this purpose. Change position of movable sub-plate carrying second set of contacts by loosening two lockscrews and shifting plate until movable contacts open exactly 45° after stationary set. Distributor firing intervals are regular 45-45-45 distributor deg.

Auto-Lite Synchronizing Tool ST-206—See Equipment Section for complete directions on synchronizing distributor with this tool. Used in connection with 45-degree marks on rotor fantail.
NOTE—Manufacturer recommends use of Neon Timing Light in setting ignition. See article in Equipment Section for directions.

Motor Gauge—Weidenhoff #105 Adapter, #5 Rod.



Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion Type J-6 (852), J-9 (Schgd. 852). 14 MM. Metric type.

Spark Plug Gaps—Set at .025".

CARBURETION:—Carburetor (852)—Stromberg Model EE-1, 1' dual downdraft type with manual choke control. See Carburetion Section for adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is

warmed up so that engine will idle at slow or hot idling speed.

Idle Adjustment—With engine hot, close throttle, see that choke control button on dash is in off position (choke valve fully released), set throttle stopscrew so that engine idles at 5-6 M.P.H. Turn inner idle adjusting screw in until engine misses, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly; repeat with outer idle adjusting screw. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever has two holes for pump link engagement. Set as follows: Inner Hole (Min. stroke)—Summer temperatures. Outer Hole (Max. stroke)—Winter temperatures.

Throttle Cracking—No adjustment required. See separate article in Carburetion Section.

Carburetor (Schgd. 852):—Stromberg Model EX-32, 1½" plain tube, downdraft type with manual choke control. See Carburetion Section for adjustment, overhaul and Jet Specifications.

Idle Adjustment—With engine hot, close throttle, see that choke control button on dash is in off position (choke valve fully released), set throttle stop screw so that engine idles at 5-6 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Air Cleaner:—AC. #1525598 oil-wetted type standard, heavy duty oil-bath type optional.

Fuel Pump:—AC. Type B #1522146 diaphragm type (both models). See article in Carburetion Section.

Gasoline Gauge:—K-S Telegauge hydrostatic type. K-S Part No. 5297 (dash unit—both models), 5652 (tank unit—852), 5310 (tank unit—Schgd. 852).

VALVE TIMING:—Tappet Clearance—.008-.010" all valves with engine hot.

Valve Spring Pressure—42-47 lbs. at 2 3/16" (valve closed), 88-94 lbs. at 1⅞" (valve open).

To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 .0253" before top dead center when flywheel mark '1/8' (dead center mark) is approximately 2.29 teeth before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter #105, Rod #5.

LUBRICATION:—Crankcase Capacity—8 qts. (refill). **Normal Oil Pressure**—15 lbs. idling, 40 lbs. maxim'm.

BATTERY:—U.S.L. Type XY-15A. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).

Starting Capacity—122 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under right hand front seat.

STARTER:—Model MAB-4063. Armature No. MAB-2006. Drive—Inboard Bendix Type R11FX-10.

Cranking Engine—140 R.P.M. 160 amperes at 5.2 v.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.5	575
22.5 "	Lock	4.0	750

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out 3 flange mounting screws.

Starting Switch:—Startix Type D. Automatic starting controlled by ignition switch. See article in Equipment Section.

GENERATOR:—Model GAR-4603-5. Armature No. GAR-2077. Air-cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator band. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate Setting—20 amperes (cold), 16 amperes (hot), 2300 R.P.M. or 25 M.P.H.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. (new brushes).

Field Current—3.70-4.10 amperes at 6.0 volts.

Field Fuse—5 ampere under cover on generator field frame near cutout relay.

Motoring Current—4.65-5.15 amperes at 6.0 volts

Removal:—Generator pivot mounted at right front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Adjusted in usual manner by swinging generator out until belt tension just sufficient to drive generator and water pump without slipping.

CUTOUT RELAY:—Model CB-4021. Mounted on generator. See article in Equipment Section for complete data.

Cuts In—6.75-7.5 volts, 800 R.P.M.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Headlamps aimed straight ahead. Upper and lower beams controlled by foot selector switch on toeboard.

Switches

Lighting—Soreng-Manegold Model A-5640-A.

Foot Selector—Delco-Remy.

Stop Light—Motometer No. 50812 hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking, Instrmt., Clock	3	63
Stop and Tail (L.H.)	21-3	1158
Tail (R.H.)	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on lighting switch.

Clock Lamp—10 ampere on clock.

HORNS:—Schwarze Vibrator type. Horn current 6 amperes each.

AMERICAN AUSTIN

BANTAM MODEL (1930-31-32)—PRODUCTION STARTED MAY 1, 1930
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

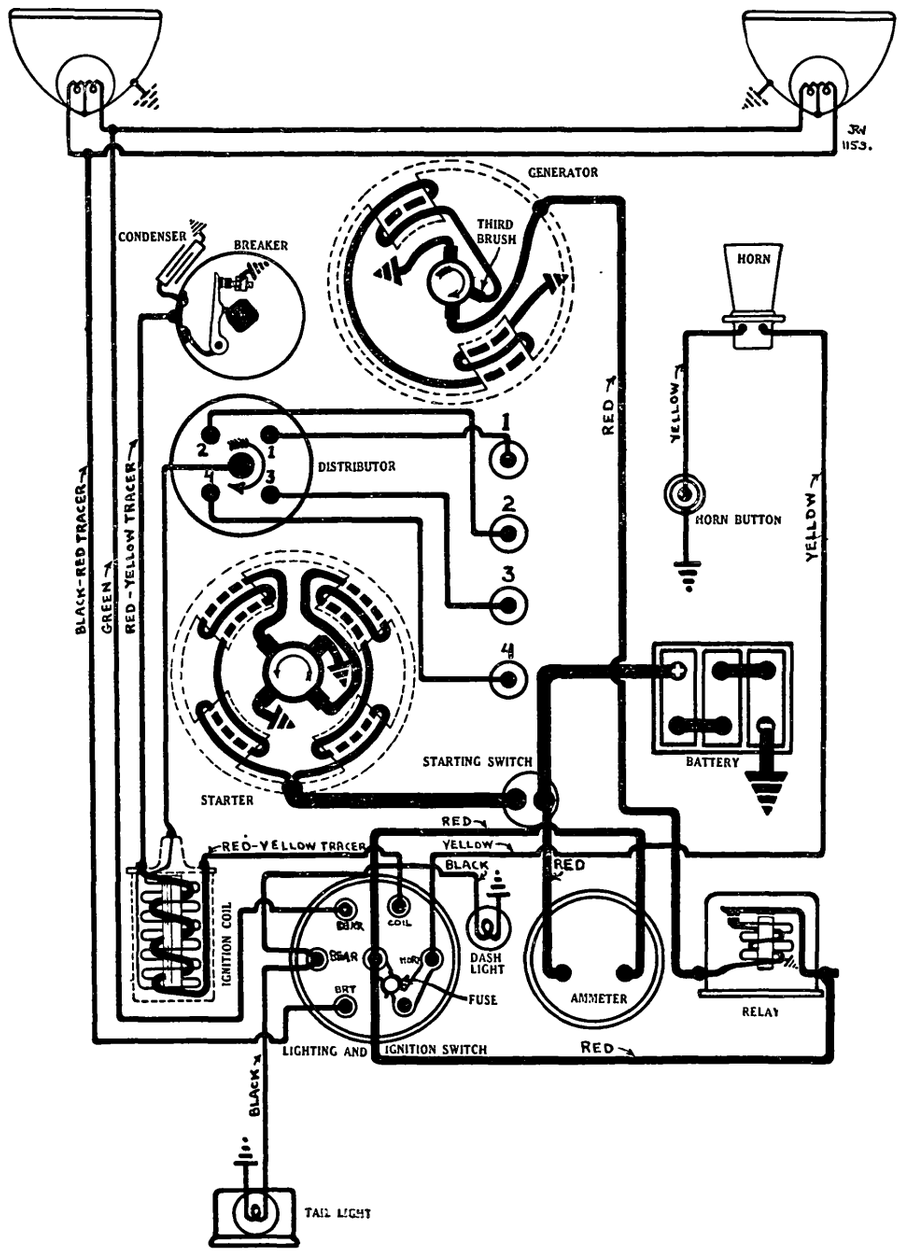
BATTERY:—U.S.L., Type 3-CYX-4X-7A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 60 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 12 hours. Battery is mounted in a recess in the cowl under the engine hood on the right side of the car.

IGNITION:—Coil Model IG-4065. Coil is mounted on the engine side of the dash. Ignition current is 3 amperes at 6.5 volts with engine running and 4 amperes at 6.4 volts with engine stopped. Ignition is controlled by the key in the combination switch on the instrument panel.

Distributor Model IGB-4034-A. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until gap is .022 inch ((new) or .020 inch (after 1000 miles) with the breaker arm on the lobe of the cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 600 R.P.M. of the engine. Maximum automatic advance is 22 degrees (flywheel) reached at 2800 R.P.M. of the engine.

Mounting:—Distributor is mounted on the commutator end of the generator at the front of the engine. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor every 500 miles of operation. Every 1000 miles remove the distributor head and rotor and put one drop of oil on the breaker arm pivot pin and put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .020 inch (actual piston travel) before top dead center. To set ignition, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Take out the spark plug in cylinder No. 1 and screw the special timing gauge in place in the spark plug port (see Equipment Section for full details of this gauge). Turn the engine over to top dead center and set gauge at zero. Then turn engine over until piston No. 1 is again coming up on compression and stop when gauge indicates piston is .020 inch before top dead center. Loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and connect the spark plugs as shown on the diagram. The firing position (.020 inch before top dead center) is approximately ¾ inch on the flywheel before the top dead center mark for cylinder No. 1.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—18 MM. Metric. A.C. Type G-12. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 1/32 inches. Stem diameter, 9/32 inch. Stem length, 3⅛ inches. Valve lift, 5/32 inch. Spring pressure, 45 pounds. Tappet clearance, .002-.003 inch. Inlet valves open at top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 1/32 inches. Stem diameter, 9/32 inch. Stem length, 3⅛ inches. Valve lift, 5/32 inch. Spring pressure, 45 pounds. Tappet clearance, .003-.004 inch. Exhaust valves open 45 degrees before lower dead center and close 15 degrees after top dead center. Valve stem guides are removable. Valves with ovrsize stems are not made.

AMERICAN AUSTIN

BANTAM MODEL (1930-31-32)—PRODUCTION STARTED MAY 1, 1930
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

To Set Valve Timing:—Camshaft is gear driven. Mesh marked tooth of crankshaft gear between two marked teeth of camshaft gear.

NOTE. The top dead center position of piston No. 1 is marked on the flywheel by the mark '#1&4 T.D.C.' This is the opening point for the inlet valve in cylinder No. 1.

STARTER:—Model MAK-4001. Starter is connected to the engine through a special inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 120 R.P.M. drawing 150 amperes at 3 volts. Brush spring tension is 27-43 ounces. When new brushes are fitted, spring tension should be 38-61 ounces. Starter switch is Model SW-4204 (first cars), superseded by Model SW-4001.

Starter Data

Torque	R.P.M.	Volts	Amperes
.3 lb. ft.	3240	5.5	100
1.3 "	1880	5.0	200
3.1 "	1000	4.5	300
4.8 "	220	4.0	400
7.0 "	Lock	4.0	520

Mounting:—Starter is flange mounted at the left of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and take out two flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the starter bearing oilers every 5000 miles of operation. Whenever the starter is dismantled the armature shaft splines should be oiled with heavy oil or graphite grease. The felt pad in the outer end of the commutator end bearing should be soaked in medium oil before being assembled.

GENERATOR:—Model GAS-4101. The direction of rotation is clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush and brush mounting plate are held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 14 amperes at 8 volts reached at 2000 R.P.M. or 28-30 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.6	835
6	7.1	1000
10	7.25	1260
14	8.0	1925
12	7.75	2900

Shunt field current is 3.8-4.18 amperes at 6.0 volts. Motoring, generator draws 4.5-4.8 amperes at 6.0 volts. Brush spring tension is 15-20 ounces with new brushes.

Mounting:—Generator is flange mounted at the front of the engine and is driven by helical gears from the camshaft drive gear. The gear mesh is adjusted by shims under the generator mounting bracket and these shims must be carefully removed and replaced whenever the generator is taken off the car. The distributor is mounted on the commutator end of the generator. To remove generator, disconnect lead and all ignition wiring or remove distributor. Then take out three flange mounting bolts. Pull the generator to the left to disengage the drive gear and lift from place.

NOTE. An adjustment is provided to mesh the generator drive gear and this should be done whenever the generator has been taken off the car. With the engine running, the three screws and the nut on the stud which hold the generator mounting bracket on the crankcase should be loosened and the weight of the generator supported by hand at the commutator end until the gears assume the proper running position. The three screws and the nut should then be tightened.

Oiling:—The bearing at the drive end of the generator is packed with grease and is oiled from the gear case. It requires no attention in service but should be repacked whenever the generator is disassembled. The commutator end bearing is fitted with a grease cup cast in the end plate. This should be refilled with No. 3 Keystone grease every year or each 10,000 miles of operation.

RELAY:—Model CB-4008. Relay is mounted on the dash. Relay contacts close at 10 M.P.H. or 875 R.P.M. when the generator voltage reaches 7-7.5 volts with a charging current of approximately 2 amperes and open at 6-7 M.P.H. or 600-650 R.P.M. with a discharge current of .5-2.5 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs & Stratton Switch, Model 50518. Lighting switch is mounted on the instrument panel. Headlights are equipped with double filament bulbs. Headlight bulbs are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

FUSES:—Lighting fuse mounted on the back of the switch is 20 ampere capacity.

AUSTIN

BANTAM MODEL (1933-34-35) AFTER MOTOR NO. L-12799
AUTO-LITE ELECTRICAL SYSTEM

ENGINE:—Four cylinder, 'L' head type, 2.2x3" bore and stroke, 45.6 cubic inch displacement, rated at 7 H.P., develops 13 H.P. at 3100 R.P.M. Compression ratio 5-1 (before engine No. L-15038), 6-1 (after engine No. 15038). Compression pressure 97 pounds.

BATTERY:—U.S.L., Type 3-CYX-4X-7A, or XY-9A, 6 volt, 9 plate, 58 ampere hour capacity (5 ampere hour rate). Starting capacity 68 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded.
Mounting:—In recess in cowl under engine hood.
Dimensions:—Width, 7". Length, 6 15/16". Height, 8⅝".

IGNITION:—Coil Model IG-4065. Coil is mounted on engine side of dash.
Ignition Current:—3 amperes at 6.5 volts (engine running), 4 amperes at 6.4 volts (engine stopped).
Ignition Switch:—Incorporated in lighting switch on instrument panel.

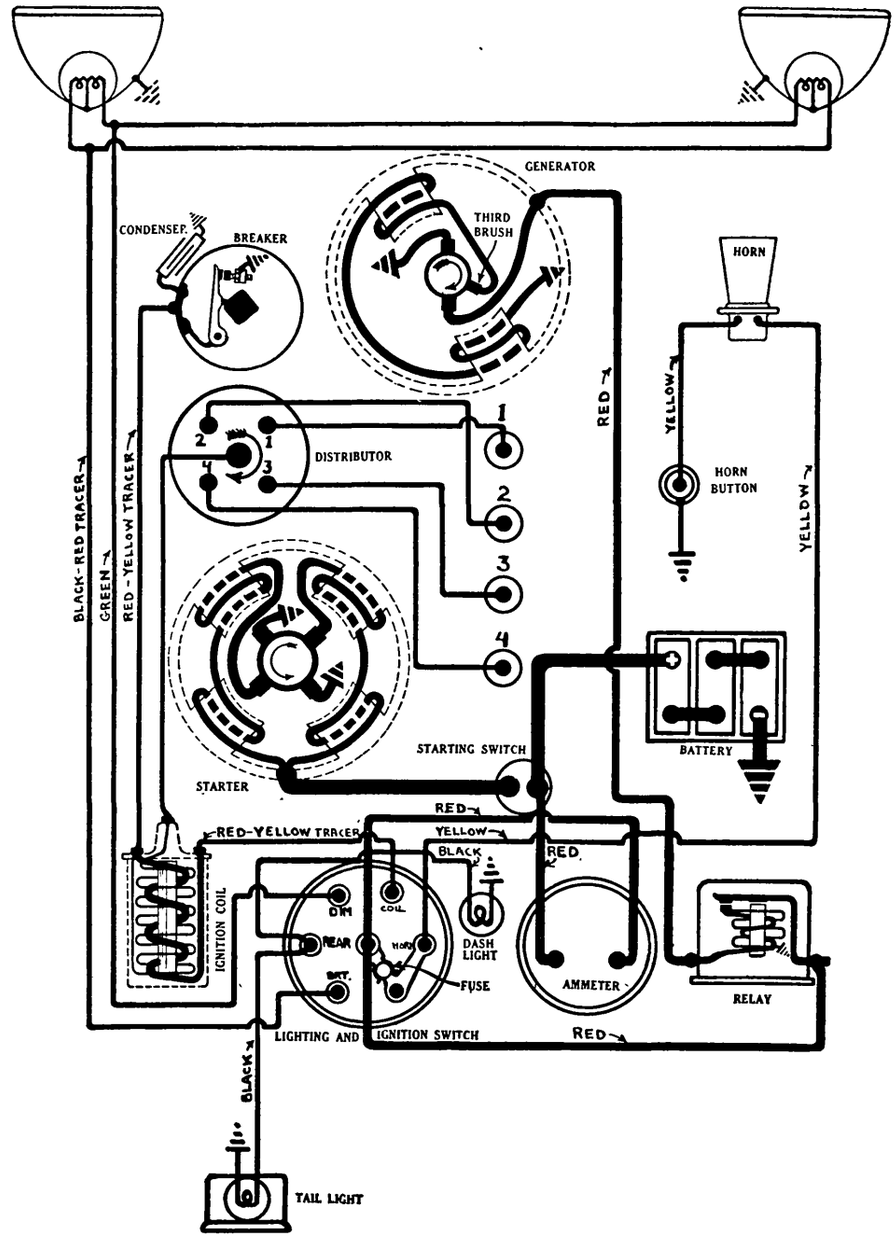
Distributor Model IGB-4086A. Single breaker 4-lobe cam, full automatic advance type. Breaker contacts adjusted by loosening lock nut on stationary contact mounting stud and turning up stud.
Breaker Gap:—Set contact gap at .018". Hold within limits of .018-.020".
Breaker Arm Spring Tension:—16-20 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.

Distributor		Automatic Advance		Engine
Degrees	R.P.M.	Degrees		R.P.M.
Start	300	0		600
2	500	4		1000
4	700	8		1400
6	900	12		1800
8	1100	16		2200
11	1400	22		2800

Mounting:—Mounted on commutator end of generator at left front of engine. To remove, disconnect breaker lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—500 Miles. Put 4-5 drops light engine oil in oiler on side of shaft.
1000 Miles. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting .010-.012" (piston) before top dead center.



To Set Ignition Timing. Remove spark plug in No. 1 cylinder and install regular timing gauge in spark plug port. With No. 1 cylinder on compression turn engine over by hand until gauge reading is .010-.012" before top dead center, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated (see Equipment Section for complete data on Timing Gauge).

Firing Order:—1-3-4-2. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025".

VALVE TIMING:—Camshaft Setting. Camshaft is driven from the crankshaft by a spiral gear. Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

To Check Valve Timing:—Check tappet clearance of No. 1 intake valve and set at .006" if necessary. With piston No. 4 on compression turn engine over by hand until piston reaches top dead center (determine top dead center by flywheel mark or use regular timing gauge installed in No. 1 cylinder). **No. 1 intake valve should begin to open at this point.**

AUSTIN

BANTAM MODEL (1933-34-35) AFTER MOTOR NO. L-12799

AUTO-LITE ELECTRICAL SYSTEM

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 1/32"	9/32"	3⅛"	45°	5/32"
Exhaust	1 1/32"	9/32"	3⅛"	45°	5/32"

Tappet Clearance

Intake and Exhaust.....006"
Allowable variation—.001" plus or minus.

Valve Springs

Spring pressure.....45 pounds

Timing

Intake Valves	Exhaust Valves
Open—At top dead center.	Open—45° before lower dead center.
Close—40° after lower dead center.	Close—15° after top dead center.

NOTE:—A new valve spring with one less coil is used beginning with Engine No. L-15055. These springs are made from Swedish steel.

CARBURETION:—Tillotson Vertical or Updraft Carburetor, Type M, Model 10-A (see Carburetor Section for complete data).

Gasoline Gauge:—K-S Telegauge, hydrostatic type (see Carburetion Section).

STARTER:—Model MAK-4001. Starter drive—Special Outboard Bendix. Starter switch Model SW-4001 is mounted on upper toeboard. Starter rotation counter-clockwise at commutator end. Brush spring tension 38-61 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
.3 lb. ft.	3240	5.5	100
1.3 "	1880	5.0	200
3.1 "	1000	4.5	300
4.8 "	220	4.0	400
7.0 "	Lock	4.0	520

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, take out two flange mounting cap screws, pull starter forward to clear Bendix drive, lift out.

Oiling:—5000 Miles. Put 5-6 drops of light engine oil in starter oilers.

GENERATOR:—Model GAS-4104B. Third brush regulation. Rotation is clockwise at commutator end. Maximum charging rate is 14 amperes at 8 volts reached at 1925 R.P.M. or 28-30 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud, clockwise to increase, or counter-clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Amperes	Volts	R.P.M.
2	6.6	835
6	7.1	1000
10	7.25	1260
14	8.0	1925
12	7.75	2900

Brush Spring Tension:—15-20 ounces on each brush.

Field Current:—3.80-4.18 amperes at 6.0 volts across field terminals.

Motoring:—4.50-4.80 amperes at 6.0 volts (without distributor).

Mounting:—Flange mounted at left front of engine and driven by helical gears from the camshaft gear. Gear mesh is determined by the number of shims under the generator mounting bracket and these must be carefully replaced when generator is replaced on engine. Distributor is mounted on commutator end of generator. To remove generator, disconnect all wiring or take off distributor, take out three flange mounting bolts, pull generator left to disengage drive gear, lift out.

Gear Adjustment:—An adjustment is provided to mesh the generator drive gear and this should be done whenever the generator is taken off the car. With the engine running, the three screws and the nut on the stud which hold the generator mounting bracket on the crankcase should be loosened slightly and the weight of the generator supported by hand at the commutator end until gears assume correct running position. The mounting screws and nut should then be tightened.

Oiling:—10,000 Miles. Drive end bearing is packed with grease and is oiled from the crankcase. This bearing and the pocket behind the bearing should be packed with Superla 4X grease whenever generator is disassembled. The grease pocket in the commutator end should be refilled with No. 3 Keystone grease yearly or at 10,000-mile intervals.

RELAY:—Model CB-4014. Relay mounted on generator. Contacts close at 10 M.P.H. or 875 R.P.M. when generator voltage reaches 7-7.5 volts with a charging current of approximately 2 amperes and open at 6-7 M.P.H. or 600-650 R.P.M. with a discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". **Air Gap:**—.010-.030" with contact closed.

LIGHTING:—Briggs & Stratton Switch, Model 50518. Lighting switch is mounted on instrument board. Headlights are fitted with double filament bulbs for 'depressed beam' dimming.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Instrument Light	6-8	3	S.C.	63
Tail Light	6-8	3	S.C.	63

FUSES:—20 ampere capacity lighting fuse mounted on back of lighting switch.

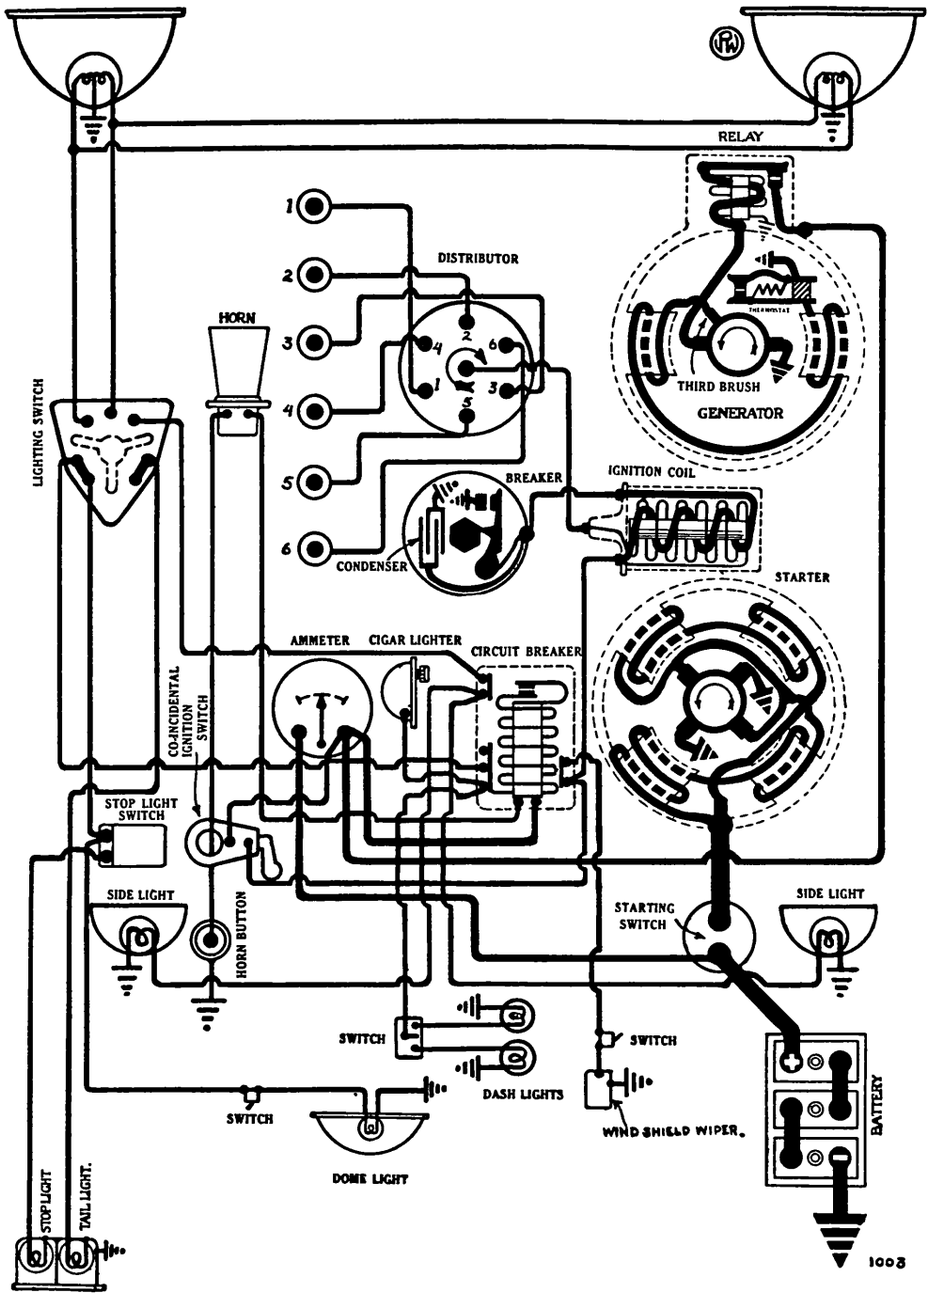
BUICK

MODELS 116, 121 AND 129 (1929)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide (Model 116), Type 3-MXV-13-1, 6 volt, 13 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours.
(Models 121 and 129), Type 3-MVX-15-1, 6 volt, 15 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 133 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 24 hours.

IGNITION:—Coil Model 528-H. Distributor Model 640-J. Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Manual advance is 24 degrees (engine). Automatic advance begins at 500 R.P.M. Maximum automatic advance is 26 degrees reached at 2400 R.P.M. (engine).

Mounting:—Coil is mounted on the engine case in front of generator. Distributor is mounted in a well on the commutator end of the generator. To remove distributor, disconnect primary lead and manual advance rod. Remove head with high tension cables intact. Remove advance arm stop screw and lift distributor from place.



Oiling:—Distributor shaft is oiled from the gear case. Oil gears with Zerk gun through connection on side of gear compartment every 500 miles. Remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam every 2000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15 degrees (Model 116) and 17 degrees (Models 121 and 129) before top dead center (measured on the flywheel) with the manual advance lever fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke. This is the up stroke with both valves closed. Fully advance spark lever. Remove cover over peephole in crankcase over flywheel, on right side of engine, and continue to crank engine until the flywheel mark is directly opposite the line on the edge of the hole. The rotor must be opposite the segment connected to the spark plug in cylinder No. 1 (see diagram). If it is not, remove manual advance stop screw and lift distributor to disengage gears. Then rotate rotor and shaft until rotor is directly opposite proper segment, remesh gears and replace stop screw. Then loosen the advance arm clamp screw and rotate distributor housing until contacts begin to separate. Connect the segment opposite the rotor to spark plug in cylinder No. 1 and connect remaining plugs in order 4-2-6-3-5 clockwise around the distributor head.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are A.C. Metric. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Model 116.) Head diameter is 1 9/16 inches; stem diameter is ⅜ inch. Tappet clearance is .008 inch (hot). Valve lift is 21/64 inch. Spring pressure is 44-56 pounds closed and 125-141 pounds open. Inlet valves open at 2 degrees after top dead center and close at 42 degrees after lower dead center.
EXHAUST VALVES:—Head diameter is 1 9/16 inches; stem diameter is ⅜ inch. Tappet clearance is .008 inch (hot). Valve lift is 21/64 inch. Spring pressure is 44-56 pounds closed and 125-141 pounds open. Exhaust valves open at 50 degrees before lower dead center and close at 20 degrees after top dead center.

BUICK

MODELS 116, 121 AND 129 (1929)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

INLET VALVES:—**(Models 121 and 129.)** Head diameter is 1⅞ inches; stem diameter is ⅜ inch. Tappet clearance is .008 inch (hot). Valve lift is 21/64 inch. Spring pressure is 44-56 pounds closed and 125-141 pounds open. Inlet valves open at 17 degrees and 54 minutes after top dead center and close 52½ degrees after lower dead center.

EXHAUST VALVES:—Head diameter is 1 9/16 inches; stem diameter is ⅜ inch. Tappet clearance is .008 inch (hot). Valve lift is 21/64 inch. Spring pressure is 44-56 pounds closed and 125-141 pounds open. Exhaust valves open at 50 degrees before lower dead center and close at 20 degrees after degrees and 4 minutes after top dead center. Valve stem guides are removable.

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth is meshed with marked space between teeth on other gear.

STARTER:—Model 725-D. Starter is connected to the engine through a mechanical gear shift. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 1½-1¾ pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is flange mounted at the right of the engine on the forand cable. Remove flange mounting screws and pull starter forward. Lift unit from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearings are oilless.

GENERATOR:—Model 940-M. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove commutator cover band and loosen the small round-headed screw on the end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

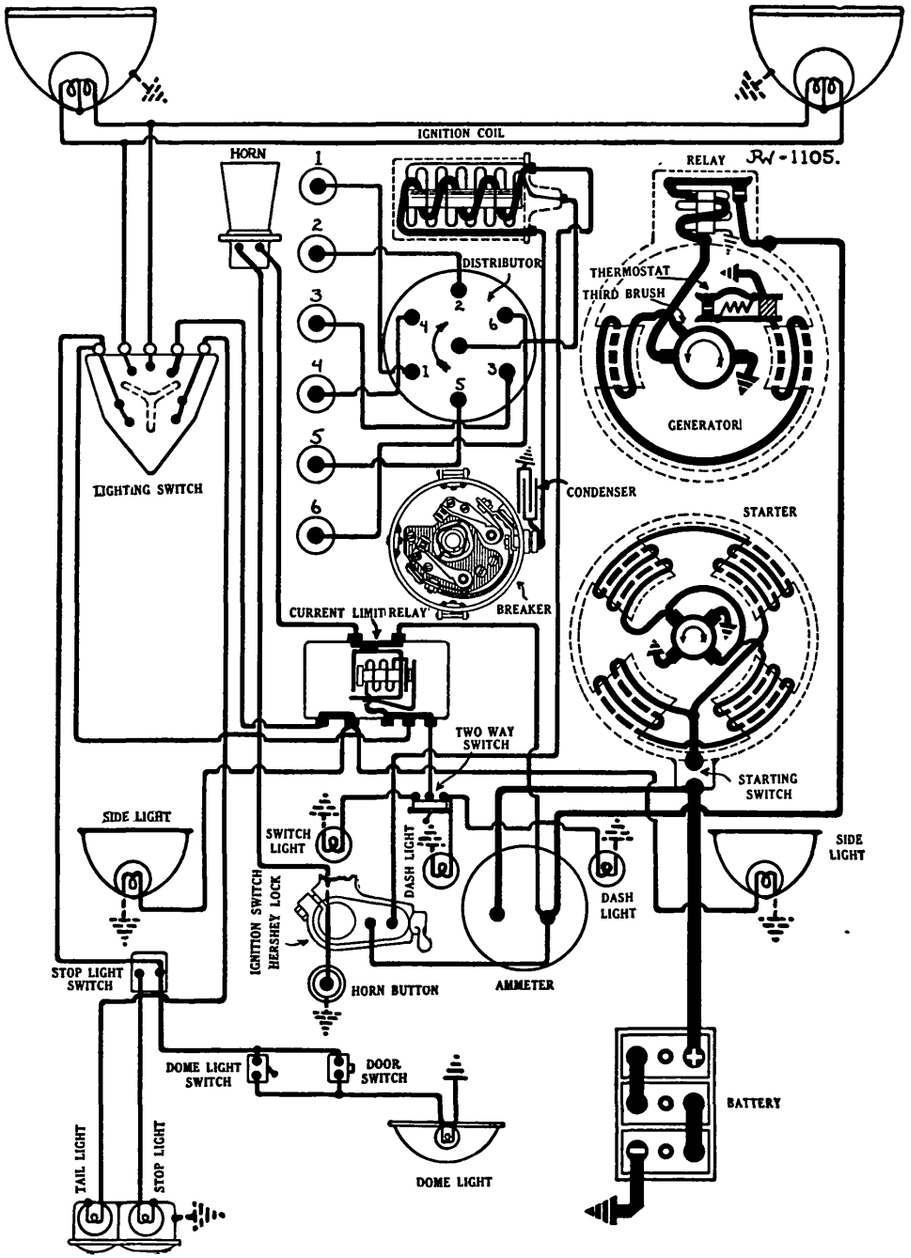
SERIES 50 (124 INCH WHEELBASE) (1930)
SERIES 60 (132 INCH WHEELBASE) (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-MXV-15-1, 6 volt, 13 plate. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 133 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 24 hours. Battery is mounted on the right frame member.

IGNITION:—Coil Model 528-H. Coil is mounted on the timing gear case at the right of the engine. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental ignition switch and steering post lock.



Distributor Model 650-B. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until contact gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 24 degrees (engine). Automatic advance begins at 500 R.P.M. of engine. Maximum automatic advance is 24 degrees reached at 2600 R.P.M. Breaker has two sets of contacts operating on a three sided cam. Contacts open alternately at intervals of 60 degrees corresponding to the 120 degree firing interval of the engine. The contacts must be synchronized for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the commutator end of the generator. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then remove advance arm stop screw and lift distributor from place.

Oiling:—Distributor shaft is oiled from the gear case. There is a grease connection on the side of the gear compartment. Fill the gear compartment with a grease gun every two weeks or each 500 miles. Every 2000 miles remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam.

Timing:—Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 17 degrees (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke. Fully advance spark control lever. Remove cover over inspection hole in crankcase directly over flywheel and continue to crank engine over until the 17 degree mark on the flywheel is directly in line with the edge of the hole. The rotor must be opposite the segment connected to the spark plug in cylinder No. 1. If it is not, remove advance arm stop screw and lift distributor to disengage gears. Then turn rotor until it is directly opposite the correct segment and remesh gears. Replace the stop screw. Then loosen advance arm clamp screw and rotate distributor until the set of contacts mounted directly on the base plate begin to open. Tighten the clamp screw. Connect the spark plugs in order 1-4-2-6-3-5 clockwise around the distributor head.

Synchronization of Contacts. The contacts must be synchronized to secure the correct firing interval between the opening of the two sets of contacts. To synchronize contacts, use special Delco-Remy tool, Part No. 820751. Full directions will be found in Equipment section under 'Delco-Remy Distributors.' Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 120 degrees from firing position of piston No. 1 when piston No. 4 will reach firing

DELCO-REMY IGNITION

position. If the second set of contacts do not open at this point, loosen the two lock screws on the sub-plate on which contacts are mounted and turn eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the breaker gap. It must be within limits of .018-.024 inch.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅞ inches. Stem diameter, ⅜ inch. Valve lift, 21/64 inch. Spring pressure, 44-56 pounds (valve closed) and 125-141 pounds (valve open). Tappet clearance, .008 inch (hot). Inlet valves open 17°54′ after top dead center and close 52°30′ after lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/16 inches. Stem diameter, ⅜ inch. Valve lift, 21/64 inch. Spring pressure, 44-56 pounds (valve closed) and 125-41 pounds (valve open). Tappet clearance, .008 inch (hot). Exhaust valves open 50°20′ before lower dead center and close 20°4′ after top dead center. Valve stem guides are removable.

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth is meshed with marked space between teeth on other gear.

STARTER:—Model 725-D. Starter is connected to the engine through a mechanical pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is flange mounted at the right of the engine on the forward side of the flywheel housing. To remove starter, disconnect starting pedal linkage and starter cable. Then take out flange mounting cap screws. Pull starter forward to clear drive and lift from place.

GENERATOR:—Model 940-M-4. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the commutator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 22-26 ounces. Generator motoring draws 5.5-6 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, first disconnect all ignition wiring or remove distributor. Disconnect generator lead and water pump drive coupling. Take out generator mounting screws. Pull generator to the rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 484-F. Lighting switch is mounted at base of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash, tail and corner lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Model 466-B.

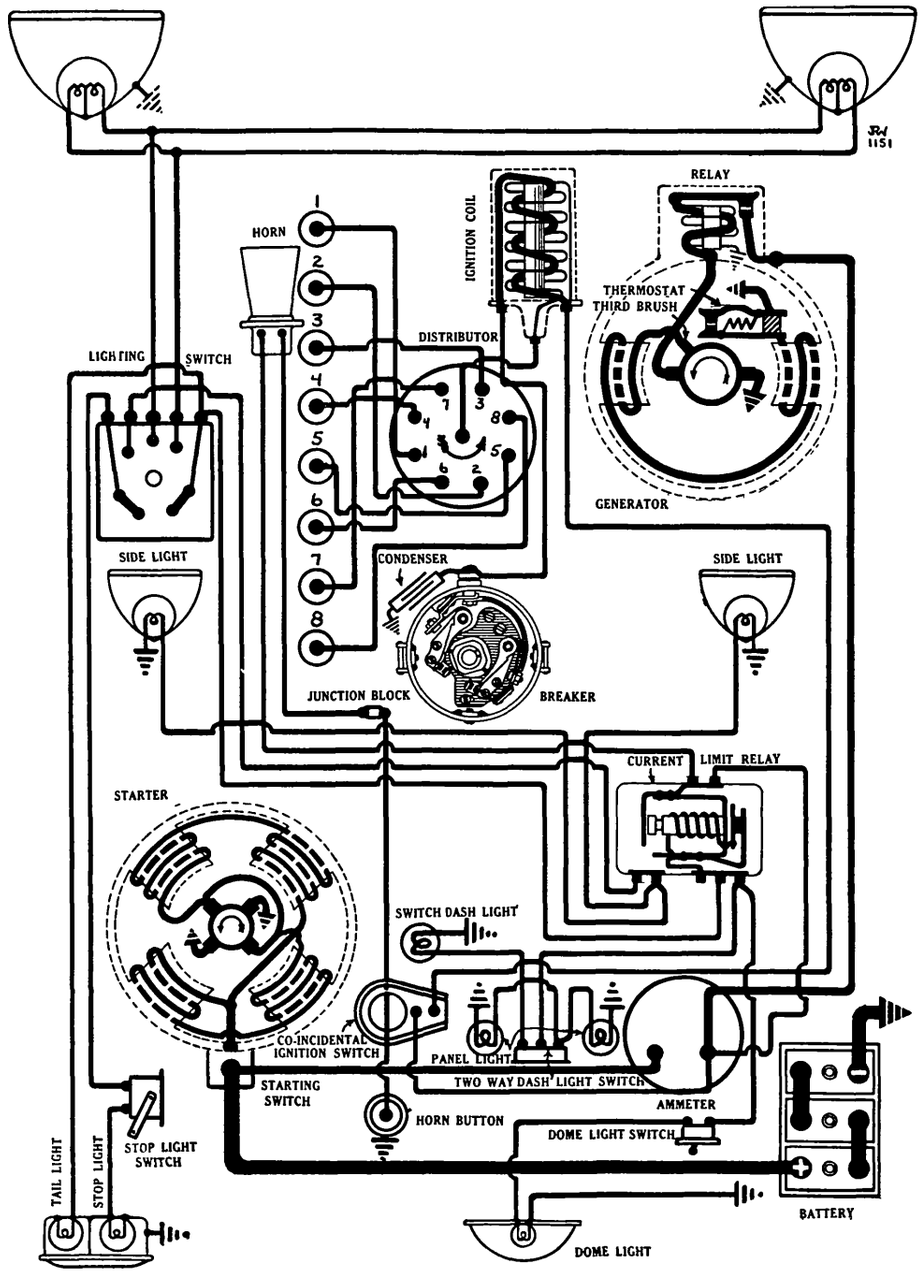
CURRENT LIMIT RELAY:—Model 410-A. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. Circuit breaker begins to operate when the current reaches 25-30 amperes and continues to vibrate limiting the current to 2-15 amperes. Contacts separate .012-.030 inch. Air gap is .015-.025 inch.

BUICK

SERIES 8-50 EIGHT CYLINDER MODELS (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Delco-Remy, Model 13-DW or 13-DF (Export), or Exide 3-VXA-13-1, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 528-H. Coil is mounted on the top of the timing gear case at the right of the engine. Ignition current is 4 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type coincidental steering post and ignition switch lock.



Distributor Model 660-L. Breaker contacts separate .018 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The contact gap of the two sets of contacts must be exactly the same; this is important. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 24 degrees (engine). Manual advance is controlled by a spark button on the dash through a flexible cable control. Automatic advance begins at 400-480 R.P.M. (engine). Maximum automatic advance is 17-21 degrees (engine) reached at 1600 R.P.M. of the engine. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized to secure this firing interval for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the rear of the generator at the right of the engine. To remove distributor, disconnect manual spark control and primary lead and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Distributor bearings and drive gear are lubricated through a Zerk grease connection on the gear housing. Fill the Zerk fitting with cup grease until grease appears at the overflow at the top of the housing every two weeks or each 500 miles of operation. Every 2000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy Tool, Part No. 1838182, and follow complete directions given in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over exactly 90 degrees to the firing position of piston No. 6 when the flywheel mark 'SYN/#6' will be directly opposite the indicator. Then loosen three lockscrews on movable sub-plate and turn eccentric adjusting screw until the second set of contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.022 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 12 degrees before top dead center with the manual spark control fully advanced (pushed all the way in toward the dash). To set timing, crank engine over until piston No. 1 enters compression stroke. Remove cover in timing inspection hole in top face of flywheel housing at right of engine. Turn engine over until piston reaches a position 12 degrees before top dead center when the flywheel mark

BUICK

SERIES 8-50 EIGHT CYLINDER MODELS (1931)
DELCO-REMY GENERATING STARTING SYSTEM
DELCO-REMY IGNITION

'ADV/' will be directly opposite the indicator line at the edge of the inspection hole. Then loosen advance arm clamp screw and rotate distributor until the first set of contacts (mounted directly on the base plate) begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 counter-clockwise around the distributor head.

The second set of contacts (mounted on the movable sub-plate) should begin to open 45 degrees after this point when the flywheel mark 'SYN/#6' is in line with the indicator.

Important Note:—The direction of the distributor rotation is now counter-clockwise, viewed from the top, which is reversed from 1930 models.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18MM. Metric, AC Type J-12. Spark plug gaps are .025-.030 inch. Type J-9 plugs should be used if trouble is experienced with excessive heating or pre-ignition.

VALVE TIMING:—INLET VALVES. Head diameter, 1 5/16 inches. Stem diameter, .3392 inch. Valve lift, .340 inch. Two valve springs are used. Spring pressure (inner spring) is 7.5-12.5 pounds (spring length, 1 13/16 inches) and 25-30 pounds (spring length, 1 15/32 inches); (outer spring) is 25-30 pounds (spring length, 1 15/16 inches) and 74-80 pounds (spring length, 1 19/32 inches). Tappet clearance or lash is .008 inch (hot). Inlet valves open 1½ degrees before top dead center and close 56½ after lower dead center.

EXHAUST VALVES. Head diameter, 1 3/16 inches. Stem diameter, .3407 inch. Valve lift, .340 inch. Two valve springs are used. Spring pressure, (inner spring) is 7.5-12.5 pounds (spring length, 1 13/16 inches) and 25-30 pounds (spring length, 1 15/32 inches); (outer spring) is 25-30 pounds (spring length, 1 15/16 inches) and 74-80 pounds (spring length, 1 19/32 inches). Tappet clearance or lash is .008 inch (hot). Exhaust valves open 54½ degrees before lower dead center and close 30½ degrees after top dead center. Valve stem guides are removable.

NOTE:—Total spring pressure of inner and outer springs assembled together is 30.5-40.5 pounds (valve closed) and 98-109 pounds (valve open).

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth is meshed with marked space between teeth on other gear.

STARTER:—Model 725-N. Starter is connected to the engine through a manual pinion shift and overrunning clutch. Pinion shift is interconnected with the starter switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect starting pedal linkage and cable and take out flange mounting screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 940-T-3. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the end plate (directly below the distributor gear housing). Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes at 8.5 volts reached at 1450 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Shunt field current is 4-6.1 amperes at 6 volts. Generator, motoring, draws 5.5 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is mounted at the right of the engine on the rear of the timing gear case. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect all ignition wiring or remove distributor. Disconnect water pump drive coupling. Take out flange mounting screws. Then pull generator to the rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles of operation. The drive end bearing is oiled from the gear case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 8-10 M.P.H. when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash, tail and instrument panel lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81. Pillar and tonneau lights when used are 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Lighting switch is Model 486-L (Domestic) or 486-B (Right Hand Drive cars for Export). Stop light switch is Model 466-G. Backing light switch is Model 440-C.

CURRENT LIMIT RELAY:—Model 410-G. This is a vibrating circuit breaker connected in the lighting lines. It is mounted on the dash. Circuit breaker begins to vibrate when the current reaches 30-35 amperes and continues limiting the current to 5-18 amperes. Contact gap is .012-.030 inch. Air gap is .015-.025 inch. Plunger spring tension should be 5 ounces.

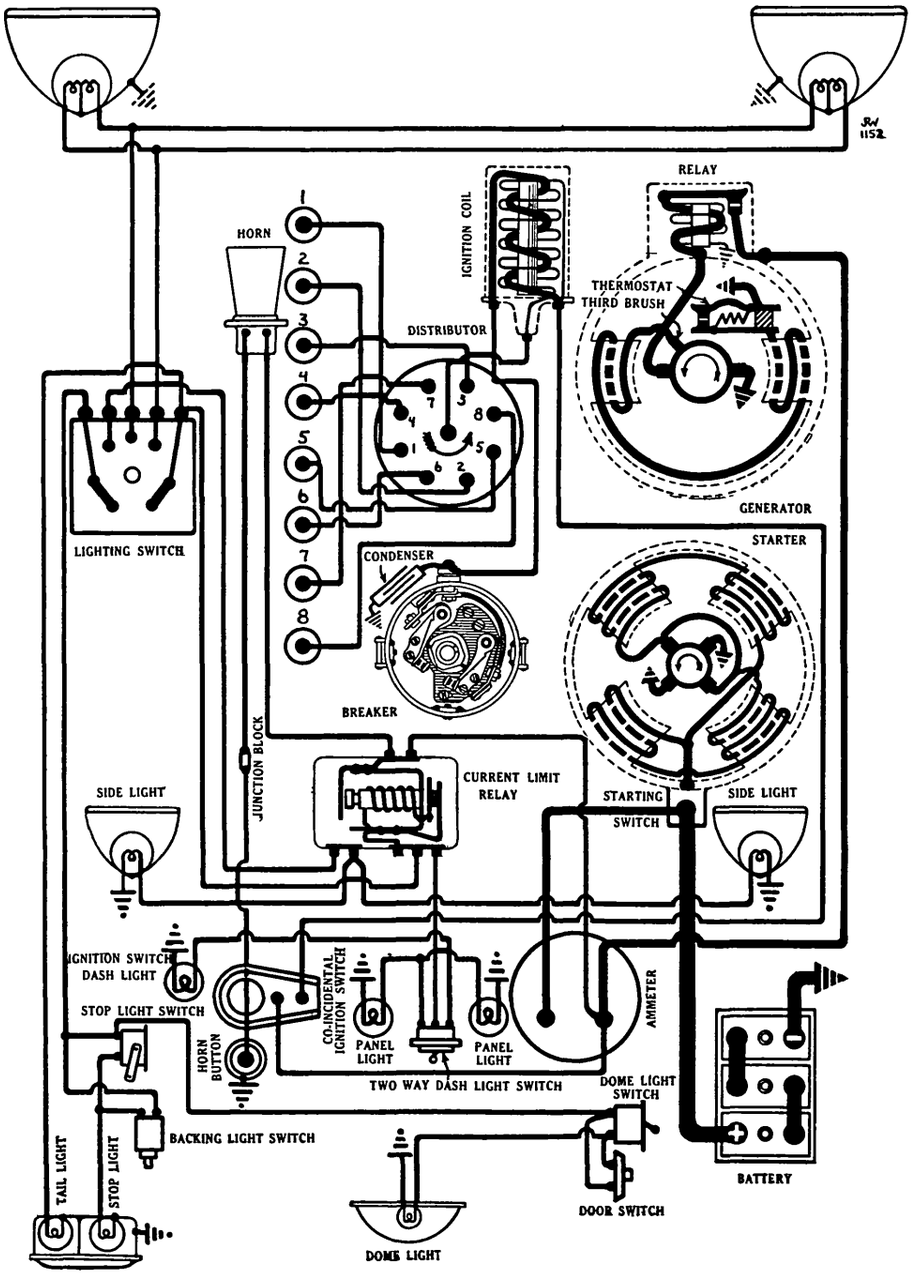
BUICK

SERIES 8-60, 8-80, 8-90 EIGHT CYLINDER MODELS (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—**(Series 8-60) Delco-Remy, Type 13-EW (Domestic), 13-EF (Export), or Exide, Type 3-MXV-13-1,** 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours.

(Series 8-80, 8-90) Delco-Remy, Type 15-CW (Domestic), 15-CF (Export), or Exide, 3-MXV-15-1, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 133 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 24 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—**Coil Model 528-H.** Coil is mounted on the timing gear case at the right front of the engine. Ignition current is 4 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental steering post and ignition switch lock.



Distributor Model 660-E. Breaker contacts separate .018 inch. Set contact gap by loosening lock screw on stationary contact mounting plate (directly behind breaker arm) and turning eccentric adjusting screw. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 24 degrees (engine). Automatic advance begins at 400-480 R.P.M. of engine. Maximum automatic advance is 34 degrees reached at 3000 R.P.M. of engine. Manual spark control is controlled through a flexible cable by a spark button on the dash. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the rear of the generator at the right of the engine. To remove distributor, disconnect spark control wire and primary lead and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Distributor bearings and drive gear are lubricated through a Zerk grease connection on the gear housing. Fill the Zerk fitting with cup grease until grease appears at the overflow at the top of the housing every two weeks or each 500 miles of operation. Every 2000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—**Synchronization of Contacts.** Synchronize contacts on a rotary spark gap or use special Delco-Remy Tool, Part No. 1838182, and follow complete directions given in Equipment Section. Contacts can be synchronized after distributor has been timed to the engine by cranking engine over exactly 90 degrees from firing position of piston No. 1 when piston No. 6 will reach firing position with the flywheel mark 'SYN/#6' directly opposite the indicator line in the inspection hole. Then loosen three lock screws on movable sub-plate and turn eccentric adjusting screw until the second set of contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 11 degrees (Series 8-60) or 10 degrees (Series 8-80, 8-90) before top dead center with the spark control button in the fully advanced position (pushed all the way in toward the

BUICK

SERIES 8-60, 8-80, 8-90 EIGHT CYLINDER MODELS (1931)
DELCO-REMY GENERATING STARTING SYSTEM
DELCO-REMY IGNITION

dash). To set timing, crank engine over until piston No. 1 enters compression stroke. Remove cover over timing inspection hole in top face of flywheel housing at right of engine and see that spark control button is fully advanced. Turn engine over until the flywheel mark 'ADV/' is directly opposite the indicator line on the edge of the inspection hole. This mark is 11 degrees (8-60) or 10 degrees (8-80, 8-90) before top dead center. Then loosen advance arm clamp screw and rotate distributor until the first set of contacts (mounted directly on base plate) begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 counter-clockwise around the distributor head.

The second set of contacts (mounted on movable sub-plate) open exactly 45 degrees after this point with the flywheel mark 'SYN/#6' opposite the indicator line.

Important Note:—The direction of distributor rotation is reversed from 1930 models and is now counter-clockwise, viewed from the top. This must be kept in mind in timing distributor and connecting spark plug cables.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric, AC Type J-12. Gaps are .025-.030 inch. Type J-9 spark plugs should be used if trouble is experienced with overheating or pre-ignition.

VALVE TIMING:—INLET VALVES. Head diameter, 1 13/32 inches (8-60), 1⅝ inches (8-80, 8-90). Stem diameter, .3715 inch. Valve lift, .340 inch. Tappet clearance or lash, .008 inch (hot). Spring pressure, 38-49 pounds (valve closed), 129-143 pounds (valve open). Inlet valves open 1½ degrees before top dead center and close 56½ degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 9/32 inches (8-60), 1 7/16 inches (8-80, 8-90). Stem diameter, .3695 inch. Valve lift, .340 inch. Tappet clearance or lash, .008 inch (hot). Spring pressure, 38-49 pounds (valve closed), 129-143 pounds (valve open). Exhaust valves open 54½ degrees before lower dead center and close 30½ degrees after top dead center.

Note:—Valves are fitted with two springs; an inner spring with a spring pressure of 11.5-16.5 pounds (spring length, 1 21/32 inches), or 49-55 pounds (spring length, 1 5/16 inches) and an outer spring with a spring pressure of 28-32 pounds (spring length, 1 15/16 inches), or 82-89 pounds (spring length, 1 19/32 inches).

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth is meshed with marked space between teeth on other gear.

STARTER:—Model 725-L. Starter is connected to the engine through a manual pinion shift and an overrunning clutch. Pinion shift is interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and pedal linkage and take out flange mounting screws. Then pull starter forward to clear drive and lift starter from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The two bearings on the drive end are oilless.

GENERATOR:—Model 940-T-2. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the end plate (directly below the distributor gear housing). Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes at 8.5 volts reached at 1450 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Shunt field current is 4-6.1 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is mounted at the right of the engine on the rear of the timing gear case. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect all ignition wiring or remove distributor. Disconnect water pump drive coupling. Take out flange mounting screws. Then pull generator to the rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles of operation. The drive end bearing is oiled from the timing gear case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 8-10 M.P.H. when the generator voltage reaches 6.75-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current is 2 amperes at closing of contacts. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash, tail and instrument panel lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81. Pillar and tonneau lights (when used) are 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Lighting switch is Model 486-L (Domestic) or 486-M (8-60 Right Hand Drive for Export) or 486-B (8-80, 8-90 Right Hand Drive for Export). Stop light switch is Model 466-G. Backing Light switch is Model 440-C.

CURRENT LIMIT RELAY:—Model 410-G. This is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits to protect them from overload and short-circuits. Circuit Breaker begins to vibrate when the current reaches 30-35 amperes and continues limiting the current to 5-18 amperes. Contact gap is .015-.025 inch with contacts closed. Plunger spring tension should be 5 ounces.

BUICK

SERIES 32-50 (1932), SERIAL NUMBERS 2,602,732 UP
PRODUCTION STARTED AUGUST 26, 1931
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate, right side of frame beneath front fender. This series 2,602,732 up.

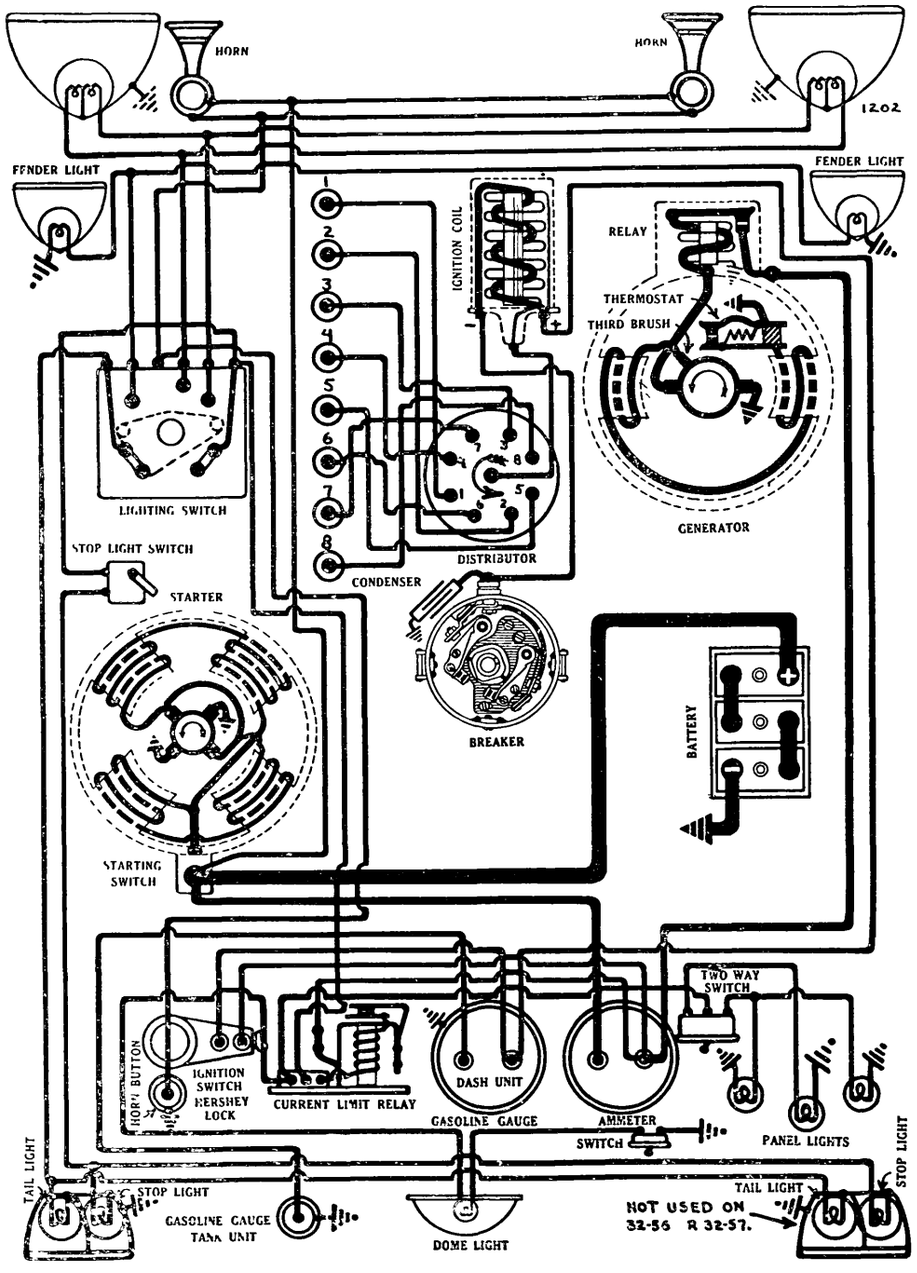
ENGINE NUMBER:—On right side upper crankcase wall above oil filler.

ENGINE NOTE:—Engines furnished with two optional compression ratios. Standard compression engines have special thick cylinder head gasket (steel insert). High compression engines use regular type gasket and are designed to operate with anti-knock fuel. Engines can be changed to high compression by changing gasket and spark plugs (valve push rod adjustment must be backed off to permit head to be bolted down). All high compression engines shipped from the factory are marked 'HC' on red label on top of valve rocker cover.

BATTERY:—Delco, Type 13-EW, 6 volt, 100 ampere hour capacity (20 hour rate). Negative (—) terminal grounded. Battery mounted under front compartment floor boards on right side.

IGNITION:—Coil Model 528-H. Coil mounted on top of timing gear case right front of engine. Ignition current 2.75 amperes at 6.8 volts (engine running), 4.0 amperes at 5.9 volts (engine stopped). Ignition switch is Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model 660-L. Two breaker arm, 4 lobe cam type with semi-automatic advance. Must be synchronized (see Timing). Manual advance controlled by button on dash, full advance position with button pushed in and distributor cup rotated clockwise to limit of advance arm slot. Pull out button to retard spark. Set breaker gap at .020 inch. Hold within limits of .018-.024 inch. Gap is adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale held at right angles to contact surface). Maximum manual advance is 24° (engine).



Cam Angles—Closed 34°, open 11° (distributor) when synchronized.

Distributor		Automatic Advance		Engine	
Degrees	R.P.M.	Degrees			R.P.M.
Start	250	3.5			500
7	400	14			800
10.5	800	21			1600

Mounting:—Distributor mounted on commutator end of generator at right of engine. Driven by extension of generator shaft. To remove, disconnect primary lead, disconnect manual spark control wire, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—500 Miles. Fill Zerk fitting on distributor gear housing, using Zerk gun and cup grease until grease appears at overflow at top of distributor well. **2000 Miles.** Take off distributor cap and rotor. Put a few drops light oil in wick oiler in center of shaft. Apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 7° before top dead center with full manual advance. No special setting necessary for high compression engines. To set timing, advance spark control button (push button in toward dash), see that distributor is rotated clockwise to full extent of advance arm slot, remove cover on inspection hole in front face right hand rear motor support. With No. 1 piston on compression crank engine over until flywheel mark 'ADV/7° is directly opposite reference line on edge of inspection hole. Loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp). Tighten advance arm clamp bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).

BUICK

SERIES 32-50 (1932), SERIAL NUMBERS 2,602,732 UP
PRODUCTION STARTED AUGUST 26, 1931
DELCO-REMY SYSTEM

Synchronization of Contacts—first method as part of timing operation. After timing of distributor is completed (above), rotate crankshaft 90 degrees until piston No. 6 reaches firing position with flywheel mark 'SYN/#6' opposite reference line on edge of inspection hole. Loosen two lock screws on movable breaker plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws. Check contact gap; if outside limits of .018-.024 inch, reset at .022 inch, repeat synchronization.

Second method—using synchronizing tool. Use Delco-Remy tool, Part No. 1838182, follow complete directions in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—Standard Compression Engines. 18 MM. A.C. Type J-12. Hold gap within limits of .025-.030 inch. **High Compression Engines.** 18 MM A.C. Type H-9. Hold gap within limits of .020-.025 inch. High compresion plugs may be identified by red washer under terminal.

VALVE TIMING:—Valves located in cylinder head and operated by rocker arm on head and pushrods at right of engine. Tappet adjustment at upper end of pushrod. Camshaft at right of engine. Textolite camshaft gear, driven by steel crankshaft gear and drives steel generator gear.

	Head Diameter	Stem Diameter	Seat Angle	Lift
Inlet	1 15/32" (1 5/16" clear)	.3407-/.3417"	45°	.340"
Exhaust	1 11/32" (1 3/16" clear)	.3392-/.3402"	45°	.340"

Tappet Clearance or Lash

Intake and Exhaust.....008" (hot). Set with engine hot and idling.

Spring Pressure

	Inner Spring	Outer Spring	Total
Closed	7½-12½ pounds (1 13/16")	25-30 pounds (1 15/16")	32½-42½ pounds
Open	25-30 pounds (1 15/32")	74-80 pounds ((1 19/32")	99-110 pounds

Timing

Inlet valves open 4½ degrees before top dead center. Inlet valves close 54 degrees after lower dead center.

Exhaust valves open 58 degrees before lower dead center. Exhaust valves close 30 degrees after top dead center. These 'timing points' indicate effective opening and closing points with valve .004" off seat with tappet clearance or lash of .008".

To Set Valve Timing. Camshaft gear and crankshaft gear are marked. Mesh gears so that marked tooth is directly opposite marked space between teeth on other gear.

STARTER:—Model 725-T. Manual pinion engagement connected to starting switch lever (switch mounted on starter field frame). Starter drives through overrunning clutch. Ratio of gear reduction 16.66 to 1 (9 tooth starter pinion drives to 150 tooth flywheel). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 135 R.P.M. drawing 147 amperes at 5.3 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
15 "	Lock	3	600

Mounting:—Starter flange mounted on left front face flywheel housing. To remove, disconnect cable, take out cotter pin and clevis pin in pedal shift linkage, take out 2 flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—1000 Miles. Put 8-10 drops light oil in commutator end oiler. Drive end bearing (pinion housing) oilless graphite bronze.

GENERATOR:—Model 940-T. Third brush regulation, thermostat control. Thermostat operates at 200°F. (contacts open, cuts in resistance), reducing output approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. Maximum charging rate 18-20 amperes (cold) at 8.3 volts reached at 1450 R.P.M. or 18-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Brush spring tension 20-28 ounces. Shunt field current 4.0-6.1 amperes at 6 volts. Generator motoring draws 6 amperes at 6 volts (without distributor).

Mounting:—Generator flange mounted at right front of engine driven by gear from timing gear case. Distributor mounted on commutator end of generator. Water pump driven by generator shaft extension. To remove, disconnect lead and all distributor wires or remove distributor, disconnect water pump drive coupling, take out flange mounting screws, pull generator out, lift from place.

Oiling:—1000 Miles. Put 8-10 drops light oil in commutator end oiler. Drive end bearing oiled from rocker arm overflow. See Distributor Oiling.

RELAY:—Model 265-B. Mounted on generator. Contacts close at 7 M.P.H., 600 R.P.M. of generator with generator voltage of 6.75-7.5 volts. Charging current approximately 1.5 amperes at closing. Contacts open with discharge current of 0-2.5 amperes. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-X (486-R on R.H.D.). Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.

Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81
Pillar and Tonneau Lights	6-8	3	S.C.	63

NOTE:—Instrument light switch Delco-Remy, Model 1364. Stop light switch Delco-Remy, Model 466-G.

CURRENT LIMIT RELAY:—Model 410-K. Vibrating circuit breaker mounted on dash. Starts with load of 35-40 amperes, limits load to 5-22 amperes with direct short-circuit. Contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring tension at brass button 5 ounces minimum (measured by spring scale hooked under contact spring at right angles to contact spring arm).

GASOLINE GAUGE:—A.C. Electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical pump (see Carburetion Section).

HORNS:—Klaxon twin installation with horns matched (the right horn having a higher tone than the left). Right horn Model K-26 Type 1376 (all except 32-56 and 32-57), Model K-26 Type 1378 (32-56, 57). Left horn Model K-26 Type 1375 (all except 32-56 and 32-57), Model K-26 Type 1377 (32-56, 57). Current draw 6.0-8.5 amperes at 6 volts (Type 1375 and 1377), 5.0-6.5 amperes at 6 volts (Type 1376 and 1378).

BUICK

SERIES 32-60, 32-80, 32-90 (1932)
PRODUCTION STARTED AUGUST 26, 1931
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate, right side of frame beneath front fender.

ENGINE NUMBER:—On right side upper crankcase wall, above oil filler.

ENGINE NOTE:—Engines furnished with two optional compression ratios. Standard compression engines have special thick cylinder head gasket (steel insert). High compression engines use regular type gasket and are designed to operate with anti-knock fuel. Engines can be changed to high compression by changing gasket and spark plugs (valve push rod adjustment must be backed off to permit head to be bolted down). All high compression engines shipped from the factory are marked 'HC' on red label on top of valve rocker cover.

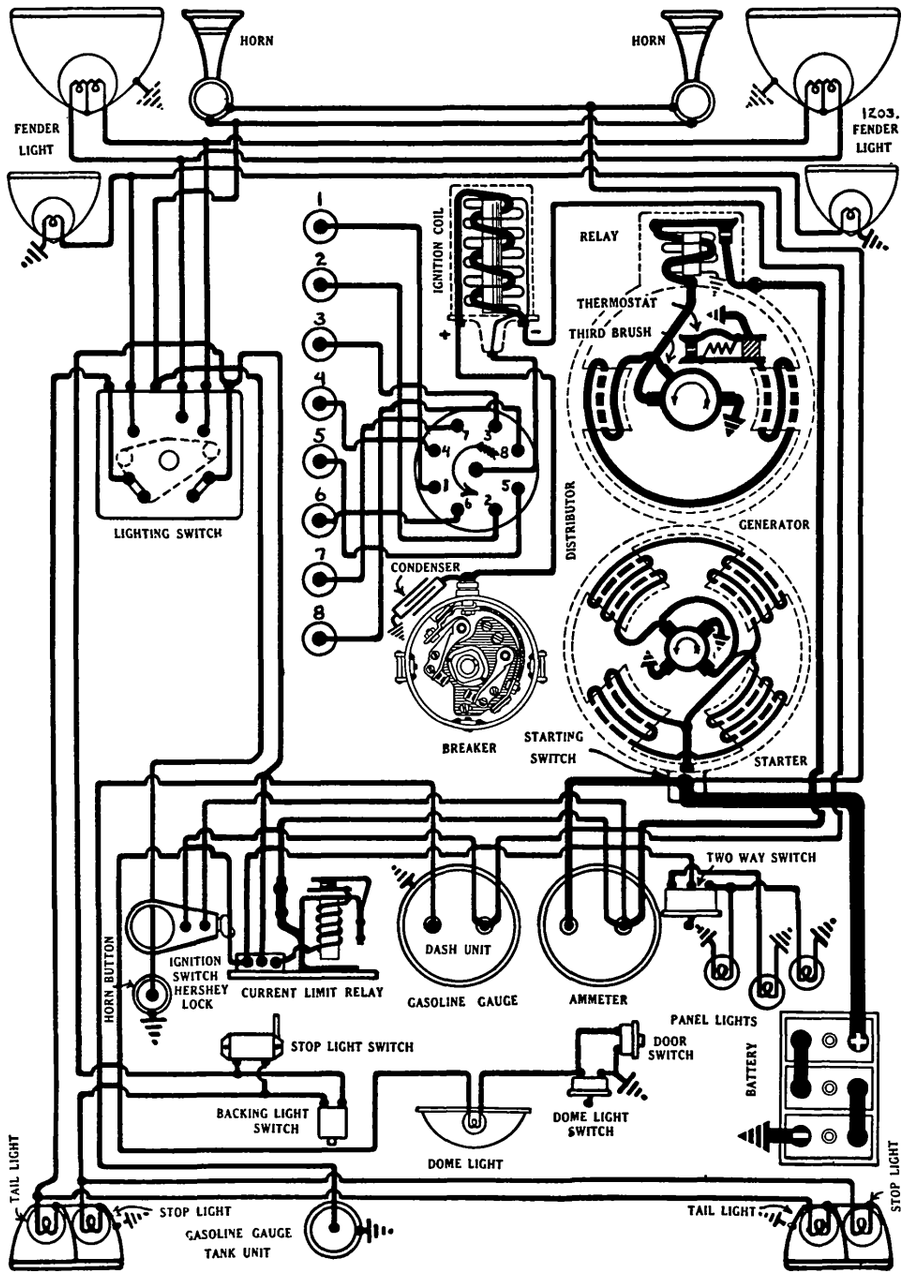
BATTERY:—**(36-60) Delco, Type 15-CW,** 6 volt, 15 plate, 120 ampere hour (20 hour rate). **(32-80, 32-90) Delco, Type 17-BW,** 6 volt, 17 plate, 135 ampere hour capacity (20 hour rate). Battery mounted under front compartment floor boards. Negative (—) terminal grounded.

IGNITION:—**Coil Model 528-H.** Coil mounted on top of timing gear case at right front of engine. Ignition current 2.75 amperes at 6.8 volts (engine running), 4.0 amperes at 5.9 volts (engine stopped). Ignition switch is Oakes 'Hershey' type coincidental ignition switch and steering post lock.

Distributor Model 662-B. Two breaker arm, 4 lobe cam type with semi-automatic advance. Must be synchronized (see Timing). Manual advance controlled by button on dash, full advance position with button pushed in toward dash and distributor rotated clockwise to limit of advance arm slot. Pull button out to retard spark. Set breaker gap at .020 inch. Hold within limits of .018-.024 inch. Gap is adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Maximum manual advance 24° (engine).

Cam Angles—Closed 34°, open 11° (distributor) when synchronized.

Distributor		**Automatic Advance**		Engine	
Degrees		R.P.M.	Degrees		R.P.M.
Start	.....	250	3.5	.....	500
7	.....	400	14	.....	800
15	.....	1300	30	.....	2600



Mounting:—Distributor mounted on generator at right front of engine. Driven by gear on generator shaft extension. To remove, disconnect primary lead, disconnect manual spark control wire, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**500 Miles.** Fill Zerk fitting on distributor gear housing using Zerk gun and cup grease until grease appears at overflow at top of distributor well.

2000 Miles. Take off distributor cap and rotor. Put a few drops light oil in wick oiler in center of shaft. Apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 11° (32-60), 10° (32-80, 32-90) before top dead center with full manual advance. No special setting necessary for high compression engines. To set timing, advance spark control button (push button in toward dash), see that distributor is rotated clockwise to full extent of advance arm slot, remove cover on inspection hole on top face of right hand rear motor support. With No. 1 piston on compression stroke crank engine over until flywheel mark 'ADV/11°' (32-60), or 'ADV/10°' (32-80, 90) is directly opposite reference line on edge of inspection hole. Loosen advnce arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp), tighten advance arm clamp bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Synchronization of Cantacts—first method as part of timing operation.

BUICK

SERIES 32-60, 32-80, 32-90 (1932)
PRODUCTION STARTED AUGUST 26, 1931
DELCO-REMY SYSTEM

After distributor has been timed to engine (as above), rotate crankshaft 90 degrees until No. 6 piston reaches firing position with flywheel mark 'SYN/#6' opposite reference line on edge of inspection hole. Loosen two lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten lock screws. Check contact gap; if outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Second Method—using synchronizing tool. Use Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—Standard Compression Engines. 18 MM. A.C. Type J-12. Hold gap within limits of .025-.030 inch. **High Compression Engines.** 18 MM. A.C. Type H-9. Hold gap within limits of .020-.025 inch. High compression plugs may be identified by red washer under terminal.

VALVE TIMING:—Valves located in cylinder head and operated by rocker arm on head and pushrods at right of engine. Tappet adjustment at upper end of pushrod (adjustment screw in end of rocker arm). Camshaft at right of engine. Textolite camshaft gear driven by steel crankshaft gear and drives steel generator gear.

32-60	Head Diameter	Stem Diameter	Seat Angle	Lift
Inlet	1 9/16" (1 13/32" clear)	.3715/.3725"	45°	.340"
Exhaust	1 7/16" (1 9/32" clear)	.370/.371"	45°	.340"
32-80, 32-90	**Head Diameter**	**Stem Diameter**	**Seat Angle**	**Lift**
Inlet	1 25/32" (1 5/8" clear)	.3715/.3725"	45°	.340"
Exhaust	1 19/32" (1 7/16" clear)	.370/.371"	45°	.340"

Tappet Clearance or Lash

Inlet and Exhaust.....008" (hot). Set with engine hot and idling.

Spring Pressure

	Inner Spring	Outer Spring	Total
Closed	11½-16½ pounds (1 21/32")	28-33 pounds (1 15/16")	39½-49½ pounds
Open	49-55 pounds (1 5/16")	82-89 pounds (1 19/32")	131-144 pounds

Timing

Inlet valves open 4½ degrees before top dead center. Inlet valves close 54 degrees after lower dead center.

Exhaust valvs open 58 degrees before lower dead center. Exhaust valves close 30 degrees after top dead center. These 'timing points' indicate effective opening and closing points with valve .004" off seat with tappet clearance or lash of .008" (hot).

To Set Valve Timing. Gears are marked. Mesh gears so that marked tooth is directly opposite marked space between teeth on other gear.

STARTER:—Model 725-S. Manual pinion engagement connected to starting switch lever (starting switch mounted on starter field frame). Starter drives through overrunning clutch. Ratio of gear reduction 17.33 to 1 (9 tooth starter pinion to 156 tooth flywheel). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 118 R.P.M. drawing 152 amperes at 5.25 volts (32-60), and at 120 R.P.M. drawing 156 amperes at 5.35 volts (32-80, 90).

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3.0	600

Mounting:—Starter flange mounted on right front face of flywheel housing. To remove, disconnect cable, take out cotter pin and clevis pin in switch linkage, tage out 3 flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—1000 Miles. Put 8-10 drops light oil in commutator end oiler. Drive end bearing (in outer end pinion housing) oilless graphite bronze.

GENERATOR:—Model 940-T. Third brush regulation, thermostat control. Thermostat operates at 200°F. (contacts open, cut in resistance) reducing output approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase and clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. Maximum charging rate 18-20 amperes (cold) at 8.3 volts reached at 1450 R.P.M. or 18-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Brush spring tension 20-28 ounces. Shunt field current 4.0-6.1 amperes at 6 volts. Generator motoring draws 6 amperes at 6 volts (without distributor).

Mounting:—Generator flange mounted at right front of engine, driven by gear from gear case. Distributor mounted on commutator end of generator. Water pump driven by generator shaft extension. To remove, disconnect lead and distributor wiring or remove distributor, disconnect water pump drive coupling, take out flange mounting screws, pull generator out, lift from place.

Oiling:—1000 Miles. Put 8-10 drops light oil in commutator end oiler. Drive end bearing oiled by rocker arm overflow. See also Distributor Oiling.

RELAY:—Model 265-B. Mounted on generator. Contacts close at 8 M.P.H., 600 R.P.M. of generator when voltage reaches 6.75-7.5 volts (generator) with charging current of approximately 1.5 amperes. Contacts open with discharge current of 0-2.5 amperes. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-X (486-R on R.H.D.). Switch is mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Tail Lights	6-8	3	S.C.	63
Stop and Backing Lights	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81
Pillar and Tonneau Lights	6-8	3	S.C.	63

NOTE:—Instrument light switch Delco-Remy, Model 1364. Stop light switch Model 466-G (domestic), 466-U (R.H.D. for export). Backing light switch Model 440-D.

CURRENT LIMIT RELAY:—Model 410-K. Vibrating circuit breaker mounted on dash. Starts with current load of 35-40 amperes, limits load to 5-22 amperes with dead short-circuit. Contact point gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring tension at brass plug 5 ounces minimum (measured by spring scale hooked under contact spring at right angles to contact spring arm).

GASOLINE GAUGE:—A.C. Electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'F' mechanical pump (see Carburetion Section).

HORNS:—Klaxon twin installation matched horns with blended tone (right horn higher note than left). Right horn Model K-26, Type 1376. Left horn Model K-26, Type 1375. Current draw 6.0-8.5 amperes at 6 volts (Type 1375), 5.0-6.5 amperes at 6 volts (Type 1376).

BUICK

MODEL 33-50 (1933)
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on right hand frame side rail under front fender.

ENGINE NUMBER:—Stamped on right side upper crankcase wall above oil filler.

ENGINE:—Eight cylinder, 'I' head overhead valve type, 2 15/16x4¼" bore and stroke, 230.4 cubic inch displacement, rated at 27.61 H.P., develops 86 H.P. (standard high compression) or 83 H.P. (optional low compression) at 3200 R.P.M. Standard compression ratio 5.25-1. Optional low compression ratio 4.84-1. Compression ratio changed by installing special thick head gasket with steel insert using same cylinder head. High compression engines may be identified by red washer under terminals on spark plugs. Plugs must be changed when compression ratio is changed and special plug gaps used (see Spark Plugs). Standard compression pressure, 114 pounds. Low compression, 102 pounds.

BATTERY:—Delco, Type 13-JW, 6 volt, 13 plate, 98 ampere hour capacity (20 hour rate). Starting capacity 117 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—Battery under right hand front seat.

Dimensions:—Width, 7". Length, 9 1/16". Height, 9⅛".

IGNITION:—Coil Model 528-H. Coil mounted on timing gear case at right front of engine.

Ignition Current:—2.75 amperes at 6.8 volts (engine running), 4.0 amperes at 5.9 volts (engine stopped).

Ignition Switch:—Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

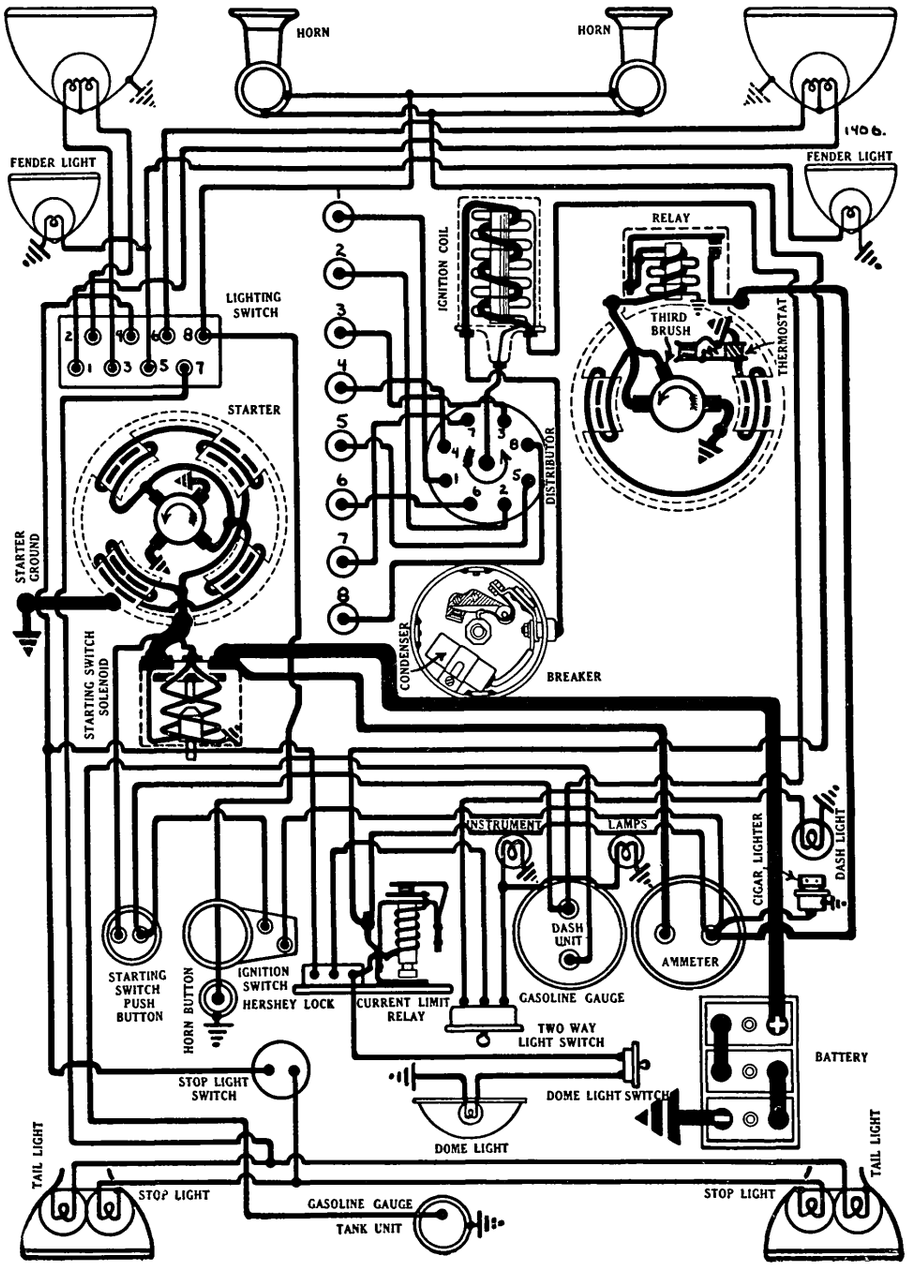
Distributor Model 661-L. Single breaker arm, 8 lobe cam, semi-automatic advance type. Spark control button on dash retards distributor 24° (engine) when pulled out for hand cranking or heavy pulling. With button pushed in (normal running position), the hold-down screw in advance arm should be at the rear of the slot. No synchronization of contacts required.

Breaker Gap:—Set contact gap at .015". Hold within limits of .0125-.0175". To set gap, loosen lock screw on stationary contact mounting plate, turn eccentric adjusting screw, tighten lock screw.

Breaker Arm Spring Tension:—19-23 ounces (measured at point directly behind contacts with spring scale at right angles to back of breaker arm.

Cam Angles—Closed 31°, open 14° (distributor degrees).

Distributor Degrees	Automatic Advance R.P.M.	Automatic Advance Degrees	Engine R.P.M.
Start	250	3.5	500
7	400	14	800
10.5	800	21	1600



Mounting:—Distributor mounted on commutator end of generator at right front of engine. To remove, disconnect primary lead, disconnect manual advance control, take off distributor cap, take out hold-down screw in advance arm, lift out.

Oiling:—1000 Miles. Fill Zerk fitting on shaft housing using Zerk gun and grease until grease appears at overflow directly above fitting.

2000 Miles. Take off distributor cap and rotor. Fill wick oiler in center of shaft with light engine oil, oil breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting, 7° before top dead center with manual spark control advanced.

To Set Ignition Timing:—Set breaker contact gap at .015", advance manual spark control button (push button in toward dash) and see that distributor hold-down screw is against rear end of advance arm slot, take off cover plate over inspection hole in right hand side of flywheel housing. With No. 1 piston on compression, turn engine over until No. 3 exhaust valve begins to open and stop when flywheel mark 'ADV/' registers with reference line on edge of inspection hole. Loosen advance arm clamp bolt, turn distributor so that terminal faces front of car, then rotate distributor clockwise until contacts begin to open, tighten clamp bolt. See that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), if it is not, take out hold-down screw in advance arm, lift distributor to disengage gears, turn distributor shaft to proper position, re-engage gears and replace hold-down screw, repeat timing. Connect spark plugs as indicated on diagram.

BUICK

MODEL 33-50 (1933)
DELCO-REMY SYSTEM

Synchronization of Contacts:—No synchronization required.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—Standard (High) Compression Engines—18 MM. Metric. A.C. Type H-9. Set spark plug gaps at .020-.025 inch. Plugs may be identified by red washer under terminal. On cars with radio use Type 'Radio H-9' with built-in resistor and set gaps at .018-.023 inch.

Low Compression Engines—18 MM. Metric. A.C. Type J-12. Set gaps at .025-.030 inch. On cars with radio use Type 'Radio J-12' with built-in resistor and set gaps at .018-.023 inch.

VALVE TIMING:—Camshaft Setting. Valves in cylinder head operated by rocker arm on head and pushrods at right of engine with tappet adjustment on rocker arm directly above pushrod. Camshaft gear driven from crankshaft. Camshaft gear (Textolite) and crankshaft gear (steel) are marked. Mesh gears so that marked tooth is opposite marked space.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 15/32" (1 5/16" clear)	.3407-.3417"	45°	.340"
Exhaust	1 11/32" (1 3/16" clear)	.3403-.3411"	45°	.340"

Tappet Clearance or Lash

Intake and exhaust—.008" (hot). Set with engine warmed up and idling.

Valve Springs

	Inner Spring	Outer Spring	Total Pressure
Closed	10-15 pounds—1 13/16".	35-40 pounds—1 15/16".	45-55 pounds
Open	36-42 pounds—1 15/32".	96-103 pounds—1 19/32".	132-145 pounds

Outer spring has two closed coils which must be installed at the bottom. These springs used for service on 1931-32 cars but only on cars with copper-plated valve lifter rollers.

Timing

Intake Valves	Exhaust Valves
Open—4½° before top dead center	Open—58° before lower dead center
Close—54° after lower dead center	Close—30° after top dead center

These opening and closing points are 'timing points' indicating effective opening and closing points with valve .004" off seat with tappet clearance or lash of .008".

CARBURETION:—Marvel Updraft Dual Carburetor Model ED-1-S (see Carburetor Section for complete data). Intake manifold heat control is automatic.

Air Cleaner:—A.C. oil-wetted wire mesh type. Remove at 2500-mile intervals, clean wire mesh by dipping in gasoline, dry thoroughly, re-oil by dipping in engine oil, drain before reassembling.

Fuel Pump:—A.C. Type 'O' mechanical fuel pump (see Carburetion Section). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—Model 725-V (725-X R.H. drive). Starter drive, mechanical pinion shift (operated by solenoid mounted on starter field frame) and overrunning clutch (see Equipment Section for complete data). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces on each brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
15 "	Lock	3.0	600

Starter Switch:—Push-button switch Delco-Remy, Model 1377. Operating Solenoid Delco-Remy, Model 1502. Can be operated only with ignition switch 'on'.

Mounting:—Two cap screw flange mounting on left hand front face of flywheel housing. To remove, disconnect cable and operating lead, take out two flange mounting screws, pull starter straight forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing at outer end of pinion housing oilless type.

GENERATOR:—Model 956-B-1 (956-B-3 with distributor). Not interchangeable with previous types. Third brush regulation with thermostat control. Thermostat contacts open at 200°F. reducing generator output approximately 40%. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting) 18 amperes (cold-summer) or 20 amperes (cold-winter) at 8.5 volts reached at 2000 R.P.M. or approximately 25 M.P.H.

Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	2000	11-14	7.5-7.9	2200-2600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—2.1-2.5 amperes at 6 volts across field terminals.

Mounting:—Flange mounted on right hand rear face of timing gear case and gear driven from camshaft gear. Distributor mounted on commutator end of generator and water pump driven by generator shaft extension. To remove, disconnect lead and all ignition wiring or remove distributor, disconnect water pump drive coupling, take out flange mounting screws (in front of gear case), pull generator out.

Oiling:—1000 Miles. Fill Zerk fitting on gear case using Zerk gun and grease until grease appears at overflow. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing oiled by rocker arm shaft overflow.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close at 8-10 M.P.H. with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 487-B (486-R on R.H. drive). Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Lighting system Guide 'Multibeam' providing special asymmetrical passing beam with standard double filament headlight bulbs. Instrument light switch at lower left hand edge of instrument panel is Model 1364.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81
Pillar Lights	6-8	3	S.C.	63

CURRENT LIMIT RELAY:—Model 410-K. Vibrating circuit breaker connected in lighting circuits. Starts with current load of 35-40 amperes limiting load to 5-22 amperes with direct short-circuit.
Contact Gap:—.012-.030 inch. **Air Gap:**—.015-.025 inch (contacts closed).
Spring Tension:—5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

HORNS:—Klaxon Model K-26, Type 1483 (low note), 1484 (high note), matched set (right hand horn—high note, left hand horn—low note). Current draw 5.0-6.5 amperes at 6 volts (Type 1483), 6.0-8.5 amperes at 6 volts (Type 1484).

T&E-316

BUICK

MODEL 33-60, 33-80, 33-90 (1933)
DELCO-REMY SYSTEM

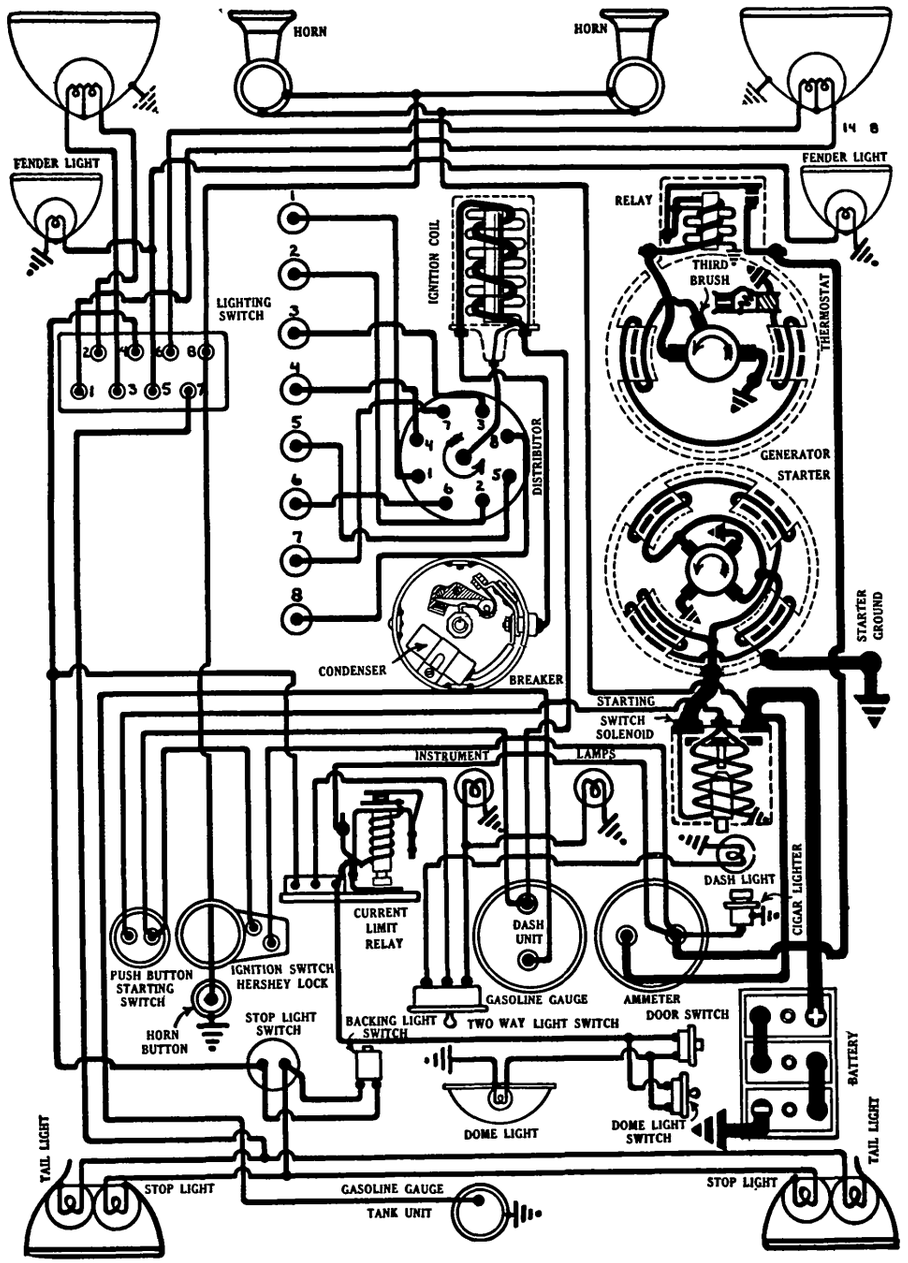
CAR SERIAL NUMBER:—On plate on right hand frame side rail under front fender.

ENGINE NUMBER:—Stamped on right side upper crankcase wall directly above generator.

ENGINE:—Eight cylinder, overhead valve type. High compression engines are standard. Compression ratio can be changed to optional low compression by installing special thick cylinder head gasket with steel insert, using same head. High compression engine may be identified by red washer under spark plug terminals. Plugs must be changed and special plug gaps used for low compression (see Spark Plugs).

Model	Comp. Ratio	Bore & Stroke	Displacement	Rated H.P.	Developed H.P.
33-60	5.25-1	3 1/16x4⅝"	272.6 cu in.	30.02	97 at 3000
33-60	4.84-1	3 1/16x4⅝"	272.6 cu in.	30.02	91 at 3000
33-80,90	4.8-1	3 5/16x5"	334.8 cu in.	35.12	113 at 3200
33-80,90	4.4-1	3 5/16x5"	334.8 cu in.	35.12	103 at 2900

BATTERY:—33-60—Delco, Type 15-GW, 6 volt, 15 plate, 114 ampere hour capacity (20 hour rate). Starting capacity 137 amperes for 20 minutes.
Dimensions:—Width, 7". Length, 10 9/32". Height, 9 3/32".
33-80, 90:—Delco, Type 17-DW, 6 volt, 17 plate, 130 ampere hour capacity (20 hour rate). Starting capacity 156 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame side rail.
Mounting:—In cradle under right front seat with removable inspection door.
Dimension:—Width, 7". Length, 11¾". Height, 9⅜".



IGNITION:—Coil Model 528-H. Coil mounted on timing gear case at right front of engine.
Ignition Current:—2.75 amperes at 6.8 volts (engine running), 4.0 amperes at 5.9 volts (engine stopped).
Ignition Switch:—Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model 661-K. Single breaker arm, 8 lobe cam, semi-automatic advance type. Spark control button on dash retards distributor 24° when pulled out for hand cranking or heavy pulling. With button pushed in (normal running position), hold-down screw in advance arm should be at rear of slot. No synchronization of contacts required.
Breaker Gap:—Set contact gap at .015". Hold within limits of .0125-.0175".
Breaker Arm Spring Tension:—19-23 ounces (measured directly behind breaker contacts with spring scale at right angles to back of breaker arm).
Cam Angles—Closed 31°, open 14° (distributor degrees).

Distributor Degrees	R.P.M.	Automatic Advance Degrees	Engine R.P.M.
Start	250	3.5	500
7	400	14	800
15	1300	30	2600

Mounting:—Distributor mounted on commutator end of generator at right of engine. To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift out.
Oiling:—1000 Miles. Fill Zerk fitting on shaft housing, using Zerk Gun and grease until grease appears at overflow directly above fitting.
2000 Miles. Take off distributor cap and rotor, fill wick oiler in center of shaft with light engine oil, oil breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting, 11° (33-60), 10° (33-80, 90) before top dead center with manual spark control advanced.
To Set Ignition Timing. Set breaker contact gap at .015", advance manual spark control button (push button in toward dash), see that distributor hold-down screw is against rear end of slot, take off cover plate over inspection hole in top face of right hand rear motor support. With No. 1 piston on compression, turn engine over until No. 3 exhaust valve begins to open and stop when flywheel mark 'ADV/' registers with reference line on edge of inspection hole. Loosen advance arm clamp bolt, turn distributor until terminal faces front of car, then rotate distributor clockwise until contacts begin to open, tighten clamp bolt. See that rotor is opposite No. 1 terminal in distributor cap (see diagram), if it is not, take out hold-down screw in

BUICK

MODEL 33-60, 33-80, 33-90 (1933)
DELCO-REMY SYSTEM

advance arm, lift distributor to disengage drive gears, turn distributor shaft to proper position, re-engage gears and replace hold-down screw, repeat timing. Connect spark plugs as indicated on diagram.

Synchronization of Contacts:—No synchronization required.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 terminal nearest radiator.

Spark Plugs:—Standard (High) Compression Engines—18 MM. Metric. A.C. Type H-9. Set gaps at .020-.025 inch. Plugs may be identified by red washer under terminal. On cars with radio, use Type 'Radio H.-9' with built-in resistor and set gaps at .018-.023 inch.

Low Compression Engine—18 MM. Metric. A.C. Type J-12. Set gaps at .025-.030 inch. On cars with radio, use Type 'Radio J-12' with built-in resistor and set gaps at .018-.023 inch.

VALVE TIMING:—Camshaft Setting. Valves in cylinder head operated by rocker arms on head and pushrods at right of engine with tappet adjustment on rocker arm directly above pushrod. Camshaft gear driven from crankshaft. Camshaft gear (Textolite) and crankshaft gear (steel) are marked. Mesh gear so that marked tooth is opposite marked space between teeth.

Valve Specifications—Model 33-60

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 9/16" (1 13/32" clear)	.3715-.3725"	45°	.340"
Exhaust	1 7/16" (1 9/32" clear)	.3711-.3719"	45°	.340"

Model 33-80, 90

Intake	1 25/32" (1⅝" clear)	.3715-.3725"	45°	.340"
Exhaust	1 19/32" (1 7/16" clear)	.3711-.3719"	45°	.340"

Tappet Clearance or Lash

Intake and exhaust—.008" (hot). Set with engine warmed up and idling.

Valve Springs

Inner Spring	Outer Spring	Total
Closed —20-25 pounds—1 21/32".	35-40 pounds—1 15/16".	45 - 55 pounds
Open— 55-61 pounds— 1 5/16".	96-103 pounds—1 19/32".	151-164 pounds

Outer spring has two closed coils which must be installed at the bottom. These springs used for service on 1931-32 cars but only on cars with copper plated valve lifter rollers.

Intake Valves	Timing	Exhaust Valves
Open 4½° before top dead center.		Open 58° before lower dead center
Close 54° after lower dead center		Close 30° after top dead center

These opening and closing figures are 'timing points' indicating effective opening and closing points with valve .004" off seat with tappet clearance of .008".

CARBURETION:—Marvel Updraft Dual Carburetor, Model ED-2-S (33-60), ED-3 (33-80, 90). See Carburetor Section for complete data. Intake manifold heat control is automatic.

Air Cleaner:—A.C. Oil-wetted wire mesh type. Remove at 2500 mile intervals, clean wire mesh by dipping in gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Type F combination fuel pump and vacuum pump (see **Carburetion Section for complete data). Pump mounted at left of engine and** driven by pushrod from camshaft on right hand side. Remove sediment bowl under pump when necessary, empty water and sediment, clean filter screen (directly above bowl) before reassembling.

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—Model 725-W. Starter drive, through overrunning clutch and mechanical pinion shift operated by solenoid mounted on starter field frame (see Equipment Section for complete data on starter control). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
16 "	Lock	3.0	600

Starter Switch:—Push button switch, Delco-Remy Model 1377. Operating Solenoid Delco-Remy, Model 1501. Operative only with ignition switch 'on'.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, disconnect cable and operating lead, take out 3 flange mounting screws, pull forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Center bearing and drive end bearing at outer end of pinion housing are both oilless.

GENERATOR:—Model 956-B-1 (956-B-2 with distributor). Not interchangeable with previous types. Third brush regulation with thermostat control. Thermostat contacts open at 200°F. reducing generator output approximately 40%. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting) 18 amperes (cold-summer) or 20 amperes (cold-winter) at 8.5 volts reached at 2000 R.P.M. or approximately 25 M.P.H.

Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	2000	11-14	7.5-7.9	2200-2600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—2.1-2.5 amperes at 6 volts across field terminals.

Mounting:—Flange mounted on right hand rear face of timing gear case and gear driven from camshaft gear. Distributor mounted on commutator end of generator and water pump driven by generator shaft extension. To remove, disconnect lead and all ignition wiring or remove distributor, disconnect water pump drive coupling, take out flange mounting screws (in front of gear case), pull generator out.

Oiling:—1000 Miles. Fill Zerk fitting on gear case using Zerk gun and grease until grease appears at overflow. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing oiled by rocker arm shaft overflow.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close at 8-10 M.P.H. with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 487-B (486-R on R.H. drive). Lighting switch mounted at lower end of steering column controlled by lever or steering wheel. Lighting system Guide 'Multibeam' providing special asymmetrical passing beam with standard double filament headlight bulbs. Instrument light switch at lower left hand edge of instrument panel is Model 1364.

Lamp Sizes

Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Backing and Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81
Pillar Lights	6-8	3	S.C.	63

CURRENT LIMIT RELAY:—Model 410-K. Vibrating circuit breaker connected in lighting circuits. Starts with current load of 35-40 amperes limiting load to 5-22 amperes with direct short-circuit.

Contact Gap:—.012-.030 inch. **Air Gap:**—.015-.025 inch (contacts closed).

Spring Tension:—5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

HORNS:—Klaxon Model K-26, Type 1483 (low note), 1484 (high note), matched set (right hand horn—high note, left hand horn—low note). Current draw 5.0-6.5 amperes at 6 volts (Type 1483), 6.0-8.5 amperes at 6 volts (Type 1484).

SERIAL NUMBER:—First number 2,735,509. On right front side of frame front cross member.

COMPRESSION:—Ratio—Std. 5.45-1 hd. No optl. ratios. **Pressure**—121 lbs. at 1000 R.P.M. or 100 lbs. at 135 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 528-H. Ignition current 2½ amperes (idling), 4½ amperes (stopped).

Ignition Switch:—Oakes 'Hershey' co-incidental steering post and ignition switch lock.

Distributor:—Model 663-E. Single breaker, 8-lobe cam type. No synchronization required. Fitted with Vacuum Spark advance and Octane Selector. **Breaker Gap**—Set at .015". Limits, .0125-.0175". **Breaker Arm Spring Tension**—19-23 ounces. Cam Angles (Distributor Degrees)—Closed 31° Open 14°.

Automatic Advance

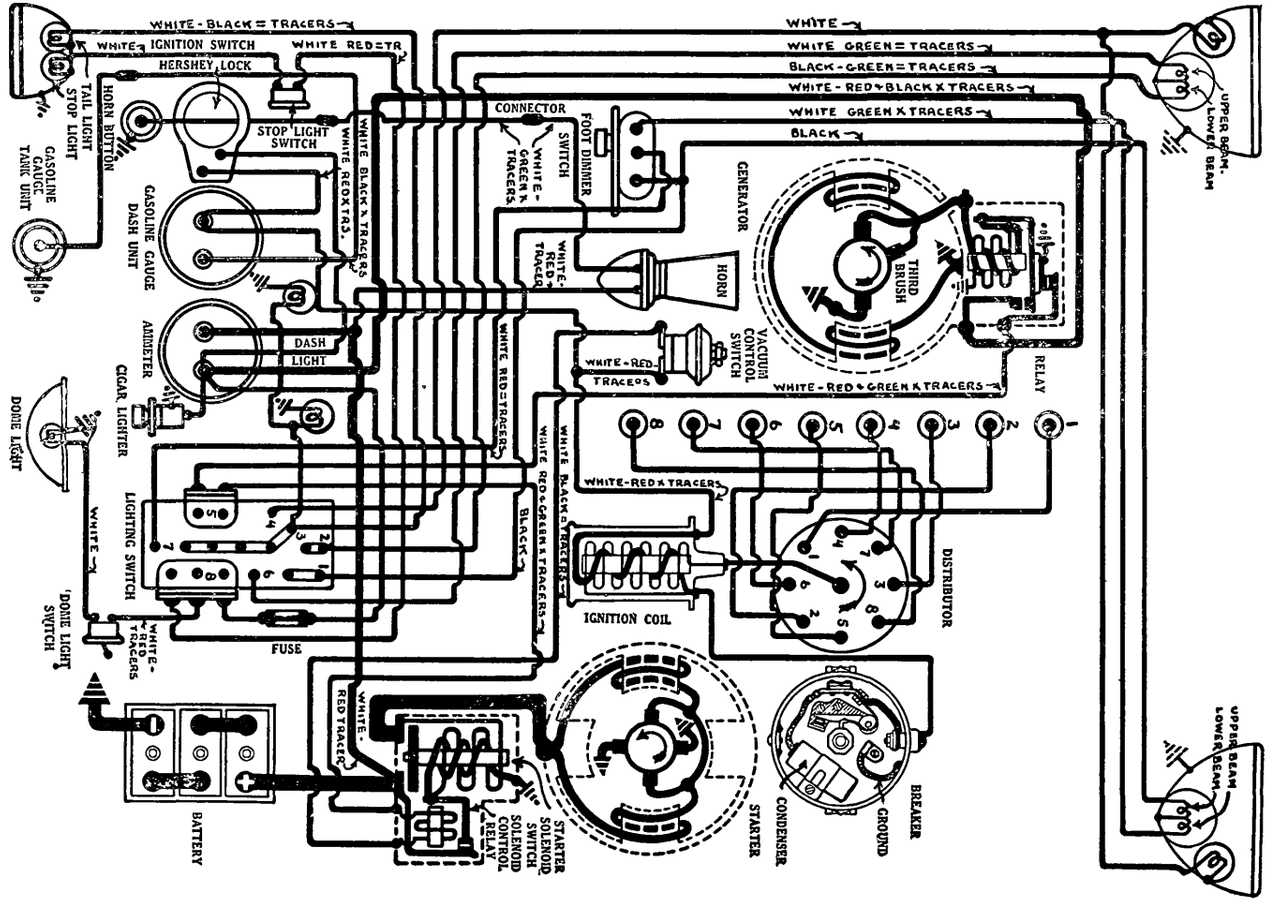
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
15	1300	30	2600

Octane Selector—Adjustable at distributor only. Pointer must be at midpoint on scale after setting timing. Octane Selector can be adjusted for fuel used by loosening two distributor hold-down screws and rotating distributor and pointer toward 'high' end of scale until very light knock is evident when engine is accelerated from 10 M.P.H. with wide open throttle.

Vacuum Spark Advance—Model 689-R. Provides additional spark advance for all speeds above idling except when engine is accelerated or is pulling heavily (return spring in unit will retard spark under these conditions).

Advance (Engine Degrees)	Vacuum (Ins. of Mercury)
Start	5-7 ins.
10-12°	10-13 ins.

Mounting—On right hand side of crankcase. To install distributor, see that cork oil seal is in place, rotate distributor until vacuum connection is at rear and parallel to engine, turn distributor shaft until rotor is opposite No. 1 segment in head, rotate oil pump drive shaft (use a screwdriver) until slot in shaft lines up with driving pin on lower end of distributor shaft, insert distributor, tighten two hold-down screws.



IGNITION TIMING:—	Flywheel Degrees	Piston Travel
Standard Fuel	2° BTDC	0014"
Ethyl Fuel	8° BTDC	0238".

All engines are timed for standard fuel at factory. No flywheel mark provided for Ethyl setting (see directions below).

Timing (Using Timing Light)—Connect timing light between distributor terminal and ground. Turn on ignition, turn engine over until #3 exhaust valve begins to open, stop when 'ADV' mark on flywheel lines up with reference line on housing (inspection hole in right front face of flywheel housing), loosen two hold-down screws, rotate distributor until indicator bulb just lights, tighten hold-down screws, see that rotor is opposite #1 terminal in cap, check spark plug connections (see diagram). Line on pointer should be opposite center line on scale. Set by loosening pointer lock screw and shifting pointer.

Ethyl Fuel Setting—After setting ignition (above) for standard 2° setting, loosen distributor hold-down screws, rotate distributor clockwise three divisions on scale, tighten hold-down screws. This will provide correct 8° setting. No flywheel mark provided.

Timing (Use Synchroscope or Neon Light)—See Equipment Section for complete directions. Flywheel mark is filled with paint so as to be easily

distinguished (ignition mark is less than ¼" before dead center mark and must not be confused). Idle engine at speed not greater than 400 R.P.M.
Motor Gauge—Weidenhoff Adapter #113, Rod #31

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—A.C. Type H-9. 18 MM. Metric type.
Spark Plug Gap—.020-.025".
Radio Suppressors—Use special elbow type United Motors #1207820 (with adaptor #1208094 for center terminal of distributor).

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, Gasoline Gauge, and Automatic Choke.
Carburetor:—Marvel Model BB-1 (first cars), Stromberg Model EE-1 (after Sept. 1st). 1" dual downdowndraft type.
Automatic Choke—Delco-Remy, Type No 498-D
Fuel Pump:—A.C. Type R on right hand side of crankcase.
Gasoline Gauge:—A.C. Electric type.

VALVE TIMING:—To Check Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve opening (gauge rod should rest on valve spring cap). Set tappet clearance at .008". Valve should be .163" open when dead center mark on flywheel for pistons #1 and #8 is visible in flywheel inspection hole
Motor Gauge—Weidenhoff Adapter #113, Rod #31.
Tappet Clearance:—(Lash) .008" hot (all valves).
Valve Spring Pressure:—Total for both springs 55-65 lbs. at 1 21/32" (inner), 1 15/16" (outer) valve closed; 151-164 lbs. at 1 5/16" (inner), 1 19/32" (outer) valve open.

LUBRICATION:—Crankcase Capacity—6 qts. (refill)
Normal Oil Pressure—35 pounds.

BATTERY:—Delco, Type 13-JW 6 volt, 13 plate, 98 ampere capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes
Grounded Terminal—Negative (—) terminal.
Location—Under right front seat.

STARTER:—Model 734-Z. Armature No. 823881.
Mounting:—Flange mounted on right front face of flywheel housing
Rotation—Counter-clockwise (commutator end).
Brush Spring Tension—24-28 ounces each.
Cranking Engine—135 R.P.M., 140-150 amperes, 5.25 volts.

Perormance Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3 63	475

Starting Switch—Solenoid No 1512. Vacuum Switch No. 1594. **Starter pinion shift operated by solenoid on starter field frame. Controlled by vacuum switch operated by foot accelerator pedal or hand throttle. See Equipment Section for complete data.**

GENERATOR:—Model 935-K. Armature No. 185485? Third brush control type. Relay cut-out fitted with extra set of contacts for control of starter operating solenoid.

Charging Rate Adjustment:—Loosen lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate (viewed from commutator end), tighten lock screw.
Standard Setting—18 amperes (cold), 8 4 volts at **30 M.P.H.**

Performance Data

	Amperes	Volts	R P M
Cold	17-20	8 0-8 4	2400
Hot	13-15	7 7-8 0	3000

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—2 3-2 5 amperes at 6 0 volts
Brush Spring Tension—22-23 ozs (main), 16-20 ozs (third brush).

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two hinge bolts and upper clamp bolt.
Belt Adjustment—Loosen hinge bolts and clamp bolt, attach spring scale to clamp bolt, pull generator away from engine until scale reading is 20 lbs, tighten clamp bolt and hinge bolts

RELAY CUT-OUT:—Model 2?5-T. Mounted on generator field frame. Relay has extra set of contacts mounted above armature for starter operating solenoid control.

Cuts In	Relay	Cuts Out
6.7-7.5 volts (10 M.P.H.).		0-2.5 amperes discharge.

Relay Contact Gap—.015-.025".
Relay Air Gap—.012-.017" (contacts closed).
Spring Tension—4.6 ozs. (to open upper contacts).

LIGHTING:—Switch Model 478-S, 478-T (RHD.). Control Switch No. 465-R. Foot control switch operative only with lighting switch in #4 position (country driving), providing assymetrical passing beam Headlight bulbs are new 'pre-focused' type

Bulb Sizes

Position		Candlepower	Mazda No.
Headlights		32-32	2330-L
"	(some cars)	32-21	2320-C
Stop and Dome	6		81-L
Dash, Tail, Parking	3		63-L

FUSE:—30 ampere capacity lighting fuse in connector in lighting switch feed line from ammeter.

HORN:—Klaxon, Model K-26-L Vibrator type. Current draw, 6.5-8.5 amperes at 6.0 volts.

SERIAL NUMBER:—First number, 2,777,650. On right front side of frame cross member.

COMPRESSION:—**Ratio**—5.45-1. No optl. ratios. **Pressure**—121 lbs. at 1000 R.P.M. or 100 lbs. at cranking speed (100 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 528-H.** Mounted on right side of engine block.

Ignition Current—2½ amperes idling, 4½ stopped.

Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model 663-E. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector.

Breaker Gap—Set at .015". Limits .0125-.0175".

Breaker Arm Spring Tension—19-23 ounces.

Cam Angles—Closed 31°. Open 14° distributor.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
15	1300	30	2600

Octane Selector—Adjustable at distributor only. Pointer must be at midpoint on scale after setting ignition timing. Selector can be adjusted for fuel being used by loosening two distributor hold-down screws and rotating distributor and pointer toward 'High' end of scale until very light knock is evident when engine is accelerated from 10 M.P.H. with wide open throttle.

Vacuum Spark Control Model 680-R. Vacuum unit provides additional advance for all speeds above idling except when engine is accelerated or is pulling heavily when return spring within unit will retard spark.

Vacuum Spark Advance

Engine Degrees	Vacuum
Start	5-7" of HG
10-13°	10-13" of HG.

Removal:—Distributor mounted on right side of crankcase. To remove, take out two hold-down screws. In installing distributor, see that cork oil seal is in place.

IGNITION TIMING:— Flywheel Degs. Piston Position

Standard Fuel	2° BTDC	.0014" BTDC.
Ethyl Fuel	8° BTDC	.0238" BTDC.

NOTE—All engines timed for standard fuel at factory. See note below for Ethyl fuel setting (no flywheel marks provided).

Timing (Using Timing Light)—Connect timing light between distributor terminal and ground. Turn on ignition. Crank engine over until #3 exhaust valve begins to open, stop when 'ADV' mark on flywheel lines up with reference line on housing inspection hole in right front face of flywheel housing. Loosen two hold-down screws, rotate distributor until timing lamp lights, indicating that contacts are opening, tighten hold-down screws, see that rotor is opposite #1 segment in cap (see diagram). See that pointer of Octane Selector is opposite center line on scale.

Timing (Using Synchroscope)—Engines can be timed with a Synchroscope or Neon light. Ignition mark on flywheel is filled in with white paint. Idle engine at 400 R.P.M. See Equipment Section for instructions.

Ethyl Fuel Setting—With ignition properly set for standard fuel (2° BTDC.), loosen distributor hold-down screws, rotate distributor clockwise 3 divisions on scale, tighten hold-down screws. This will provide correct 8° BTDC. setting for Ethyl fuel.

Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type H-9. 18 MM. Metric.

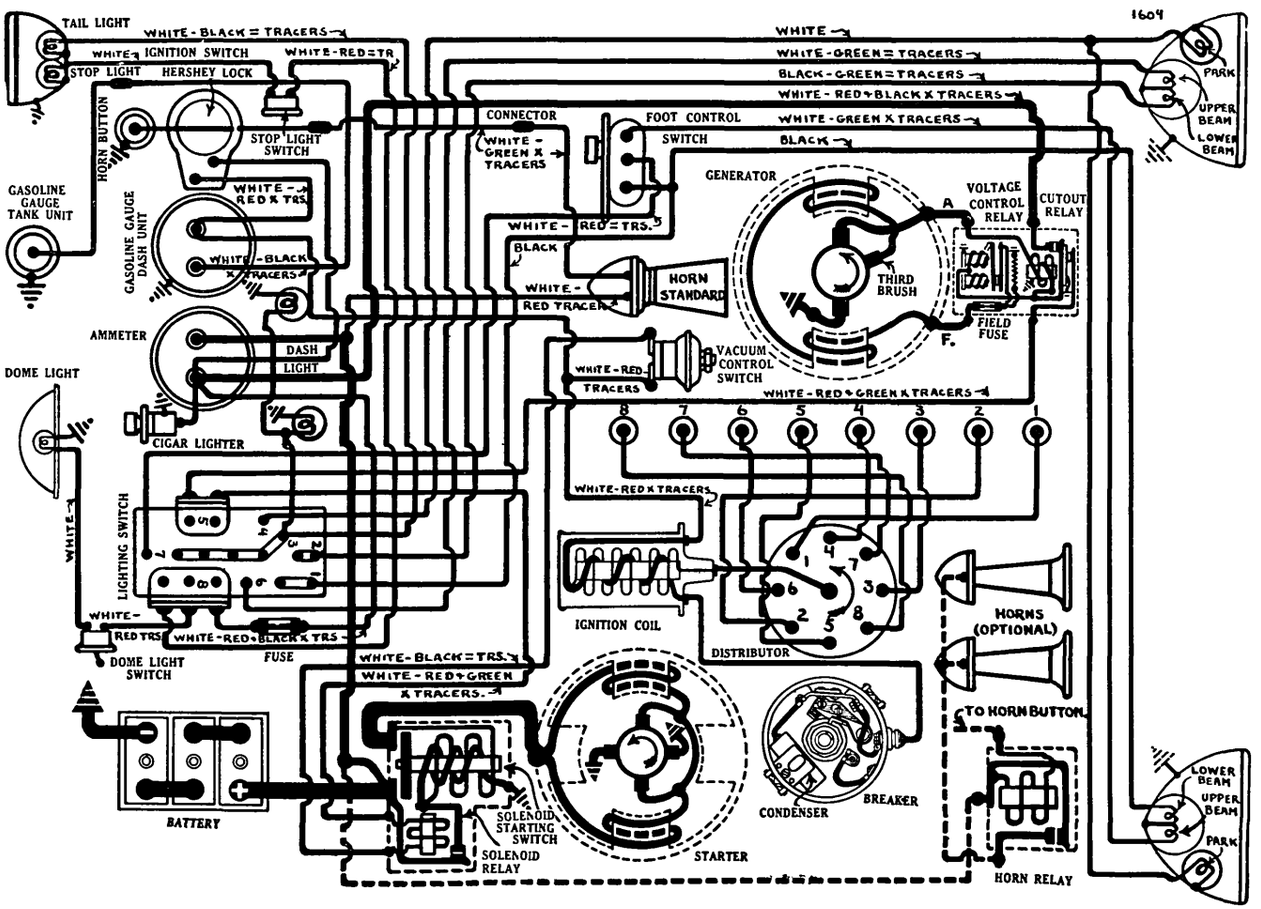
Spark Plug Gaps—.020-.025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-1, 1" dual, downdraft type.

Automatic Choke—Delco-Remy Carburetor Control, Type 498-D, 498-E, 498-F.

Fuel Pump:—A.C., Type R-1521794 diaphragm type.



Gasoline Gauge:—A.C., electric type.

VALVE TIMING:—**To Check Timing**—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve opening (gauge rod should rest on valve spring cap). Valve should be .163" open when dead center mark for pistons #1 and 8 is visible in flywheel inspection hole.

Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Tappet Clearance:—.008" all valves—engine hot.

Valve Spring Pressure:—55-65 lbs. at 1 15/16" (valve closed), 151-164 lbs. at 1 19/32" (valve open), total for both springs.

LUBRICATION:—Crankcase Capacity—6 qts. (refill). Normal Oil Pressure—35 lbs.

BATTERY:—Delco, Type 13-JW, 13-JF (export). 6 volt, 13 plate, 98 A.H. capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Under right front seat.

STARTER:—Model 734-Z. Armature No. 823881.

Starter Drive—Solenoid operated pinion shift and overrunning clutch.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Cranking Engine—135 R.P.M., 140-150 amperes, 5.25 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Solenoid Switch Type 1512. Vacuum Switch Type 1594. Starting switch and pinion shift solenoid mounted on starter. Controlled through relay in solenoid case by vacuum switch operated by accelerator pedal. See Equipment Section for complete data.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mountig capscrews.

GENERATOR:—Model 936-C. Armature No. 1854856. Third brush control in conjunction with Voltage Control Relay (two-step charging control).

Charging Rate Adjustment—Use test meters to check generator output. Connect jumper wire from 'F' terminal on generator to ground on generator frame. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw, remove jumper wire.

Maximum Charging Rate—18 amperes (cold), 14 amperes (hot), 8.5 volts, 2400 R.P.M., 30 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—2.3-2.6 amperes at 6.0 volts.
Field Fuse—6 ampere in regulator case.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator away from engine by means of spring scale hooked to clamp bolt until tension is 20 lbs., tighten mounting bolts.

SPECIAL GENERATORS:—Model 931-Z (City Police), 935-L (State Police). Available as special equipment. See Equipment Section for complete data.

CONTROL UNIT:—Model 5589. Mounted on generator. Consists of Cutout Relay and Voltage Control Relay in a single case. Cutout Relay has special ground contacts for starter solenoid circuit control. See Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.4-6.8 volts, 7.25-7.75 M.P.H.

Cuts Out—0-3.0 ampere discharge current.

Relay Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.

Contacts Close—7.3-7.7 volts at 70°F.

Contact Gap—.008-.013".

Contact Spring Tension—.7-.9 ounces.

Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Switch Model 478-S, 478-T (RHD). Control Switch Model 465-R. Foot control switch operative only with lighting switch in #4 position (Country Driving) providing assymetrical passing beam. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Stop, Dome	6	81
Inst., Tail, Parking	3	63

FUSES:—Lighting—30 ampere in connector in lighting switch feed line from ammeter.

HORNS:—Klaxon Model K-26-L, Type 1609 Std. Model K-33-B, Type 1851 (low note), 1852 (high note) (Optional). Optional horns are matched tone, twin horns controlled by horn relay.

Horn Relay:—Model 266-T. Current draw .8 amps.
Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number, 2,706,453 ('34), 2,777,650 ('35). On right frame side rail in front of shock absorber.

COMPRESSION:—Ratio—5.25-1. No optl. ratios. **Pressure**—114 lbs. at 1000 R.P.M. or 97 lbs. at cranking speed (135 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 528-H. Ignition current 2½ amperes (idling), 4½ amperes (stopped).

Ignition Switch:—Oakes 'Hershey' type co-incidental steering post and ignition switch lock.

Distributor Model 663-C. Single breaker, 8-lobe cam type. No synchronization required. Fitted with vacuum spark advance and Octane Selector.

NOTE:—Original soft advance plate should be replaced by new hard plate stamped 'H' on all cars not equipped with the new plate.

Breaker Gap—Set. at .015". Limits .0125-.0175".

Breaker Arm Spring Tension—19-23 ounces.

Cam Angles (Distributor Degrees) — Closed 31°. Open 14°.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
10.5	800	21	1600

Octane Selector—Consists of manual retard (12° engine maximum) located on instrument panel to adjust spark for various fuel characteristics. Lever should be placed at 'High' end of scale with fuel of 76-78 Octane rating and should be moved toward 'Low' end of scale only enough to eliminate excessive knock when fuel of lower rating is used. Lever must be placed at 'High' when ignition setting is being checked or adjusted.

Vacuum Spark Advance—Model 680-H—Vacuum unit provides additional spark advance for all speeds above idling except when engine is accelerated or is pulling heavily (return spring in unit will retard spark under these conditions).

Advance (Engine Degrees)	Engine R.P.M.	Vacuum (Ins. of Mercury)
Start	700	5-7"
10-12	900	10-13"

Mounting:—On generator at right of engine. Distributor held in place by hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degrees Piston Travel
All engines .....7° BTDC..... .0198" BTDC.
This setting is correct with Octane Selector turned to 'High' end of scale.

Timing (using Timing Light)—Connect timing light between ignition terminal on distributor and ground. Turn Octane Selector to 'High' position and see that distributor is advanced (rear end of slot in advance plate should be against stop screw). Turn on ignition, turn engine over until #3 exhaust valve begins to open, stop when 'ADV/7°' mark on flywheel lines up with reference mark on housing (inspection hole on top face right rear motor support), loosen advance arm clamp bolt, rotate distributor until indicator bulb just lights, tighten clamp bolt, see that rotor is opposite No. 1 terminal in cap, check spark plug connections (see diagram).

Timing (using Synchroscope or Neon Light)—See Equipment Section for complete directions. Idle engine at speed not greater than 400 R.P.M.

Motor Gauge—Weidenhoff Adapter #113, Rod #38.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type H-9. 18 MM. Metric type.

Spark Plug Gap—.020-.025".

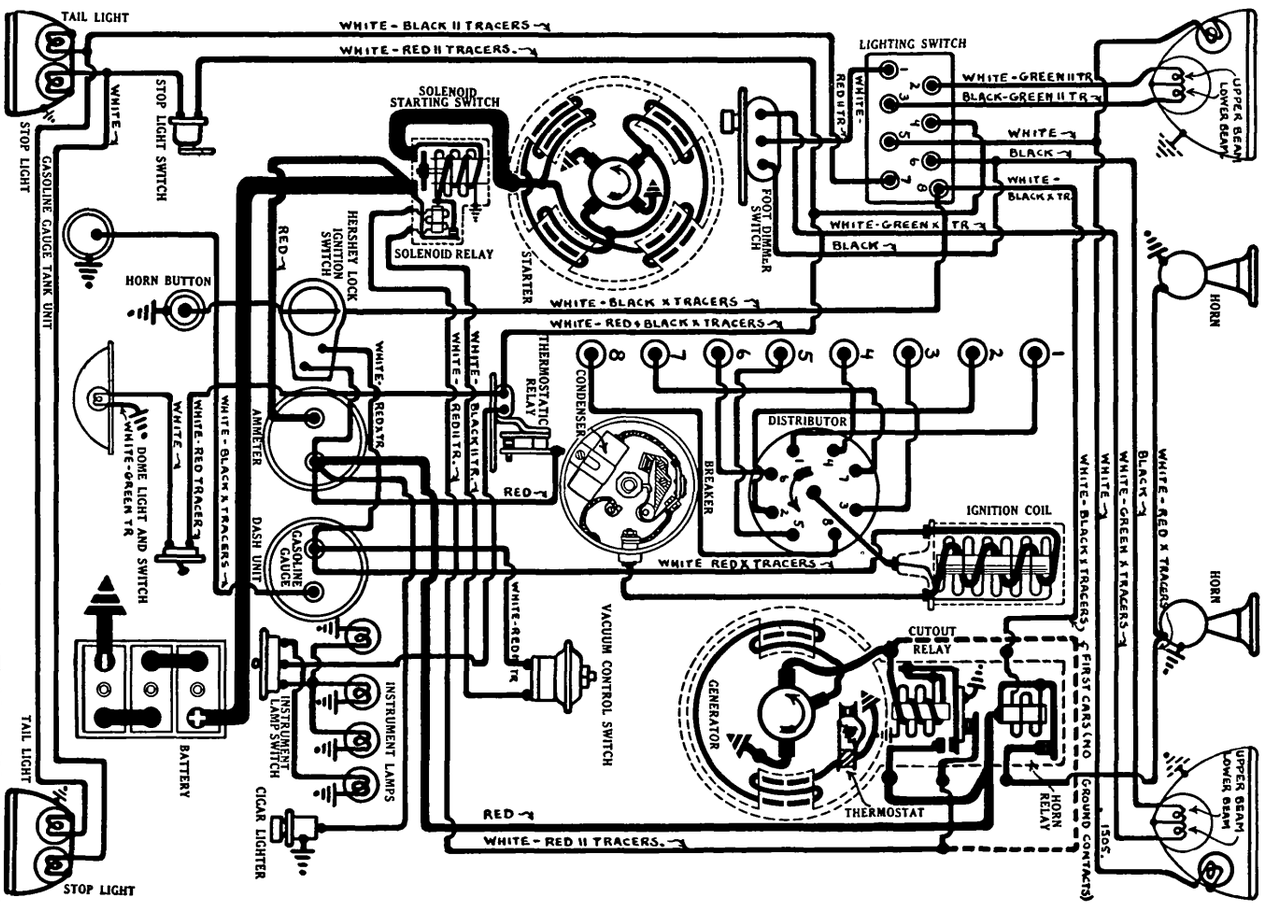
CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Marvel, Model ED-1-S, 1¼" dual updraft type.

Automatic Choke—Delco-Remy, type No. 498-C.

Fuel Pump:—A.C., Type 'I' combination fuel and vacuum pump.

Gasoline Gauge:—A.C. electric type.



VALVE TIMING:—To Check Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve movement (gauge rod should rest on valve spring cap). Set tappet clearance at .008". Valve should be .180" open when dead center mark for pistons #1 and 8 is visible through inspection hole.

Motor Gauge—Weidenhoff Adapter #113, Rod #38.

Tappet Clearance—.008" all valves (hot).

Valve Spring Pressure—44-55 lbs. at 1 15/16" (valve closed), 132-145 lbs. at 1 19/32" (valve open), total for both springs.

LUBRICATION:—Crankcase Capacity—9 qts. (dry), 7 qts. (refill).
Normal Oil Pressure—35 lbs.

BATTERY:—Delco, Type 13-J, 13-JF (Export), 6 volt, 13 plate, 98 A.H. capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Under right front seat.

STARTER:—Model No. 727-G. Armature No. 823881.

Rotation—Counter-clockwise (commutator end).

Brush Spring Tension—24-28 ounces each.

Cranking Engine—135 R.P.M., 150-175 amperes, 5.25 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid No. 1513. Vacuum Switch No. 1587. Starter pinion shift operated by solenoid on starter field frame. Controlled by vacuum switch operated by foot accelerator pedal or hand throttle. See Equipment Section for complete data.

Mounting—Flange mounted on right front face of flywheel housing.

GENERATOR:—Model 956-H. Armature No. 1845920. Third brush control type with thermostat. Thermostat contacts open at 200°F. cutting resistance in field circuit and reducing output approximately 40%. Thermostat is not adjustable.

Charging Rate Adjustment—Slotted adjustment lever located on commutator end plate directly below distributor cup. Loosen clamp screw on lever one turn, move lever down (clockwise) to increase, or up (counter-clockwise) to decrease, charging rate, tighten clamp screw.

Standard Setting—20 amperes (cold), 8.5 volts, 21.5-26 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.3-8.7	2000
Hot	11-14	7.5-7.9	2200-2600

Rotation—Counter-clockwise (commutator end).

Shunt Field Current—2.1-2.5 amperes at 6.0 volts.

Brush Spring Tension—23-27 ounces each.

Mounting—Flange mounted on right rear face of timing gear case.

SPECIAL GENERATORS:—Models 929-B, 956-L. These generators are special equipment. See Equipment Section for complete data.

CUTOUT RELAY:—Model 264-H, 264-K. Cutout relay and horn relay. Model 264-H used on first cars in 1934. Model 264-K has ground contacts for starter solenoid circuit control. See diagram for connections for each type. See special article in Equipment Section for complete data.

Cuts in **Cut-out Relay** Cuts out
6.7-7.5 volts (7-7.5 M.P.H.). 0-2 amperes discharge.

Contact Gap—.015-.025".

Air Gap:—.012-.017" (contacts closed).

Horn Relay

Contacts Close—2 volts minimum.

Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

LIGHTING: — Switch Model 487-F. Export Models 487-G (L.H.D.), 486-W (R.H.D.). Foot Control Switch No. 465-R. Foot Control Switch operative only with lighting switch lever in extreme right (country driving) position, providing asymmetrical passing beam (lower beam from right hand lamp which lights left hand side of road). Headlight bulbs are new 'pre-focused' type.

Bulb Sizes

Position	Candlepower	Mazda No.
Headlights	32-32	2330-L
Stop (Backing)	15	87
Dome	6	81
Dash, Tail, Parking	3	63

THERMOSTAT RELAY:—Model 411-A. New type current limit relay operated by thermostatic arm (no winding). Adjustment is sealed and complete unit should be replaced if defective. Contacts will remain closed with current of 25 amperes but will open in one minute with current of 38 amperes at temperature of 70-80°F.

HORNS:—Klaxon, Model K-33-C. Matched set, blended tone. Current draw 12 amperes at 6.0 volts each. Horns operated by horn relay (see Relay paragraph above).

SERIAL NUMBER:—First number, 2,706,453 ('34), 2,777,650 ('35). On right frame siderail in front of front shock absorber.

COMPRESSION:—Ratio—5.25-1 (60), 4.95-1 (90). **Pressure**—114 lbs. (60), 103 lbs. (90) at 1000 R.P.M. or 114 lbs. (60), 95 lbs. (90) at cranking speed (120 R.P.M.)

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 528-H. Ignition current 2½ amperes (idling), 4½ amperes (stopped).

Ignition Switch:—Oakes 'Hershey' type co-incidental steering post and ignition switch lock.

Distributor Model 663-A. Single breaker 8-lobe cam type. No synchronization required. Fitted with Vacuum Spark Advance and Octane Selector.

NOTE:—Original soft advance plate should be replaced by new hard plate stamped 'H' on all cars not equipped with the new plate.

Breaker Gap—Set at .015". Limits, .0125-.0175".

Breaker Arm Spring Tension—19-23 ounces.

Cam Angles (Distributor Degrees) — Closed 31°. Open 14°.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
15	1300	30	2600

Octane Selector—Consists of manual retard (12° engine maximum) with operating lever located on instrument board. Used to adjust spark for various fuel characteristics. Lever should be placed at 'High' end of scale for fuel of 76-78 Octane rating and should be moved toward 'Low' end of scale only enough to eliminate excessive knocking when fuel of lower rating is used. Lever must be placed in 'High' position when ignition is being checked or set.

Vacuum Spark Advance—Model 680-H. Vacuum unit on distributor provides additional spark advance for all speeds above idling except when engine is accelerated or is pulling heavily (return spring will retard spark under these conditions.

Advance (Engine Degrees)	Engine R.P.M.	Vacuum Ins. of Mercury)
Start	700	5-7"
10-12°	900	10-13"

IGNITION TIMING:—

	Flywheel Degs.	Piston Travel
Model 60	11° BTDC	.0523" BTDC.
Model 90	10° BTDC	.0466" BTDC.

Octane Selector turned to 'High' end of scale.

Timing (using Timing Light)—Connect timing light between distributor terminal and ground. Turn Octane Selector lever to 'High' end of scale and see that distributor is advanced (rear end of slot in advance plate should be against stop screw). Turn on ignition, turn engine over until #3 exhaust valve begins to open, stop when 'ADV/11°' (60) or 'ADV/10°' (90) mark on flywheel lines up with reference mark on housing (inspection hole located on top face of right rear motor support), loosen advance arm clamp bolt, rotate distributor until indicator bulb just lights, tighten clamp bolt, see that rotor is directly opposite #1 terminal in cap, check spark plug connections (see diagram).

Timing (using Synchroscope or Neon Light)—See Equipment Section for complete directions.

Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

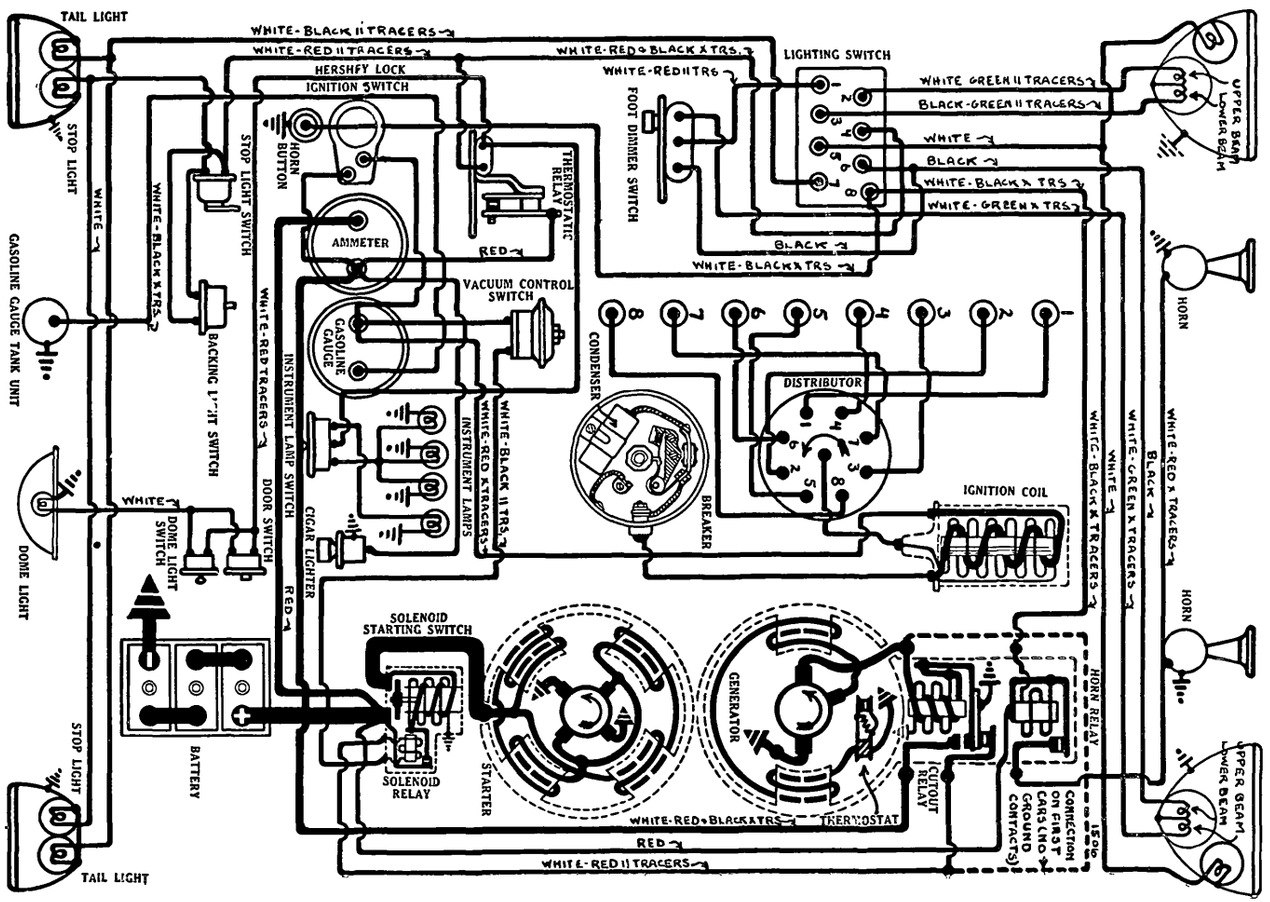
Spark Plugs:—A.C., Type H-9. 18 MM. Metric type.

Spark Plug Gap—.020-.025".

Radio Suppressors—Use special elbow type United Motors #1207820 (with adaptor #1208094 for center terminal of distributor).

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—(60) Marvel, Model ED-2-S, 1 5/16". **(90)** Marvel, Model ED-3, 1 7/16" dual updraft **Automatic Choke**—Delco-Remy, Type No. 498-C.



Fuel Pump:—A.C., Type 'F' fuel and vacuum pump.

Gasoline Gauge:—A.C., electric type.

VALVE TIMING:—To Check Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve movement (gauge should rest on valve spring cap). Set tappet clearance at .008". Valve should be .180" open when dead center mark for #1 and 8 pistons is visible in inspection hole.

Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Tappet Clearance (Lash):—.008" all valve (hot).

Valve Spring Pressure:—Inner Spring—20-25 lbs. at 1 21/32" (valve closed), 55-61 lbs. at 1 5/16" (valve open). Outer spring—35-40 lbs. at 1 15/16" (valve closed), 96-103 lbs. at 1 19/32" (valve open). Total spring pressure—55-65 lbs. (valve closed), 151-164 lbs. (valve open).

LUBRICATION:—Crankcase Capacity—Dry 11½ qts. (60), 12½ qts. (90), Refill—8 qts. (60), 9 qts. (90).

Normal Oil Pressure—35 lbs.

BATTERY:—(60) Delco, Type 15-G, GF (Export), 6 volt, 15 plate, 114 A.H. capacity (20 hour rate).

Starting Capacity—137 amperes for 20 minutes.

(90) Delco, Type 17-D, DF (Export), 6 volt, 17 plate, 130 A.H. capacity (20 hour rate).

Starting Capacity—156 amperes for 20 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Under right front seat.

STARTER:—Model 727-F. Armature No. 820158.

Rotation—Counter-clockwise (commutator end).

Brush Spring Tension—24-28 ounces each.

Cranking Engine—135 R.P.M., 175-200 amperes, 5.25 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
16 "	Lock	3.0	600

Starting Switch:—Solenoid No. 1512. Vacuum Switch No. 1587. Starter pinion shift operated by solenoid on starter field frame. Controlled by vacuum switch operated by foot accelerator pedal or hand throttle (see Equipment Section for complete data).

GENERATOR:—Model 956-H. Armature No. 1845920. Third brush control type with thermostat. Thermostat contacts open at 200°F. cutting resistance in field circuit and reducing output approximately 40%. Thermostat is not adjustable.

Charging Rate Adjustment—Slotted adjustment lever located on commutator end plate directly below distributor cup. Loosen clamp screw on lever one turn, move lever down (clockwise) to increase, or up (counter-clockwise) to decrease, charging rate, tighten clamp screw.

Standard Setting—20 amperes (cold), 8.5 volts, 22.5-27.5 M.P.H. (60), 24.5-30 M.P.H. (90).

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.3-8.7	2000
Hot	11-14	7.5-7.9	2200-2600

Rotation—Counter-clockwise (commutator end).

Shunt Field Current—2.1-2.5 amperes at 6.0 volts.

Brush Spring Tension—23-27 ounces.

Mounting—Flange mounted on right rear face of timing gear case.

SPECIAL GENERATORS:—Model 929-B, 956-L. These generators are special equipment. See Equipment Section for complete data.

CUTOUT RELAY:—Model 264-H, 264-K. Cutout relay and horn relay. Model 264-H used on first cars in 1934. Model 264-K has ground contacts for starter solenoid circuit control. See diagram for connections for each type. See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.75-7.5 volts, 7.5-8 M.P.H. (60), 8-8.5 M.P.H. (90).

Cuts Out—0-2 ampere discharge.

Contact Gap:—.015-.025".

Air Gap:—.012-.017" (contacts closed).

Horn Relay

Contacts Close—2 volts minimum.

Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

LIGHTING: — Switch Model 487-F. Export Models 487-G (L.H.D.), 486-W (R.H.D.). Foot Control Switch No. 465-R. Foot Control Switch operative only with lighting switch lever in extreme right (country driving) position, providing asymmetrical passing beam (lower beam from right hand lamp which lights left hand side of road). Headlight bulbs are new 'pre-focused' type.

Bulb Sizes

Position	Candlepower	Mazda No.
Headlights	32-32	2330-L
Stop (Backing)	15	87
Dome	6	81
Dash, Tail, Parking	3	63

THERMOSTAT RELAY:—Model 411-A. New type current limit relay operated by thermostatic arm (no winding). Adjustment is sealed and complete unit should be replaced if defective. Contacts will remain closed with current of 25 amperes but will open in one minute with current of 38 amperes at temperature of 70-80°F.

HORNS:—Klaxon, Model K-33-C. Matched set, blended tone. Horns operated by horn relay (see Relay paragraph above).

SERIAL NUMBER:—First number—2,830,899. On right frame siderail at rear of right front wheel.

COMPRESSION:—Ratio 5.55-1. Pressure 118 lbs. at 1000 R.P.M. or 96 lbs. (approx.) at cranking speed of 135 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 400-450 R.P.M. or 7-8 M.P.H.

IGNITION:—Coil Model 536-H. On right side of block near distributor.

Coil Draw—2½ amperes idling, 4½ stopped.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Ignition Lock—Briggs & Stratton.

Distributor Model 663-F.—Single breaker, 8 lobe cam, full automatic advance type with integral vacuum spark control and Octane Selector adjustment.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ozs.

Condenser—Part No. 1855968. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
13	1050	26	2100

Vacuum Spark Control—Vacuum unit mounted on side of distributor, linked directly to breaker plate. Provides additional advance at speeds greater than 18 M.P.H. except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5- 7"
10-13°	10-13"

Octane Selector—Adjustment at distributor providing advance or retard from standard setting (pointer midway on scale) to compensate for fuel characteristics. See Ignition Timing for setting.

Distributor Removal:—Mounted on right side of crankcase. To remove, take out two hold-down screws in mounting flange.

IGNITION TIMING:—Initial setting for fuel of 70 Octane rating as given. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All Engines	2° BTDC	.0015" BTDC

To Set Timing (Synchroscope)—Recommended by manufacturer. Insert one Synchroscope lead in #1 terminal in distributor cap, clip other lead to #1 spark plug cable. Direct Synchroscope light on flywheel through inspection hole in front face of housing above starter. Idle engine at speed not more than 400 R.P.M. Note position of flywheel timing mark 'ADV/', loosen two distributor hold-down screws, rotate distributor slowly until timing mark coincides with reference line on housing, tighten hold-down screws. If reference line on Octane Selector pointer does not coincide with center line on scale, loosen pointer lockscrew, shift pointer, tighten lockscrew.

NOTE—The 'ADV/' flywheel mark is less than ¼" before the dead center mark and is filled in with paint to be more easily distinguished.

To Set Timing (Without Synchroscope)—No means provided to crank engine (engage gears and roll car on floor). With #1 piston on compression, turn engine over until #3 exhaust valve (fifth valve from front of engine) begins to open, stop when flywheel mark 'ADV/' lines up with mark on housing (inspection hole in right front face of housing above starter). Use timing light or form spark gap between distributor high tension lead and housing to check contact opening. Loosen two hold-down screws, rotate distributor until contacts begin to open, tighten hold-down screws, loosen Octane Selector pointer lockscrew, center pointer reference line on scale, tighten lockscrw.

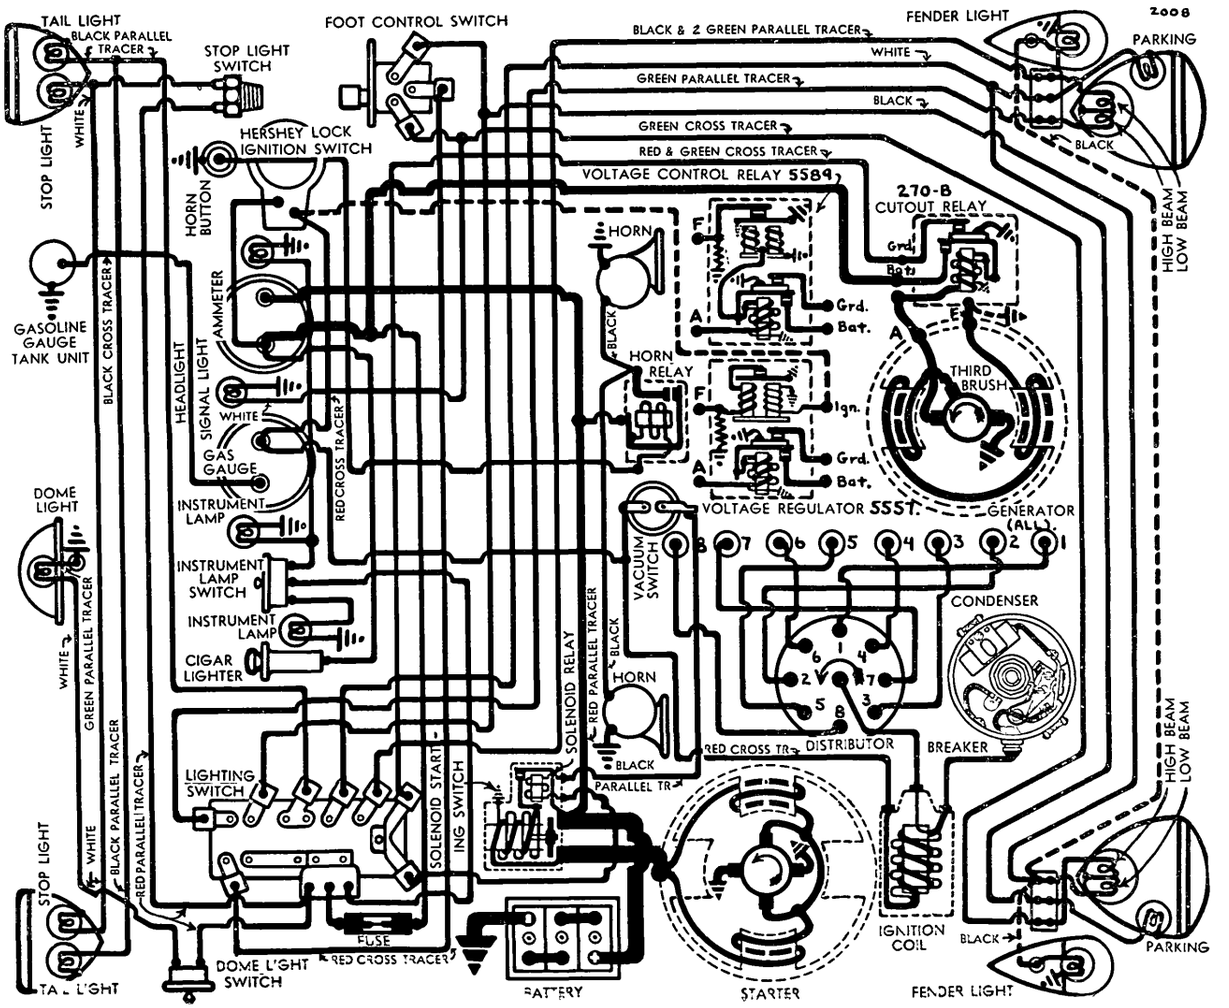
Timing (Motor Gauge)—Weidenhoff #113 Adapter, #31 Rod.

Octane Selector—Should be set for final ignition setting dependent upon fuel used. To adjust, loosen two distributor hold-down screws, rotate distributor clockwise so that pointer moves toward 'Low' end of scale for fuel of less than 70 Octane rating or counter-clockwise toward 'High' end of scale for fuel of higher rating until slight 'ping' noticeable at speeds between 10-15 M.P.H. but not at higher speeds when car is accelerated with wide open throttle.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type H-9. 18 MM. Metric type.

Spark Plug Gaps—.020-.025".



NOTE—Gap may be set at .030" if necessary in extreme cases to secure good idling performance. This gap may result in high speed missing after some service.

Radio Suppressors. One suppressor installed in distributor high tension terminal only. If suppressors used on spark plugs maximum resistance should be 15000 ohms (preferably 10000).

CARBURETION:—Carburetor—Stromberg Model EE-1, 1" dual, downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not adjust carburetor until engine is thoroughly warmed up with choke valve wide open and idling at slow or hot idling speed.

Idle Adjustment—Adjust throttle stopscrew so that engine idles at 400-440 R.P.M. or 7-8 M.P.H. Turn idle adjusting screw for each carburetor barrel (in succession) in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Not adjustable.

Fast Idle—Buick Cold Idle Control. See article in Carburetion Section.

Accelerator Linkage Adjustment:—Linkage adjustment must be maintained to provide correct throttle opening for starting. With carburetor set for 7-8 M.P.H. idling speed and throttle button pushed in, rotate fast idle cam to extreme left against stop (fast idle position), adjust vacuum switch rod length so that switch lever reference line coincides with 'Fast Idle' line on housing. Hold cam in fast idle position, depress accelerator pedal, note throttle position when vacuum switch makes contact and starter operates. Gap between point of throttle stopscrew and cam must be at least 5/32".

Automatic Choke Delco-Remy Model 498-H:—See article in Carburetion Section for complete checking data.

Choke Setting—Connecting rod is engaged in inner hole in automatic choke lever marked 'R' for standard setting. Shift to center hole if over-richness experienced. Outer hole marked 'H' used only to overcome over-richness due to highly volatile gasoline.

Air Cleaner:—AC. #1525959 or 1526659 oil-wetted type standard. #1525921 or 1526654 oil-bath type option'l. NOTE—Smaller main metering jets must be used with the heavy duty oil-bath type cleaners. See Stromberg Jet Specification table in Carburetion Section.

Fuel Pump:—AC. Type W #1521854. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515205 (dash unit), #1515416 (tank unit). See article in Carburetion Sec.

VALVE TIMING:—Tappet Clearance—.015" for all valves with engine hot.
Valve Spring Pressure—52½-62½ lbs. (valve closed), 134½-146½ lbs. (valve open) total for both springs.
To Check Valve Timing—Set up dial indicator over #2 or 7 exhaust valve spring cap so as to measure valve movement. Set indicator at '0' with valve closed. Indicator reading should be .150" with pistons #1 and 8 on top dead center and flywheel mark 'TDC/1-8' lined up with indicator in inspection hole in right front face of housing.

LUBRICATION:—Crankcase Capacity—6 qts. refill.
Normal Oil Pressure—10 lbs. idling, 45 lbs. at 35 M.P.H. maximum.

BATTERY:—Delco, Type 13-J. 6 volt, 98 A.H. capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes.
Zero Capacity—300 amperes for 3 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Under right front seat.

STARTER:—Model 734-Z. Armature No. 823881.
Drive—Solenoid pinion shift and overrunning clutch.
Cranking Engine—135 R.P.M., 150 amperes at 4.5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 ft. lbs.	Lock	3.63	475

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange capscrews.

Starting Switch:—Solenoid Switch Type 1512. Vacuum Switch Type 1594. Solenoid switch controlled through relay by vacuum switch operated by accelerator pedal with ignition 'on.' See article in Equipment Section.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts max. **Open**—1.6-2.0 volts.
Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed).

Vacuum Switch

Contacts Close—10-14° rotation counter-clockwise from latch position.
Unlatch Action—3.4-4.6" of Hg. approximately 30° from latch position.

GENERATOR—STANDARD:—Model 936-C. Armature No. 1854856. Third brush control type. Voltage Control Relay (step-voltage control) optional. Ventilated by fan on drive pulley.
Charging Rate Adjustment—Connect test ammeter in charging line at 'BAT' terminal. On cars with step-voltage control, ground generator field 'F' terminal to frame. Loosen lockscrew on commutator end plate, shift third brush adjusting handle (visible through upper ventilating hole on commutator endplate) counter-clockwise to increase or clockwise to decrease charging rate. Tighten lockscrew and remove generator field ground.
Maximum Charging Rate—20 amperes (cold), 17 amperes (hot), 8.2-8.5 volts, 2760 R.P.M., 31 M.P.H. Manufacturer allows maximum generator output of 24 amperes (cold), 19 amperes (hot) with heavy accessory load when step-voltage unit is installed.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.
Motoring—500-700 R.P.M., 4.5-5.5 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out two pivot capscrews and one clamp bolt.

Belt Adjustment:—Loosen clamp bolt and pivot screws, pull generator away from engine until belt deflection midway between generator and fan pulleys is ½" with light pressure, tighten clamp bolt and screws.

GENERATOR—CANADIAN:—Model 936-V. Armature No. 1854856. Third brush control in conjunction with Vibrating Voltage Regulator. All specifications, performance data, and adjustments same as for Model 936-W (Canadian production generator on Models 60, 80, 90). See next page.

GENERATOR—SPECIAL SERVICE:—Model 931-Z. Third brush regulation in conjunction with external step-voltage control. Used on Taxicabs. See article on Special Generators in Equipment Section.

CUTOUT RELAY:—Model 270-B (Std. on Model 936-C). Mounted on generator. Has ground contacts for starter solenoid relay control. See article in Equipment Section.

Cuts In—6.75-7.5 volts, 900 R.P.M., 10 M.P.H.
Cuts Out—0-3.5 ampere discharge.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

CONTROL UNIT (STEP-VOLTAGE TYPE):—Model 5589 (Optl. on Model 936-C). Cutout Relay and Voltage Control Relay in case on generator. See article in Equipment Section.

Cutout Relay

Cuts In—6.4-6.8 volts, 900 R.P.M., 10 M.P.H.
Cuts Out—3 amperes maximum discharge current.
Contact Gap and Air Gap—Same as for Mod. 270-B.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70° F.
Contacts Close—7.3-7.7 volts at 70° F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5557 (Std. on Model 936-V). Vibrating Voltage Regulator. All specifications and adjustments same as when used on Models 60, 80, 90. See next page.

LIGHTING:—Headlamps—Guide Multi-beam, Prefocused, cross-beam type with special non-interchangeable lenses. Headlamps aimed straight-ahead with lenses removed. Assymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in fourth or 'Country Beam' position.
Headlamp Beam Indicator—Located at top of instrument cluster (above speedometer dial). Lighted whenever 'Country Beam' or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 479-M, 479-L Export.
Foot Selector—Delco-Remy Model 471-T.
Instrument Lamp—Delco-Remy Model 1404.
Stop Lamp—Hydraulic type on brake distributor mounted on left front leg of 'X' member.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-L
Parking Bulbs (Std.)	1.5	55
Fender (Optl).	3	63-L
Instrument, Beam Indicator	1	51
Map Light	1.5	55
Tail	3	63-L
Stop	15	87-L
Dome	6	81-L

NOTE—Bulbs are Long-Life 'L' type.

FUSES:—Lighting—30 ampere in connector in lighting switch feed line (#6 terminal) from ammeter.

HORNS:—Klaxon Model K-33-S. Type 2051 (low note—right side), Type 2052 (high note—left side). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2051 Low Note	11-13	.042-.046"
2052 High Note	10-12	.032-.036"

Horn Relay:—Model 268-W. Requires .25 amperes at 2 volt minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number—2,830,899. On right frame siderail at rear of front wheel.

COMPRESSION:—Ratio 5.45-1. **Pressure**—108 lbs. at 1000 R.P.M. or 94 lbs. (approx.) at cranking speed of 135 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 400 R.P.M. or 7-8 M.P.H.

IGNITION:—Coil Model 536-H. On right side of block near distributor.

Coil Draw—2½ amperes idling, 4½ stopped.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Ignition Lock—Briggs & Stratton.

Distributor Model 663-E.—Single breaker, 8 lobe cam, full automatic advance type with integral vacuum spark control and Octane Selector adjustment.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ozs.

Condenser—Part No. 1855968. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
15	1300	30	2600

Vacuum Spark Control—Vacuum unit mounted on side of distributor, linked directly to breaker plate. Provides additional advance at speeds greater than 15 M.P.H. except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5- 7"
10-13°	10-13"

Octane Selector—Adjustment at distributor providing advance or retard from standard setting (pointer midway on scale) to compensate for fuel characteristics. See Ignition Timing for setting.

Distributor Removal:—Mounted on right side of crankcase. To remove, disconnect vacuum line, take out two hold-down screws in mounting flange.

IGNITION TIMING:—Initial setting for fuel of 75 Octane rating as given. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All engines	10° BTDC	.0442" BTDC

To Set Timing (with Synchroscope)—Recommended by manufacturer. Insert one Synchroscope lead in #1 terminal in distrubutor cap, clip second lead to #1 spark plug cable. Direct Synchroscope light at flywheel through timing inspection hole in right front face of flywheel housing above starter. Idle engine at speed not greater than 400 R.P.M. Note position of flywheel timing mark 'ADV/'. If 'ADV' line does not coincide with line on housing, loosen two distributor hold-down screws, rotate distributor slowly until lines coincide, tighten hold-down screws. Check position of Octane Selector pointer. If reference line on pointer does not coincide with center line of scale, loosen pointer lockscrew, shift pointer, tighten lock-screw.

NOTE—The 'ADV/' ignition timing mark filled with paint.

To Set Timing (Without Synchroscope)—No means provided to crank engine (engage gears and roll car to turn engine over). With #1 piston on compression, turn engine over until #3 exhaust valve (fifth valve from front of engine) begins to open, stop when flywheel mark 'ADV/' lines up with mark on flywheel housing (timing inspection hole in right front face of housing above starter). Use timing light or form spark gap between distributor high tension lead and housing to check contact opening. Loosen two distributor hold-down screws, rotate distributor until contacts begin to open, tighten hold-down screws. Check position of Octane Selector pointer. If reference line on pointer does not line up with center line on scale, loosen pointer lock-screw, shift pointer, tighten lockscrew.

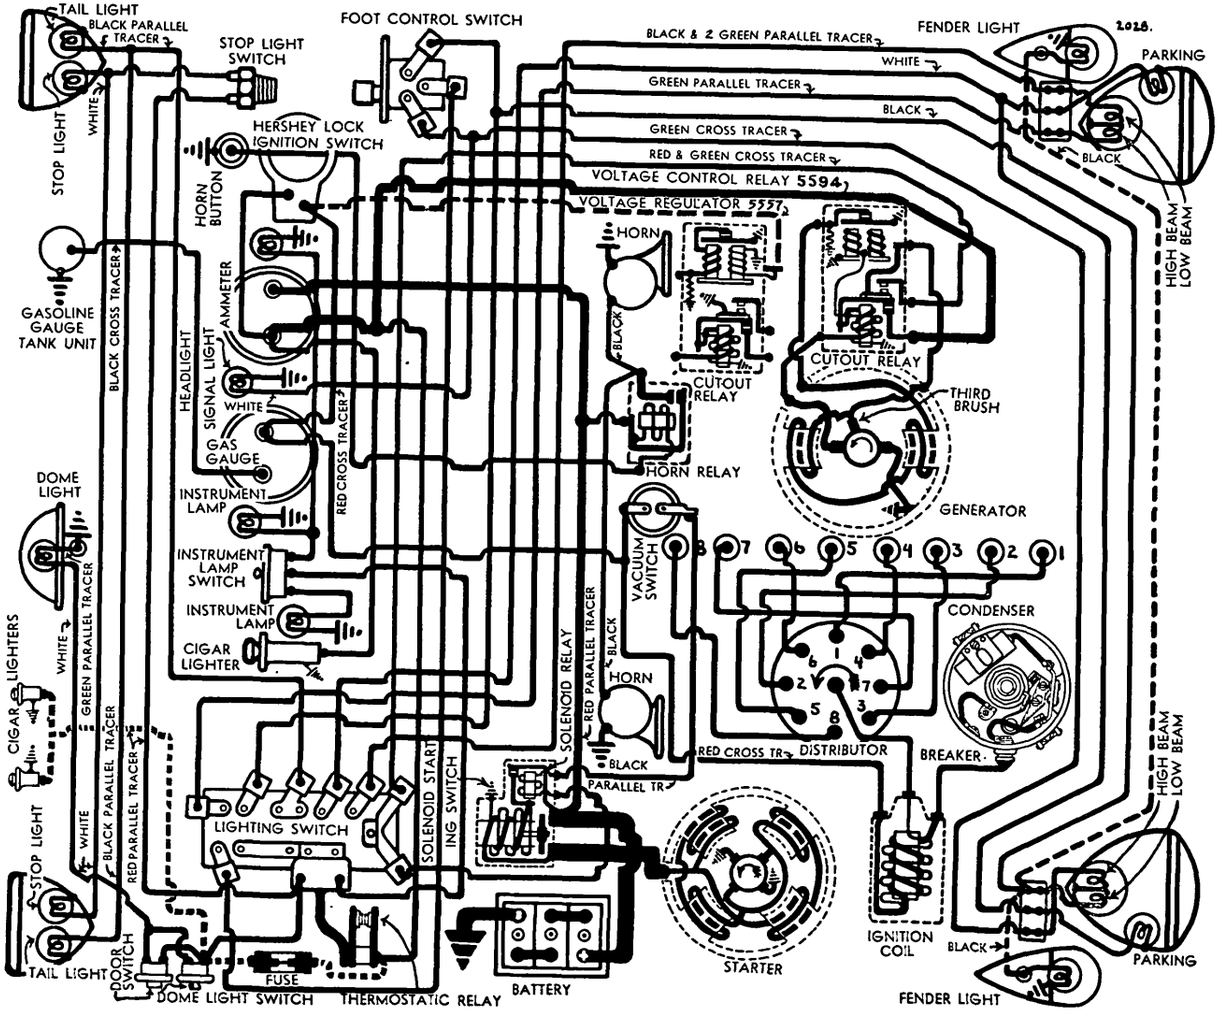
Timing (Motor Gauge)—Weidenhoff #113 Adapter, #31 Rod.

Octane Selector—Should be adjusted for final ignition setting dependent upon Octane Rating of fuel used by car owner. Initial setting (above) correct for fuel of 75 Octane Rating. To adjust, loosen two distributor hold-down screws, rotate distributor clockwise so that pointer moves toward 'Low' end of scale for fuel of lower rating, or counter-clockwise (toward 'High' end of scale) for higher rating until a slight 'ping' is noticeable at speeds between 10 and 15 M.P.H. but not at higher speeds when car is accelerated with wide open throttle.

Firing Order—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—AC. Type H-9. 18MM. Metric type.

Spark Plug Gaps—Set at .020-.025".



NOTE—In extreme cases gaps may be set at .030" if necessary to secure good idling performance. This setting may result in high speed missing after some service.

Radio Suppressors—One suppressor installed in center distributor high tension terminal only. If suppressors used on spark plugs, maximum resistance should be 15000 ohms (preferably 10000 ohms).

CARBURETION:—Carburetor—Stromberg Model EE-22 1¼" dual, downdraft type. See Carburetion Section for adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is thoroughly warmed up with choke valve wide open and idling at hot or slow idling speed.

Idle Adjustment—Set throttle stopscrew so that engine idles at 400 R.P.M. or 7-8 M.P.H. Turn idling adjusting screw for each carburetor barrel (in succession) in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally

turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Not adjustable.

Fast Idle:—Buick Cold Idle Control. See article in Carburetion Section.

Accelerator Linkage Adjustment:—Must be maintained to provide correct throttle opening for starting. With carburetor set for correct 7-8 M.P.H. hot idling speed and throttle button pushed in, rotate fast idle cam to extreme left against stop (fast idle position), adjust vacuum switch rod length so that switch lever reference line coincides with 'Fast Idle' line on housing. Hold cam in fast idle position, depress accelerator pedal, note throttle position when vacuum switch makes contact and starter operates. Gap between throttle stopscrew and cam must be at least 5/32" at this point.

Automatic Choke Delco-Remy Model 498-J:—See article in Carburetion Section for complete data.

Choke Setting—Connecting rod is engaged in inner hole in automatic choke lever marked 'R' for standard setting. Shift to center hole if over-richness is experienced. Outer hole marked 'H' used only for over-richness due to highly volatile gasoline.

Air Cleaner:—AC. #1525960 (60), #1525982 (80,90) oil-wetted type standard, #1526618 (60,80), #1526619 (90) oil-bath type optional.

NOTE—Smaller main metering jets must be used with the heavy-duty oil-bath type cleaner. See Jet Specification table in Carburetion Section.

Fuel Pump:—AC. Type AB #1521838. Diaphragm type combination fuel-and-vacuum pump. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515205 (dash unit), #1515416 (tank unit - 60), #1515415 (tank unit - 80, 90). See article in Carburetion Section.

VALVE TIMING:—Tappet clearance—.015" for all valves with engine hot.

Valve Spring Pressure—52½-62½ lbs. (valve closed) 134½-146½ lbs. (valve open) total for both springs.

To Check Valve Timing—Set up dial indicator over #2 or 7 exhaust valve so as to measure valve movement. Set indicator at 'O' with valve closed. Indicator reading should be .155" with pistons #1 and 8 on top dead center and flywheel mark 'TDC/1-8' lined up with indicator in right front face of housing.

LUBRICATION:—Crankcase Capacity—8 qts. (refill).

Normal Oil Pressure—10 lbs. idling, 45 lbs. maximum at 45 M.P.H.

BATTERY:—Delco, Type 15-G. 6 volt, 15 plate, 114 amp. hour capacity (20 hour rate).

Starting Capaciy—137 amperes for 20 minutes.

Zero Capaciy—300 amperes for 4.5 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Under right front seat.

STARTER:—Model 727-W, 729-B (RHD. 60). Armature No. 820158.

Drive—Solenoid pinion shift and overrunning clutch.

Cranking Engine—115 R.P.M., 175 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5	65
16 ft. lbs.	Lock	3	600

Removal:—Mounted on right front face of flywheel housing. To remove, take out capscrews.

Starting Switch:—Solenoid Switch Type 1512 (727-W), 1530 (729-B). Vacuum Switch Type 1601. Solenoid switch controlled through relay by vacuum switch operated by accelerator pedal with ignition 'on'. See article in Equipment Section.

Solenoid Switch Type 1512, 1530

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

Vacuum Switch

Contacts Close—10-14° rotation counter-clockwise from latch position.

Unlatch Action—3.4-4.6" of HG. approximately 30° from latch position.

GENERATOR—STANDARD:—Model 936-P. Armature No. 1854856. Third brush control type with Voltage Control Relay (step voltage control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Connect test ammeter in charging line at 'BAT' terminal, ground generator field 'F' terminal to frame. Loosen lockscrew on commutator end plate, shift third brush adjusting handle (visible through upper ventilating hole on commutator endplate) counter-clockwise to increase or clockwise to decrease charging rate. Tighten lockscrew and remove generator field ground.

Maximum Charging Rate—21 amperes (cold), 18 amperes (hot), 8.3-8.5 volts, 2770 R.P.M., approx. 36 M.P.H. Manufacturer allows maximum generator output of 24 amperes (cold), 19 amperes (hot) with heavy accessory load.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).

Field Current—2.3-2.6 at 6 volts.

Motoring—500-700 R.P.M., 4.5-5.5 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out two pivot capscrews and one clamp bolt.

Belt Adjustment:—Belt deflection midway between generator and fan pulleys should be ½" with light pressure.

GENERATOR—CANADIAN:—Model 936-W. Armature No. 1854856. Third brush conrtol in conjunction with vibrating voltage regulator. Ventilated by fan on drive pulley.

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below and special article in Equipment Section. Do not shift third brush or run generator on open-circuit.

Maximum Charging Rate—As shown in table below. Reached at approx. 38 M.P.H. To check charging rate, connect test ammeter in charging line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Rotation, Brush Spring Tension, Field Current, Removal and Belt Adjustment same as for standard generator above.

CONTROL UNIT (STEP VOLTAGE TYPE):—Model 5594 Cutout Relay and Voltage Control Relay in case on generator. See article in Equipment Section.

Cutout Relay

Cuts In—6.4-6.8 volts, 900 R.P.M., 10 M.P.H.

Cuts Out—3 amperes maximum discharge current.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70° F.

Contacts Close—7.3-7.7 volts at 70° F.

Contact Gap—.008-.013".

Contact Spring Tension—.7-.9 ounces.

Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5557 Std. on Model 936-W Generator. Cutout Relay and Vibrating Voltage Regulator in case on generator. See articles in Equipment Section.

Cutout Relay

Cuts In—6.5-7.25 volts.

Cuts Out—3 ampere max. discharge at 6.3 volts.

Contact Gap & Air Gap—Same as for Model 270-B.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly. NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.

Contact Gap—.015-.025".

Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper just touching stop, .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, Prefocused, cros-beam type with special non-interchangeable lenses. Headlamps aimed straight-ahead with lenses removed. Assymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in fourth or 'Country Beam' position.

Headlamp Beam Indicator—Located at top of instrument cluster (above speedometer dial). Lighted whenever 'Country Beam' or upper headlamp beams are lighted. **Switches**

Lighting—Delco-Remy Model 479-M, 479-L Export.

Foot Selector—Delco-Remy Model 471-T.

Instrument Lamp—Delco-Remy Model 1404.

Stop Lamp—Hydraulic type on brake distributor on outside of left front leg of 'X' member.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-L
Parking Bulbs (Std.)	1.5	55
Fender (Optl).	3	63-L
Instrument, Beam Indicator..	1	51
Map Light	1.5	55
Tail	3	63-L
Stop	15	87-L
Dome	6	81-L

NOTE—Bulbs are Long-Life 'L' type.

THERMOSTATIC RELAY:—Mounted on lighting switch (part of assembly). Non-adjustable. Contacts will remain closed with current of 25 amperes but will open in one minute with current of 38 amperes at temperature of 70-80° F.

FUSES:—Dome Light and Rear Cigar Lighters (90). 30 ampere in connector in dome lamp feed wire from lighting switch at rear of instrument board.

HORNS:—Klaxon Model K-33-S. Type 2051 (low note—right side), Type 2052 (high note—left side). Vibrator type, blended tone, twin horns operated by horn relay. See Model 40 (previous page) for horn and relay data.

SERIAL NUMBER:—First number 2,999,497. On right frame sideraıl at rear of right front wheel.

COMPRESSION:—Ratıo 5 75-1. Pressure 97-103 lbs. at 150 R P M

Vacuum Reading—Steady readıng of 18-20" wıth engıne ıdlıng at 7-8 M P H

IGNITION:—Coil Model 536-H. On rıght sıde of block near dıstrıbutor

Coil Draw—2½ amperes ıdlıng, 4½ stopped

Ignıtıon Switch:—Oakes-Hershey type co-ıncıdental ıgnıtıon swıtch and steerıng post lock

Ignition Lock—Brıggs & Stratton #45922 (cylın-der), #45900 (case) **Key Series**—8000-9499.

Distrıbutor Model 663-Y—Sıngle breaker, 8 lobe cam, full automatıc advance type wıth ıntegral vacuum spark control and Octane Selector adjustment

Breaker Gap— 015" Lımıts 0125- 0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ounces

Condenser—Part No 1865972 Capacıty 20- 25 mfds

Automatic Advance

Dıstrıbutor		Engine	
Degrees	R P M	Degrees	R P M
Start	250	2 0	500
6 0	500	12 0	1000
13 0	1650	26 0	3300

Vacuum Spark Control—Vacuum unıt mounted on sıde of dıstrıbutor, lınked dırectly to breaker plate Provıdes addıtıonal advance at speeds greater than 18 M P H except when engıne ıs accelerated or operated wıth wıde open throttle when spark ıs retarded by return spring wıthın unıt

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	5-7"
10-13°	10-13"

Octane Selector—Consısts of adjustment at dıstrıb-utor provıdıng 10° advance or retard from center '0' posıtıon See Ignıtıon Tımıng (below) for settıng

Distrıbutor Removal:—Mounted on rıght sıde of crankcase To remove, dısconnect vacuum lıne, take out two hold-down screws ın mountıng flange

IGNITION TIMING:—Initıal settıng (standard for fuel of 70 Octane Ratıng) as gıven See Octane Selector (followıng) for fınal settıng

	Flywheel Degrees	Piston Position
All Engınes	6° BTDC.	0144" BTDC

NOTE—'ADV/' mark on engınes prıor to #4-3,201,034 ıs 2° or ¼" BTDC These fırst engınes should be tımed 6° BTDC usıng the 2° mark as follows Wıth cars tımed ın usual manner (contacts openıng wıth ADV/ mark at ındıcator), rotate dıstrıbutor counter-clockwıse two graduatıons on the Octane Selector scale before tıghtenıng hold-down screws Thıs wıll gıve correct 6° settıng

To Set Tımıng (with Synchroscope)—Recommended by manufacturer Insert one Synchroscope lead ın #1 terminal ın dıstrıbutor cap, clıp second lead to #1 spark plug cable Dırect Synchroscope lıght at flywheel through tımıng ınspectıon hole ın rıght front face of flywheel housıng above starter Idle engıne at speed not greater than 400 R P M or 8 M P H Note posıtıon of flywheel tımıng mark 'ADV/' If 'ADV/' lıne does not coıncıde wıth lıne on housıng, loosen two dıstrıbutor hold-down screws, rotate dıstrıbutor slowly untıl lınes coıncıde, tıghten hold-down screws If pointer on Octane Selector does not regıster at '0' mark loosen pointer lock-screw, shıft to '0' mark, tıghten lockscrew.

NOTE—'ADV/' mark fılled wıth whıte paınt Do not confuse wıth top dead center mark which ımmedi-ately follows 'ADV/' mark.

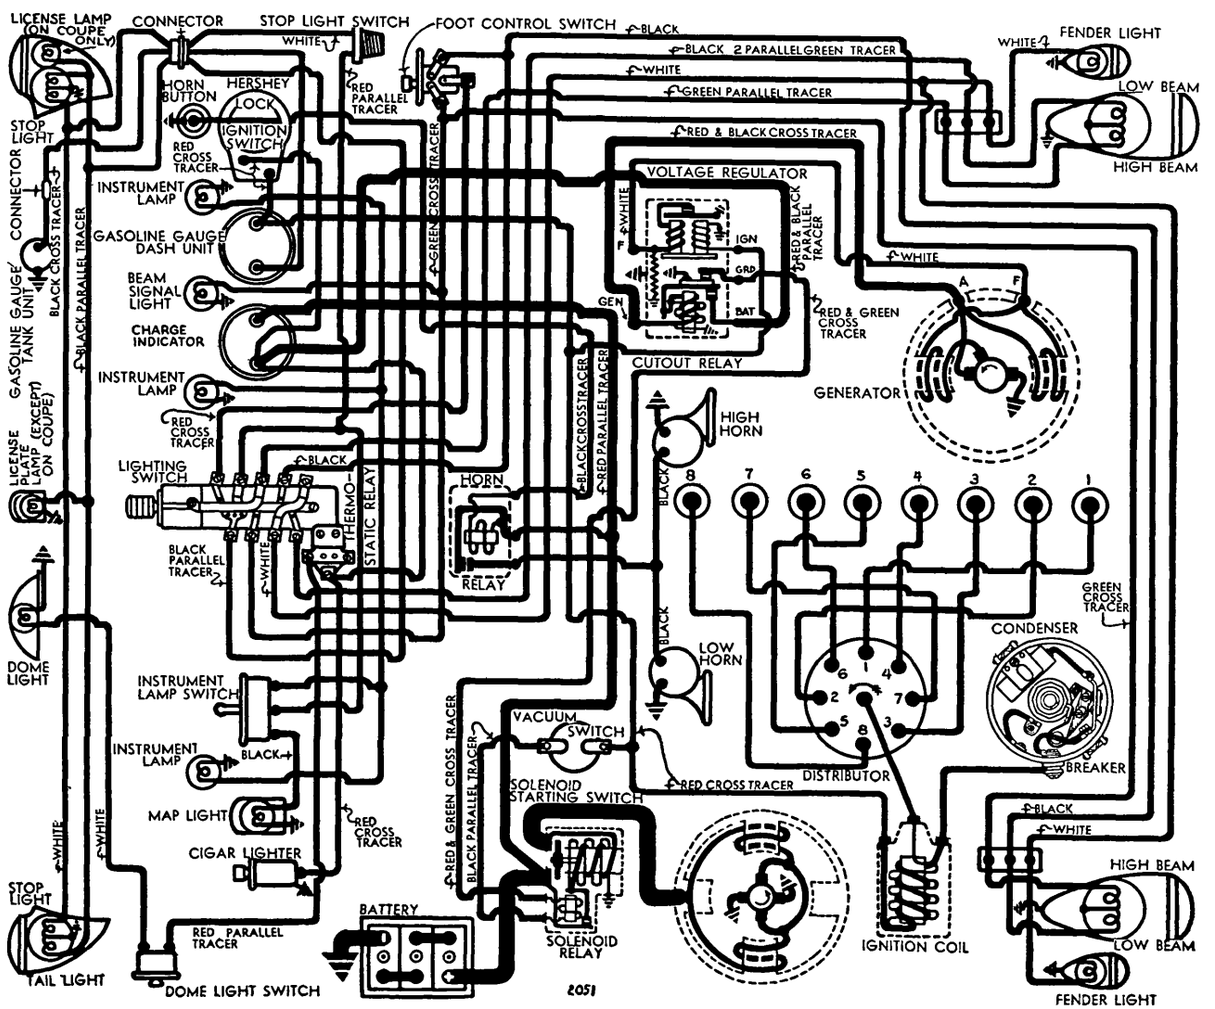
To Set Timing (Without Synchroscope)—To crank engıne engage gears and roll car on floor (wıth ıgnıtıon turned 'off'). Turn engıne over untıl #1 pıston on compressıon (#3 exhaust valve, fıfth valve from front of engıne, begıns to open), stop when flywheel mark 'ADV/' lınes up wıth mark on housıng above starter Turn ıgnıtıon 'on' and form spark gap between dıstrıbutor hıgh tensıon lead and housıng to check contact openıng Loosen two hold-down screws, rotate dıstrıbutor untıl contacts begın to open, tıghten hold-down screws Center pointer on Octane Selector by loosenıng lockscrews and shıftıng pointer, tıghten lockscrew.

Motor Gauge—Weıdenhoff Adapter #113, Rod #31

Octane Selector—Adjust for fuel used. For fuels of less than 70 Octane ratıng (loosen two hold-down screws) shıft pointer to 'Low' end of scale, for fuels of hıgher ratıng shıft to 'Hıgh' sıde of scale Slıght 'pıng' should be notıceable at speeds between 10-15 M P H but not at hıgher speeds when car ıs accele-rated wıth wıde open throttle

Firing Order:—1-6-2-5-8-3-7-4. See dıagram.

Spark Plugs:—AC Type H-9 18 MM Metrıc type.
NOTE—H-9 dıscontınued by AC. Use No. 86.



Spark Plug Gaps— 025".
NOTE—If necessary, gap may be set at 030" to secure good ıdlıng, however hıgh speed mıssıng may occur after some servıce

Radio Suppressors—If suppressors used on spark plugs, maxımum resıstance should be 15000 ohms (10000 preferred).

CARBURETION:—Carburetors—Stromberg Model AA-1 or Marvel Model BD-1 (No 10-1749 std aır cleaner), (No 10-1750 heavy duty aır cleaner). All carburetors 1" dual downdraft type

See Articles in Carburetion Section for each model.

Idle Adjustment—Wıth engıne warm, choke valve wıde open and engıne ıdlıng at hot or slow ıdlıng speed, adjust throttle stopscrew so that engıne ıdles at 7-8 M P H. Turn ıdle adjustıng screw for each

barrel (in succession) in until engine begins to lag or miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Final setting should be 1⅜ turns (Stromberg), ⅝-⅞ turns (Marvel) of screw from closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—(Stromberg). Two holes for pump engagement. Set for maximum stroke unless too rich a charge occurs on accelerating.

(Marvel)—Four holes for pump link engagement.

#1—Minimum stroke—summer driving.
#2—Interm. stroke—warm temperatures.
#3—Normal stroke—standard setting.
#4—Maximum stroke—winter driving.

Fast Idle:—Buick Cold Idle Control.
See Article in Carburetion Equipment Section.

Accelerator Linkage Adjustment:—Linkage adjustment must be maintained to provide correct throttle opening for starting. With carburetor set for 7-8 M.P.H. idling speed and throttle button pushed in, rotate fast idle cam to extreme left against stop (fast idle position), adjust vacuum switch rod length so that switch lever reference line lines up with 'Fast Idle' line on housing. Check accelerator pedal. Throttle should be wide open with pedal down against pedal stop (floor mat). Adjust by turning trunnion on accelerator rod. Accelerator rod spring length should be 9 15/16".

Automatic Choke Delco-Remy Model 490-A:—See article in Carburetion Equipment Section for complete data.

Fuel Volatility Selector—Change setting as required to provide correct choke action with fuel used. Std. setting second notch from 'Low' side of scale. Movement toward 'High' end compensates for too rich mixture, and toward 'Low' end for too lean mixture.

Air Cleaner:—AC. #1528010 oil-wetted type standard. #1528011 oil-bath type optional.

NOTE—If heavy duty oil-bath type cleaner installed, main metering (Stromberg), or power jet and metering pin jet (Marvel) must be changed. See Jet Specification Tables for each carburetor in Carburetion Section.

Fuel Pump—AC. Type W #1521854. Diaphragm type.
See Article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric #1515321 (dash unit), #1515444 (tank unit).
See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—#2 or #7 valve should be .145" open (actual opening as measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' lined up with indicator in inspection hole in right front face of flywheel housing above starter.

Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Tappet Clearance:—.015" all valves, engine hot.

Valve Spring Presure:—42-52 lbs. (valve closed), 112-124 lbs. (valve open), total for both springs.

LUBRICATION:—Crankcase Capacity—7 qts. (dry), 6 qts. (refill).

Normal Oil Pressure—45 lbs. at normal speeds.

BATTERY:—Delco, Type 13-J. 6 volt, 98 ampere hour capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Right side under front seat.

STARTER:—Model 734-Z. Armature No. 823881.

Drive—Solenoid pinion shaft & overunning clutch.

Cranking Engine—135 R.P.M., 150 amps. at 4.5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 ft. lbs.	Lock	3.63	475

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out flange capscrews.

Starting Switch—Solenoid Switch Type 1542. Vacuum Switch Type 1607. Solenoid switch controlled through relay by vacum switch operated by accelerator pedal with ignition 'on'. Accelerator pedal and hand throttle must be in fully 'off' position prior to starter operation.
See Article in Electrical Equipment Section.

NOTE—Solenoid switch should be used in servicing earlier models. Past switches not adaptable for use on 1937 models.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—1.9 volts max. **Open**—1.0-1.2 volts.
Contact Gap—.025-.045". **Air Gap**—.010-.013".

Vacuum Switch

Contacts Close—10-14° clockwise from latch position.

Unlatch Action—3.4-4.6" of HG. approximately 30° from latch position.

GENERATOR:—Models 918-B, G. Armature No. 1866410. New type 'split-field' generator (one straight-shunt coil, one third-brush shunt coil—see wiring diagram) with fixed third brush and vibrating voltage regulator control.

NOTE—Field coils changed in production.
See Article in Electrical Equipment Section.

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data

Maximum Charging Rate—As given in table below. Reached at car speed of 40.8 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

NOTE—Do not operate generator on open-circuit.

Performance Data

	Amperes	Volts	R.P.M.
Cold	27-31	8.0	4000
Hot	25-28	8.0	4200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third).

Field Current—Shunt (1.44-1.56 amps. at 6 volts), third brush (.89-.94 amperes at 6 volts).

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot capscrews and clamp screw.

Belt Adjustment:—Loosen clamp screw and pivot screws, pull generator away from engine until belt deflection midway between generator and fan pulleys is ½" with light presure, tighten clamp screws and pivot screws.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5807. Mounted on engine side of dash. Consists of Cutout Relay and vibrating type Voltage Regulator.
See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.25 volts, 8.1 M.P.H.

Cuts Out—0-3.0 amperes discharge at 6.3 volts.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.

NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open circuit.

Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, cross-beam type with special non-interchangeable lenses. Foot selector switch provides for switching from upper beams to city beam (upper filaments, both lamps) with light switch in 3rd position and asymetrical passing beam (lower filament left headlamp, upper filament right headlamp) with switch in 4th position or 'country driving' position.

Headlamp Adjustment—Headlamps must be adjusted with lenses in place (beam with lenses removed is approximately 4° to right), upper beams lighted, car unloaded. Aim left hand headlamp (side movement controlled by screw under hood, up and down movement by screw in hole in bottom of lamp body) so that upper edge of hot spot is on horizontal line (at lamp center height) and left edge just touches vertical car center line (not lamp center line). Aim right hand headlamp for same beam height but center hot spot on lamp vertical center line (hot spot right cut-off approximately 8" to right of vertical line).

Headlamp Beam Indicator—Located at top of speedometer dial. Lighted whenever upper beams are in use.

Switches

Lighting—Delco-Remy Model 480-W, R (Export).
Foot Selector—Delco-Remy Model 471-T.
Instrument Lamp—Delco-Remy Model 1404.
Stop Lamp—Delco-Remy Model 476-S. Hydraulic type mounted in brake distributor.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Fender, Instrument, Map	1½	55
Stop and Tail	21-3	1154
License (Coupe incl'd)	3	63
Dome	6	81

THERMOSTATIC RELAY:—Mod. No. 1865577. Mounted on lighting switch and may be replaced separately. Contacts close within 1 minute at 38 amperes (70° F.). .Remain closed at 25 amperes (70° F.). Non-adjustable.

Clock Fuse—2 ampere on clock.

HORNS:—Klaxon Model K-33-S. Type 2051 (low note—right side), Type 2052 (high note—left side). Vibrator type, blended tone twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2051 Low Note	11-13	.042-.046"
2052 High Note	10-12	.032-.036"

Horn Relay:—Mod. 271-A. Points close at 2.7-4.0 volts. **Contact Gap**—.015-.030". **Air Gap**—.010-.025".

NOTE:—Marvel equipped cars. Special Distributor, Starter Vacuum Switch & Automatic Choke used.

SERIAL NUMBER:—First number 2999497. On right frame siderail at rear of right front wheel.

COMPRESSION:—Ratio—5.75-1 std. cast-iron head.
Pressure—100-106 lbs. at 150 R.P.M. Check pressure with engine warm, spark plugs removed, and starter cranking engine.

IGNITION:—Coil Model 536-H. Mounted on right side of block near distributor.
Coil Draw—2½ amperes idling, 4½ stopped.
Ignition Switch:—Oakes-Hershey type co-incidental Ignition switch and steering post lock.
Ignition Lock—Briggs & Stratton. #45922 (cylinder), #45900 (case). **Key Series**—8000-9499.
Distributor Models 663-Z, ZX. Single breaker, 8 lobe cam, full automatic advance type with integral vacuum spark control & Octane Selector adjustm't.
Breaker Gap—.015". Limits .0125-.0175".
Cam Angle or Dwell—31° (closed), 14° (open).
Breaker Arm Spring Tension—19-23 ounces.
Condenser—Part No. 1865972. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	2.0	500
6.0	500	12.0	1000
8.0	825 (633-Z)	16.0	1650
10.0	1140 (663-ZX)	20.0	2250

Vacuum Spark Control—Vacuum unit mounted on side of distributor, linked directly to breaker plate. Provides additional advance at speeds greater than 18 M.P.H. except when engine is acelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

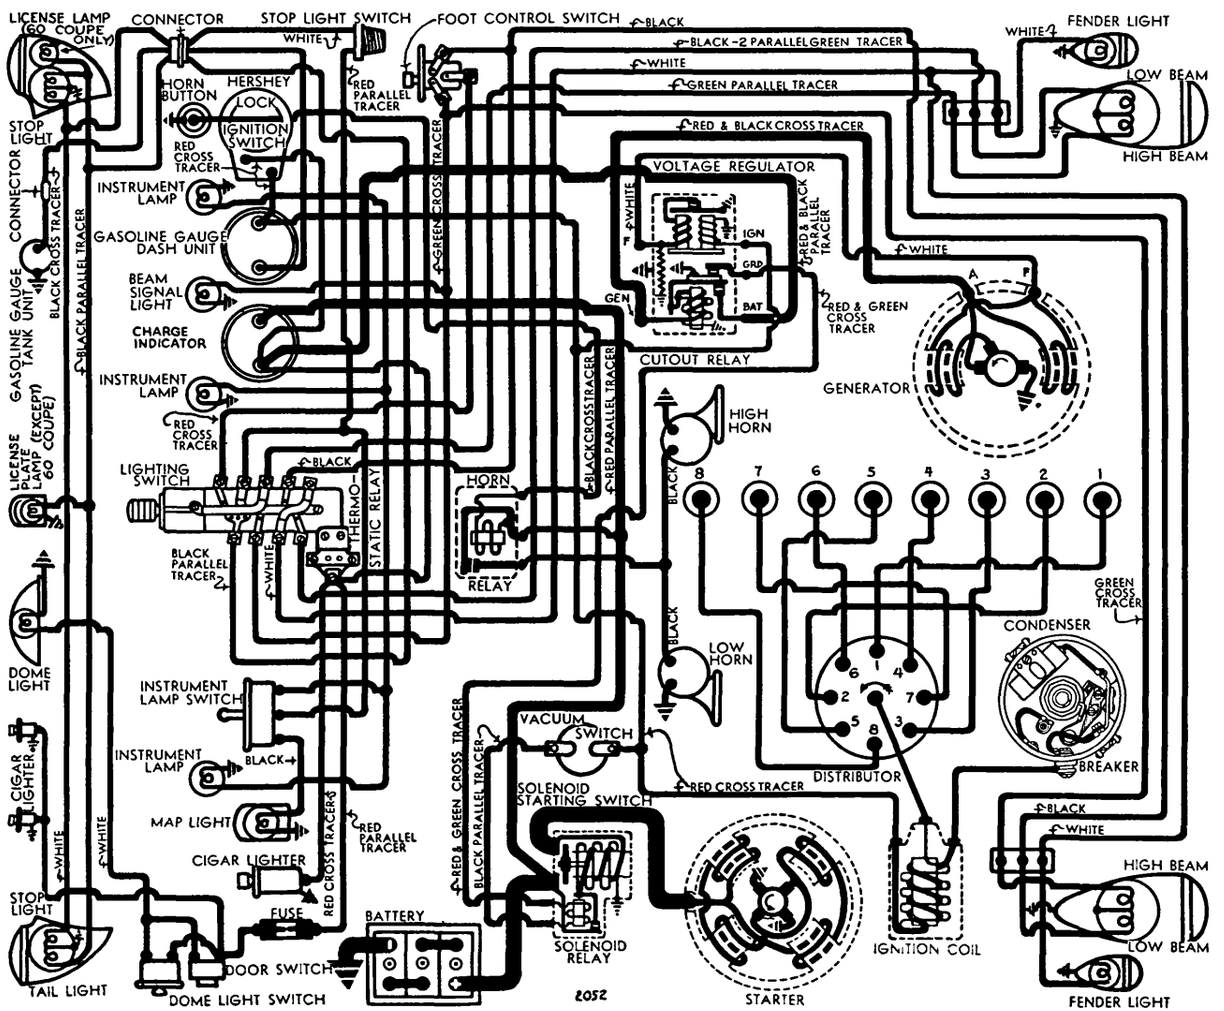
Engine Degrees	Vacuum (" of HG.)
Start	5-7"
10-13°	10-13"

Octane Selector—Consists of adjustment at distributor providing 10° advance or retard from center '0' position. See Ignition Timing (below) for setting.
Distributor Removal:—Mounted on right side of crankcase. To remove, take out two mounting screws in mounting flange, disconnect vacuum line.

IGNITION TIMING:—Initial setting for fuel of 75 Octane rating. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All Engines	10° BTDC.	.0442" BTDC.

To Set Timing (with Synchroscope)—Recommended by manufacturer. Insert one Synchroscope lead in #1 terminal in distributor cap, clip second lead to #1 spark plug cable. Direct Synchroscope light at flywheel through timing inspection hole in right front face of flywheel housing above starter. Idle engine at speed not greater than 400 R.P.M. Note position of flywheel timing mark 'ADV/'. If 'ADV' line does not coincide with line on housing, loosen two distributor hold-down screws, rotate distributor slowly until lines coincide, tighten hold-down screws. Check position of Octane Selector pointer. If reference line on pointer does not coincide with center line of scale, loosen pointer lockscrew, shift pointer, tighten lockscrew.
NOTE—'ADV/' timing mark filled with paint.
To Set Timing (Without Synchroscope)—No means provided to crank engine (engage gears and roll car to turn engine over). With #1 piston on compression, turn engine over until #3 exhaust valve (fifth valve from front of engine) begins to open, stop when flywheel mark 'ADV/' lines up with mark on flywheel housing (timing inspection hole in right front face of housing above starter). Use timing light or form spark gap between distributor high tension lead and housing to check contact opening. Loosen two distributor hold-down screws, rotate distributor until contacts begin to open, tighten hold-down screws. Check position of Octane Selector pointer. If reference line on pointer does not line up with center line on scale, loosen pointer lockscrew, shift pointer, tighten lockscrew.



Timing (Motor Gauge)—Weidenhoff #113 Adapter, Rod #38 (60), #31 (80, 90).

Octane Selector—Should be adjusted for final ignition setting dependent upon Octane Rating of fuel used by car owner. Initial setting (above) correct for fuel of 75 Octane Rating. To adjust, loosen two distributor hold-down screws, rotate distributor clockwise so that pointer moves toward 'Low' end of scale for fuel of lower rating, or counter-clockwise (toward 'High' end of scale) for higher rating until a slight 'ping' is noticeable at speeds between 10 and 15 M.P.H. but not at higher speeds when car is accelerated with wide open throttle.

Firing Order—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—AC. Type H-9. 18MM. Metric type.
NOTE—H-9 discontinued by AC. Use No. 86.
Spark Plug Gaps—Set at .020-.025".
NOTE—In extreme cases gaps may be set at .030" if necessary to secure good idling performance. This may result in high speed missing after some service.
Radio Suppressors—See Model 40 (1937) page.

CARBURETION:—Carburetors—Stromberg Model AA-2 or Marvel Mod. BD-1S (No. 10-1751 std. air cleaner), (No. 10-1752 heavy duty air cleaner). 1¼" dual downdraft types. Stromberg aircraft type.
See Articles in Carburetion Section on each model.
Idle Adjustment—With engine warm, choke valve wide open and engine idling at hot or slow idling speed, adjust throttle stopscrew so that engine idles at 7-8 M.P.H. Turn idle adjusting screw for each barrel (in succession) in until engine begins to lag or miss, then turn screws out until engine begins to

roll, finally turn screws in slowly until engine fires smoothly. Final setting should be 1¼ turns (Stromberg), ⅝-⅞ turns (Marvel) of screw from closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump (Stromberg)—Two holes for pump engagement. Set for maximum stroke unless too rich a charge occurs on accelerating

(Marvel)—Four holes for pump link engagement.

#1—Minimum stroke—summer driving.
#2—Interm stroke—warm temperatures
#3—Normal stroke—standard setting.
#4—Maximum stroke—winter driving

Fast Idle:—Buick Cold Idle Control.

See Article in Carburetion Equipment Section.

Accelerator Linkage Adjustment:—Linkage adjustment must be maintained to provide correct throttle opening for starting With carburetor set for 7-8 M P H idling speed and throttle button pushed in, rotate fast idle cam to extreme left against stop (fast idle position), adjust vacuum switch rod length so that switch lever reference line lines up with 'Fast Idle' line on housing Check accelerator pedal Throttle should be wide open with pedal down against pedal stop (floor mat). Adjust by turning trunnion on accelerator rod Accelerator rod spring length should be 9 15/16".

Automatic Choke D-R Models 490-A, 498-H. See Article in Carburetion Equipment Section

Fuel Volatility Selector—Change setting as required to provide correct choke action with fuel used Standard setting second notch from 'Low' side of scale Movement toward 'High' end compensates for too rich mixture, and toward 'Low' end for too lean a mixture

Air Cleaner:—AC #1526989 oil-wetted type standard #1528114 oil-bath optional

NOTE—If heavy duty oil-bath type cleaner installed, main metering jet (Stromberg), or power jet and metering pin jet (Marvel) must be changed See Jet Specification Tables for each carburetor in Carburetion Section

Fuel Pump:—AC Type AB #1521838 (1st 10,000 cars) combination fuel-and-vacuum pump. Type AK #1523195 (after 1st 10,000 cars) fuel pump

See Article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric #1515321 (dash unit), #1515444 (tank unit—60), #1515440 (80, 90)

See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check—#2 or #7 exhaust valve should be 155" open (actual opening is measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' at indicator in inspection hole in right front face of flywheel housing above starter

Motor Gauge—Weidenhoff Adapter #113, Rod #38 (60), #31 (80-90)

Tappet Clearance:— 015" all valves engine hot

Valve Spring Pressure:—42-52 lbs (valve closed), 112-124 lbs (valve open), total for both springs

LUBRICATION:—Crankcase Capacity—9 qts. (dry), 8 qts (refill).

Normal Oil Pressure—45 lbs. at normal speeds.

BATTERY:—Delco, Type 15-G. 6 volt, 15 plate, 114 ampere hour capacity (20 hour rate).

Starting Capacity—137 amperes for 20 minutes.

Zero Capacity—300 amperes for 4 5 minutes

Grounded Terminal—Negative (—) terminal.

Location—Under right front seat

STARTER:—Model 727-W, 729-B (RHD-60). Armature No. 820158.

Drive—Solenoid pinion shift & overrunning clutch.

Cranking Engine—115 R P M, 175 amps. at 5 volts

Rotation—Counter-clockwise at commutator end

Brush Spring Tension—24-28 ounces

Performance Data

Torque	R P M.	Volts	Amperes
0 ft. lbs.	5500	5	65
16 "	Lock	3	600

Removal:—Mounted on right front face of flywheel housing To remove, take out capscrews

Starting Switch:—Solenoid Switch 1542 (727-W), 1545 (729-B), Vacuum Switch 1594, 1607 Solenoid switch controlled through relay by vacuum switch operated by accelerator pedal with ignition 'on' Accelerator pedal and hand throttle must be in fully 'off' position prior to starter operation

See Article in Electrical Equipment Section.

Solenoid Switch Type 1542, 1545

Closes against 70 lb pull with ½" air gap drawing 65-71 amperes at 5 volts Holds switch closed with draw of 12-14 amperes (hold-in coil only)

Solenoid Relay

Contacts Close—1 9 volts max. **Open**—1 0-1 2 volts

Contact Gap— 025- 045". **Air Gap**— 010- 013".

Vacuum Switch

Contacts Close—10-14° counter- clockwise (1594), clockwise (1607), from latch position

Unlatch Action—3 4-4 6" of HG. approximately 30° from latch position

GENERATOR:—Model 918-A, F. Armature No. 1866410. New type 'Split-field' generator (one straight-shunt coil, one third-brush coil—see wiring diagram) with fixed third brush and vibrating voltage regulator control

NOTE—Field coils changed in production

See **Article in Electrical Equipment Section.**

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator See Regulator data

Maximum Charging Rate—As given in table below Reached at car speed of 46 5 (60), 44 5 (80), 41 9 (90) M P H (cold) To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action

NOTE—Do not operate generator on open-circuit

Performance Data

	Amperes	Volts	R P M
Cold	27-31	8 0	4000
Hot	25-28	8 0	4200

Rotation—Counter-clockwise at commutator end

Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third)

Field Current—Shunt (1 44-1 56 amperes at 6 volts), third brush (89- 94 amperes at 6 volts)

Removal:—Generator pivot mounted at left front of engine To remove, take out mounting screws

Belt Adjustment:—Loosen clamp screw and pivot screws, pull generator away from engine until belt deflection midway between generator and fan pulleys is ½" with light pressure

CONTROL UNIT (VOLTAGE REGULATOR:—Model 5807. Mounted on engine side of dash Consists of Cutout Relay and vibrating type Voltage Regulator

See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6 5-7.25 volts, 9 1(60), 8 8(80), 8 2(90) MPH

Cuts Out—0-3 0 amperes discharge at 6 3 volts

Contact Gap— 018- 025"

Air Gap—.018- 022" with contacts closed

Voltage Regulator

Setting—7 55-7 85 volts at 70°F., 7 45-7 55 volts at 150°F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground Operate generator at 2800-3000 R P M, adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above

NOTE—Regulator cover must be in place when tests are made Do not operate generator on open circuit

Contact Gap— 015- 025"

Contact Spring Tension—2 7-3 5 ounces

Air Gap— 060- 070" between armature and center of core with armature down and fibre bumper touching stop, 008- 013" between fibre bumper and stop with armature up

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, cross-beam type with special non-interchangeable lenses Foot selector switch provides for switching from upper beams to city beam (upper filaments, both lamps) with light switch in 3rd position and asymetrical passing beam (lower filament left headlamp, upper filament right headlamp) with switch in 4th position or 'country driving' position

Headlamp Adjustment—Headlamps must be adjusted with lenses in place (beam with lenses removed is approximately 4° to right) and upper beams lighted, car unloaded Aim left hand headlamp (side movement controlled by screw under hood, up and down movement by screw in hole in bottom of lamp body) so that upper edge of hot spot is on horizontal line (at lamp center height) and left edge just touches vertical car center line (not lamp center line) Aim right hand headlamp for same beam height but center hot spot on lamp vertical center line (hot spot right cut-off approximately 8" to right of vertical line)

Headlamp Beam Indicator—Located at top of speedometer dial Lighted whenever upper beams are in use

Switches

Lighting—Delco-Remy Model 480-W, R (Export)

Foot Selector—Delco-Remy Model 471-T

Instrument Lamp—Delco-Remy Model 1404

Stop Lamp—Delco-Remy Model 476-S Mounted in brake distributor

Bulb Specifications

Position	Candlepower	Mazda No
Headlamps	32-21	2320
Fender, Instrument, Map	1½	55
Stop and Tail	21-3	1154
License (Coupe included)	3	63
Dome	6	81

THERMOSTATIC RELAY:—Model No. 1865577. Mounted on lighting switch and may be replaced separately Contacts close within 1 minute at 38 amperes (70° F) Remain closed at 25 amperes (70° F). Non-adjustable

FUSES:—Dome Light & Rear Cigar Lighter (80, 90). 30 ampere in connector back of instrument panel

Electric Clock. Two ampere on clock

HORNS:—Klaxon Model K-33-S. Type 2051 (low note—right side), Type 2052 (high note—left side) Vibrator type, blended tone twin horns operated by horn relay

Horn Type	Current at 6 volts	Air Gap
2051 Low Note	11-13	042- 046"
2052 High Note	10-12	032- 036"

Horn Relay:—Model 271-A Points close at 2 7-4.0 v.

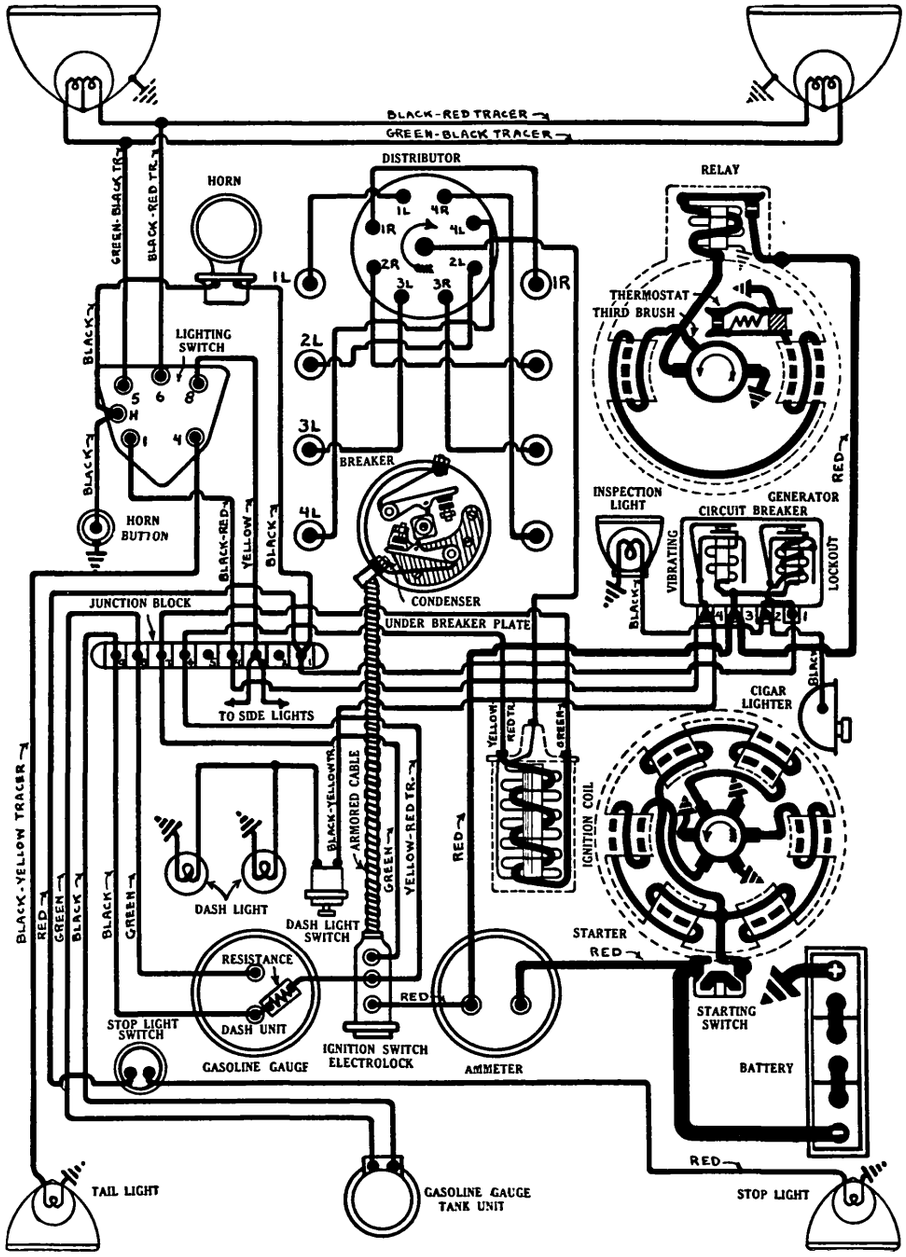
Contact Gap—.015-.030". **Air Gap**—.010-.025".

CADILLAC

SERIES 341 (1927) SERIAL NOS. 3-00001 UP
SERIES 341-A (1928)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXRV-15-2G, 6 volt. Starting capacity is 137 amperes for 20 minutes. Lighting cepacity is 5 amperes for 26 hours. The positive (+) terminal is grounded. Battery is mounted on right side of car on right frame member under the dust shield. This battery is not interchangeable with battery used on Series 314 Cadillac because filler plugs are located on opposite side of cap.

IGNITION:—Coil Model 2195. Distributor Model 4032. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts whenever necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 38° (engine) or 20° distributor. Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20° (engine) reached at 3000 R.P.M. (engine). Breaker arm spring tension is 16-20 ounces. There are two sets of breaker contacts set at an angle of 135° and operating on a four lobed cam. Contacts open alternately at intervals of 45° corresponding to 90° of crankshaft rotation, which is the correct firing interval for the Cadillac engine. This must be accurately set. (See Timing.)



Mounting:—Ignition coil is mounted on side of distributor mounting. Distributor is mounted at front of engine between the cylinder banks. The ignition system is fitted with an Electrolock switch on the dash which must be removed with the distributor when the distributor is taken off the car. To remove the distributor, disconnect manual advance rod and remove head with high tension cables attached. Then remove hold down screw and lift the distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Synchronization of Contacts. To synchronize contacts, use special Delco-Remy tool, Part No. 822572, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 90 degrees to firing position of the next cylinder when the flywheel mark 'IG/A-2/6' will be opposite the indicator. Then loosen the lock screws on the movable sub-plate and turn the eccentric adjusting screw until the second set of contacts (mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches a position 7/8 inch on the flywheel before top dead center with the spark lever fully advanced. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is 7/8 inch before top dead center. To set timing, crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Then continue to crank engine until flywheel mark 'IG/A-1-5' is opposite the indicator on the case. If contacts are not beginning to separate, loosen the taper screw in the center of the cam and rotate cam until one set of contacts open. The other set will be open but just closing. Tighten the screw. The second set of contacts open 45 degrees (distributor) after this point with the flywheel mark IG/A-2-6' opposite the indicator. These directions apply only to standard compression engines. For high compression engines see following paragraph.

Special Directions for Timing High Compression Engines:—On Cadillac engine with high compression heads (with letters 'H.C' cast in head) contacts separate with the piston 1/2 inch (on the flywheel) before top dead center. The engine should be cranked over until a point approximately half way between the 'IG/A-1-5' mark on the flywheel and the top dead center mark is opposite the indicator. Contacts

CADILLAC

SERIES 341 (1927) SERIAL NOS. 3-00001 UP
SERIES 341-A (1928)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

should separate at this point. On engines with high compression heads the spark plug gap must be set at .026 inch.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. The right hand cylinder bank is right viewed from the driver's seat. Number one cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Spark plug gaps on standard compression engines are .032 inch. Gaps on high compression engines must be set at .026 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 6 17/64 inches (over all); valve lift, 23/64 inch; spring pressure, 133-139 pounds compressed to 2 5/32 inches; tappet clearance, .004 inch (cold). Inlet valves open 11° 2′ before top dead center and close 58° 38′ after lower dead center with cold engine.

EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 6¼ inches (over all); valve lift, 23/64 inch; spring pressure, 133-139 pounds compressed to 2 5/32 inches; tappet clearance, .006 inch (cold). Exhaust valves open 38° 12′ before lower dead center and close 7° 38′ after top dead center with cold engine. Valve stem guides are removable. Oversize valve stems are not made.

To Set Valve Timing. Camshaft is driven from the crankshaft by a silent chain at the forward end of the engine. No chain adjustment is provided. To set valve timing, turn the camshaft and crankshaft until the tooth on each sprocket which is marked by an '0' are directly opposite and in line with a straightedge laid across the two shaft centers. Assemble the timing chain.

STARTER:—Model 382. Starter is connected to the engine through a mechanical pinion shift interconnected with the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
4.5 lb. ft.	750	5	200
19 "	Lock	3	600

Mounting: Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting capscrews. Then pull starter to rear and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165°F. inserting a resistance in the field circuit and reducing the output approximately 2.5 amperes. Generator output is adjusted by shifting third brush. Remove commutator cover band and shift third brush mounting plate in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction washers. The maximum charging rate of 18-20 amperes at 8.6 volts is reached at 1400-1600 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test 75°F.			Hot Test 175°F.		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.2-8.62	1450	10-12	7.3-7.7	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Generator brush spring tension is 16-20 ounces.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the accessory drive chain housing. The water pump is mounted on the front of the housing. To remove generator, disconnect lead and take off right hand mud pan. Then remove nuts on two upper flange mounting bolts and take out lower mounting cap screw. Pull generator to the rear to disengage drive coupling. Generator can then be dropped down and removed from underneath.

Chain Adjustment. To take up accessory drive chain, loosen the two upper generator mounting bolts and the lower mounting cap screw and also the pivot screw on the front of the chain housing. Pull generator away from the engine as far as possible. Back off approximately ⅛ inch to provide necessary play and tighten mounting bolts and pivot screw. With the correct adjustment the chain should run noiselessly.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at 8-10 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

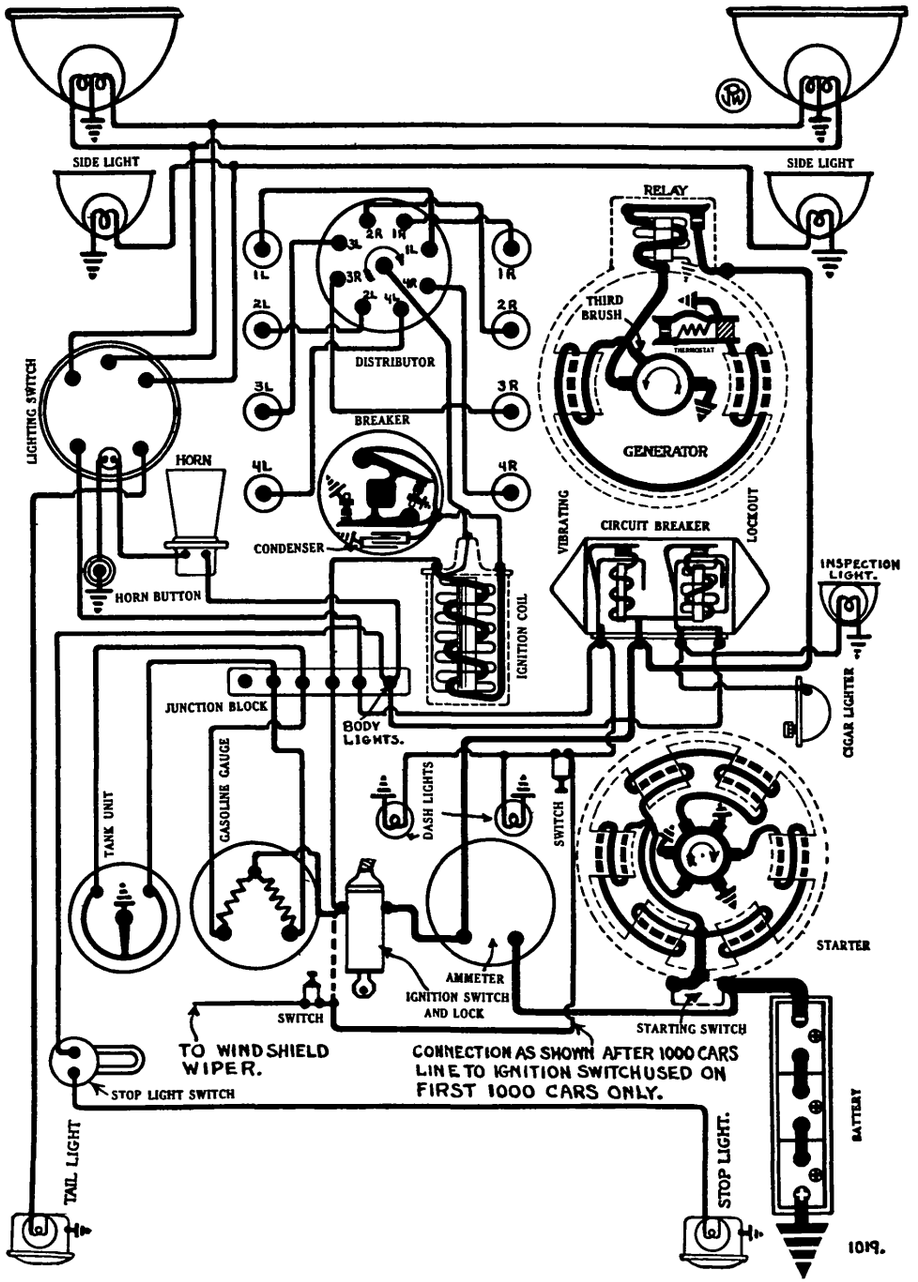
LIGHTING:—Switch Model 1313 is mounted at lower end of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Inspection lamp is 6-8 volt, 21 cp. S.C. Side, dash, tail, tonneau, dome, corner and step lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5759. A combination vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. It begins to operate at 25-30 amperes limiting the current flow to 10-15 amperes. The lockout circuit breaker protects the horn, stop lamp, inspection lamp, cigar lighter and body lamps. It opens the circuit when the current reaches 25-30 amperes and operate with a discharge current of less than 1 ampere.

CADILLAC

SERIES 341-B (1929), BEGINNING ENGINE NO. 322501
PRODUCTION STARTED AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide. Type 3-LXRV-15-2G. 6 volt. Rated capacity is 130 ampere hours. Starting capacity is 137 amperes for 20 minutes (20 minute rate). Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. The positive (+) terminal is grounded. Battery is mounted on right frame member under dust shield. The battery is not interchangeable with the Series 314 battery because the filler plugs are located on the opposite side of the cap.



IGNITION:—Coil Model 2195. Distributor Models 4042, 4023, 4041. Breaker contacts separate .022-.027 inch. Resurface contacts whenever necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 38 degrees (engine). Automatic advance begins at approximately 1100 R.P.M. Maximum automatic advance is 21 degrees (engine). Breaker arm spring tension is 16-20 ounces. There are two sets of breaker contacts set at an angle of 135 degrees and operating on a four-lobed cam. Contacts open alternately at intervals of 45 degrees, corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Cadillac engine and must be accurately set. (See Timing.) Ignition switch is a Delco-Remy Dual-lock, Model 426-A or E.

Mounting:—Ignition coil is mounted on side of distributor support. Distributor is mounted at front of engine between cylinder banks. A Blossom Co-incidental ignition switch is used. To remove the distributor, disconnect the primary feed wire, manual advance rod and remove the distributor cap with the high tension cables attached. Then remove the hold-down screw and lift the distributor from place. (NOTE:—The lower end of the distributor shaft has an offset tongue which fits a groove in the top of the driving shaft. Do not try to force the distributor into place as the tongue may be turned 180 degrees from its correct position.)

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or 1000 miles.

Timing:—Synchronization of Contacts. To synchronize contacts, use special Delco-Remy tool, Part No. 822572, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 90 degrees to firing position of the next cylinder when the flywheel mark 'IG/A-2/6' will be opposite the indicator. Then lock screws on movable sub-plate and turn eccentric adjusting screw until the second set of contacts (which are mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches a position ⅞ inch on the flywheel before top dead center with the spark lever fully advanced. With piston No. 1 in firing position the flywheel mark "IG/A-1-5" will be opposite the indicator on the flywheel case. This mark is ⅞ inch before top dead center. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Then continue to crank engine until flywheel mark "IG/A-1-5" is opposite the indicator on the case. If contacts are not beginning to separate, loosen the taper screw in the center of the cam and rotate cam until one set of contacts open. The other set will be open but just closing. Tighten the screw. The second set of contacts open 45 degrees (distributor) after this point with the flywheel mark "IG/A-2-6" opposite the indicator. Beginning with Series 341-B, engine unit 322501, high compression heads are standard equipment. The flywheel setting remains

CADILLAC

SERIES 341-B (1929), BEGINNING ENGINE NO. 322501
PRODUCTION STARTED AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

the same as for former low compression heads (7/8 of an inch before top dead center). The reason for this same setting is that the new distributor 4041 has different advance characteristics which take care of the high compression heads.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. The right hand cylinder bank is right viewed from the driver's seat. Number one cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. All engines are equipped with A.C. type Y special high compression or semi-aircraft type plugs. Gaps are set at .025-.028 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1½ inch; stem diameter, ⅜ inch; stem length, 6 17/64 inches. Valve lift, 23/64 inch. Spring pressure 156-164 pounds compressed to 2 5/32 inch. Tappet clearance is .004 inch (cold). Inlet valves open 9½ degrees before top dead center and close 58½ degrees after lower dead center. Width of valve seat on cylinder block 1/16 inch.

EXHAUST VALVES:—Head diameter, 1½ inch; stem diameter, ⅜ inch; stem length, 6¼ inches. Valve lift, 23/64 inch. Spring pressure 156-164 pounds compressed to 2 5/32 inch. Tappet clearance is .006 inch (cold). Exhaust valves open 46 degrees before lower dead center and close 5 degrees after top dead center. Width of valve seat on cylinder block 5/64 inch. All valve stem guides are removable. No oversize valve stems are supplied.

To Set Valve Timing. Camshaft is driven by a silent chain at the forward end of the engine. No chain adjustment is provided. To set valve timing, turn the camshaft and crankshaft until the marked tooth on each sprocket (one tooth is marked by an '0') are directly opposite and in line with a straightedge laid across the two shaft centers. Assemble the timing chain.

STARTER:—Model 382. Starter is connected to the engine through a mechanical pinion shift interconnected with the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
4.5 lb. ft.	750	5	200
19.0 "	Lock	3	600

Mounting:—Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting capscrews. Then pull starter to rear and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165 degrees F. inserting a resistance in the field circuit and reducing the output approximately 2.5 amperes. Generator output is adjusted by shifting third brush. Remove commutator cover band and shift third brush mounting plate in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction washers. The maximum charging rate of 18-20 amperes at 8.6 volts is reached at 1400-1600 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test 75° F.			Hot Test 175° F.		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.2-8.62	1450	10-12	7.3-7.7	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Generator brush spring tension is 16-20 ounces.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the accessory drive chain housing. To remove generator, disconnect lead and take off right hand mud pan. Then remove nuts on two upper flange mounting bolts and take out lower mounting cap screw. Then pull generator to the rear slightly to disengage drive coupling. Generator can then be dropped and removed from underneath.

Chain Adjustment. Accessory drive chain is adjusted by shifting the generator. To take up chain, loosen the two upper generator mounting bolts and the lower mounting cap screw. Loosen the pivot screw on the front of the housing also. Pull the generator away from the engine as far as possible and then back off ⅛ inch to provide necessary play. Tighten the mounting bolts and screws. With proper adjustment the chain should run noiselessly.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at 8-10 M.P.H. when generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch Model 486-D. Lighting switch is mounted at the lower end of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact). Stop light is 6-8 volt, 15 cp. S.C. Inspection light is 6-8 volt, 21 cp. S.C. Side, dash, tail, tonneau, dome, corner and step lights are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5759. A combination vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. It begins to operate at 35-40 amperes limiting the current flow to 5-22 amperes. The lockout circuit breaker protects the horn, stop light, inspection light, cigar lighter and body lights. It opens the circuit when the current reaches 25-30 amperes and operates with a discharge current of less than 1 ampere.

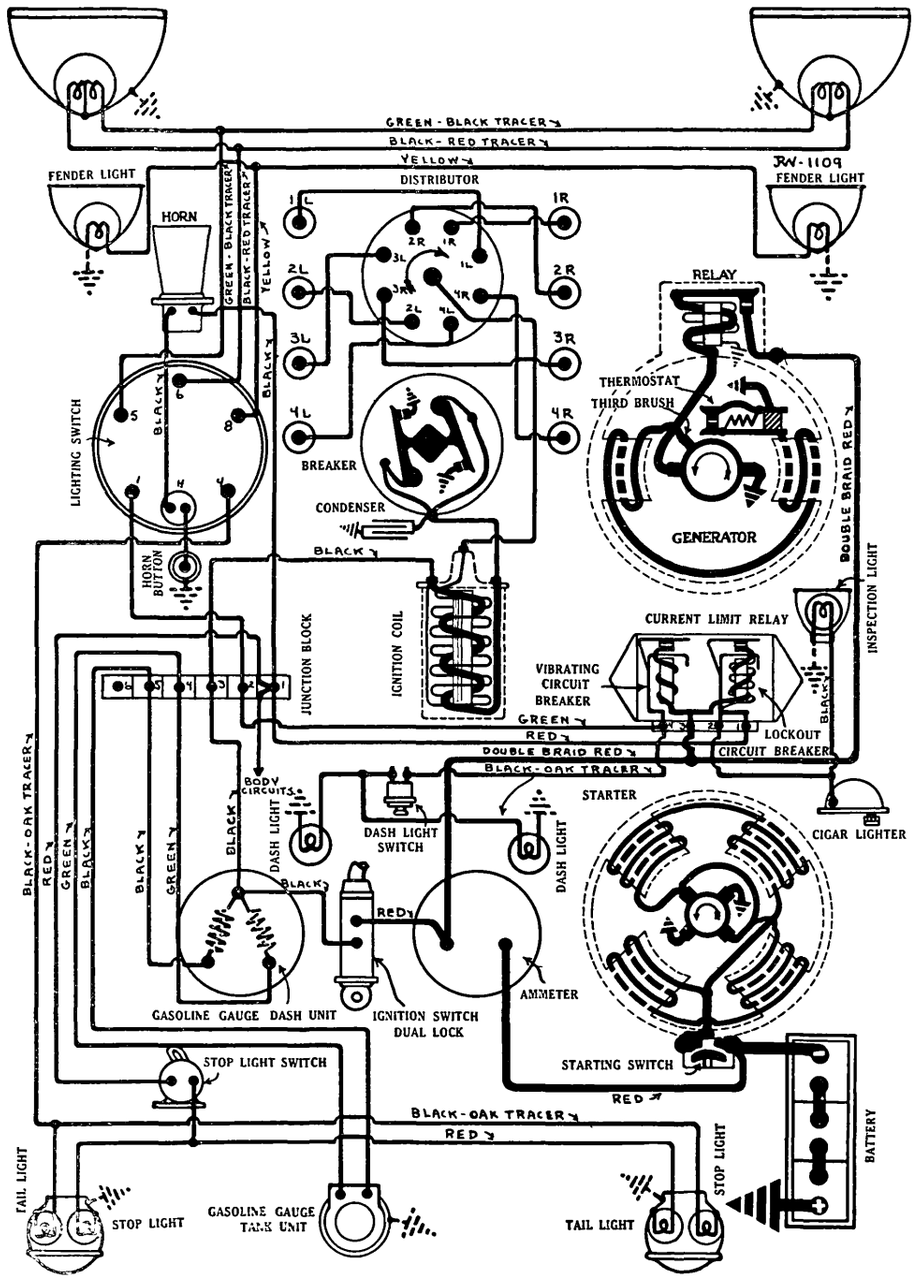
CADILLAC

SERIES 353 (1930), SERIAL NUMBERS 500,001 UP
PRODUCTION STARTED AUGUST 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXV-15-2G, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 137 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted on the right frame member under the dust shield.

IGNITION:—Coil Model 530-B. Coil is mounted on the radiator brace rods directly over the distributor. Ignition current is 2.5 amperes with engine running and 2 amperes with engine stopped.

Distributor Models 4050, 4056, 4055. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Tighten the lock nut. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 1000 R.P.M. (engine). Maximum automatic advance is 30 degrees reached at 3600 R.P.M. Breaker has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct performance. See Timing. Ignition switch is Delco-Remy Dual Lock Model 426-L, 426-M or 426-P.



Mounting:—Distributor is mounted at the front of the engine between the cylinder blocks. To remove distributor, disconnect primary lead and spark control rod and remove distributor head with cables intact. Then take out two hold-down screws and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 1000 miles of operation. At the same time put a drop of oil on the breaker arm pivot pins and in the hole drilled in the top of the breaker cam which oils the path of the breaker arm rubbing blocks on the face of the cam.

Timing:—Synchronization of Contacts. The interval between the opening of the two sets of contacts must be exactly 45 degrees (distributor). This can be set by using special Delco-Remy Tool, Part No. 822572, and following directions on Distributors in Equipment section. The breakers may be synchronized without use of the tool after the distributor has been timed to the engine by cranking the engine over 90 degrees from the firing position of piston No. 1 when the flywheel mark 'IG/A-2-6' will be opposite the indicator. If the second set of contacts does not open at this point, the lock screws on the breaker arm mounting plate should be loosened and the eccentric adjusting screw turned until the contacts begin to open. Then tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 2¼ inches (on the flywheel) before top dead center with the spark control lever in the fully advanced position. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is 2½ inches before the top dead center position of the piston. To set timing, crank engine over until piston No. 1 reaches firing position. Fully advance spark control lever. Then loosen taper screw in center of breaker cam and rotate cam until the set of contacts mounted on the stationary breaker plate begin to open. Tighten the screw and check to see that segment directly opposite rotor is connected to the spark plug in cylinder No. 1. The second set of contacts open exactly 45 degrees after this point.

NOTE:—Distributor Model 4050 as used on first 1734 cars has the condenser mounted inside the distributor housing. After Engine Unit No. 5-1734

CADILLAC

SERIES 353 (1930), SERIAL NUMBERS 500,001 UP
PRODUCTION STARTED AUGUST 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

the condenser is mounted on the outside of the case. Distributor Model 4055 is used beginning with Serial No. 3146.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. Cylinder banks are right and left as viewed from the driver's seat. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.785-1.791 inch. Stem diameter, ⅜ inch. Stem length, 6⅛ inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds compressed to 2½ inches (valve closed). Tappet clearance, .004 inch (cold). Inlet valves open 11 degrees before top dead center and close 59 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.696-1.702 inches. Stem diameter, ⅜ inch. Stem length, 6 7/64 inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds compressed to 2½ inches (valve closed). Tappet clearance, .006 inch (cold). Exhaust valves open 48 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing. Camshaft is driven by silent chain at the forward end of the engine. No provision is made for chain adjustment. To set valve timing, turn the camshaft and crankshaft so that the marked teeth on the sprockets (each sprocket has one tooth marked by an '0') are directly opposite each other and in line with a straightedge laid across the two shaft centers. Then assemble the chain.

STARTER:—Model 728-D. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch and an overrunning clutch. The direction of rotation is counter-clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starting pedal linkage and take out three flange mounting cap screws. Then pull starter to rear to clear drive and lift from place.

Oiling:—Starter bearings are oilless. They require no attention. Every six months repack reduction gear case with graphite grease.

GENERATOR:—Model 927-D. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at approximately 165°F. cutting the resistance in series with the field and reducing the output 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw in the end plate. Then shift the third brush mounting plate by hand. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum standard charging rate is 10-12 amperes (hot) at 7.3-7.7 volts reached at 1600 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.2-8.6	1400	10-12	7.3-7.7	1600

Brush spring tension is 20-28 ounces. Generator field current is 1.8-2.3 amperes at 6 volts.

Mounting:—Generator is flange mounted on the rear of the accessory chain case at the right of the engine. The water pump is mounted on the forward side of the chain case. To remove generator, disconnect lead and drop mud pan at right of engine. Then remove nuts on two upper mounting bolts and take out lower mounting screw. Slide generator to the rear to disengage coupling. Generator can then be taken out from underneath.

Drive Chain Adjustment:—To adjust generator and water pump drive chain, loosen two pivot screws and nuts on flange mounting. Then force water pump away from engine until chain is tight. Then back off approximately ⅛ inch and tighten mounting screws and nuts.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at 420 R.P.M. or 8-10 miles per hour when the generator voltage reaches 7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.021 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch Model 486-H. Lighting switch is mounted at lower end of the steering column. Double filament headlights using the second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights or parking lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome and corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—Model 5759. This device consists of a vibrating and lockout circuit breaker mounted on the dash. The vibrating unit protects the lighting circuits. It starts to operate when the current reaches 35-40 amperes and continues limiting the current to 5-22 amperes. The lockout circuit breaker protects the horn, stop light, inspection light, cigar lighter and body light circuits. It begins to operate when the current reaches 25-30 amperes and continues limiting the current to less than 1 ampere. Contact gap is .012-.030 inch. Air gap between armature and coil core is .015-.025 inch. Plunger spring tension is 5 ounces.

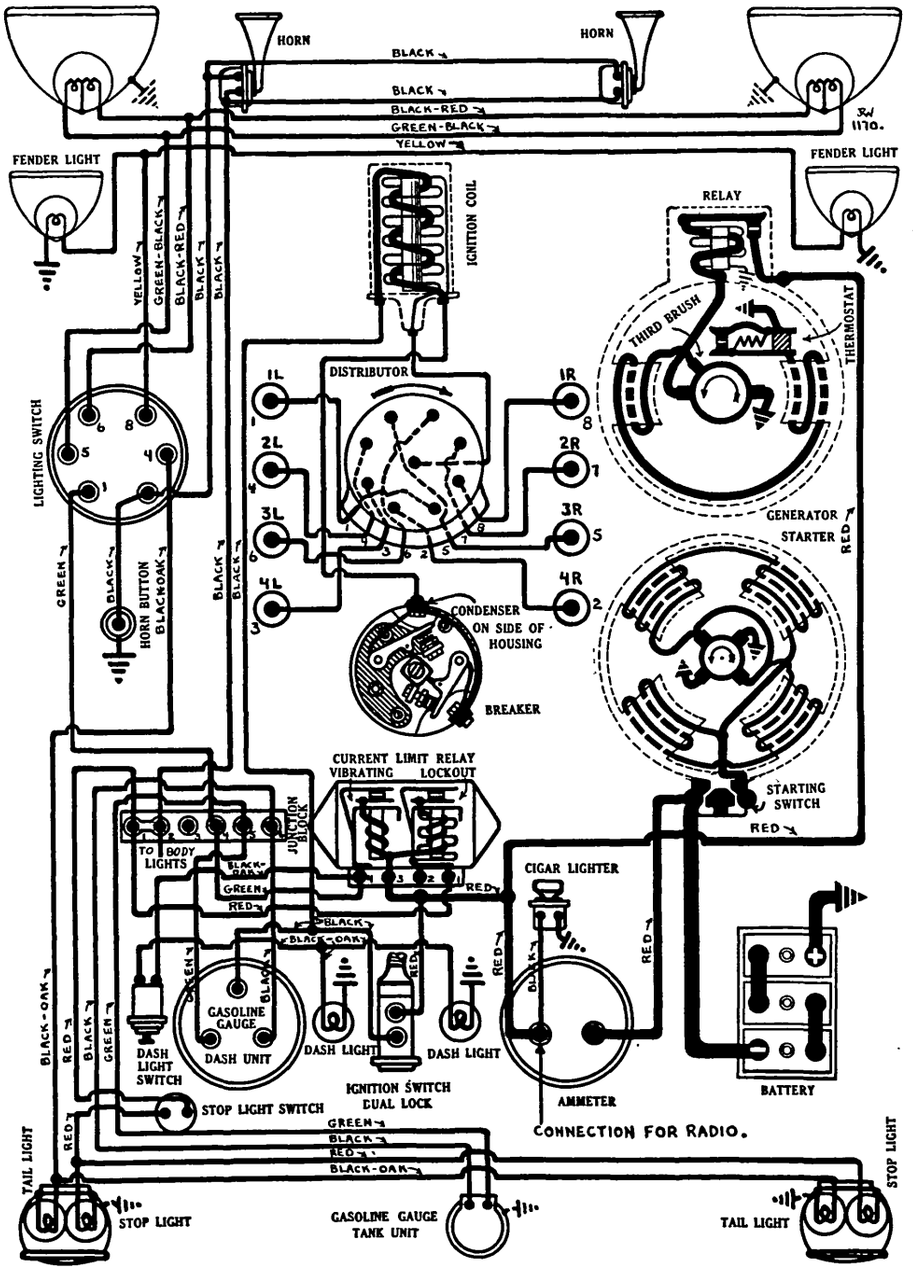
DELCO-REMY IGNITION

BATTERY:—Delco, Type 15-CW, 6 volt, 120 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 24 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model 530-D. Coil is mounted on the radiator brace rods directly over the distributor. Ignition current is 2.5 amperes with engine running and 2 amperes with engine stopped.



Distributor Model 4055. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Tighten the lock nut. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 1000 R.P.M. (engine). Maximum automatic advance is 30 degrees reached at 3600 R.P.M. Breaker has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct performance. See Timing. Ignition switch is Delco-Remy Dual Lock Model 426-P.

Mounting:—Distributor is mounted at the front of the engine between the cylinder blocks. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out two hold-down screws and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 1000 miles of operation. At the same time put a drop of oil on the breaker arm pivot pins and in the hole drilled in the top of the breaker cam which oils the path of the breaker arm rubbing blocks on the face of the cam.

Timing:—Synchronization of Contacts. The interval between the opening of the two sets of contacts must be exactly 45 degrees (distributor). This can be set by using special Delco-Remy Tool, Part No. 822572 and following directions on Distributors in Equipment Section. The breakers may be synchronized without use of the tool after the distributor has been timed to the engine by cranking the engine over 90 degrees from the firing position of piston No. 1 when the flywheel mark 'IG/A-2-6' will be opposite the indicator. If the second set of contacts does not open at this point, the lock screws on the breaker arm mounting plate should be loosened and the eccentric adjusting screw turned until the contacts begin to open. Then tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7/8 inch (on the flywheel) before top dead center with the manual spark control in the fully advanced position. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is 7/8 inch before the top dead center position of the piston. To set timing, crank engine over until piston No. 1 reaches firing position. Fully advance manual spark control. Then loosen taper screw in center of breaker cam and rotate cam until the set of contacts mounted on the stationary breaker plate begin to open. Tighten the screw and check to see that segment directly opposite rotor is connected to the spark plug in cylinder No. 1. The second set of contacts open exactly 45 degrees after this point.

CADILLAC

SERIES 355 (1931), SERIAL NUMBERS 800-001 UP
PRODUCTION STARTED OCTOBER 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. Cylinder banks are right and left as viewed from the driver's seat. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.660-1.666 inch. Stem diameter, ⅜ inch. Stem length, 6 17/64 inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds (spring length, 2½ inches) or 160 pounds (spring length, 2.148 inches). Tappet clearance, .004 inch (cold). Inlet valves open 9 degrees before top dead center and close 58 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1.634-1.640 inches. Stem diameter, ⅜ inch. Stem length, 6¼ inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds (spring length, 2½ inches) and 160 pounds (spring length, 2.148 inches). Tappet clearance, .006 inch (cold). Exhaust valves open 46.5 degrees before lower dead center and close 7 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Camshaft is driven by two-sprocket non-adjustable chain drive. To set timing, turn camshaft and crankshaft sprockets so that marked teeth (one tooth on each marked by '0') are adjacent to and in line with a straightedge across the shaft centers. Mesh chain.

STARTER:—**Model 728-D.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch and an overrunning clutch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes

Brush spring tension is 20-28 ounces. Generator field current is 1.8-2.3 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on the rear of the chain case. The water pump is mounted on the front face of the chain case. To remove generator, disconnect lead and drop mud pan at right of engine. Then remove nuts on two upper flange mounting bolts and take out lower flange mounting cap screw. Pull generator to the rear to disengage drive coupling. The generator can then be taken out from underneath the car.

Drive Chain Adjustment:—To adjust generator and water pump drive chain, loosen two pivot screws and nuts on flange mounting. Then force water pump away from engine until chain is tight. Then back off approximately ⅛ inch and tighten mounting screws and nuts.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation.

RELAY:—**Model 266-N.** Relay is mounted on the generator. Relay closes at 420 R.P.M. or 8-10 miles per hour when the generator voltage reaches 7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.021 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—**Switch Model 486-H.** Lighting switch is mounted at lower end of the steering column. Double filament headlights using the second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights or parking lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome and corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

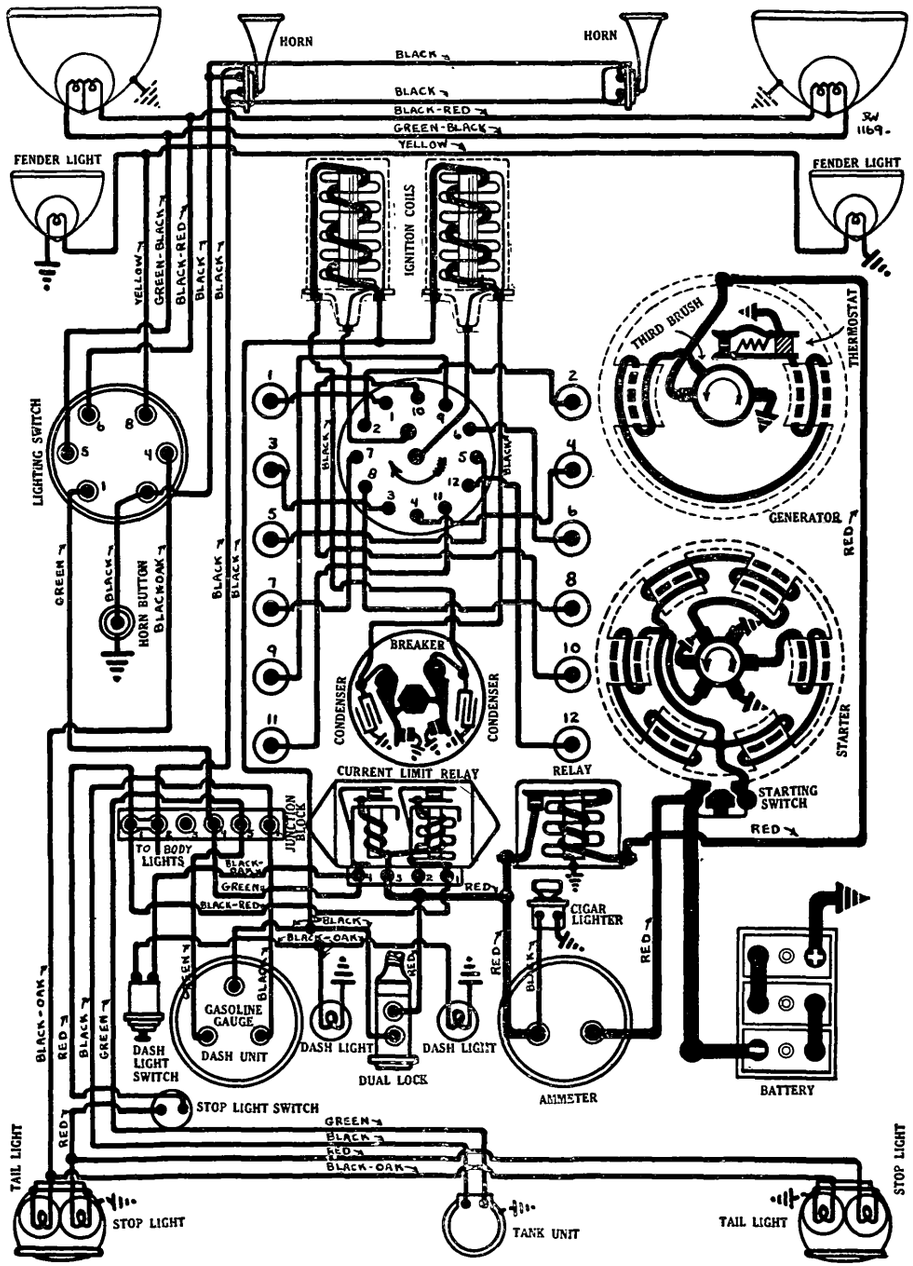
CURRENT LIMIT RELAY:—**Model 5759.** This device consists of a vibrating and lockout circuit breaker mounted on the dash. The vibrating unit protects the lighting circuits. It starts to operate when the current reaches 35-40 amperes and continues limiting the current to 5-22 amperes. The lockout circuit breaker protects the horn, stop light, inspection light, cigar lighter and body light circuits. It begins to operate when the current reaches 25-30 amperes and continues limiting the current to less than 1 ampere. Contact gap is .012-.030 inch. Air gap between armature and coil core is .015-.025 inch. Plunger spring tension is 5 ounces (minimum).

CADILLAC

V-12 SERIES 370 (1931) SERIAL NUMBERS 1000-001 UP
PRODUCTION STARTED OCTOBER 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXV-15-1R, 6 volt. The positive (+) terminal is grounded to the battery hanger. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted on the outside of the right frame member under the dust shield. The starting cable ends at a terminal on the frame flange and a laminated strap connector runs from the terminal to the negative post of the battery.

IGNITION:—Coil Model 530-G, H (2 used). Ignition coils are mounted in a recess in the top tank of the radiator directly above the distributor. Ignition current (each coil) is 2 amperes at 6 volts with engine running and 2.5 amperes at 6 volts with engine stopped. The ignition switch is a Delco-Remy Dual Lock, Model 426-P.



Distributor Model 4069. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 14 degrees (engine). Automatic advance begins at 600 R.P.M. of the engine. Maximum automatic advance is 32 degrees reached at 1460 R.P.M. of the engine. Breaker has two sets of contacts operating on a six sided cam. Contacts open alternately at intervals of 22½ and 37½ degrees corresponding to the alternate firing intervals of the engine which are 45 and 75 degrees. Contacts must be synchronized for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted at the front of the engine between the cylinder banks. To remove the distributor, disconnect the primary leads and manual spark control and remove the distributor head with cables intact. Then take out two hold-down screws and lift the distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 1000 miles. At the same time remove the distributor head and rotor and put 2 or 3 drops of oil in the hole drilled in the top of the cam. This oiler oils the breaker arm rubbing blocks on the cam.

Timing:—Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 1 27/32 inches (on the flywheel) before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke and stop when the mark 'C/2-12' on the flywheel is directly in line with the indicator on the flywheel case. Then turn engine over slowly until the ignition mark for cylinder No. 1 'IG/A' (which is 3 11/16 inches after the mark 'C/2-12') is directly opposite the indicator. See that manual spark control is fully advanced (spark control button pushed all the way in toward the dash) and that the distributor housing is rotated counter-clockwise to the full limit of the stop screw slot. Then loosen the lock screw in the center of the breaker cam and carefully locate the cam so that the right hand contacts are beginning to open with the rotor terminal (which is connected to the high tension terminal in the center of the distributor head) directly opposite No. 1 segment in the distributor head (see diagram).

Synchronization of Contacts. Synchronization of contacts is very important since the firing interval of the engine is alternately 45 and 75 degrees. Synchronize contacts on a rotary spark gap or use the synchronizing tool developed for the V-16 (Cadillac Part No. 109224) modified for use on the V-12 with special markings on the quadrant. The special markings are shown in the diagram. The synchronizing fixture is adjusted on the distributor so

CADILLAC

V-12 SERIES 370 (1931) SERIAL NUMBERS 1000-001 UP
PRODUCTION STARTED OCTOBER, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

that the right hand (stationary set of contacts) just open with the pointer on the farthest indicating point on the quadrant. The second set of contacts (mounted on the movable plate) should begin to open when the pointer is opposite the mark '12 L.H.' on the quadrant. If the contacts do not open at this point, loosen the lock screws on the movable breaker plate and shift the plate until the contacts begin to open. The right hand contacts begin to open again when the pointer is opposite the '12 R.H.' mark. These distances are 37½ and 22½ degrees (distributor) respectively. The synchronization of the contacts can be checked after the distributor has been timed to the engine by cranking the engine over until piston No. 4 reaches firing position. This point is 75 degrees on the flywheel after the firing position of piston No. 1 when the second set of contacts should begin to open.

Firing Order:—The firing order is 1-4-9-8-5-2-11-10-3-6-7-12 with spark plugs numbered as shown on the diagram. The firing order in conventional terms is 1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with number 1 cylinder nearest the radiator and the cylinder banks right and left as viewed from the driver's seat.

Spark Plugs:—Spark plugs are 18 MM. Metric A.C. Type G-8. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.446-1.452 inches. Stem diameter, .3392-.3397 inch. Stem length, 6 1/16 inches. Valve lift, 11/32 inch. Spring pressure, 65 pounds (valve closed) and 130 pounds (valve open). Inlet valves open at top dead center and close 44 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1.446-1.452 inches. Stem diameter, .3392-.3397 inch. Stem length, 6 1/16 inches. Valve lift, 11/32 inch. Spring pressure, 65 pounds (valve closed) and 130 pounds (valve open). Exhaust valves open 39 degrees before lower dead center and close 5 degrees after top dead center. Valve stem guides are removable.

SPECIAL NOTE:—A special automatic valve tappet take-up is used. The rocker arm is mounted on an eccentric bushing which is rotated to take up all valve lash by a spring under the plunger which bears on an arm of the eccentric. The plunger operates in an oil cylinder. This device requires no attention in service and there will be no appreciable tappet clearance or valve lash. It is reset when a valve is replaced by using a special combination screwdriver and wrench, Cadillac Part No. 109627-T, and adjusting the clearance to .030 inch with the plunger held down at the bottom of the dashpot. This adjustment should be made with the engine running and a special tool, Cadillac Part No. 109624, must be used to hold the plunger down. See Mechanical Equipment Section for complete data.

STARTER:—Model 457. Starter is connected to the engine through a set of reduction gears and an overrunning clutch. The manual pinion shift is interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 36-40 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2200	5.7	70
35 "	Lock	3	600

Mounting:—Starter is flange mounted at the right of the engine on the rear of the flywheel housing. To remove starter, lift up floor of front compartment, disconnect cable and leads at starting switch and disconnect starting pedal linkage at the shifter yoke. Then take out three flange mountig cap screws. Pull starter to the rear to clear drive and lift from place.

GENERATOR:—Model 927-K. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40 per cent. To adjust the generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. The maximum standard charging rate is 10-12 amperes (hot) reached at 1600 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.2-8.6	1400	10-12	7.3-7.7	1600

Brush spring tension is 20-28 ounces. Shunt field current is 1.8-2.3 amperes at 6 volts.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the timing chain case. To remove generator, disconnect lead and take out three flange mounting cap screws. Then slide generator to the rear to disengage coupling and lift from place. The water pump is driven by an extension of the generator shaft and it will be necessary to disconnect water pump coupling before the generator can be removed.

CAUTION:—An automatic chain take-up idler sprocket is used. When the generator is removed it will be necessary to turn up the set screw in the generator sprocket support flange to hold the flange in position when the generator flange screws are released. If this is not done, the automatic take-up sprocket will require resetting when the generator is installed. The manual adjustment (next paragraph) is designed to be used only when the automatic take-up has reached the maximum point and is no longer operative.

Timing Chain Adjustment:—Timing chain tension is adjusted by shifting the generator. To take up timing chain, loosen the three mounting screws and pry the generator away from the engine as far as possible. Then back off ⅛ inch and tighten the mounting screws. The chain should run noiselessly with the correct adjustment.

RELAY:—Model 266-E. Relay is mounted on the left body sill under the dash. Relay contacts close at 420 R.P.M. (generator) or 8-10 M.P.H. when the generator voltage reaches 7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch

LIGHTING:—Delco-Remy Switch, Model 486-H. Lighting switch is mounted at the lower end of the steering column and is controlled by a lever on the steering wheel. Double filament headlight bulbs are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome and corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—Model 5759. This device consists of two circuit breakers mounted on the dash. A vibrating circuit breaker is connected in the lighting circuits. It begins to operate when the current reaches 35-40 amperes and continues limiting the current to 5-22 amperes. The lockout circuit breaker is connected in the stop light and body light circuits. It opens the circuit when the current reaches 25-30 amperes limiting the current to less than 1 ampere. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

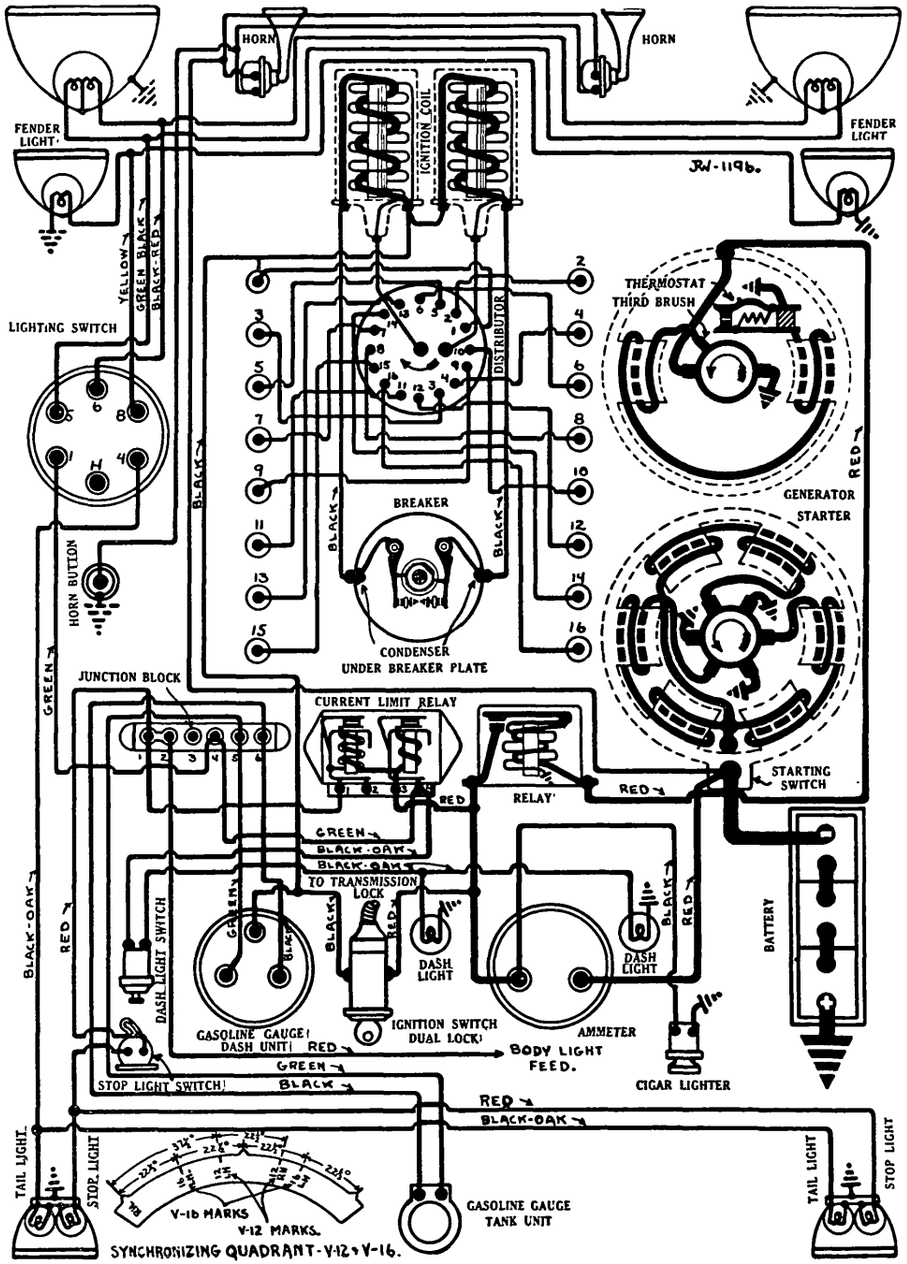
CADILLAC

MODEL V-16, SERIES 452 (1930-31)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-XC-RV-21-2G. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 137 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted on the right frame member under the dust shield.

IGNITION:—Coil Model 530-G, H (2 used). Coils are mounted in a recess in the top tank of the radiator. Ignition current is 2 amperes at 6 volts with engine running and 2.5 amperes at 6 volts with engine stopped (each coil). The ignition switch is a Delco-Remy Dual-Lock. Model 426-M or L (R.H.D.).

Distributor Model 4057. Breaker contacts separate .014-.018 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 38 degrees (engine). Automatic advance begins at 600 R.P.M. of the engine. Maximum automatic advance is 34.5 degrees reached at 2700 R.P.M. Breaker has two sets of contacts operating on a single eight sided cam. Each set of contacts controls one ignition coil and fires the spark plugs in eight cylinders. Contacts open alternately at intervals of 22½ degrees corresponding to the 45 degree firing interval of the engine. The firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.



Mounting:—Distributor is mounted between the cylinder banks at the front of the engine. To remove distributor, disconnect primary leads and manual advance rod and remove distributor head with cables intact. Then take out two hold-down screws and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 1000 miles. At the same time remove the distributor head and rotor and put 2 or 3 drops of oil in the hole drilled in the top of the cam. This oiler oils the breaker arm rubbing blocks on the face of the breaker cam.

Timing:—Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 10.5 degrees (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until No. 1L piston enters compression stroke (the up stroke with both valves closed). Fully advance the spark control lever. Crank engine over until the flywheel mark 'IG/A' which is 10½ degrees or 1¼ inches on the flywheel before the top dead center mark 'C/1-15' is opposite the indicator. Then loosen the taper lock screw in the center of the breaker cam and carefully locate cam so that one set of breaker contacts are beginning to open. Tighten the lock screw and see that the segment in the distributor directly opposite the rotor is connected to the spark plug in cylinder No. 1L. Connect the remaining spark plugs in accordance with the diagram. The firing order and numbering of the cylinders is given in accordance with Cadillac specifications.

Synchronization of Contacts. Contacts can be synchronized on a rotary spark gap or directly on the engine after the distributor has been timed to the engine by cranking engine over 45 degrees when piston No. 4R (No. 8) will reach firing position. If the second set of contacts do not separate at this point loosen the lock screws on the movable sub-plate and shift position of plate until contacts begin to open. Tighten the lock screws and check the contact gap with breaker arm on lobe of cam.

Firing Order:—The firing order is 1-8-9-14-3-6-11-2-15-10-7-4-13-12-5-16 with spark plugs numbered as shown on the diagram. This firing order in con-

CADILLAC

MODEL V-16, SERIES 452 (1930-31)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

ventional terms is 1L-4R-5L-7R-2L-3R-6L-1R-8L-5R-4L-2R-7L-6R-3L-8R with number 1 cylinder nearest the radiator and cylinder banks right and left as viewed from the driver's seat.

NOTE:—The distributor is of the 'side outlet type' with the coil high tension leads and all spark plug cables arranged in two tiers or decks across the rear of the distributor cap. Connections from left to right (facing toward the front of the car) are as follows:

Upper Deck—R.H. Coil Lead—3-1-14-9-4-12-16-8.

Lower Deck—L.H. Coil Lead—7-11-2-5-10-6-15-13.

Spark Plugs:—Spark plugs are 18 MM. Metric. A.C. Type G-8. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.446-1.452 inches. Stem diameter, ..3392-.3397 inch. Valve length, 6 1/16 inches. Valve lift, 11/32 inch. Spring pressure, 65 pounds (valve closed), 130 pounds (valve open). Inlet valves open at top dead center and close 44 degrees after lower dead center. The flywheel is marked 'C/1-15' at point of inlet opening for cylinders Nos. 1L and 8L.

EXHAUST VALVES. Head diameter 1.446-1.452 inches. Stem diameter, .3392-.3397 inch. Valve length, 6 1/16 inches. Valve lift, 11/32 inch. Spring pressure, 65 pounds (valve closed), 130 pounds (valve open). Exhaust valves open 39 degrees before lower dead center and close 5 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

SPECIAL NOTE:—A special automatic valve tappet take-up is used. The rocker arm is mounted on an eccentric bushing which is rotated to take up all valve lash or clearance by a spring under the plunger which bears on an arm of the eccentric. The plunger operates in an oil cylinder. This device requires no attention in service and there will be no appreciable tappet clearance or valve lash. It is reset whenever a valve is replaced by using a special combination screwdriver and wrench, Cadillac Part No. 109627-T, and adjusting the clearance to .030 inch with the plunger held down at the bottom of the dashpot. This adjustment must be made with the engine running and a special tool, Cadillac Part No. 109624, must be used to hold the plunger down at the end of the stroke. See Mechanical Equipment Section for complete data.

STARTER:—Model 457. Starter is connected to the engine through a set of reduction gears and an overrunning clutch. The manual pinion shift is interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 36-40 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2200	5.7	70
35 "	Lock	3	600

Mounting:—Starter is flange mounted at right of engine on rear of flywheel housing. To remove starter, take up floor boards of front compartment and disconnect cable and leads at starting switch. Disconnect pedal rod at shifter yoke and take out three mounting cap screws. Then pull starter to rear to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the drive end of the starter every 1000 miles. Every six months repack the reduction gear case with medium grease.

GENERATOR:—Model 927-E, K. The direction of rotation is counter-clockwise, viewed from the comutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18-20 amperes at 8.6 volts reached at 1400 R.P.M. or 23 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.2-8.62	1400	10-12	7.3-7.7	1600

Brush spring tension is 20-28 ounces. Shunt field current is 1.8-2.3 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and water pump drive coupling. Take out three flange mounting cap screws. Pull generator to the rear to disengage drive coupling and lift from place.

CAUTION:—An automatic chain take-up idler sprocket is used. When the generator is removed it will be necessary to turn up the set screw in the generator sprocket support flange to hold the flange in position when the generator flange screws are released. If this is not done, the automatic take-up sprocket will require resetting when the generator is installed. The manual adjustment (next paragraph) is designed to be used only when the automatic take-up has reached the maximum point and is no longer operative.

Timing Chain Adjustment. Timing chain is adjusted by shifting the generator. To take up timing chain, loosen the three mounting screws and pry the generator away from the engine as far as possible. Then back off 1/8 inch and tighten the mounting screws. With correct adjustment, the chain should run noiselessly.

Oiling:—Put 8 or 10 drops of light engine oil in the generator oilers every 500 miles of operation.

RELAY:—Model 266-N, E. Relay is mounted on the left body sill under the dash. Relay contacts close at 420 R.P.M. (generator) when the generator voltage reaches 7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

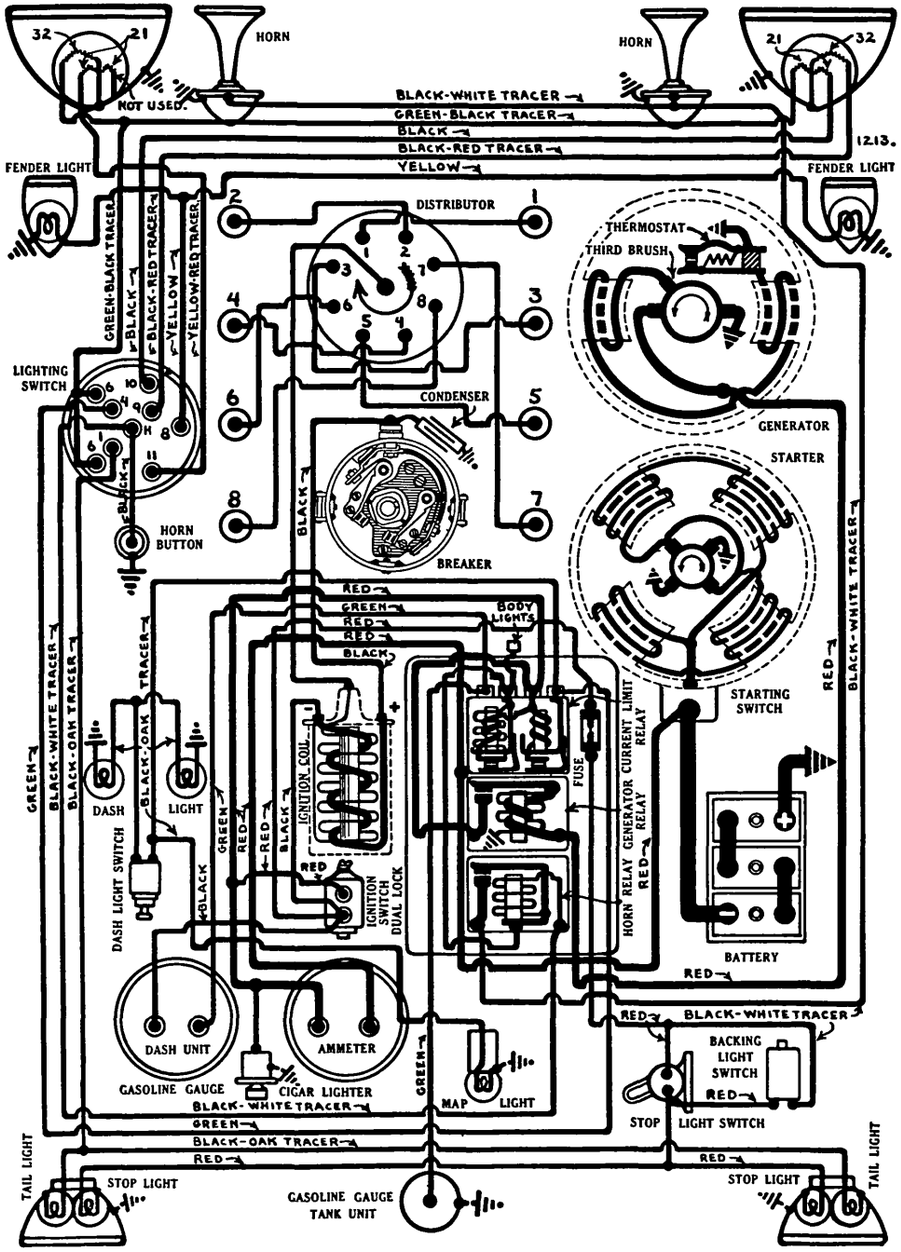
LIGHTING:—Delco-Remy Switch Model 486-H. Lighting switch is mounted at lower end of steering column. Double filament headlights using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights (on fenders) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome and corner lights are 6-8 volt, 3 cp. Mazda 63.

CURRENT LIMIT RELAY:—Model 5759. This device consists of two circuit breakers mounted on the dash. A vibrating circuit breaker is connected in the lighting circuits. It begins to operate when the current reaches 35-40 amperes and continues limiting the current to 5-22 amperes. The lockout circuit breaker is connected in the stop light and body light circuits. It begins to operate with a current of 25-30 amperes and limits the current to less than 1 ampere. Contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

CADILLAC

V-8 MODEL 355-B (1932), SERIAL NUMBERS 1,200,001 UP
V-8 MODEL 355-C (1933), SERIAL NUMBERS 3,000,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Same as engine number.
ENGINE NUMBER:—Stamped on right side of crankcase below water inlet.
ENGINE:—Eight cylinder 90 degree 'V', 'L' head type, 3⅜x4 15/16" bore and stroke, 353 cubic inch displacement, rated at 36.45 H.P., develops 115 H.P. at 3000 R.P.M. Standard compression ratio 5.4-1. Optional high compression ratio of 5.7-1 and low compression ratio of 5.2-1 are available. When installed at factory to compensate for fuel characteristics or altitude conditions the standard ignition setting is used. Standard compression pressure 104 pounds at 1000 R.P.M.
BATTERY:—Delco, Type 17-BW ('32), 17-CF ('33), 6 volt, 17 plate, 130 ampere hour capacity (20 hour rate). Starting capacity 156 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—On outside of frame under right hand front fender.
Dimensions:—Width, 7". Length, 11¾". Height, 9⅜".
IGNITION:—Coil Model 528-G. Coil is mounted on dash under cowl.
Ignition Current:—.5-2 amperes (engine idling), 2 amperes (engine stopped).
Ignition Switch:—Delco-Remy Dual-lock Model 426-T.
Distributor Model 660-Y, 662-Y. Two breaker, 4 lobe cam, full automatic advance type. Breaker contacts open alternately at 45° intervals corresponding to the 90° firing interval of the engine. Contacts must be synchronized.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm.
Cam Angles—Closed 34°, open 11° (distributor) when synchronized.
Distributor Model 661-P (Late 1933 cars). Single breaker, 8 lobe cam, full automatic advance type. No synchronization required.
Breaker Gap—Set at .015". Hold within limits of .0125-.0175".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles—Closed 31°, open 14° (distributor degrees).



Automatic Advance—Model 660-Y

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		250	4		500
10		1475	20		2950

Automatic Advance—662-Y, 661-P

Start		250	2		500
3.75		500	7.5		1000
5.5		800	11		1600

Mounting:—Distributor is mounted at front of engine between cylinder banks. Driven by gears from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out two capscrews in distributor bracket.
IGNITION TIMING:—Standard setting 9°12' (flywheel) or .039" (piston) before top dead center. To set timing, remove cover plate on flywheel housing. Center distributor pointer on quadrant scale by loosening hold-down screw in pointer arm and rotating distributor cup, tighten hold-down screw. With No. 1 piston (right hand block) on compression stroke rotate crankshaft until flywheel mark 'IG/A-1' is directly opposite indicator on flywheel housing. Loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp). Tighten clamp bolt, connect spark plugs as indicated on diagram.
Synchronization of Contacts—first method as part of timing operation. After timing has been completed (as above), turn crankshaft 90 degrees to firing position of piston No. 2 when flywheel mark 'IG/A-2' should be opposite indicator. Loosen two lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten lock screws. Check contact gap; if outside limits of .018-.022 inch, reset at .020 inch and repeat synchronization.
Second Method—using synchronizing tool. Use Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section.
Firing Order:—1-2-7-8-4-5-6-3 with cylinders numbered as shown on diagram, or 1R-1L-4R-4L-2L-3R-3L-2R with cylinder banks right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder nearest radiator in each case.
Spark Plugs:—18 MM. A.C. Type D-8. Hold gap within limits of .025-.028 inch.
VALVE TIMING:—Camshaft mounted directly above crankshaft driven by two-sprocket non-adjustable chain drive. Valves adjustable at center of engine

CADILLAC

V-8 MODEL 355-B (1932), SERIAL NUMBERS 1,200,001 UP
V-8 MODEL 355-C (1933), SERIAL NUMBERS 3,000,001 UP
DELCO-REMY SYSTEM

between cylinder banks. New manifolding on 355-B engine requires new location of valves. With valves numbered 1 to 8, beginning at radiator, valves are #1—exhaust, #2—intake, #3—exhaust, #4 and #5—intake,# 6—exhaust, #7—intake, #8—exhaust. Both cylinder blocks are identical.

To Set Valve Timing:—Camshaft sprocket and crankshaft sprocket are marked. Chain should be assembled with crankshaft and camshaft turned so that sprocket marks are directly opposite and in line with a straightedge across the shaft centers.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.660-1.666"	3/8"	6 17/32"	30°	23/64"
Exhaust	1.634-1.640"	3/8"	6½ "	45°	23/64"

Tappet Clearance		Valve Springs	
Intake	.006" (cold)	Closed	79 pounds (2½")
Exhaust	.008" (cold)	Open	160 pounds (2.148")

Timing

Intake valves open 6 degrees before top dead center. Intake valves close 42 degrees after lower dead center. This applies with .004" tappet clearance

Exhaust valves open 38 degrees before lower dead center. Exhaust valves close 2 degrees after top dead center. This applies with .006" tappet clearance.

CARBURETION:—Updraft type carburetor, Cadillac make (see Carburetor Section for complete data).

Fuel Pump:—A.C. mechanical type fuel pump operated by eccentric on camshaft (see Carburetion Section).

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—**Model 728-P.** Manual pinion engagement connected to starting switch lever (not adjustable). Starter drives through reduction gears and an overrunning clutch. Rotation (armature shaft) counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 80-90 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3.0	600

Mounting:—Starter flange mounted on rear face of flywheel housing at right of transmission. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting cap screws, pull starter to rear to clear housing, lift from place.

GENERATOR:—**Model 927-S.** Third brush regulation, thermostat control. Thermostat contacts open at 175°F. reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end. With standard setting maximum charging rate is 14-17 amperes at 8 volts (hot) reached at 1800 R.P.M. or 22 M.P.H.

Charging Rate Adjustment:—Loosen hexagonal lock screw on endplate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.6-9.0	1400	14-17	7.8-8.2	1800-2000

Brush Spring Tension:—23-27 ounces on each brush.

Field Current:—4.4-5.0 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted at right of engine on rear of accessory drive chain case. Water pump mounted on front of chain case. Driven by special chain from crankshaft. To remove, drop mud pan at right of engine. disconnect lead, take off nuts on two upper flange mounting bolts, take out lower flange mounting cap screw, pull generator to rear to disengage drive coupling, take out from underneath car.

Chain Adjustment. Loosen nuts on flange mounting bolts, loosen two pivot screws (second screw on front of chain case), pull generator away from engine until chain is tight, slack off ⅛ inch, tighten bolts and screws.

RELAY:—See paragraph on 'Apparatus Box'.

LIGHTING:—**Delco-Remy Switch, Model 486-S or 487-A.** Switch is mounted at lower end of steering column controlled by lever on steering wheel. Lighting system new Cadillac 'Super-Safe' system equipped with new type three-filament bulbs Mazda No. 3001 (32-21-21 cp.). Bulbs are interchangeable but are installed in left head lamp with 32 cp. filament at the top and in the right hand head lamp with 32 cp. filament at the bottom. Sockets are designed so that bulb cannot be inserted incorrectly. Headlight doors, lenses and reflectors are not interchangeable, being designed to give a particular pattern of light for each headlamp filament.

SPECIAL NOTE:—As in 'Tilt Ray Depressed Beam' practise, the lower filament gives a higher or farther range of light than the upper filament which is used for the 'depressed beam' or passing light. The 32 cp. filament in the right hand headlight being installed at the bottom gives a high and far-reaching light for country driving. In the left hand headlight this 32 cp. filament is installed at the top and gives a 'depressed' light. The manufacturer recommends in states which prohibit direct light above the horizontal that the 32 cp. filament in the right hand headlight not be used. Insulate wire to No. 3 in headlight plug (black wire with red tracer—tip has shortest shank). Head lamps are aimed so that right hand head lamp points straight ahead, left hand lamp illuminates the right side of the road.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21-21	Triple	3001
Fender Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Backing and Stop Lights	6-8	15	S.C.	87
Map Reading Lights	6-8	3	S.C.	63
Dome and Corner Lights	6-8	6	S.C.	81

NOTE:—The map reading light in the center of the instrument panel has a switch built in the socket. Switch is operated by pulling the light out against the stop. To remove map reading lamp bulb, pull lamp out part way until the end of the threaded shaft on the lamp plunger is flush with the end of the cylinder (behind instrument panel), turn bulb shield until the hole in the plunger lines up with the hole in the cylinder, insert a nail to prevent plunger turning, unscrew bulb shield (right hand thread).

APPARATUS BOX:—**Delco-Remy, Model 480-Z.** Mounted on rear of dash under cowl. Consists of current limit relay (vibrating and lock-out circuit breaker), generator cut-out relay, horn relay, and a 10-ampere capacity fuse (in circuit to backing and stop lights).

Current Limit Relay:—Vibrating circuit breaker begins to operate with current load of 35-40 amperes limiting current to 5-20 amperes maximum with direct short-circuit. Lock-out circuit breaker begins to operate with current load of 25-30 amperes limiting current to less than 1 ampere with direct short-circuit. Circuit breaker contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring tension 5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

Cut-out Relay:—Contacts close at 8-9 M.P.H. or 420 R.P.M. (generator) with a generator voltage of 6.75-7.5 volts and open with a discharge current of 0-2 amperes. Contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

Horn Relay:—**Model 266-T.** Pressing horn button energizes horn relay winding, closing horn relay contacts and completing horn circuit. Horn current does not pass through horn button. Horn relay requires .25 amperes to close contacts. Horn relay contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

FUSES:—Backing and stop light fuse mounted in Apparatus Box, 10 ampere capacity.

HORNS:—Klaxon vibrator type matched set with blended note, Model K-22-C Type 1160 (low note) and Model K-22-C Type 1161 (high note). Horns draw 6.0-8.0 amperes at 6 volts each.

CADILLAC

V-12 MODEL 370-B (1932), SERIAL NUMBERS 1,300,001 UP
V-12 MODEL 370-C (1933), SERIAL NUMBERS 4,000,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on right hand side of chain housing directly behind fan.

ENGINE:—Twelve cylinder 45 degree 'V', 'I' or overhead valve type, 3⅛x4" bore and stroke, 368 cubic inch displacement, rated at 46.9 H.P., develops 135 H.P. at 3400 R.P.M. Standard compression ratio 5.6-1. Optional low compression ratios of 5.4-1 and 4.9-1 are available. When installed at factory to compensate for fuel characteristics or altitude conditions, the standard ignition setting is is used. Standard compression pressure 117 pounds at 1000 R.P.M.

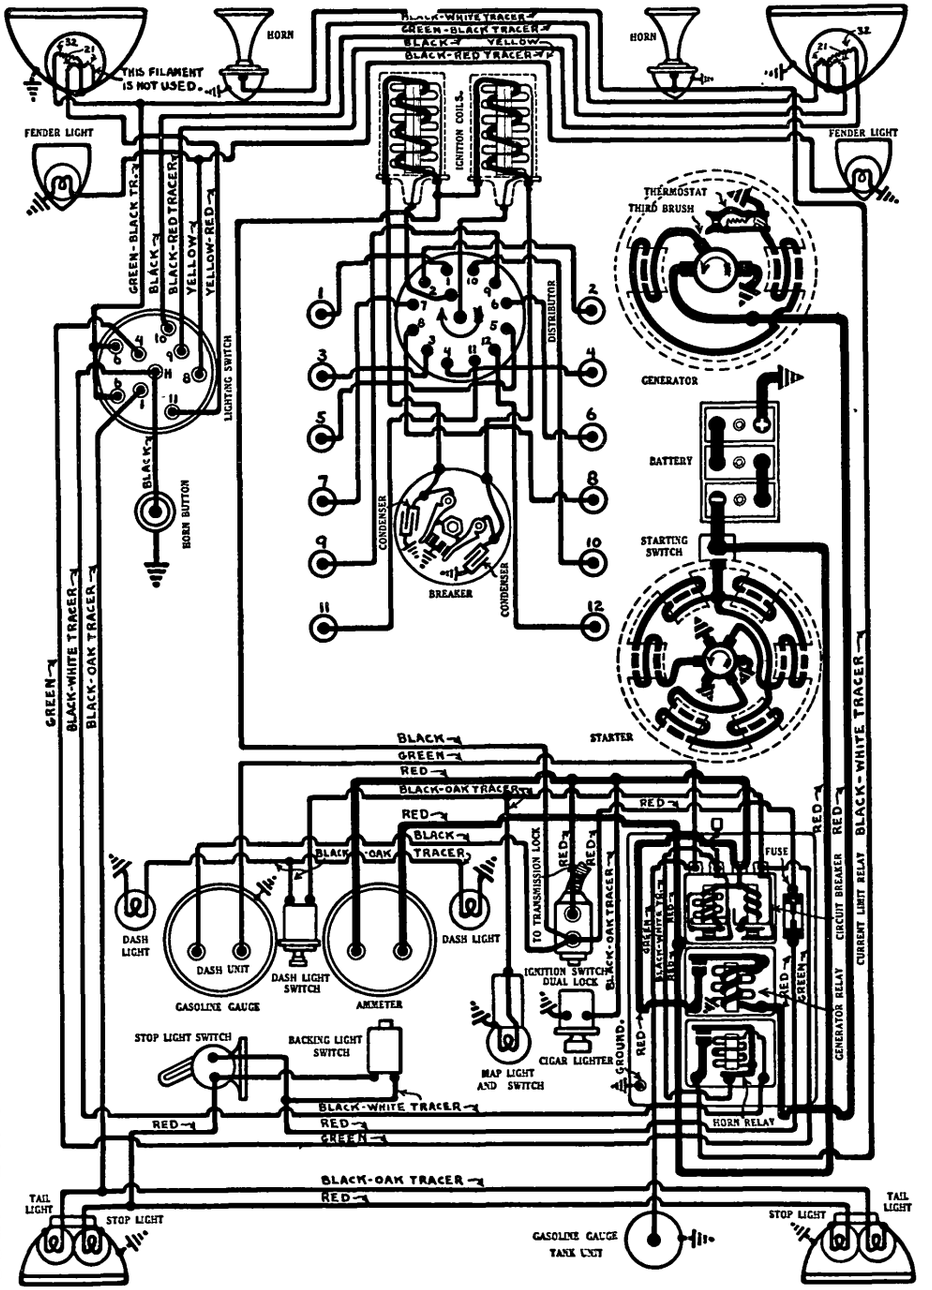
BATTERY:—Delco, Type 21-CW ('32), 21-CF ('33), 6 volt, 21 plate, 164 ampere hour capacity. Starting capacity 195 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—Outside of frame under right hand front fender.
Dimensions:—Width, 7". Length, 13 9/16". Height, 9 3/16".

IGNITION:—Coil Model 530-K ('32), 526-E ('33)—2 used. Coils are mounted in recess in radiator top tank directly above distributor.
Ignition Current:—2.5 amperes (engine idling), 4 amperes (engine stopped).
Ignition Switch:—Delco-Remy Dual-lock, Model 426-T co-incidental ignition switch and transmission lock (see Equipment Section for complete data).

Distributor Model 4092 ('32), 4110 ('33). Two breaker, 6 lobe cam, full automatic advance type. Contacts open alternately at 37½ and 22½ degree intervals, corresponding to the firing intervals of 75 and 45 degrees (this unequal firing interval is caused by 45° included angle between cylinder banks). Contacts must be synchronized (see Timing).
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Cam Angles—Closed 39°, open 21° (distributor) each set independently.

Automatic Advance—Model 4092

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	5		600
16		800	32		1460



Automatic Advance—Model 4110

Start		250	2.5		500
21		1100	42		2200

Mounting:—Distributor mounted at front of engine between cylinder banks. Driven by gears from camshaft. To remove, disconnect primary leads, take off distributor cap, take out two mounting screws in distributor bracket.

IGNITION TIMING:—Ignition Settings as follows:
1932—15° or 1 13/16" (flywheel), .0826" (piston) before top dead center.
1933—4° (flywheel), .006" (piston) before top dead center.
To Set Timing:—First remove cover plate over inspection hole in flywheel housing. Center distributor pointer on quadrant scale by loosening hold-down screw in advance arm and rotating distributor cup, tighten hold-down screw. With No. 1 piston on compression stroke crank engine over until flywheel mark 'C/2-12' appears at inspection hole and stop when mark 'IG/A' 30°—1932, 41°—1933, after the 'C/2-12' mark) is opposite the indicator on the housing (this is necessary because the 'IG/A' ignition marks are not numbered to indicate the cylinder to which they refer). Then take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that right hand contacts are beginning to open (use test lamp) with rotor terminal connected to center terminal in distributor head directly opposite No. 1 terminal in head (see diagram), tighten cam locking screw. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Synchronization of Contacts—using synchronizing tool, Cadillac Part No. 109224. This tool developed for use on V-16 engines has special markings for use in synchronizing V-12 distributors with unequal firing intervals (see 1931 V-16 diagram in National Service Manual). Install tool and adjust so that right hand (stationary) set of breaker contacts begin to open with pointer on farthest indicating point on quadrant 'RH'. Crank engine over until pointer is directly opposite '12 L.H.' mark on quadrant. Loosen lock

CADILLAC

V-12 MODEL 370-B (1932), SERIAL NUMBERS 1,300,001 UP
V-12 MODEL 370-C (1933), SERIAL NUMBERS 4,000,001 UP
DELCO-REMY SYSTEM

screws on movable sub-plate (carrying second set of breaker contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws. Right hand contacts should open again when pointer is opposite '12 R.H.' mark on quadrant. These marks are 37½ and 22½ degrees apart, respectively.

Second Method—as part of timing operation. After distributor has been timed to engine (second paragraph above), crank engine over 75 degrees to firing position of piston No. 4 with 1G/A' opposite indicator in inspection hole Loosen locking screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open (left hand set), tighten locking screws, check contact gap.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram, or 1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with cylinder banks right (R) and left (L) as viewed from driver's seat. No. 1 cylinder nearest radiator in each case.

Spark Plugs—18 MM. Metric. A C. Type D-8 ('32), G-7 ('33). Set gaps at .025- 028".

VALVE TIMING:—Camshaft mounted directly above crankshaft driven by silent chain. Chain adjustment automatic. Generator also driven by timing chain Engine valve-in-head type with valves operated by rocker arms on head and pushrods between cylinder banks. Valve tappet clearance adjustment automatic (see Special Note).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 446"	11/32'	6 9/64"	45°	11/32"
Exhaust	1 452"	11/32"	6 9/64"	45°	11/32"

Tappet Clearance

No appreciable clearance or lash in service (see Special Note).

Spring Pressure

Closed ..... 70 pounds
Open ..... 167 pounds

Timing

Intake Valves	Exhaust Valves
Open—At top dead center	Open—39° before lower dead center
Close—44° after lower dead center.	Close—5° after top dead center

SPECIAL NOTE:—Special automatic valve tappet take-up is used. Rocker arm is mounted on eccentric bushing which is rotated to take up all valve lash or clearance by a spring under the plunger which bears on an arm of the eccentric. Plunger operates in an oil cylinder or dashpot. This device requires no attention in service and there will be no appreciable tappet clearance or lash. It must be reset when replacing valves by using special combination screwdriver and wrench, Cadillac Part No. 109627-T, and adjusting clearance to .030 inch with plunger held down at the bottom of the dashpot. Adjust with engine running and use special tool, Cadillac Part No. 109624, to hold plunger down See article in Mechanical Equipment Section.

CARBURETION:—Two Detroit Lubricator Updraft Carburetors, Model 51 One carburetor is used for each cylinder block Carburetors must be equalized when they are adjusted (see Carburetor Section for complete data)

Fuel Pump:—A C mechanical type fuel pump operated by eccentric on camshaft (see Carburetion Section).

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—Model 495. Manual pinion engagement connected to starting switch lever. Starter drives engine through reduction gears and overrunning clutch. Rotation (armature shaft) counter-clockwise at commutator end. Brush spring tension 36-40 ounces. Starter cranks engine at 80-90 R.P.M.

Starter Data

Torque	R P M.	Volts	Amperes
0 lb. ft.	2200	5.7	70
35 "	Lock	3.0	600

Mounting:—Starter flange mounted on rear face flywheel housing at right of transmission. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting cap screws, pull starter to rear to clear housing, lift from place.

GENERATOR:—Model 931-D. Third brush regulation, thermostat control Thermostat contacts open at 175°F. reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end. With standard setting, maximum charging rate is 13 5-16 5 amperes at 7 6 volts (hot) reached at 1600 R P M or 23 M P H.

Charging Rate Adjustment. Loosen hexagonal headed lock screw on end-plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw Generator is air cooled and charging rate may be set at 24 amperes (cold—maximum) without danger.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R P.M.	Amperes	Volts	R.P.M.
22-24	8.6-9.0	1300-1500	13.5-16.5	7.7-8.1	1600-1800

Brush Spring Tension:—20-28 ounces on each brush

Field Current:—3 5-4 0 amperes at 6 volts across field terminals

Mounting:—Generator flange mounted on rear face timing chain case at right of engine. Driven by timing chain. Chain adjustment automatic, requires no attention during life of chain. To remove, disconnect lead, disconnect water pump drive coupling, take out 3 flange mounting screws, slide generator to rear to disengage coupling, lift from place.

RELAY:—See paragraph on 'Apparatus Box'.

LIGHTING:—Delco-Remy Switch, Model 486-S or 487-A. Switch mounted at lower end of steering column controlled by lever on steering wheel. Lighting system new Cadillac 'Super-Safe' system equipped with new type three filament bulbs Mazda No. 3001 (32-21-21 cp.). Bulbs are interchangeable but are installed in left head lamp with 32 cp. filament at the top, and in the right hand head lamp with 32 cp. filament at the bottom. Sockets are designed so that bulb cannot be inserted incorrectly. Headlight doors, lenses and reflectors are not interchangeable, being designed to give a particular pattern of light for each headlamp filament.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21-21	Triple	3001
Fender Lights	6-8	3	S C.	63
Dash and Tail Lights	6-8	3	S C.	63
Backing and Stop Lights	6-8	15	S C.	87
Map Reading Lights	6-8	3	S.C.	63
Dome and Corner Lights	6-8	6	S.C.	81

APPARATUS BOX:—Delco-Remy, Model 480-Z. Mounted on rear of dash under cowl Consists of current limit relay (vibrating and lock-out circuit breaker), generator cut-out relay, horn relay, and a 10 ampere capacity fuse (in circuit to backing and stop lights).

Current Limit Relay:—Vibrating circuit breaker begins to operate with current load of 35-40 amperes limiting current to 5-20 amperes maximum with direct short-circuit Lock-out circuit breaker begins to operate with current load of 25-30 amperes limiting current to less than 1 ampere with direct short-circuit Circuit breaker contact gap limits, .012- 030 inch. Air gap limits, 015- 025 inch (contacts closed). Spring tension 5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

Cut-out Relay:—Contacts close at 7-9 M P.H. or 520 R P.M. (generator) with a generator voltage of 6 75-7 5 volts and open with a discharge current of 0-2 amperes. Contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

Horn Relay:—Model 266-T. Pressing horn button energizes horn relay winding, closing horn relay contacts and completing horn circuit. Horn current does not pass through horn button. Horn relay requires .25 amperes to close contacts Horn relay contact gap limits, .015-.025 inch. Air gap limits, 012- 017 inch (contacts closed).

FUSES:—Backing and stop light fuse mounted in Apparatus Box, 10 ampere capacity.

HORNS:—Klaxon vibrator type matched set with blended note. Model K-22-C Type 1160 (low note), and Model K-22-C Type 1161 (high note). Horns should draw 6.0-8 0 amperes at 6 volts.

CADILLAC

V-16 MODEL 452-B (1932), SERIAL NUMBERS 1,400,001 UP
V-16 MODEL 452-C (1933), SERIAL NUMBERS 5,000,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on right hand side of chain housing directly behind fan.

ENGINE:—Sixteen cylinder 45 degree 'V', 'I' or overhead valve type, 3x4 inches bore and stroke, 452 cubic inch displacement, rated at 57.7 H.P., develops 165 H.P. at 3400 R.P.M. Standard compression ratio 5.7-1. Optional low compression ratios of 5.4-1 and 4.9-1 are available. When installed at factory to compensate for fuel characteristics or altitude conditions the standard ignition setting is used. Standard compression pressure 123 pounds at 1000 R.P.M.

BATTERY:—Delco, Type 25-AW ('32), 25-AF ('33), 6 volt, 25 plate, 190 ampere hour capacity (20 hour rate). Starting capacity 234 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—On outside of frame under right hand front fender.
Dimensions:—Width, 7". Length, 16 3/16". Height, 9 3/16".

IGNITION:—Coil Model 530-K (2 used). Coils are mounted in recess in radiator top tank directly above distributor.
Ignition Current:—2.5 amperes (engine idling), 4 amperes (engine stopped).
Ignition Switch:—Delco-Remy Dual-lock, Model 426-T co-incidental ignition switch and transmission lock (see Equipment Section for complete data).

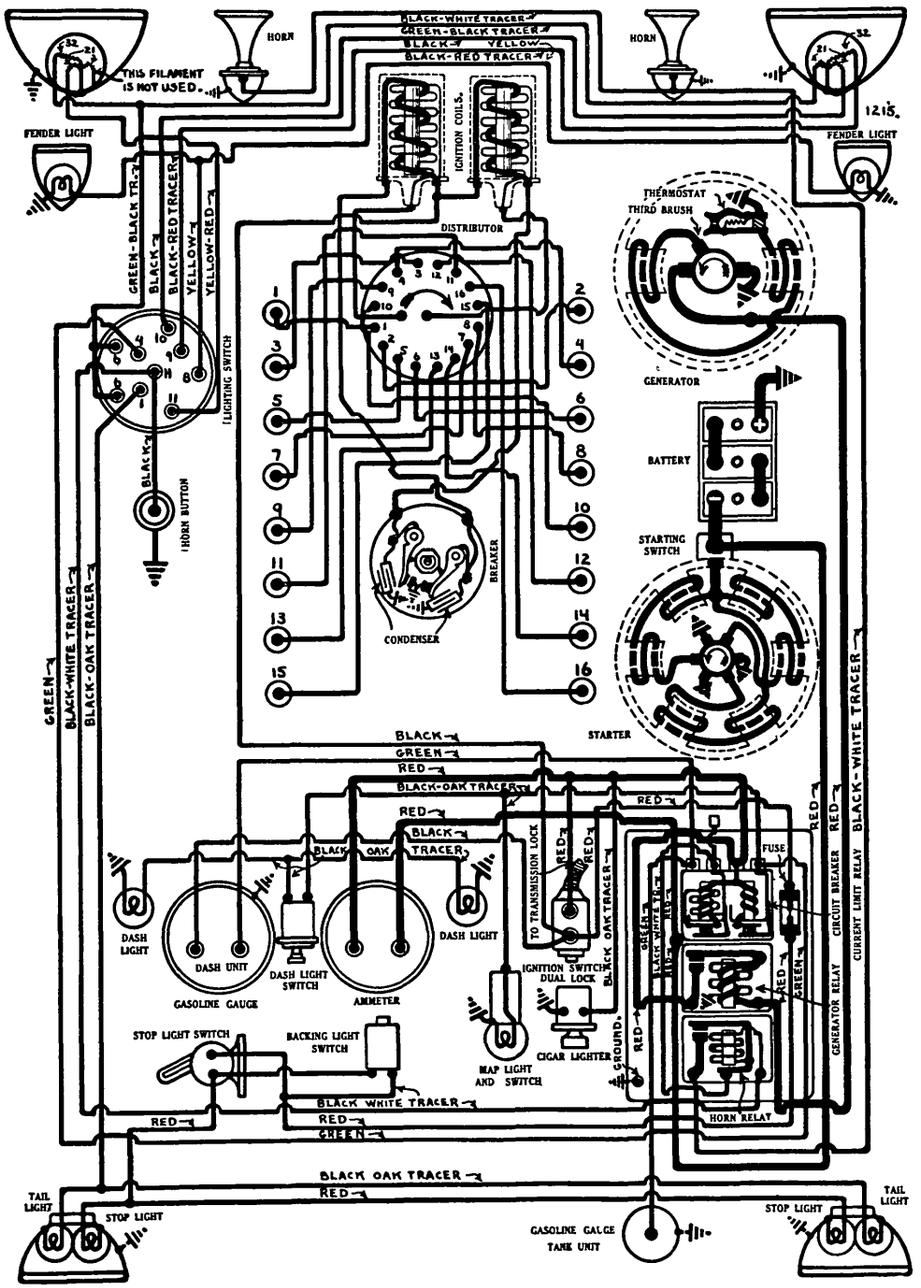
Distributor Model 4093 ('32), 4111 ('33). Two breaker, 8 lobe cam, full automatic advance type. Contacts open alternately at 22½ degree intervals, corresponding to 45 degree firing intervals of the engine. Contacts must be synchronized (see Timing).
Breaker Gap:—Set contact gap at .016". Hold within limits of .014-.018".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Cam Angles—Closed 27°, open 18° (distributor) each set independently.

Automatic Advance—Model 4093

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	4		600
17.25		1400	34 5		2700

Automatic Advance—Model 4111

Start	250	1.5			500
14	1200	28			2400



Mounting:—Distributor mounted at front of engine between cylinder banks. Driven by gears from camshaft. To remove, disconnect primary leads, take off distributor cap, take out two mounting screws in distributor bracket.

IGNITION TIMING:—Standard Settings as follows:
1932—10°5′ or 1¼" (flywheel), 037⅝ (piston) before top dead center.
1933—4° (flywheel), .006" (piston) before top dead center.

To Set Timing:—First remove cover over inspection hole in flywheel housing. Center distributor pointer on quadrant scale by loosening hold-down screw in advance arm and rotating distributor cup, tighten hold-down screw. With No. 1 piston on compression stroke, turn engine over (see note) until flywheel mark 'IG/A' (10°5′—'32, 4°—'33 before the dead center mark 'C/1-15') is directly opposite indicator on flywheel housing. Then take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that first set of breaker contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw. Connect spark plugs as indicated on diagram.

Synchronizing Contacts—using synchronizing tool, Cadillac Part No. 109224. Install tool and adjust so that first set of contacts begin to open with the pointer on farthest indicating point on quadrant 'R.H.' Crank engine over until pointer is directly opposite next graduation on the quadrant '16 L.H.' Loosen lock screws on movable sub-plate (carrying second set of breaker contacts), turn eccentric adjusting screw until contacts begin to open, tighten lock screws. The first set or "stationary' set of contacts should open again when pointer is directly opposite center point on quadrant. These marks are 22½ degrees apart (see illustration on 1931 V-16 wiring diagram).

Second Method—as part of timing operation. After distributor has been timed to engine (second paragraph above), turn engine over 45 degrees to firing position of piston No. 8. Loosen lock screws on movable sub-plate,

CADILLAC

V-16 MODEL 452-B (1932), SERIAL NUMBERS 1,400,001 UP
V-16 MODEL 452-C (1933), SERIAL NUMBERS 5,000,001 UP
DELCO-REMY SYSTEM

turn eccentric adjusting screw until contacts begin to open, tighten locking screws, check contact gap.

NOTE:—No provision is made for hand cranking of engine. Manufacturer recommends that transmission be engaged, the car jacked up and engine cranked by turning one of the rear wheels.

Firing Order:—1-8-9-14-3-6-11-2-15-10-7-4-13-12-5-16 with cylinders numbered as shown on diagram, or 1L-4R-5L-7R-2L-3R-6L-1R-8L-5R-4L-2R-7L-6R-3L-8R with cylinder banks right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder nearest radiator in each case.

Spark Plugs:—18 MM. Metric. A.C. Type D-8 ('32), G-7 ('33). Set gaps at .028".

VALVE TIMING:—Camshaft mounted directly above crankshaft driven by silent chain. Chain adjustment automatic. Generator also driven by timing chain. Engine valve-in-head type with valves operated by rocker arms on head and pushrods between cylinder banks. Valve tappet clearance adjustment automatic (see Special Note).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 446"	11/32"	6 9/64"	45°	11/32"
Exhaust	1 452"	11/32"	6 9/64"	45°	11/32'

Tappet Clearance

No appreciable clearance or lash in service (see Special Note).

Spring Pressure

Closed ..... 70 pounds
Open ..... 167 pounds

Timing

Intake Valves	Exhaust Valves
Open—At top dead center	Open—39° before lower dead center
Close—44° after lower dead center	Close—5° after top dead center

SPECIAL NOTE:—Special automatic valve tappet take-up is used. Rocker arm is mounted on eccentric bushing which is rotated to take up all valve lash or clearance by a spring under the plunger which bears on an arm of the eccentric. Plunger operates in an oil cylinder or dashpot. This device requires no attention in service and there will be no appreciable tappet clearance or lash. It must be reset when replacing valves by using special combination screwdriver and wrench, Cadillac Part No. 109627-T, and adjusting clearance to .030 inch with plunger held down at the bottom of the dashpot. Adjust with engine running and use special tool, Cadillac Part No. 109624, to hold plunger down See article in Mechanical Equipment Section

CARBURETION:—Two Detroit Lubricator Updraft Carburetors, Model 51 One carburetor is used for each cylinder bank Carburetors must be equalized when they are adjusted (see Carburetor Section for complete data)

Fuel Pump:—A C mechanical fuel pump operated by eccentric on camshaft (see Carburetion Section).

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—Model 495. Manual pinion engagement connected to starting switch lever. Starter drives engine through reduction gears and overrunning clutch. Rotation (armature shaft) counter-clockwise at commutator end. Brush spring tension 36-40 ounces. Starter cranks engine at 80-90 R.P.M.

Starter Data

Torque	R P M	Volts	Amperes
0 lb. ft.	2200	5.7	70
35 "	Lock	3.0	600

Mounting:—Starter flange mounted on rear face flywheel housing at right of transmission. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting cap screws, pull starter to rear to clear housing, lift from place.

GENERATOR:—Model 931-D. Third brush regulation, thermostat control Thermostat contacts open at 175°F. reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end With standard setting, maximum charging rate is 13 5-16 5 amperes at 7.6 volts (hot) reached at 1600 R P M. or 24 M P.H.

Charging Rate Adjustment:—Loosen hexagonal headed lock screw on end-plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw. Generator is air cooled and charging rate may be set at 24 amperes (cold—maximum) without danger.

Generator Data

Cold Test Amperes	Cold Test Volts	Cold Test R.P.M.	Hot Test Amperes	Hot Test Volts	Hot Test R.P.M.
22-24	8.6-9.0	1300-1500	13.5-16.5	7.7-8.1	1600-1800

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—3 5-4 0 amperes at 6 volts across field terminals

Mounting:—Generator flange mounted on rear face timing chain case at right of engine. Driven by timing chain. Chain adjustment automatic, requires no attention during life of chain. To remove, disconnect lead, disconnect water pump drive coupling, take out 3 flange mounting screws, slide generator to rear to disengage coupling, lift from place.

RELAY:—See paragraph on 'Apparatus Box'.

LIGHTING:—Delco-Remy Switch, Model 486-S or 487-A. Switch is mounted at lower end of steering column controlled by lever on steering wheel. Lighting system new Cadillac 'Super-Safe' system equipped with new type three filament bulbs Mazda No. 3001 (32-21-21 cp.). Bulbs are interchangeable but are installed in left head lamp with 32 cp. filament at the top, and in the right hand head lamp with 32 cp. filament at the bottom. Sockets are designed so that bulb cannot be inserted incorrectly. Headlight doors, lenses and reflectors are not interchangeable, being designed to give a particular pattern of light for each headlamp filament

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21-21	Triple	3001
Fender Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Backing and Stop Lights	6-8	15	S.C.	87
Map Reading Lights	6-8	3	S.C.	63
Dome and Corner Lights	6-8	6	S.C.	81

APPARATUS BOX:—Delco-Remy, Model 480-Z. Mounted on rear of dash under cowl. Consists of current limit relay (vibrating and lock-out circuit breaker), generator cut-out relay, horn relay, and a 10 ampere capacity fuse (in circuit to backing and stop lights).

Current Limit Relay:—Vibrating circuit breaker begins to operate with current load of 35-40 amperes limiting current to 5-20 amperes maximum with direct short-circuit. Lock-out circuit breaker begins to operate with current load of 25-30 amperes limiting current to less than 1 ampere with direct short-circuit. Circuit breaker contact gap limits, .012-.030 inch. Air gap limits 015-030 inch (contacts closed) Spring tension 5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

Cut-out Relay:—Contacts close at 7-9 M.P.H. or 520 R.P.M. (generator) with a generator voltage of 6.75-7.5 volts and open with a discharge current of 0-2 amperes. Contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

Horn Relay:—Model 266-T. Pressing horn button energizes horn relay winding, closing horn relay contacts and completing horn circuit. Horn current does not pass through horn button. Horn relay requires .25 amperes to close contacts Horn relay contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

FUSES:—Backing and stop light fuse mounted in Apparatus Box, 10 ampere capacity.

HORNS:—Klaxon vibrator type matched set with blended note. Model K-22-C Type 1160 (low note), and Model K-22-C Type 1161 (high note). Horns should draw 6.0-8.0 amperes at 6 volts.

SERIAL NUMBER:—Same as engine number. Stamped on right hand side of crankcase below water inlet. First number, 3,100,101 ('34), 3,105,101 ('35).

COMPRESSION:—Ratio—6.25-1 (Std.), 5.75-1 (Optl.). **Pressure**—148 lbs. at 1000 R.P.M. or 160 lbs. at 2800 R.P.M. or approx. 105-110 lbs. at cranking speed (std. head).

VACUUM READING:—Gauge should show steady read-reading of 18-20" with engine idling.

IGNITION:—Coil Type 539-D. Lock coil type mounted on back of instrument board.

Ignition Current. 2.2 amperes (idling), 4.4 amperes (engine stopped).
Ignition Switch—Delco-Remy Model 431-D. Assembled as part of coil.

Distributor:—Type 661-V. Single breaker, 8 lobe cam type. No synchronization is required. Regular 45° firing intervals (90° 'V' type engine).

Breaker Gap—Set at .015". Limits .0125-.0175".

Breaker Arm Spring Tension—19-23 ounces.

Manual Advance. 20° (engine) adjustment at distributor only.
Cam Angles—Closed 31°. Open 14° (distributor).

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1.5	1000
12	1200	24	2400

Mounting—Two cap screw flange mounting at front of engine (between banks).

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....4° BTDC..... .0075" BTDC.
To Set: Loosen hold-down screw in pointer arm on distributor, center pointer on quadrant scale, tighten hold-down screw. Take off flywheel inspection cover (top—right hand side). Turn engine over with No. 1 piston (right hand block) on compression, stop when 'IG/A-1' mark on flywheel before TDC. mark 'C¼' lines up with indicator on housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. See diagram for spark plug cable connections.

Synchronization—Not required.

Motor Gauge—Weidenhoff Adapter #104, Rod #42.

Firing Order:—1-2-7-8-4-5-6-3. See diagram.

Spark Plugs:—A.C., Type G-7 ('34), G-6 ('35). 18 MM. Metric type.

Spark Plug Gaps—.025-.027".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

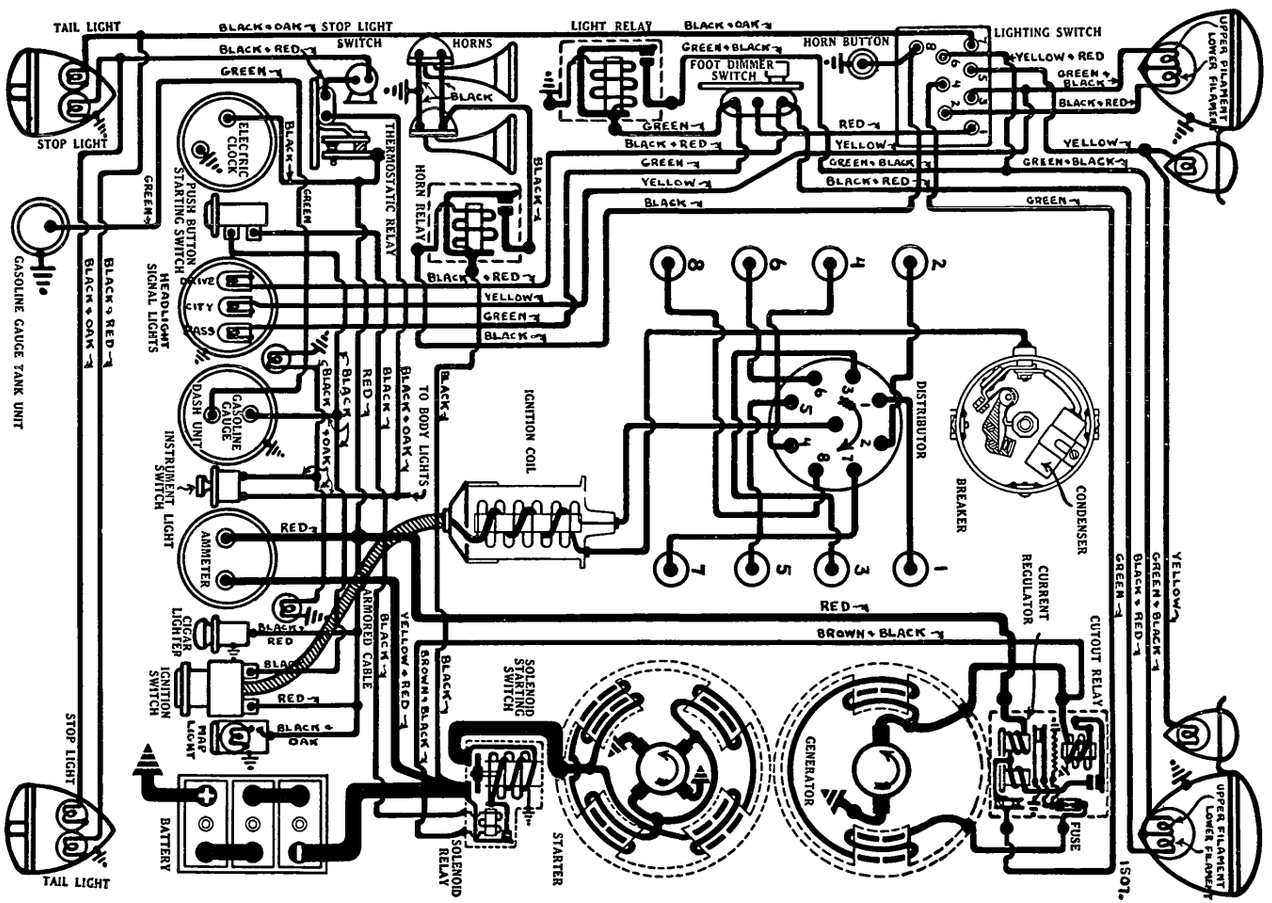
Carburetor:—Detroit Lubricator, Type X-8244 2" updraft type (see Carburetor Section).
Choke Control—Detroit semi-automatic type.

Fuel Pump:—A.C., Type D mechanical pump.
Gasoline Gauge:—A.C. Electric type.

VALVE TIMING:—To Check Timing—No flywheel marks. Intake opening point for #1 cylinder is approximately 1.883 teeth before flywheel mark 'C1/4'. with piston .0168" before top dead center.

Motor Gauge—Weidenhoff Adapter #104, Rod #42.

Tappet Clearance:—.006" Int., .010" Exh., engine cold.
Valve Spring Pressure:—Valve closed—70 lbs. at 1.751" (inner spring), 1.922" (outer). Valve open—185 lbs. at 1.407" (inner), 1.587" (outer).



LUBRICATION:—Crankcase Capacity—8 quarts.
Normal Oil Pressure—30 lbs. at idling speed.

BATTERY:—Delco, Type 17-D, 17-DF (Export), 6 volt, 17 plate, 130 A.H. capacity (20 hour rate).

Starting Capacity—156 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under right hand front seat or right front fender (when mounted under fender, battery is accessible by lifting engine hood).

Dimensions—Width, 7". Length, 11¾". Height, 9⅜".

STARTER:—Model 728-U, 728-V (RHD.). Armature No. 818134. Four pole mechanical shift (solenoid) type through reduction gears and overrunning clutch.

Rotation — Counter-clockwise (armature shaft) commutator end and also drive end (drive gear).

Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
28 "	Lock	3.0	600

Starting Switch:—Solenoid switch, Type 1514, 1521, 1519 (R.H.D.). Pushbutton switch 1379. Solenoid (starting switch and gear shift) mounted on starter field frame, controlled by pushbutton switch, operative only with ignition 'on'. See Equipment Section 'Starter Controls'.

Starter Mounting:—Three screw flange mounting at right of transmission (on rear face of flywheel housing). Shift solenoid mounted on starter.

GENERATOR:—Model 933-B. Armature No. 1854458. Current regulated, two-brush shunt wound type. Lamp load capacity, 11 amperes.

Adjustment—See Control Unit paragraph and Electrical Equipment Section for complete data. Generator is two-brush type—no third brush is used. Lamp load must not exceed 11 amperes.

Charging Rate—Constant rate at all speeds above 1200 R.P.M. or 20 M.P.H.

Performance Data

	Amperes Lamps Off	Amperes Lamps On	Volts	R.P.M.
Cold	13-16	20.5	7.7-8.1	1200
Hot	9-11	15.5	7.3-7.55	1200

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—1.6-1.9 amperes at 6 volts.

Brush Spring Tension—22-26 ounces.

Field Fuse—6 ampere capacity (in control unit).

Generator Mounting:—Three bolt flange mounting on right side. Drop mud pan and remove generator from underneath car. Do not disturb pivot cap screw on front of chain case (used only for chain adjustment).

Chain Adjustment. Loosen generator mounting bolts and pivot screw, loosen second pivot screw on front of chain case, pull generator away from engine until tight, slack off ⅛", tighten mounting bolts and pivot screws.

CONTROL UNIT:—Delco-Remy Type 5541. Consists of cut-out relay, current regulator unit, field fuse, field resistance, thermostat relay. See Electrical Equipment Section 'Delco-Remy Current Regulator (Lamp Load Type)' for complete data.

Adjustment—Increase current regulator armature spring tension to increase generator output, decrease spring tension to decrease output.

Setting—13-16 amperes (cold—lamps off), 19-22 amperes (cold—lamps on). Above 'lamps on' figure correct with 11 ampere lamp load. Cold figures correct with generator at 70°F.

Cut-out Relay

Cuts in—6.75-7.25 volts, 650-750 R.P.M.
Cuts out—3 ampere discharge (max. at 6.3 volts).
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Current Regulator

Regulator Contact Gap—.015-.025".

Contact Spring Tension—2.0-2.5 ounces.

Air Gap—.055-.060" between armature and center of core (armature down until fibre bumper just touches stop).
.006-.008" between fibre bumper and stop (armature up).

LIGHTING:—Series 10, 20—Switch Model 487-J, 487-G (RHD.). Series 30—Switch Model 487-H, 487-K (Export). Foot Control Switch Model 465-Z. Foot Control switch used to control assymetric passing beam (obtained by depressing beam from right hand headlamp only). Operative with light switch in 'Country' or driving position. Headlights are aimed straight forward.

Headlight Indicators—Illuminated dial on instrument board indicates position of light switch lever as follows:

Pass—Assymetric passing beam (see above).

City—Lower beam—upper filaments.

Drive—Upper beam—lower filaments.

Headlight Type—New prefocused type bulb with flange base. Not interchangeable with other type bulbs. No focusing operation required. Headlights are aimed straight forward (with lenses removed). Lenses are marked 'Right' and 'Left' and are not interchangeable.

Bulb Specifications

Lamps	Candlepower	Mazda No.
Headlights (new Pre-focused type)	32-32	2330-L
Rear Signal (Stop) lights	15	87
Rear (tail), Map, Parking, Instrument	3	63
Dome, Quarter, Deck, Tonneau	6	81
Headlight Indicators	....	40

HEADLIGHT THERMOSTAT RELAY: — Thermostatic arm type current limit relay (no winding) in Control Unit case. Protects headlamp circuits. Contacts open with lamp load of 20 amperes at temperature of 210°F.

THERMOSTAT RELAY:—Model 411-A. New type current limit relay operated by thermostatic arm (no winding). Adjustment is sealed and complete unit should be replaced if found to be defective. Contacts will remain closed with 25 ampere current load but will open in one minute with load of 38 amperes at temperature of 70-80°F.

HORNS:—Klaxon, Model K-33B, Type 1855 (low note), Type 1856 (high note). Matched set, blended tone, vibrator type. Horns operated by horn relay. Horn current, 24-28 amperes.

Horn Relay Model 266-T:—Horn relay requires .25 amperes at 2.0 volts (min.) to close contacts.

Current draw, .8 amps.

Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

FUSES:—Generator field—6 ampere capacity (in control unit).

SERIAL NUMBER:—Same as engine number Located on right hand side of chain case in front of generator First number 4,100,001 ('34), 4,101,701 ('35)

COMPRESSSION:—Ratio—6 0-1 (std), 5 65-1 (optl) **Pressure**—145 lbs at 1000 R P M or 160 lbs at 3200 R P M or approx 100-105 lbs at cranking speed (std head)

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling

IGNITION:—Coil Model 553-E. Two coil unit assembled with ignition switch
Ignition Switch—Model 431-EA Connected to coil unit by armored cable

Distributor Model 667-C. Double breaker, 6 lobe cam, full automatic advance type Contacts open alternately at 37½° and 22½° intervals, corresponding to 75° and 45° firing intervals of engine (unequal firing intervals caused by 45° included angle between cylinder banks) Contacts must be synchronized (see Timing)

Breaker Gap—Set gap at 020 Limits, 018-024

Breaker Arm Spring Tension—17-21 ounces

Cam Angles (Distributor Degrees)—Closed 39° Open 21° Each set operates independently

Manual Advance—28° (engine), adjustment at distributor

Automatic Advance

Distributor		Engine	
Degrees	R P M	Degrees	R P M
Start	300	2	600
12	800	24	1600
16	1100	32	2200
19	1400	38	2800

IGNITION TIMING:— Flywheel Degs Piston Position
All engines 4° BTDC 0058 BTDC
Timing (Stationary Contacts)—Loosen hold-down screw in advance arm, center distributor pointer on quadrant scale by rotating distributor, tighten hold-down screw, take off cover plate over inspection plate in flywheel housing With #1 piston on compression, crank engine by jacking up one rear wheel, placing car in gear and turning wheel, stop with piston 4° before top dead center when flywheel mark 'IG A' lines up with indicator on housing (the IG/A mark does not have any identifying symbol and care must be taken to use the right mark, which is 4° before flywheel mark 'C/1-11') Loosen advance arm clamp bolt, rotate distributor housing until stationary contacts (mounted directly on breaker plate) are beginning to open, tighten lock bolt, check rotor position and spark plug connections (see diagram) Then synchronize movable contacts
Synchronization (Movable Contacts)—first method—Turn engine over 75° or slightly less than ¼ revolution to firing position of piston #4 stop when flywheel mark 'IG/A', which is 4° before top dead center mark 'C 4-10' lines up with indicator on housing, loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws

Synchronization—second method:—Use synchronizing tool, Cadillac Part No 109224. This tool developed for use on V-16 but has special marks for use on V-12 distributor with unequal firing intervals Install tool, adjust so that stationary contacts begin to open when pointer is on farthest indicating point on quadrant 'RH', turn engine over or rotate distributor shaft until pointer is directly opposite '12 L H' mark on quadrant, loosen lock screws on movable sub-plate, turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Firing Order—1-4-9-8-5-2-11-10-3-6-7-12 (see diagram) Cables not connected in this order

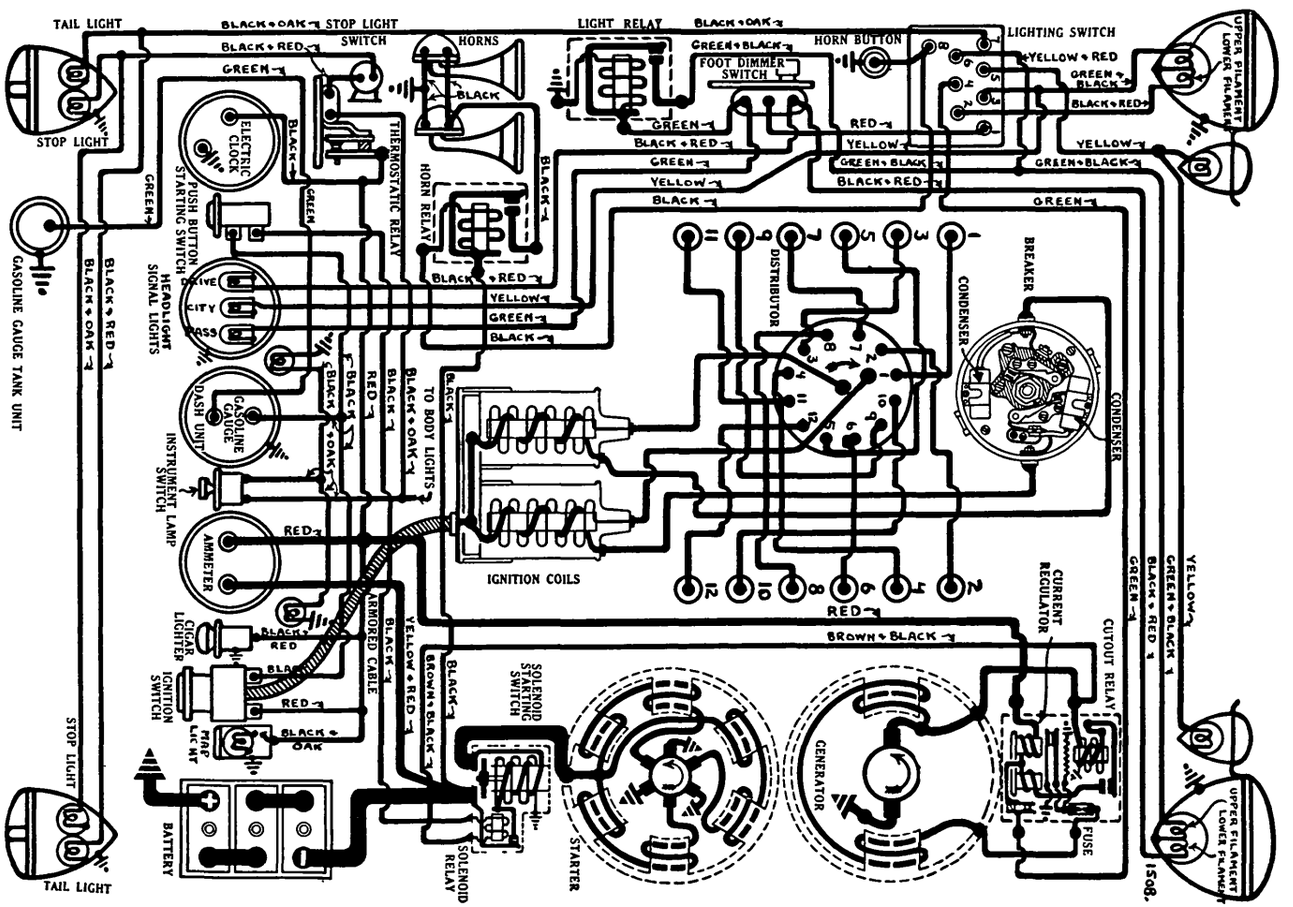
Spark Plugs:—A C, Type G-7 ('34), G-6 ('35). 18 MM Metric type

Spark Plug Gaps— 026" Limits, 025-027"

CARBURETION: — (Fuel System) See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge

Carburetor:—Detroit, Model 51, 1½" expanding vane or air valve, updraft type One carburetor used for each cylinder bank with interconnected throttles Carburetor throttles must be synchronized

Automatic Choke—Detroit semi-automatic type



Fuel Pump:—A C, Type D

Gasoline Gauge:—A C, Electric type

VALVE TIMING:—To Check Valve Timing—#1 intake valve should open with piston on top dead center when flywheel mark 'C/1-11' lines up with indicator. **Motor Gauge**—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance:—None in service (automatic take-up) See Mechanical Equipment Section

Valve Spring Pressure:—Valve closed—69½ lbs at 1 751" (inner spring), 1 922" (outer spring) Valve open—167 lbs at 1 407" (inner), 1 587" (outer).

LUBRICATION:—Crankcase Capacity—9 quarts.
Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 21-C, 21-CF (Export), 6 volt, 21 plate, 164 A.H. capacity (20 hour rate).

Starting Capacity—195 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In compartment under right front fender, accessible by lifting engine hood.

STARTER:—Model 580. Armature No. 1837058. Six pole type with reduction gears and overrunning clutch. Starter drive is solenoid operated pinion shift type.

Rotation—Counter-clockwise (armature shaft) at commutator end.

Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2200	5.7	70
35 "	Lock	3.0	600

Starting Switch:—Solenoid Switch Model 1515. Push-button Switch Model 1379. Starter pinion shift operated by solenoid switch. Solenoid circuit controlled by solenoid relay and pushbutton switch on instrument panel. See Equipment Section.

Mounting:—Flange mounted on rear face of flywheel housing at right of transmission. To remove, take out 3 flange mounting cap screws.

GENERATOR:—Model 933-C. Armature No. 1854458. Current regulated, two-brush shunt wound type. Lamp load capacity limited to 11 amperes.

Adjustment—See Control Unit paragraph and Equipment Section for complete data. Generator is two-brush type—no third brush used.

Charging Rate—Constant at all speeds above 1200 R.P.M. or 16 M.P.H.

Performance Data

	Amperes Lamps off	Amperes Lamps on	Volts	R.P.M.
Cold	13-16	19-22	7.7-8.1	1200
Hot	9-11	15.5	7.3-7.55	1200

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—1.6-1.9 amperes at 6.0 volts.

Brush Spring Tension—22-26 ounces each.

Field Fuse—6 ampere capacity (in control unit).

Mounting:—Flange mounted on rear face of timing chain case at right of engine. To remove, disconnect water pump drive coupling, take out flange mounting screws. Chain adjustment automatic, requires no attention during life of chain.

CONTROL UNIT:—Model 5541. Consists of Cut-out Relay, Current Regulator unit, field fuse, field resistance, thermostat relay in case on generator field frame. See Delco-Remy Current Regulator (Lamp Load Type) in Electrical Equipment Section.

Cut-out Relay

Cuts in—6.75-7.25 volts.

Cuts out—2.5 ampere discharge (max)., 6.3 volts.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

Current Regulator

Adjustment—Operate generator at 2500 R.P.M, adjust current regulator armature spring tension to secure output below (increase spring tension to increase generator output, decrease spring tension to decrease output).

Setting—13-16 amperes (cold—lamps off), 19-22 amperes (cold—11 ampere lamp load).

Regulator Contact Gap—.015-.025".

Contact Spring Tension—2.0-2.5 ounces.

Air Gap—.055-.060" between armature and center of core (armature down until fibre bumper just touches stop).
.006-.008" between fibre bumper and stop (armature up).

LIGHTING:—Switch Model 487-H, 487-K (Export). Foot Control Switch Model 465-Z. Foot control switch used to control assymetric passing beam (obtained by depressing beam from right hand headlight only). Operative with light switch in 'Country' or Driving position.

Headlight Indicator—Illuminated dial on instrument board indicates position of lighting switch lever as follows:

Pass—Assymetric passing beam (see above)

City—Lower beam—upper filaments.

Drive—Upper beam—lower filaments.

Bulb Specifications

Lamps	Candlepower	Mazda No.
Headlights	32-32	2330-L
Rear Signal (Stop)	15	87
Tail, Map, Parking, Instrument	3	63
Dome, Quarter, Deck, Tonneau	6	81
Indicator Lights	....	40

THERMOSTAT RELAY:—Model 411-A. New type current limit relay operated by thermostatic arm (no winding). Adjustment is sealed and complete unit should be replaced if found to be defective.

HEADLIGHT THERMOSTAT RELAY:—Thermostatic arm type current limit relay (no winding) in control unit. Protects headlamp circuits. Contacts open with lamp load of 20 amperes at temperature of 210°F.

HORNS:—Klaxon, Model K-33B, Type 1855 (low note), Type 1856 (high note), matched set, blended tone, vibrator type. Horns operated by horn relay.

Horn Relay Model 266-T:—Horn relay requires .25 amperes at 2.0 volts (min.) to close contacts. Current draw, .8 amperes.

Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

FUSES:—Generator field—6 ampere capacity.

SERIAL NUMBER:—Same as engine number. Located on right hand side of crankcase in front of generator. First number, 5,100,001.

Bore—3". **Stroke**—4".
Free end .0001" clearance or hand push fit at Intake Valves Open—At TDC. Close—44° ALDC.

COMPRESSION:—Ratio—6.0-1 (std)., 5.65-1 (optl.).
Pressure—154 lbs. at 1000 R.P.M. or 172 lbs. at 3200 R.P.M. or approx. 100-105 lbs. at cranking speed (std. head).

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 320 R.P.M.

IGNITION:—Coil Model 553-E. Two coil unit assembled with ignition switch.

Ignition Switch—Model 431-EA. Connected to coil unit by armored cable.

Distributor Model 4118. Double breaker, 8 lobe cam, full automatic advance type. Contacts open alternately at regular 22½° intervals, corresponding to 45° firing interval of engine. Contacts must be synchronized (see Timing).

Breaker Gap—Set at .016". Limits .014-.018".

Breaker Arm Spring Tension—17-21 ounces.

Cam Angles (Distributor Degrees) — Closed 31°. Open 14°. Each set operates independently and controls one coil.

Manual Advance—28° (engine), adjustment at distributor only.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	2.5	400
8.25	600	16.5	1200
17	1100	34	2200

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....4° BTDC. ..... .0058" BTDC.
Timing (Stationary Contacts)—Loosen hold-down screw in advance arm, center distributor pointer on quadrant scale by rotating distributor, tighten hold-down screw, take off cover plate over inspection hole in flywheel housing. With #1 piston on compression, crank engine by jacking up one rear wheel, placing car in gear and turning wheel, stop with piston 4° before top dead center when flywheel mark 'IG/A' (which is 4° before top dead center mark 'C/1-15') lines up with indicator on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, check rotor position and spark plug cable connections (see diagram). Then synchronize.

Synchronization (Movable Contacts)—first method:—Turn engine over 45° or ⅛ revolution to firing position of piston #8, stop when 'IG/A' mark lines up with indicator, loosen lock screw on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

Synchronization—Second Method—Use synchronizing tool, Cadillac Part No. 109224. Install tool and adjust so that stationary or first set of contacts begin to open with pointer opposite farthest indicating point on quadrant 'R.H.', turn engine over until pointer is directly opposite next or '16 L.H.' graduation on quadrant. Loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts open, tighten lockscrew.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

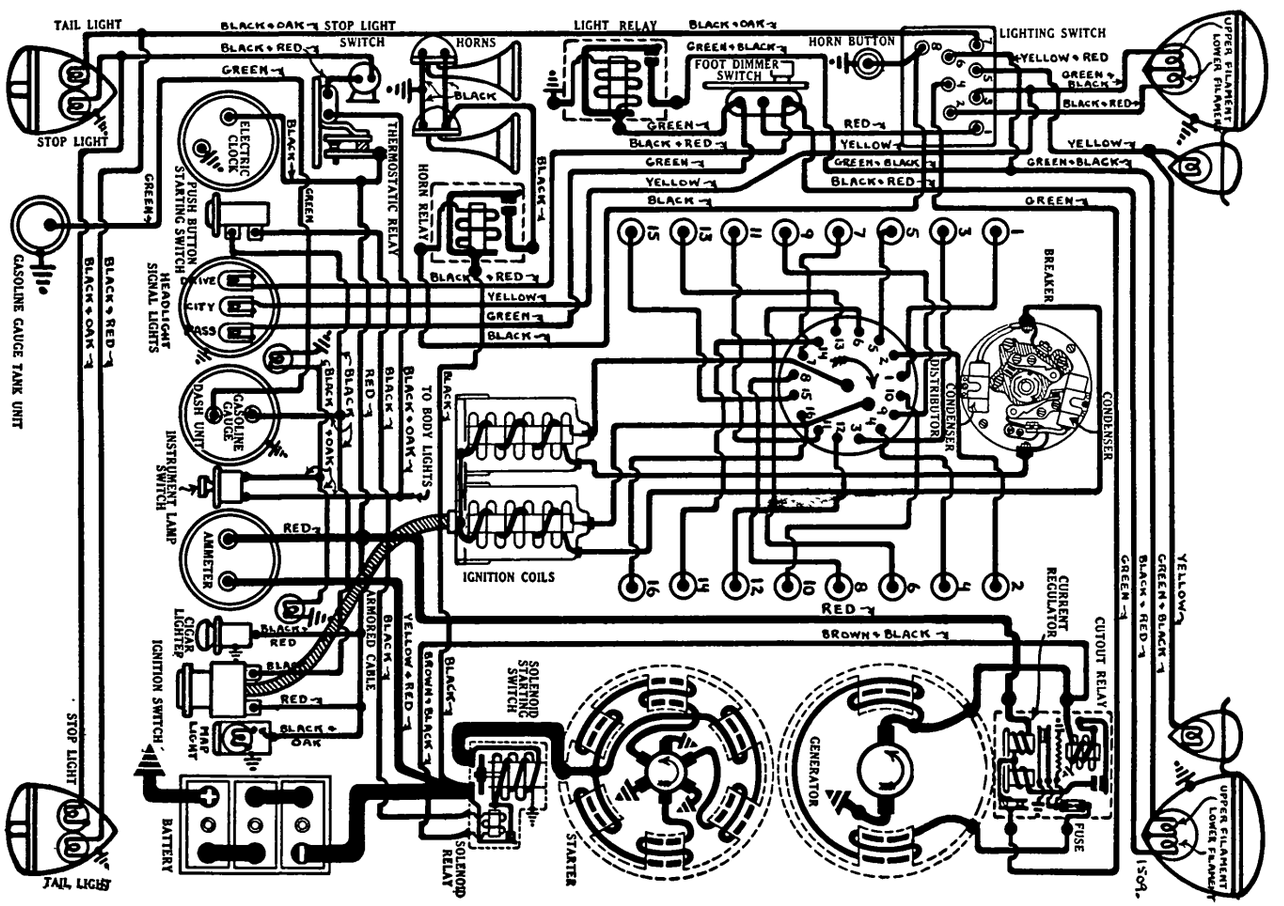
Firing Order: — 1-8-9-14-3-6-11-2-15-10-7-4-13-12-5-16 (see diagram). Spark plug cables not connected in this order.

Spark Plugs:—A.C., Type G-7 ('34), G-6 ('35). 18 MM. Metric type.

Spark Plug Gaps—.026". Limits, .025-.027".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Detroit, Model 51, 1½" expanding vane or air valve, updraft type. One carburetor used for each cylinder bank with interconnected throttles. Carburetor throttles must be synchronized.
Automatic Choke—Detroit semi-automatic type.



Fuel Pump:—A.C., Type D.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Valve Timing—#1 intake valve should open with piston on top dead center when flywheel mark 'C1/15' lines up with indicator.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance:—None in service (automatic take-up). See Mechanical Equipment Section.

Valve Spring Pressure—Valve closed—64 lbs. at 1.751 (inner spring), 1.875" (outer). Valve open—141 lbs. at 1.407" (inner), 1.531" (outer).

LUBRICATION:—Crankcase Capacity—10 quarts.

Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 25-A, 25-AF (Export), 6 volt, 25 plate, 196 A.H. capacity (20 hour rate).

Starting Capacity—234 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal).

Location—In compartment under right front fender. Accessible by lifting engine hood.

STARTER:—Model 580. Armature No. 1837058. Six pole type with reduction gears and overrunning clutch. Starter drive is solenoid operated pinion shift type.

Rotation—Counter-clockwise (armature shaft) at commutator end.

Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2200	5.7	70
35 "	Lock	3.0	600

Starting Switch:—Solenoid Switch Model 1515. Push-button Switch Model 1379. Starter pinion shift operated by solenoid switch. Solenoid circuit controlled by solenoid relay and pushbutton switch on instrument panel (see Equipment Section).

Mounting:—Flange mounted on rear face of flywheel housing at right of transmission. To remove, take out 3 flange mounting cap screws.

GENERATOR:—Model 933-C. Armature No. 1854458. Current regulated, two-brush shunt wound type. Lamp load capacity limited to 11 amperes.

Adjustment—See Control Unit paragraph and Equipment Section for complete data. Generator is two-brush type—no third brush used.

Charging Rate—Constant at all speeds above 1200 R.P.M. or 16 M.P.H.

Performance Data

	Amperes Lamps off	Amperes Lamps on	Volts	R.P.M.
Cold	13-16	19-22	7.7-8.1	1200
Hot	9-11	15.5	7.3-7.55	1200

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—1.6-1.9 amperes at 6.0 volts.

Brush Spring Tension—22-26 ounces each.

Field Fuse—6 ampere capacity (in control unit).

Mounting:—Flange mounted on rear face of timing chain case at right of engine. To remove, disconnect water pump drive coupling, take out flange mounting screws. Chain adjustment automatic, requires no attention during life of chain.

CONTROL UNIT:—Model 5541. Consists of Cut-out Relay, Current Regulator unit, field fuse, field resistance, thermostat relay in case on generator field frame. See Delco-Remy Current Regulator (Lamp Load Type) in Electrical Equipment Section.

Cut-out Relay

Cuts in—6.75-7.25 volts.

Cuts out—2.5 ampere discharge (max.) at 6.3 volts.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

Current Regulator

Adjustment—Operate generator at 2500 R.P.M., adjust current regulator armature spring tension to secure output below (increase spring tension to increase generator output, decrease spring tension to decrease output).

Setting—13-16 amperes (cold—lamps off), 19-22 amperes (cold—lamps on). Lamps on figure correct with 11 ampere lamp load.

Regulator Contact Gap—.015-.025".

Air Gap—.055-.060" between armature and center of core (armature down until fibre bumper just touches stop).
.006-.008" between fibre bumper and stop (armature up).

LIGHTING:—Switch Model 487-H, 487-K (Export). Foot Control Switch Model 465-Z. Foot control switch used to control assymetric passing beam (obtained by depressing beam from right hand headlight only). Operative with light switch in 'Country' or Driving position.

Headlight Indicator—Illuminated dial on instrument board indicates position of lighting switch lever as follows:

Pass—Assymetric passing beam (see above).

City—Lower beam—upper filaments.

Drive—Upper beam—lower filaments.

Bulb Specifications

Lamps	Candlepower	Mazda No.
Headlights	32-32	2330-L
Rear Signal (Stop)	15	87
Tail, Map, Parking, Instrument	3	63
Dome, Quarter, Deck, Tonneau	6	81
Indicator Lights	....	40

THERMOSTAT RELAY:—Model 411-A. New type current limit relay operated by thermostatic arm (no winding). Adjustment is sealed and complete unit should be replaced of found to be defective.

HEADLIGHT THERMOSTAT RELAY: — Thermostatic arm type current limit relay (no winding) in Control Unit case. Protects headlamp circuits. Contacts open with lamp load of 20 amperes at temperature of 210°F.

HORNS:—Klaxon, Model K-33B, Type 1855 (low note), Type 1856 (high note). Matched set, blended tone, vibrator type. Horns operated by horn relay. Horn current, 24-28 amperes.

Horn Relay Model 266-T:—Horn relay requires .25 amperes at 2.0 volts (min.) to close contacts.

Current draw, .8 amps.

Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

FUSES:—Generator field—6 amperes capacity.

SERIAL NUMBER:—Same as engine number. Located on top of crankcase behind fan support. First number 6010001 (60), 3110001 (70, 75).

COMPRESSION:—Ratio 6.25-1 Std. 5.75-1 Optl.
Pressure—155 lbs. (60), 170 lbs. (70, 75) at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed for std. 6.25-1 head.

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on dash.
Ignition Current—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Delco-Remy Model 431-L (60), 431-Z (60 RHD.), 435-A (70, 75). Switch and cable assembly. Connected to coil by armored cable. See article in Equipment Section.
Ignition Lock—Briggs & Stratton.

Distributor Model 663-G. Single breaker, 8 lobe cam, automatic advance type with auxiliary vacuum spark control and manual adjustment (see Timing).
Breaker Gap—Set at .015". Limits .012-.018".
Cam Angle or Dwell—31° closed, 14° open.
Breaker Arm Spring Tension—19-23 ounces.
Condenser—Part No. 1855968. Capacity .20-.25 mfd.

Automatic Advance

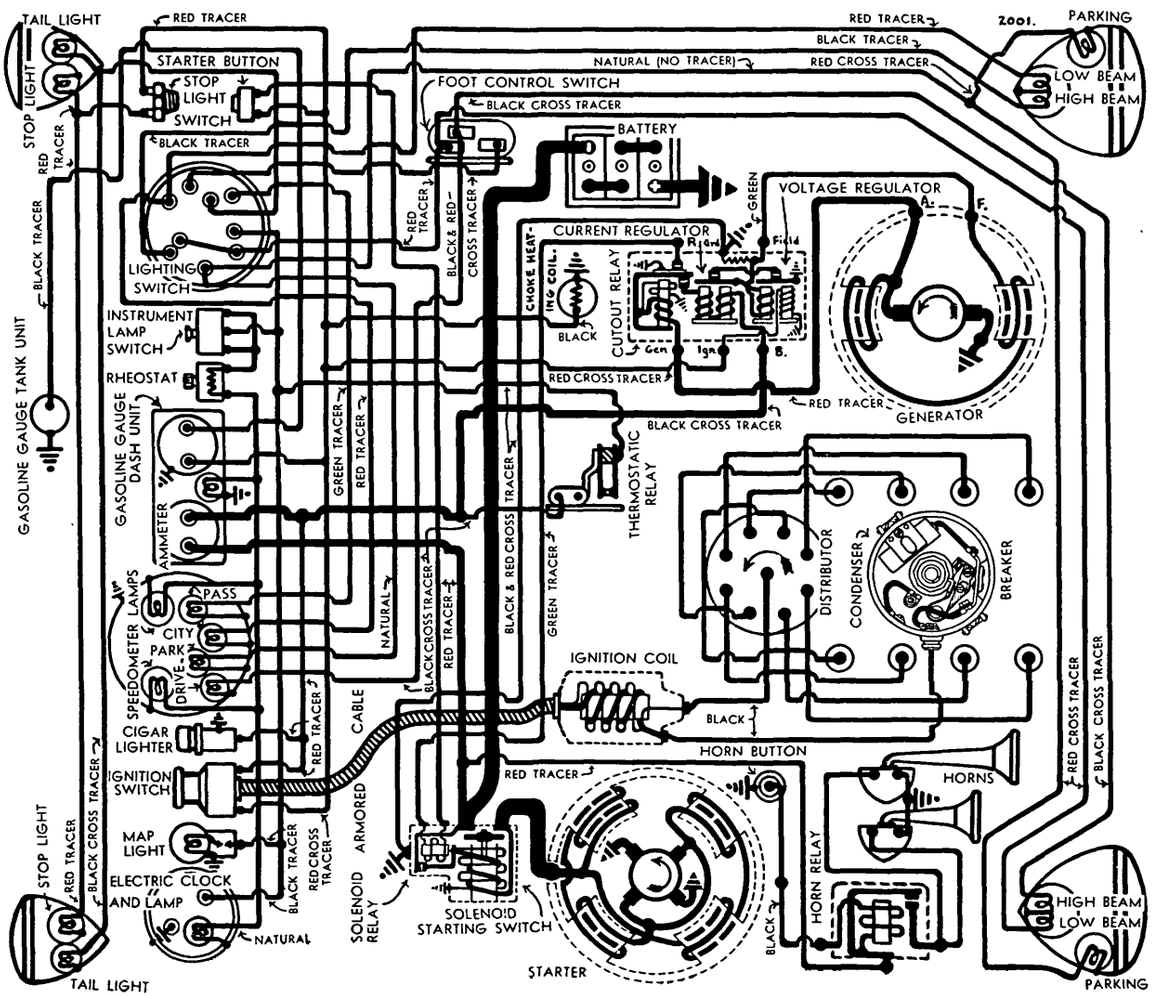
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1	1000
12	2000	24	4000

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance for speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring in unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	9-11"
15° Max.	16-18"

Distributor Removal:—Mounted between cylinder banks at rear of engine. Take out two capscrews in mounting bracket.
NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear to that slot in upper end of shaft is offset toward rear of engine.



IGNITION TIMING:—Setting for all engines is as follows. See Manual Adjustment section below.

	Flywheel Degrees	Piston Position
All engines	4° BTDC	.0069" BTDC

To Set Timing (Using Synchroscope)—Recommended by manufacturer. Clip Synchroscope lead to #1 spark plug and direct light on crankshaft pulley at front of engine. Idle engine, loosen hold-down screw in advance arm, rotate distributor until pulley mark 'IG/A' which is 4° before top dead center mark 'C.1/6' lines up with pointer on chain case cover, tighten hold-down screw.
Timing (Without Synchroscope)—Turn engine over until #1 piston (front piston left block) reaches firing position 4° before top dead center on compression stroke, stop when crankshaft pulley mark 'IGN' at front of engine lines up with pointer on chain case cover, loosen hold-down screw in advance arm, rotate distributor until contacts begin to open, tighten hold-down screw.
Motor Gauge—Weidenhoff #114 Adapter, #42 Rod.
Manual Adjustment—With ignition set as above, slight 'ping' should be noticeable when engine is accelerated with wide open throttle at speeds below 15 M.P.H. If ping is too severe, loosen hold-down screw in advance arm, rotate distributor one graduation on scale counter-clockwise to retard spark, repeat test. Adjustment permits 10° advance or retard from center 'O' position.
NOTE—Check engine for faulty spark plugs, excessive carbon deposits or localized 'hot spots' before changing the manual adjustment.

Firing Order:—1-8-7-3-6-5-4-2 with spark plugs numbered 1-3-5-7 (left bank), 2-4-6-8 (right bank), with 1 and 2 nearest radiator.
Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
Spark Plug Gaps—Set at .025-.030".

CARBURETION:—Carburetor—Stromberg Model EE-25, 1¼" Dual, downdraft type. See Carburetion Section for adjustment, overhaul, and Jet Specifications.
NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.
Idle Adjustment—Set throttle stopscrew so that idling speed is 6 M.P.H.. Turn each idle adjusting screw in until engine begins to miss, out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Setting—Not adjustable.
Fast Idle—Integral with Carburetor. See article on Fast Idle and Automatic Choke as used on EE-15 & EE-25 Carburetors in Carburetion Section.
Automatic Choke:—Triple Range Automatic and manual choke control. See article on Automatic Choke as used on EE-15 and EE 25 Carburetors in Carburetion Section.
Air Cleaner:—AC. #1525988 oil-wetted type standard, #1525966 oil-bath type optional.
NOTE—Smaller main metering jets must be used in carburetor when heavy duty oil-bath type cleaner is used. See Stromberg Jet Specifications in Carburetion Section.
Fuel Pump:—AC. Type AB. #1522119 combination fuel and vacuum pump. See article in Carburetion Sec.

Gasoline Gauge:—AC. Electric. #1515303 (dash unit—all models), #1515419 (tank unit—60), #1515420 tank unit—70, 75). See article in Carburetion Sec.

VALVE TIMING:—To Check Timing—Intake valve for #1 cylinder (front cylinder—left bank) should open with piston on top dead center when 'C.1/6' mark on crankshaft pulley at front of engine lines up with pointer on chain case cover.

Tappet Clearance—None in service (hydraulic tappet take-up used). See article in Mechanical Section.

Valve Spring Pressure—62-69 lbs. at 1 15/16" (valve closed), 140-151 lbs. at 1 9/16" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. refill.

Normal Oil Pressure—15 lbs. idling, 30 lbs. at 60 M.P.H.

BATTERY:—(60) Delco, Type 17-K. 6 volt, 17 plate, 110 ampere hour capacity (20 hour rate).

Starting Capacity—131 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.4 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat (all models).

(Model 70, 75) Delco, Type 17-D. 6 volt, 17 plate, 130 ampere hour capacity (20 hour rate).

Starting Capacity—156 amperes for 20 minutes.

Zero Capacity—300 amperes for 5.0 minutes.

STARTER:—Model 727-V, 729-C (60 RHD). Armature No. 820158.

Drive—Overrunning Clutch and manual pinion shift operated by solenoid switch.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
16 ft. lbs.	Lock	3.0	600

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward and remove from below.

Starting Switch:—Solenoid Switch Type 1512 (727-V), 1532 (729-C). Pushbutton Switch Type 1405 (60), 1407 (70, 75). Solenoid switch controlled through relay by push button on instrument board. Operative only with ignition 'on.' See article in Equipment Section.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

GENERATOR:—Model 961-E. Armature No. 1857866. Straight shunt (two brush) type with external voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below and special article in Equipment Section.

Maximum Charging Rate—20 amperes (cold) with discharged battery as indicated on test ammeter connected in charging line at 'BAT' terminal on control unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1700 R.P.M. or 20 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
7	7.0-7.2	900
22	8.1-8.3	1900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ounces.

Field Current—1.7-1.9 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take off left front wheel, remove cover in dust shield under left front fender by taking out three screws. Take out two generator pivot bolts and one clamp bolt, remove generator through opening.

Belt Adjustment:—Loosen generator pivot bolts and clamp bolt, pull generator out until belt deflection midway between pulleys is ⅞-1" (measured from straightedge with ⅞" projection at center laid along belt).

CONTROL UNIT:—Model 5559. Mounted on dash. Consists of Vibrating Voltage Regulator, Vibrating Current Regulator, and Cutout Relay. See article in Equipment Section for complete data on these units.

NOTE—Units are sealed. Performance can be checked as directed below without breaking seals. Seals must be broken and cover removed (voiding warranty) to make adjustments.

Cutout Relay

Cuts In—6.5-7.0 volts, 12 M.P.H.

Cuts Out—3 ampere max. discharge at 6.3 volts.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 72° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

To Check—Disconnect lead at 'IGN' terminal on regulator case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground on engine. Operate generator at 2800-3200 R.P.M., adjust charging rate to 8-10 amperes, note voltmeter reading (should agree with setting given above).

To Adjust—Set regulator by bending spring hanger at lower end of armature spring slightly.

NOTE—Do not operate generator on open-circuit at any time. All Voltage Regulator readings must be taken with cover on unit and setting should be checked by decreasing speed until Cutout Relay contacts open, and then increasing speed to original point.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ozs. minimum.

Air Gap—.060-.070" between armature and core with armature down so that fibre bumper just touches stop, .007-.010" between fibre bumper and stop with armature up.

Current Regulator

Setting—20-22 amperes.

To Check—Connect ammeter in charging line at 'BAT' terminal on regulator, disconnect lead on 'IGN' terminal (to eliminate voltage regulator action). Turn on lights, operate generator and increase speed until current regulator operates and output remains constant. Ammeter reading should agree with setting given above.

To Adjust—Set regulator by bending spring hanger at lower end of armature spring slightly.

NOTE—Generator voltage must not be allowed to exceed 8.5 volts with Voltage Regulator shorted out.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ozs. minimum.

Air Gap—.070-.080" between armature and core with armature down so that fibre bumper just touches stop, .007-.010" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, Cross-beam type with special non-interchangeable lenses. Headlamps aimed straight-ahead with lenses removed. Assymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp), controlled by foot selector switch with lighting switch in 'Country Driving' position.

Headlamp Beam Indicators—Consists of four bulbs in lower half of speedometer which illuminate markers as follows:

City—Lower beam both headlamps.
Drive—Upper beam both headlamps.
Pass—Assymetrical passing beam (see above).
Park— Parking bulbs in headlamps.

Switches

Lighting—Delco-Remy Model 487-N,P. 487-U (RHD)

Foot Selector—Delco-Remy Mod. 471-Z,471-U(RHD)

Instrument Lamp—Delco-Remy Model 1364.

Stop Lamp—Hydraulic type on distributor at rear of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamp (Right)	50-32	2530-L
Headlamp (Left)	32-32	2330-L
Instrmt., Map, Qtr., Step, Tail	3	63
Parking, Clock	1.5	55
Beam Indicators	1	51
Stop, Dome	15	87

NOTE—Headlamp bulbs are Pre-focused, 'Long-life' type. In all states where 50 cp. bulbs are prohibited, the 32-32 cp. 2330-L bulb is used in both headlamps.

THERMOSTATIC RELAY:—Model 411-A. Contacts remain closed with current of 25 amperes but open within one minute with load of 38 amperes. Non-adjustable.

HORNS:—Klaxon Model K-33-B, Type 1855 (low note), 1856 (high note). Vibrator type, twin horns with blended tone operated by horn relay.

Horn Type	Current at 6 Volts	Air Gap
1855	12-14	.045-.050"
1856	11-13	.036-.040"

NOTE—Horns identified by letter stamped on front of power unit cover and projectors must be assembled as follows: 'S'—low note, short projector; 'L'—high note, long projector.

Horn Relay:—Model 266-T. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amps. **Contact Gap**—.015-.025". **Spring Tension**—6-8 ozs. **Air Gap**—.012-.017" with contacts closed.

SERIAL NUMBER:—Same as engine number. Located on right hand side of chain case in front of generator. First number 4110001.

COMPRESSION:—Ratio 6.0-1 Std. 5.65-1 Optional.

Pressure—145 lbs. at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed for std. 6.0-1 head.

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 320 R.P.M.

IGNITION:—Coil Model 553-E. Two coil unit assembled with ignition switch.

Ignition Current—2.2 amperes idling, 4.4 stopped (each coil).

Ignition Switch:—Delco-Remy Model 435-A. Switch and cable assembly. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton.

Series 80, 85 Distributor (Model 667-C):—Double breaker, 6 lobe cam, full automatic type with manual adjustment (see Timing). Contacts open alternately at 37½° and 22½° intervals, corresponding to 75° and 45° firing intervals of engine (unequal firing intervals caused by 45° included angle betwee cylinder banks). Contacts must be synchronized (see Timing).

Breaker Gap—Set at .020". Limits .018-.024".

Cam Angle or Dwell—Closed 39°. Open 21° (distributor degrees). Each set operates independently.

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 1837231. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2	600
12	800	24	1600
16	1100	32	2200
19	1400	38	2800

Distributor Removal:—Mounted between cylinder banks at front of engine. Take out two capscrews in mounting bracket.

NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting for all engines as follows. See Manual Adjustment section below.

	Flywheel Deg.	Piston Pos.
All Engines	4° BTDC	.0058" BTDC.

Timing (Stationary Contacts)—Loosen hold-down screw in advance arm, center distributor pointer on quadrant scale by rotating distributor, tighten hold-down screw, take off cover plate over inspection hole in flywheel housing. With #1 piston on compression, crank engine by jacking up one rear wheel, placing car in gear and turning wheel, stop with piston 4° before top dead center when flywheel mark 'IG/A' (4° before 'C/1-11' mark) lines up with indicator on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, check rotor position and spark plug cable connections (see diagram). Then synchronize movable contacts as directed below.

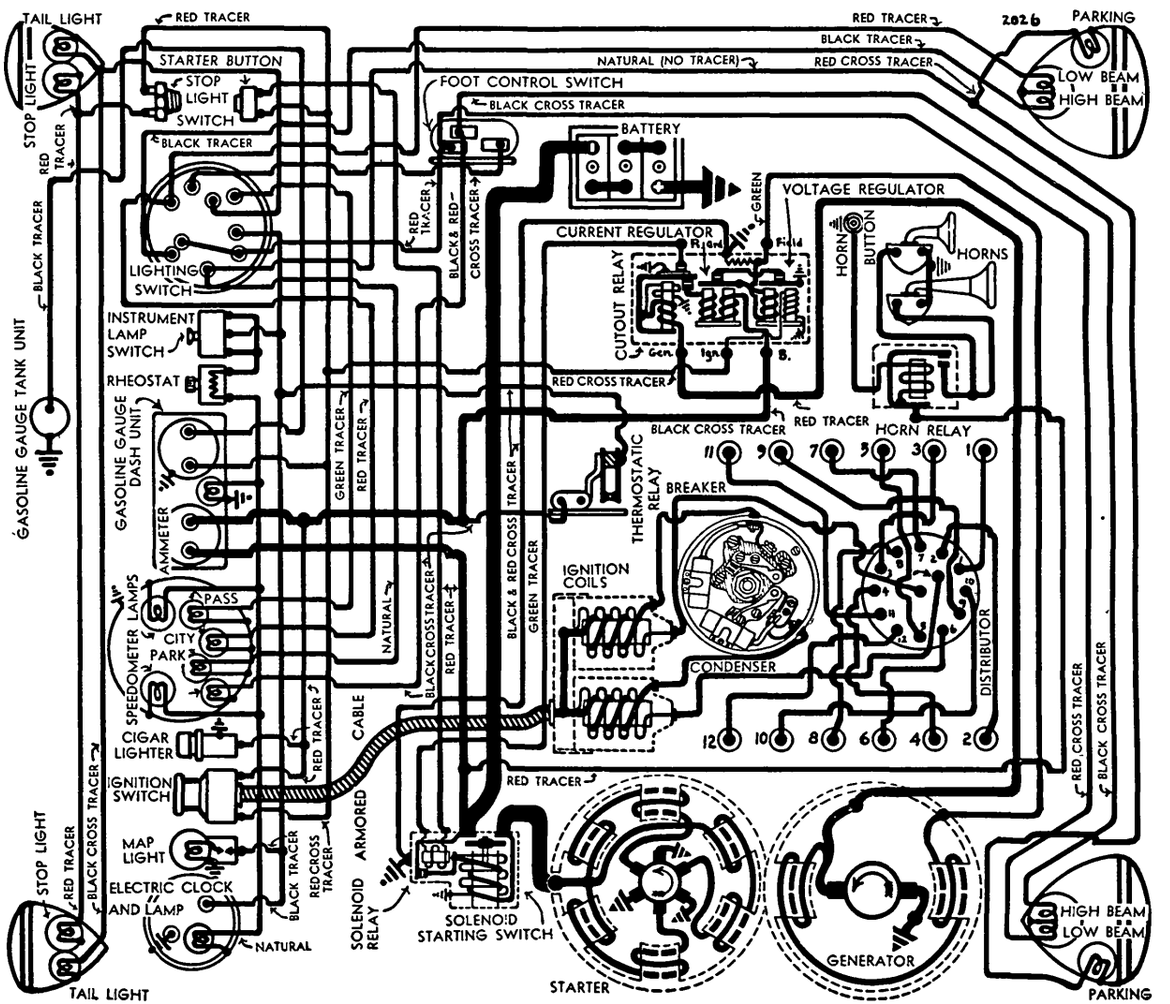
Synchronization (Movable Contacts)—1st method: Turn engine over 75° or slightly less than ¼ revolution to the firing position of piston #4 (80, 85), stop when flywheel mark 'IG/A' (4° before top dead center mark 'C/4-10' on 80, 85) lines up with indicator on housing, loosen lock screws on movable sub-plate (carrying second set of contacts), turn accentric adjusting screw until contacts begin to open, tighten locking screws.

Synchronization—2nd Method: Use synchronizing tool, Cadillac Part No. 109224. Install tool and adjust so that stationary contacts begin to open when pointer opposite farthest indicating point on quadrant 'R.H.', turn engine over until pointer is directly opposite '12 L.H.' mark (approx. ¼ revolution) on quadrant. Loosen lockscrews on movable sub-plate, turn eccentric adjusting screw until contacts open, tighten lockscrew.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Manual Adjustment—With ignition set as above, slight 'ping' should be noticeable when engine is accelerated with wide open throttle at speeds below 15 M.P.H. If ping is too severe, loosen hold-down screw on pointer, rotate distributor one graduation on scale clockwise to retard spark, repeat test. Adjustment permits advance or retard of 10° from center 'O' position.

NOTE—Check engine for faulty spark plugs, excessive carbon deposits or localized 'hot spots' before changing the manual adjustment.



Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 (80, 85—see diagram). Spark plug cables not connected in this order on distributor cap.

Spark Plugs:—AC. Type G-7. 18 MM. Metric type.

Spark Plug Gaps—Set at .025-.030".

CARBURETION:—Carburetor—Detroit Model 51, 1½" expanding vane or air valve, updraft type. One carburetor used for each bank with interconnected throttles. Carburetor throttles must be synchronized. See Carburetion Section for adjustment and overhaul.

Automatic Choke:—Detroit semi-automatic type. See special article in Carburetion Section.

Air Cleaner:—AC. #1526626 oil-wetted type standard.

Fuel Pump:—AC. Type D. #1522149. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515303 (dash unit—#1515428 (tank unit).

VALVE TIMING:—To Check Timing—Intake valve for #1 cylinder (front cylinder—left bank) should open with piston on top dead center when flywheel mark 'C/1-11' lines up with indicator on housing.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance—None in service (hydraulic tappet take-up used). See article in Equipment Section.

Valve Spring Pressure:—Inner spring—18-21 lbs. at 1¾" (valve closed), 49-52 lbs. at 1 7/16" (valve open) Outer spring—48-52 lbs. at 1 15/16" (valve closed), 111-120 lbs. at 1 9/16" (valve open).

LUBRICATION:—Crankcase Capacity—9 qts. (80, 85).

Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—(80, 85) Delco, Type 21-D. 6 volt, 21 plate, 164 ampere hour capacity (20 hour rate).

Starting Capacity—195 amperes for 20 minutes.

Zero Capacity—300 amperes for 7.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat (all models).

STARTER:—Model 580, SM-1748 (RHD—80, 85). Armature No. 1837058.

Drive—Solenoid pinion shift and overrunning clutch type with reduction gears.

Rotation—Counter-clockwise (armature shaft) at commutator end.

Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2200	5.7	70
35 ft. lbs.	Lock	3.0	600

Removal:—Flange mounted on rear face of flywheel housing at right of transmission. To remove, take out 3 flange capscrews.

Starting Switch:—Solenoid Switch Type 1515. Push-button switch 1407 (on instrument panel). Solenoid switch controlled through relay by push button on instrument board. Operative only with ignition 'on'. See article in Equipment Section.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts. max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

GENERATOR:—Model 933-M. Armature No. 1854448. Straight shunt (two brush) type with external voltage and current regulation.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below and special article in Equipment Section.

Maximum Charging Rate—20 amperes (cold) with discharged battery as indicated on test ammeter connected in charging line at 'BAT' terminal on control unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1700 R.P.M. or 20 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
7	7.0-7.2	900
22	8.1-8.3	1900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ounces.

Shunt Field Curent—1.7-2.0 amperes at 6 volts.

Removal:—Flange mounted on rear face of timing chain case at right of engine. To remove, disconnect water pump drive coupling, take out flange mounting screws. Chain adjustment automatic, requires no attention during life of chain.

CONTROL UNIT:—Model 5559. Mounted on dash. Consists of Vibrating Voltage Regulator, Vibrating Current Regulator, and Cutout Relay. See article in Equipment Section for complete data on these units.

NOTE—Units are sealed. Performance can be checked as directed below without breaking seals. Seals must be broken and cover removed (voiding warranty) to make adjustments.

Cutout Relay

Cuts In—6.5-7.0 volts, 12 M.P.H.

Cuts Out—3 amperes max. discharge at 6.3 volts.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 72° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—See Control Unit paragraph and 'Voltage Regulator' adjustments on previous page on Cadillac V-8 Series 60.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ozs. minimum.

Air Gap—.060-.070" between armature and core with armature down so that fibre bumper just touches stop, .007-.010" between fibre bumper and stop with armature up.

Current Regulator

Setting—20-22 amperes.

Adjustment, Contact Gap, Contact Spring Tension, and Air Gap same as for Cadillac V-8 Series 60. See Control Unit paragraph on previous page.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, Cross-beam type with special non-interchangeable lenses. Headlamps aimed straight-ahead with lenses removed. Assymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp), controlled by foot selector switch with lighting switch in 'Country Driving' position.

Headlamp Beam Indicators—Consists of four bulbs in lower half of speedometer which illuminate markers as follows:

City—Lower beam both headlamps.

Drive—Upper beam both headlamps.

Pass—Assymetrical passing beam (see above).

Park— Parking bulbs in headlamps.

Switches

Lighting—Delco-Remy Model 487-N,P. 487-R (RHD)

Foot Selector—Delco-Remy Mod. 471-Z,471-U (RHD)

Instrument Lamp—Delco-Remy Model 1364.

Stop Lamp—Hydraulic type on distributor at rear of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamp (Right)	50-32	2530-L
Headlamp (Left)	32-32	2330-L
Instrmt., Map, Qtr., Step, Tail	3	63
Parking, Clock	1.5	55
Beam Indicators	1	51
Stop, Dome	15	87

NOTE—Headlamp bulbs are Pre-focused, 'Long-life' type. In all states where 50 cp. bulbs are prohibited, the 32-32 cp. 2330-L bulb is used in both headlamps.

THERMOSTATIC RELAY:—Model 411-A. Contacts remain closed with current of 25 amperes but open within one minute with load of 38 amperes at 70-80° F. Non-adjustable.

HORNS:—Klaxon Model K-33-B, Type 1855 (low note), 1856 (high note). Vibrator type, twin horns with blended tone operated by horn relay. See previous Cadillac V-8, Series 60 page for horn data and Horn Relay.

SERIAL NUMBER:—Same as engine number (60) 6030001 and Up, (65) 7030001 and Up. Stamped on crankcase behind left cylinder block (visible from left with engine hood up).

COMPRESSION:—Ratio—6.25-1 Std. 5.75-1 Optl.

Pressure—170 lbs. at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed (Std. 6.25-1 head).

VACUUM READING:—20-21" steady reading with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on dash.

Coil Draw—2.2 amperes idling, 4 4 stopped.

Ignition Switch:—Delco Remy Mod. 435-K (60), 435-H (65). Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #80203 (case). **Key Series**—8000-9499.

Distributor Model 665-G. Single breaker, 8 lobe cam, full automatic advance with manual adjustment at distributor. Vacuum spark control not used.
NOTE—Distributor rotation now clockwise (accessory drive idler gear dropped). Distributor and oil pump driveshaft gear meshed directly with camshaft gear.

Breaker Gap—Set at .015". Limits .0125-.0175".

Cam Angle or Dwell—31° closed, 14° open.

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 829107. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R P.M.
Start	500	1	1000
3	820	6	1640
6	1200	12	2400
9	1600	18	3200
12	2000	24	4000

Removal:—Distributor mounted between cylinder banks at rear of engine To remove, take out two capscrews in mounting bracket.
NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting for all engines (with fuel of 70 Octane Rating) as follows. See Manual Adjustment section below for final setting giving best performance with type of fuel regularly used.

Flywheel Degrees	Piston Position
5° BTDC	.0114" BTDC

To Set Timing (With Synchroscope)—Recommended by manufacturer. Clip Synchroscope lead to #1 spark plug, direct light on crankshaft pulley at front of engine. Idle engine, loosen hold-down screw in advance arm, rotate distributor until 'IG/A' mark on pulley (which is 5° before dead center mark 'C.1/6') appears to line up with pointer on chain case cover, tighten hold-down screw. Adjust for fuel (see Manual Adjustment).

Timing (Without Synchroscope)—Turn engine over to firing position for piston #1 (front piston, left bank) with mark 'IG/A' on crankshaft pulley (5° before dead center mark 'C.1/6' lined up with pointer on chain case. Loosen hold-down screw on advance arm, center pointer on scale, tighten hold-down screw on advance arm. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. Adjust for fuel (see Manual Adjustment).

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

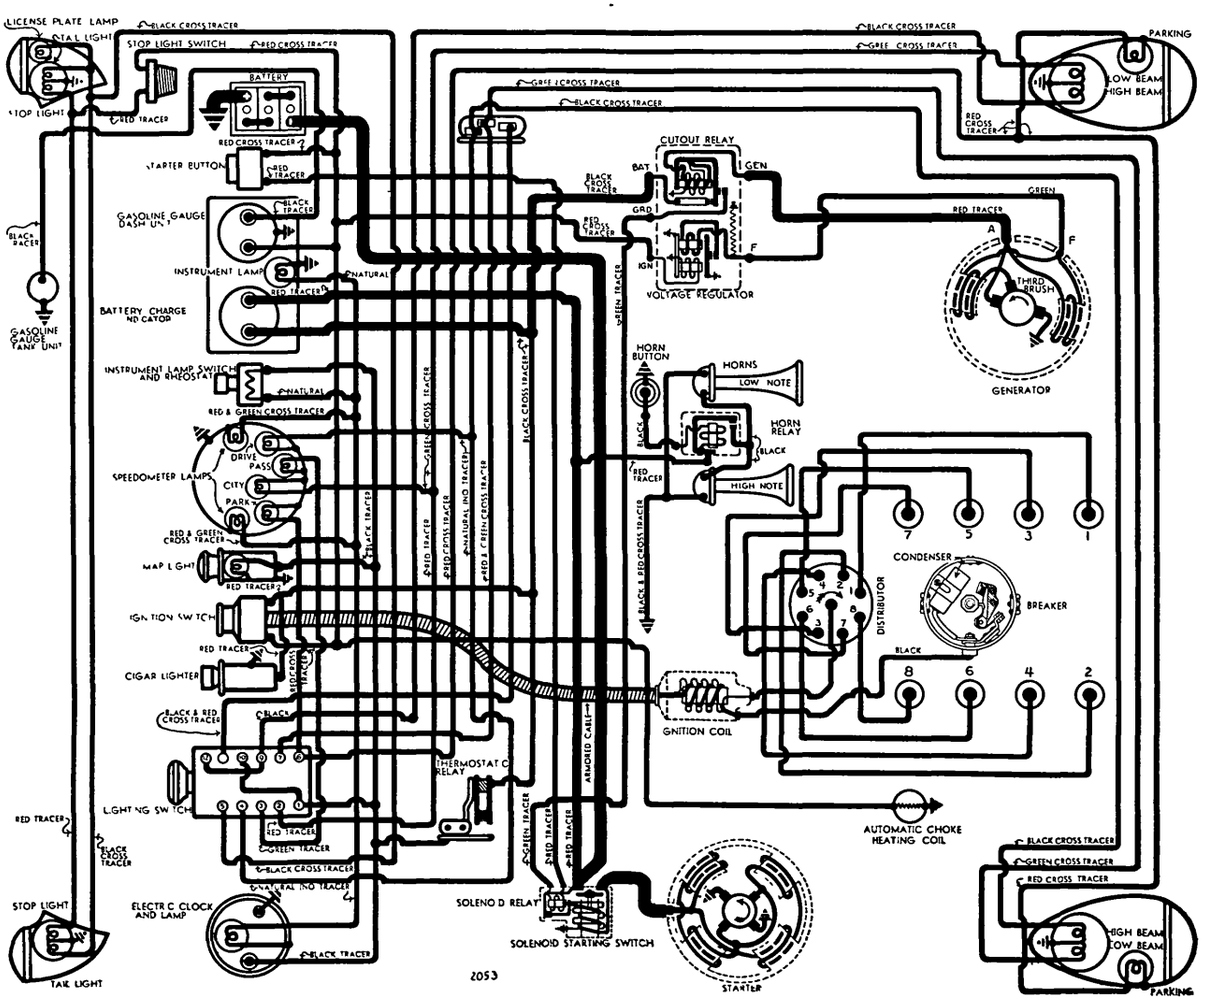
Manual Adjustment—Slight ping should be evident at speeds below 15 M.P.H. when car accelerated with wide open throttle. To adjust, loosen hold-down screw on advance arm, rotate distributor one graduation on scale counter-clockwise (if ping too severe), clockwise (if no ping noted), repeat test, adjust until best performance is secured.
NOTE—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots, or lean carburetor setting before changing manual adjustment.

Firing Order:—1-8-7-3-6-5-4-2 with spark plugs numbered as shown on diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
NOTE—K-7 discontinued by AC. Use No. 45.

Spark Plug Gaps—.025-.027".

CARBURETION:—Carburetor—Stromberg Mod. AA-25, 1¼" Dual, Downdraft, Aircraft type.



See article in Carburetion Section for data.

Idle Adjustment—Engine must be warmed up so that Automatic Choke and Fast Idle are inoperative. Set throttle lever stopscrew so that engine idles at 6 M.P.H. Turn each idle adjusting screw in until engine begins to miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Both screws must be adjusted equally. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Integral with carburetor. No adjustment.

See article in Carburetion Equipment Section.

Automatic Choke:—Integral with carburetor (linked directly to choke valve shaft). No adjustment

See article in Carburetion Equipment Section.

Air Cleaner:—AC #1528136 Std, #1528137 Heavy Duty, Oil-bath type

Fuel Pump:—AC Mod AB #1522119 Diaphragm type combination fuel-and-vacuum pump

See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric type No 1515338 (Dash unit), 1515442 (Tank unit—60), 1515420 (Tank unit —65)

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Intake valve for cylinder #1 (front cylinder, left bank) should open when piston reaches top dead center when mark 'C 1/6' on crankshaft pulley lines up with pointer on chain case cover

Motor Gauge—Weidenhoff Adapter #114, Rod #42

Tappet Clearance:—None in service (hydraulic take-up)

See article in Mechanical Equipment Section.

Valve Spring Pressure:—66 lbs at 1 926" (Valve closed), 145 lbs at 1 581" (valve open)

LUBRICATION:—Crankcase Capacity—7 quarts

Normal Oil Pressure—30 lbs at 60 M P H

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 amp hour capacity (20 hour rate)

Starting Capacity—131 amperes for 20 minutes

Zero Capacity—300 amperes for 4 4 minutes

Grounded Terminal—Positive (+) terminal

Location—Under left front seat

STARTER:—Model 727-V, 729-F (60 RHD). Armature No. 820158. Overrunning Clutch and solenoid pinion shift type

Rotation—Counter-clockwise at commutator end

Brush Spring Tension—24-28 ounces

Performance Data

Torque	R P M	Volts	Amperes
0 ft lbs	5500	5 0	65
16 "	Lock	3 0	600

Removal:—Starter flange mounted on right front face of flywheel housing To remove, take out flange mounting screws, pull starter forward, remove from below

Starting Switch:—Solenoid Switch Type 1542 Push-button Switch Type 1389 (60), 1407 (65) Solenoid switch controlled through relay in switch case by pushbutton on instrument panel
See article in Electrical Equipment Section

Solenoid Switch Specifications

Closes against 70 lbs pull with ½" air gap drawing 65-71 amperes at 5 volts Holds switch closed with current draw of 12-14 amperes (hold-in coil only)

Solenoid Relay Specifications

Contacts Close—1 9 volts max **Open**—1 0-1 2 volts
Contact Gap— 025- 045" **AirGap**— 010- 013"(closed)

GENERATOR:—Model 918-C. Armature No. 1866789. New type 'Split-Field' generator (one straight-shunt coil, one third-brush coil—see diagram) with fixed third brush and vibrating voltage regulator control
NOTE—Field coils changed in production

See article in Electrical Equipment Section.

Charging Rate Adjustment—No adjustment at generator (fixed third brush) Adjusted by changing setting of Voltage Regulator See Regulator data below

Maximum Charging Rate—As given in table below Reached at 4000 R P M or 51 M P H Actual charging rate controlled by Voltage Regulator and dependent on battery condition To check generator output, connect test ammeter in charging line at 'BAT' terminal on regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action
NOTE—Do not operate generator at excessive speed with regulator cut out Do not operate generator on open-circuit

Performance Data

	Amperes	Volts	R P M
Cold	27-31	8 0	4000
Hot	25-28	8 0	4200

Rotation—Counter-clockwise at commutator end

Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third brush)

Field Current—1 44-1 56 amperes (shunt), 89- 94 amperes (third brush field) at 6 0 volts

Removal:—Generator pivot mounted at front of engine between cylinder banks Belt driven in tandem with water pump (separate belt for fan) To remove, take out pivot bolts and clamp bolt, slip off drive belt

Belt Adjustment:—Loosen generator pivot bolts and clamp bolt, lift generator up until belt deflection midway between generator and pump pulleys is ⅞-1" (measure with straightedge along belt, use ⅞" projection on straightedge at center)

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5817. Mounted on dash Consists of Cutout Relay and Vibrating Voltage Regulator in single case

See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6 5-7 0 volts

Cuts Out—0-3 0 ampere discharge current

Contact Gap— 018- 025"

Air Gap— 018- 022" with contacts closed

Voltage Regulator

Setting—7 55-7 85 volts at 70° F, 7 45-7 55 volts at 150°F Regulator over-compensated for temperature and must be checked at these points

Adjustment—Disconnect lead on 'IGN' regulator terminal, connect jumper between 'IGN' and 'BAT' terminals, connect ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground Operate generator at 2800-3000 R P M, adjust charging rate to 8-10 amperes Adjust regulator armature spring tension by bending spring hanger at lower end of armature spring slightly until setting is as given above
NOTE—Regulator cover must be in place when tests made Do not operate generator on open-circuit

Contact Gap— 015- 025"

Contact Spring Tension—2 7-3 5 ounces

Air Gap— 060- 070" between armature and center of core with armature down so that fibre bumper just touches stop, 008- 013" between fibre bumper and stop with armature up

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type with special non-interchangeable lenses Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in third or Country Driving position
NOTE—With lighting switch in second position, foot selector switch controls upper driving beam and lower city beam (for both headlamps)

Headlamp Adjustment—With driving (upper beam) lighted and lenses in place, aim left hand headlamp so that upper edge of hot spot is at lamp center height and left edge is at vertical line for lamp center (entire hot spot to right of this center line) at 25' Aim right hand headlamp for same height but center hot spot on lamp-center vertical line (right cut-off of hot spot about 1' to right of center-line)

Headlamp Indicators—Consists of 4 bulbs in speedometer dial which illuminate markers as follows
City—Lower beam, both headlamps
Drive—Upper beam, both headlamps
Pass—Special passing beam (see above)
Park—Parking bulbs in headlamps lighted

Switches

Lighting—Delco-Remy Model 480-S, 480-N (Exp)

Foot Selector—Delco-Remy Model 471-T, 471-U (RHD)

Bulb Specifications

Position	Candlepower	Mazda No
R H Headlamp (see note)	32-50	2530-L
L H Headlamp	32-32	2330-L
Parking, Instrument	1½	55
Clock, Indicators	1	51
Map, Quarter, License	3	63
Stop and Tail	21-3	1154-L
Dome	15	87

NOTE—In states where this bulb not legal, 32-32 cp, 2330-L bulb used in both headlamps Type 1154 has stop pin which insures correct installation of bulb

THERMOSTATIC RELAY:—Part No. 1866707. Mounted on lighting switch Contacts open within 1 minute with load of 38 amperes Not adjustable

HORNS:—Delco-Remy Model K-33-D, Type 1965 (low note), 1966 (high note). Vibrator type, twin horns with blended tone Operated by horn relay

Horn Type	Current at 6 volts	Air Gap
1965	12-14 amperes	045- 050"
1966	11-13 amperes	036- 040"

Horn Relay Model 271-A:—Contacts close a' 2 7-4 0 volts

Contact Gap— 015- 030"

Air Gap— 010- 014" with contacts closed

SERIAL NUMBER:—Same as engine number 3130001 & Up. Stamped on crankcase behind left cylinder block (visible from left side with engine hood up).

COMPRESSION:—Ratio—6.25-1 Std., 5.75-1 Optl.

Pressure—170 lbs. at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed (Std. 6.25-1 head).

VACUUM READING:—20-21" steady reading with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on the dash.

Coil Draw—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Delco-Remy Model 435-H. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #80203 (case). **Key Series**—8000-9499.

Distributor Model 665-G. Single breaker, 8 lobe cam, full automatic advance with manual adjustment at distributor. Vacuum spark control not used.
NOTE—Distributor rotation now clockwise (accessory idlear gear has been dropped). Distributor and oil pump driveshaft gear meshes directly with camshaft gear.

Breaker Gap—Set at .015". Limits .0125-.0175".

Cam Angle or Dwell—31° closed. 14° open.

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 829107. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1	1000
3	820	6	1640
6	1200	12	2400
9	1600	18	3200
12	2000	24	4000

Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, take out two capscrews in mounting bracket.
NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting for all engines (with fuel of 70 Octane Rating) as follows. See Manual Adjustment section below for final setting giving best performance with type of fuel regularly used.

Flywheel Degrees	Piston Position
5° BTDC	.0114" BTDC

To Set Timing (With Synchroscope)—Recommended by manufacturer. Clip Synchroscope lead to #1 spark plug, direct light on crankshaft pulley at front of engine. Idle engine, loosen hold-down screw in advance arm, rotate distributor until 'IG/A' mark on pulley (which is 5° before dead center mark 'C.1/6') appears to line up with pointer on chain case cover, tighten hold-down screw. Adjust for fuel (see Manual Adjustment).

Timing (Without Synchroscope)—Turn engine over to firing position for piston #1 (front piston, left bank) with mark 'IG/A' on crankshaft pulley (5° before dead center mark 'C.1/6') lined up with pointer on chain case. Loosen hold-down screw on advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. Adjust for fuel (see Manual Adjustm't).

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Manual Adjustment—Slight ping should be evident at speeds below 15 M.P.H. when car accelerated with wide open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor one graduation on scale counter-clockwise (if ping too severe), clockwise (if no ping noted), repeat test, adjust until best performance is secured.
NOTE—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots, or lean carburetor setting before changing manual adjustment.

Firing Order:—1-8-7-3-6-5-4-2 with spark plugs numbered as shown on diagram.

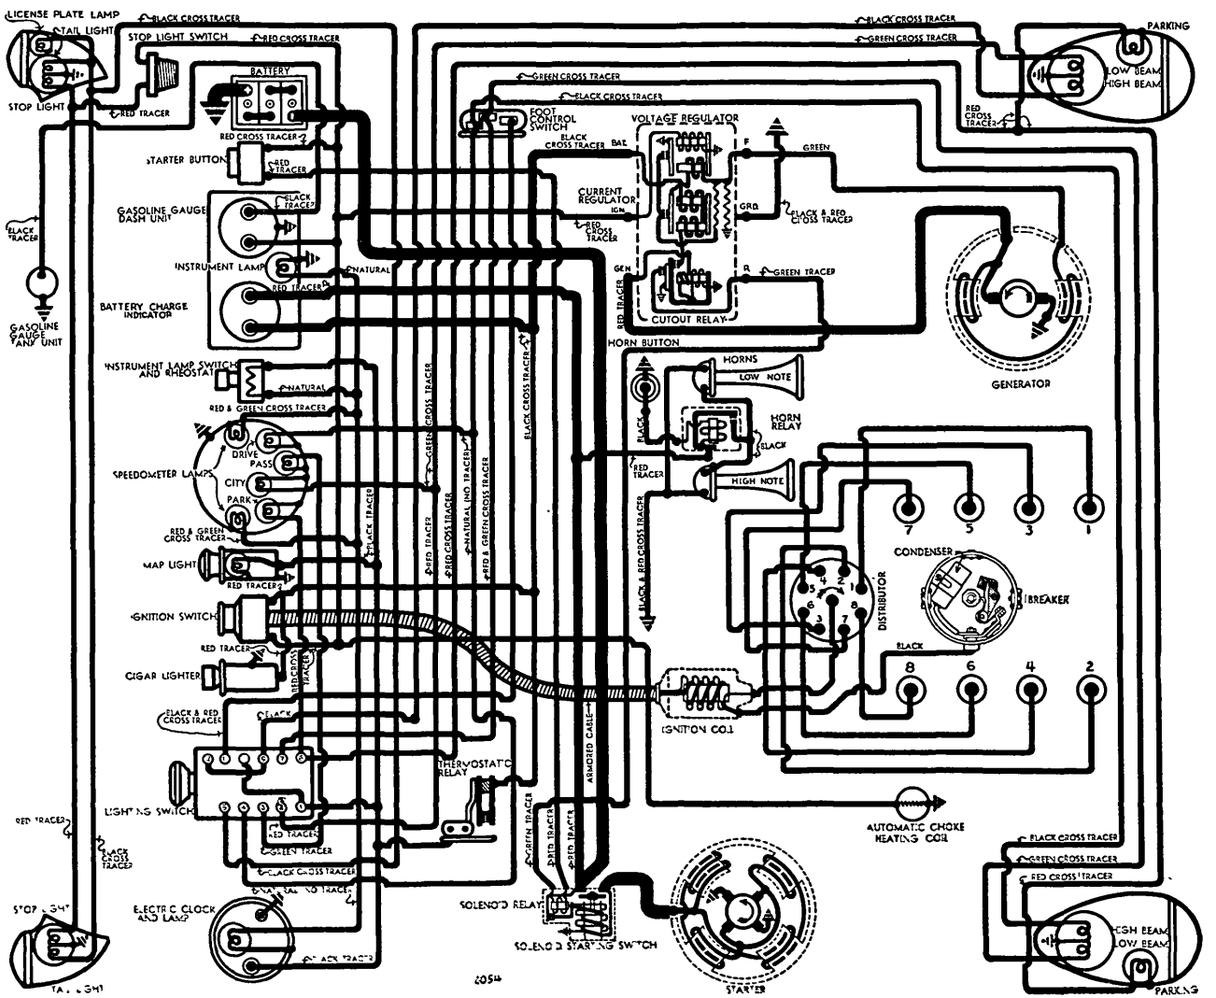
Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
NOTE—K-7 discontinued by AC. Use No. 45.

Spark Plug Gaps—.025-.027".

CARBURETION:—Carburetor—Stromberg Model AA-25 1¼" Dual, Downdraft, Aircraft type.

See article in Carburetion Section for data.

Idle Adjustment—Engine must be warmed up so that Automatic Choke and Fast Idle are inoperative. Set throttle lever stopscrew so that engine idles at 6 M.P.H. Turn each idle adjusting screw in until engine begins to miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Both screws must be adjusted equally. Readjust throttle stopscrew for correct idling speed.



Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Integral with carburetor. No adjustment.

See article in Carburetion Equipment Section.

Automatic Choke:—Integral with carburetor (linked directly to choke valve shaft). No adjustment.

See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528136 Std., #1528137 Heavy Duty, Oil-bath type.

Fuel Pump:—AC. Model AB #1522119. Diaphragm type combination fuel-and-vacuum pump.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric type. No. 1515338 (dash unit), 1515420 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Intake valve for cylinder #1 (front cylinder, left bank) should open when piston reaches top dead center when mark 'C.1/6' on crankshaft pulley lines up with pointer on chain case cover.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—None in service (hydraulic take-up).
See article in Mechanical Equipment Section.

Valve Spring Pressure:—66 lbs. at 1.926" (valve closed) 145 lbs. at 1.581" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 17-D. 6 volt, 17 plate, 130 amp. hour capacity (20 hour rate).
Starting Capacity—156 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.5 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.

STARTER:—Model 727-V. Armature No. 820158.
Drive—Overrunnning clutch and solenoid pinion shift.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
16 "	Lock	3.0	600

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward, remove from below.

Starting Switch:—Solenoid Switch Type 1542. Push-button Switch Type 1407. Solenoid switch controlled through relay in switch base by pushbutton on instrument panel.
See article in Electrical Equipment Section.

Solenoid Switch Specifications

Closes against 70 lbs. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay Specifications

Contacts Close—1.9 volts max. **Open**—1.0-1.2 volts.
Contact Gap—.025-.045". **Air Gap**—.010-.013" closed.

GENERATOR:—Model 961-K. Armature No. 1857866. Two brush, straight shunt, 'Peak Load' type with external voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below.

Maximum Charging Rate—25 amperes (cold) maximum at 1650 R.P.M. or 20 M.P.H. and above with discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
25	8.0	1650

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (all).
Field Current—2.0-2.2 amperes at 6.0 volts.

Removal:—Generator pivot mounted between cylinder banks at front of engine. To remove, take out pivot bolts and clamp bolt, slip off drive belt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, raise generator until belt deflection midway between generator and pump pulleys is ⅞-1" (use straightedge, with ⅞" projection at center, along belt to check tension).

CONTROL UNIT (VOLTAGE-CURRENT REGULATOR) —Model 5818. Mounted on dash. Consists of Cutout Relay, Vibrating Voltage Regulator, Vibrating Current Regulator in a single case.
See article in Electrical Equipment Section.
NOTE—Cover or regulator case is sealed. Units can be checked without breaking seals. Seals must be broken to remove cover for adjustments.

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—0-3.0 amperes discharge current.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator over-compensated for temperature and must be checked at these points.
Checking—To check without breaking seal, disconnect lead at 'IGN' terminal on case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3400 R.P.M., adjust charging rate to 8-10 amperes. Voltmeter reading should agree with setting above.
NOTE—Cover should be in place when tests are made. Do not operate generator on open-circuit.
Adjusting—Seal must be broken and cover removed. With ammeter and voltmeter connected as above, set regulator by bending spring hanger at lower end of armature spring slightly until performance is correct (with cover in place). Remove jumper and restore original connections.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.060-070" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

Current Regulator

Setting—26 amperes.
Checking—To check without breaking seal, disconnect 'IGN' lead at regulator, connect test ammeter in charging line at 'BAT' terminal. Operate generator and check performance.
NOTE—Do not allow generator voltage to exceed 8.5 volts with voltage regulator inoperative.
Adjusting—Seal must be broken and cover removed. Set regulator by bending spring hanger at lower end of armature spring slightly until performance is as noted above (cover must be in place when testing). Restore original connections.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.070-.080" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.
NOTE—Repolarize generator whenever Control Unit disconnected or removed by connecting jumper between 'GEN' and 'BAT' terminals momentarily after all leads connected. Disconnect 'BAT' lead first, connect this lead last.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type with special non-interchangeable lenses. Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in third or Country Driving position.
NOTE—With lighting switch in second position, foot selector switch controls upper driving beam and lower city beam (for both headlamps).
Headlamp Adjustment—With driving (upper beam) lighted and lenses in place, aim left hand headlamp so that upper edge of hot spot is at lamp center height and left edge is at vertical line for lamp center (entire hot spot to right of this center line) at 25'. Aim right hand headlamp for same height but center hot spot on lamp-center vertical line (right cut-off of hot spot about 1' to right of center-line).
Headlamp Indicators—Consists of 4 bulbs in speedometer dial which illuminate markers as follows:
City—Lower beam, both headlamps.
Drive—Upper beam, both headlamps.
Pass—Special passing beam (see above).
Park—Parking bulbs in headlamps lighted.

Switches

Lighting—Delco-Remy Model 480-S, 480-N (Exp.).
Foot Selector—Delco-Remy Model 471-T, 471-U (RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
R. H. Headlamp (see note)	32-50	2530-L
L. H. Headlamp	32-32	2330-L
Parking, Instrument	1½	55
Clock, Indicators	1	51
Map, Quarter, License	3	63
Stop & Tail	21-3	1154-L
Dome	15	87

NOTE—In states where this bulb not legal, 32-32 cp., 2330-L bulb used in both headlamps. Type 1154 bulb has stop pin which insures correct installation.

THERMOSTATIC RELAY:—Part No. 1866707. Mounted on lighting switch. Contacts open within 1 minute with load of 38 amperes. Not adjustable.

HORNS:—Delco-Remy Model K-33-D, Type 1965 (low note), 1966 (high note). Vibrator type, twin horns with blended tone. Operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
1965	12-14 amperes	.045-.050"
1966	11-13 amperes	.036-.040"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.014" with contacts closed.

SERIAL NUMBER:—Same as engine number. First number 4130001. Stamped on crankcase on generator drive chain housing (visible from right with engine hood up).

COMPRESSION:—Ratio—6.0-1 Std. 5.65-1 Optional.

Pressure—145 lbs. at 1000 R.P.M., 160 lbs. at 3200 R.P.M. or aproximately 100-105 lbs. at cranking speed for standard 6.0-1 head.

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 320 R P.M.

IGNITION:—Coil Model 553-E. Two coil unit assembled with ignition switch.

Ignition Current—(For each coil)—2.2 amps. idling, 4.4 amperes stopped.

Ignition Switch:—Delco-Remy Model 435-J. Switch and cable assembly. Connected to coil unit by armored cable.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #80203 (case). **Key Series**—8000-9499.

Distributor Model 667-C:—Double breaker, 6 lobe cam, full automatic advance type with manual adjustment (see Timing). Contacts open alternately at 37½° and 22½° intervals, corresponding to 75° and 45° firing intervals of engine (unequal firing intervals cause by 45° included angle between cylinder banks). Contacts must be synchronized (see Timing).

Breaker Gap—Set at .020". Limits .018-.024".

Cam Angle or Dwell—Closed 39°. Open 21° (distributor degrees). Each set operates independently.

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 1837231. Capacity .20- 25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P M.	Degrees	R.P.M.
Start	300	2	600
12	800	24	1600
16	1100	32	2200
19	1400	38	2800

Distributor Removal:—Mounted between cylinder banks at front of engine. Take out two capscrews in mounting bracket.

NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting for all engines as follows. See Manual Adjustment section below.

	Flywheel Degrees	Piston Position
All engines	10° BTDC	.0369" BTDC

Timing (Stationary Contacts)—Loosen hold-down screw in advance arm, center distributor pointer on quadrant scale by rotating distributor, tighten hold-down screw, take off cover plate over inspection hole in flywheel housing. With #1 piston on compression, crank engine by jacking up one rear wheel, placing car in gear and turning wheel, stop with piston 10° before top dead center when flywheel mark 'IG/A' (which is 10° before top dead center mark 'C/1-11') lines up with indicator on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, check rotor position and spark plug cable connections (see diagram). Then synchronize movable contacts as directed below.

Synchronization (Movable Contacts)—1st method: Turn engine over 75° or slightly less than ¼ revolution to firing position of piston #4, stop when flywheel mark 'IG/A' lines up with indicator on housing, loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

Synchronization—2nd Method: Use synchronizing tool, Cadillac Part No. 109224. Install tool and adjust so that stationary contacts begin to open when pointer opposite farthest indicating point on quadrant 'R.H.', turn engine over until pointer is directly opposite '12 L.H.' mark on quadrant. Loosen lockscrews on movable sub-plate, turn eccentric adjusting screw until contacts open, tighten lockscrew.

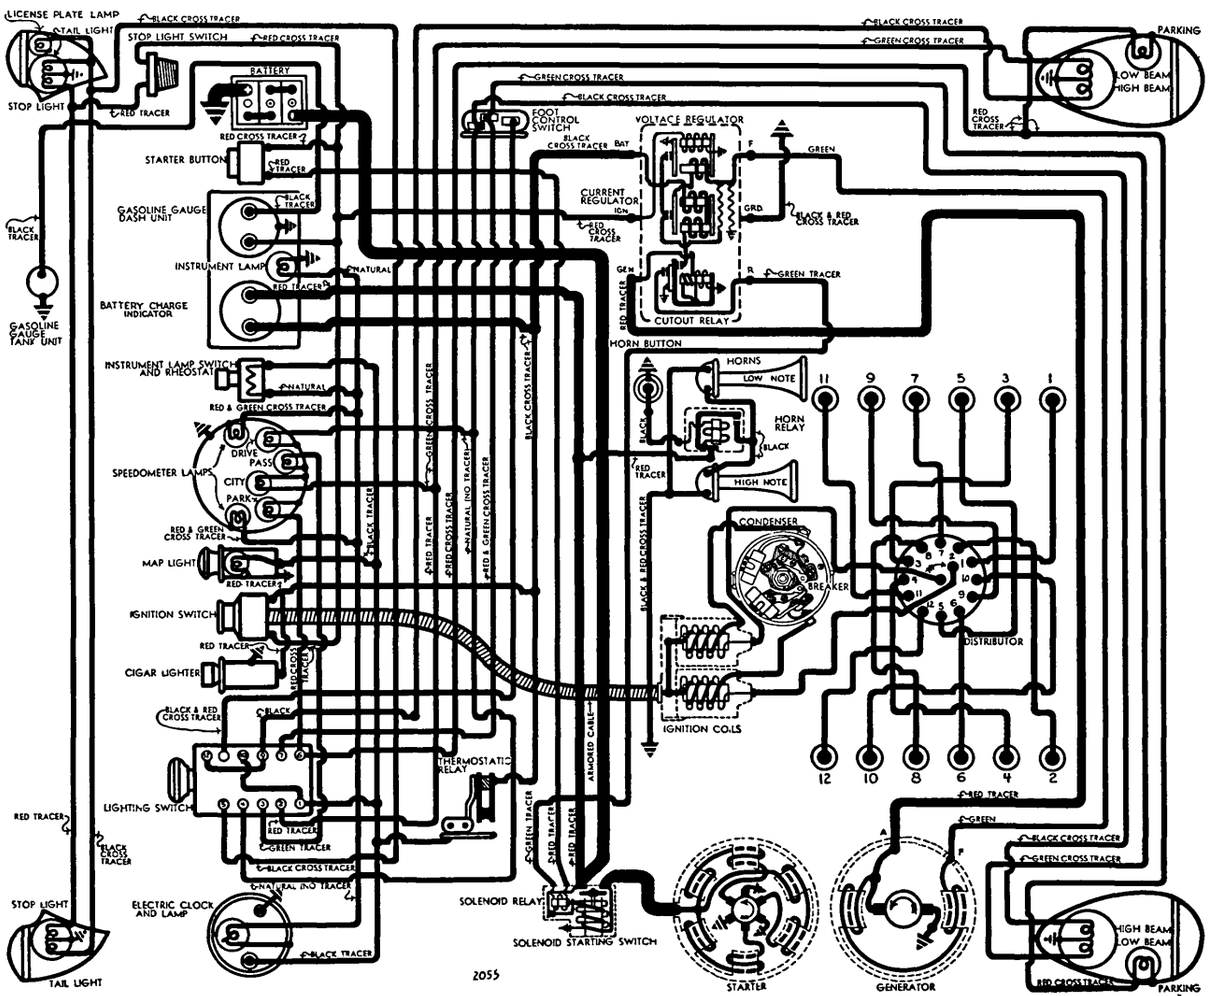
Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Manual Adjustment—With ignition set as above, slight 'ping' should be noticeable when engine is accelerated with wide open throttle at speeds below 15 M.P.H. If ping is too severe, loosen hold-down screw on pointer, rotate distributor one graduation on scale clockwise to retard spark, repeat test. Adjustment permits advance or retard of 10° from center 'O' position.

NOTE—Check engine for faulty spark plugs, excessive carbon deposits or localized 'hot spots' before changing the manual adjustment.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12. See diagram; spark plug cables not connected in this order

Spark Plugs:—AC. Type G-7. 18 MM. Metric type.



NOTE—G-7 discontinued by AC. Use No. 84.

Spark Plug Gap—.025-.027".

CARBURETION: Carburetor—Detroit Model 51, 1½" expanding vane or air valve, updraft type. One carburetor used for each bank with interconnected throttles.

NOTE—Carburetor throttles must be synchronized.

See article in Carburetion Section for data.

Automatic Choke:—Detroit semi-automatic type. **See article in Carburetion Equipment Section.**

Air Cleaner:—AC. #1528123 heavy duty oil-bath type standard.

Fuel Pump:—AC. Type D #1522149. Diaphragm type. **See article in Carburetion Equipment Section.** NOTE—AC. Type K #1521542 vacuum pump mounted as separate unit.

Gasoline Gauge:—AC. Electric. #1515338 (dash unit), #1515420 (tank unit). **See article in Carburetion Equipment Section.**

VALVE TIMING:—To Check Timing—Intake valve for #1 cylinder (front cylinder—left bank) should open with piston on top dead center when flywheel mark 'C/1-11' lines up with indicator on housing.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance—None in service (hydraulic tappet take-up used). **See article in Mechanical Equipment Section.**

Valve Spring Pressure:—Inner spring—19.5 lbs. at 1.751" (valve closed), 51.5 lbs. at 1.407" (valve open). Outer spring—50 lbs. at 1.922" (valve closed), 115.5 lbs. at 1.578" (valve open).

LUBRICATION:—Crankcase Capacity—9 quarts.

Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 21-D. 6 volt, 21 plate, 164 ampere hour capacity (20 hour rate).

Starting Capacity—195 amperes for 20 minutes.

Zero Capacity—300 amperes for 7.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat.

STARTER:—Model 580, SM-1748 (RHD). Armature No. 1837058.

Drive—Solenoid pinion shift and overrunning clutch type with reduction gears.

Rotation—counter-clockwise (armature shaft) at commutator end.

Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2200	5.7	70
35 ft. lbs	Lock	3.0	600

Removal:—Flange mounted on rear face of flywheel housing at right of transmission. To remove, take out 3 flange capscrews.

Starting Switch:—Solenoid Switch Type 1515. Push-button Switch 1407. Solenoid switch controlled thru relay by push button on instrument board. Operative only with ignition turned 'on'. **See article in Electrical Equipment Section.**

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts. max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

GENERATOR:—Model 933-M. Armature No. 1854448. Two brush, straight shunt, 'Peak Load' type with external voltage and current regulation. Air cooled type.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below.

Maximum Charging Rate—26 amperes (cold) with discharged battery as indicated on test ammeter connected in line at 'BAT' terminal on Control Unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1700 R.P.M. or 20 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
26	8.0	1450

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces.
Shunt Field Current—1.7-2.0 amperes at 6 volts.

Removal:—Flange mounted on rear face of timing chain case at right of engine. To remove, disconnect water pump drive coupling, take out flange mounting screws. Chain adjustment automatic, requires no attention during life of chain.

CONTROL UNIT (VOLTAGE-CURRENT REGULATOR) —Model 5818. Mounted on left side of dash. Consists of Cutout Relay, Vibrating Voltage Regulator, Vibrating Current Regulator in a single case. **See article in Electrical Equipment Section.** NOTE—Cover of regulator case is sealed. Units can be checked without breaking seal. Seals must be broken to remove cover for adjustments.

Cutout Relay

Cuts In—6.5-7.0 volts.

Cuts Out—0-3.0 ampere discharge current.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator over-compensated for temperature and must be checked at these points.

Checking—To check without breaking seal, disconnect lead at 'IGN' terminal on case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes. Voltmeter reading should agree with setting above.
NOTE—Cover should be in place when tests are made. Do not operate generator on open-circuit.
Adjusting—Seal must be broken and cover removed. With ammeter and voltmeter connected as above, set regulator by bending spring hanger at lower end of armature spring slightly until performance is correct (with cover in place). Remove jumper and restore original connections.

Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.060-.070" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

Current Regulator.

Setting—24-26 amperes.
Checking—To check without breaking seal, disconnect 'IGN' lead on regulator, connect test ammeter in charging line at 'BAT' terminal. Operate generator and check performance.
NOTE—Do not allow generator voltage to exceed 8.5 volts with voltage regulator inoperative.
Adjusting—Seal must be broken and cover removed. Set regulator by bending spring hanger at lower end of armature spring slightly until performance is as noted above (cover must be in place when testing). Restore original connections.

Contact Gap—.015-.025".
Contact Spring Tension—3.5 ounces minimum.
Air Gap—.070-.080" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.
NOTE—Repolarize generator whenever Control Unit disconnected or removed by connecting jumper between 'GEN' and 'BAT' terminals momentarily after all leads connected. Disconnect 'BAT' lead first, connect this lead last.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type, with special non-interchangeable lenses. Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in third or Country Driving position.
NOTE—With lighting switch in second position, foot selector switch controls upper driving beam and lower city beam (for both headlamps).

Headlamp Adjustment:—With driving (upper beam) lighted and lenses in place, aim left hand headlamp so that upper edge of hot spot is at lamp center height and left edge is at vertical line for lamp center (entire hot spot to right of this center line) at 25 feet. Aim right hand headlamp for same height but center hot spot on lamp-center vertical line (right cut-off of hot spot about 1 foot to right of center-line).

Headlamp Indicators—Consits of 4 bulbs in speedometer dial which illuminates markers as follows:
City—Lower beam, both headlamps.
Drive—Upper beam, both headlamps.
Pass—Special passing beam (see above).
Park—Parking bulbs in headlamps lighted.

Switches

Lighting—Delco-Remy Model 480-S, 480-N (RHD).
Foot Selector—Delco-Remy Model 471-T, U (RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
R. H. Headlamp (see note)	32-50	2530
L. H. Headlamp	32-32	2330
Parking, Instrument	1½	55
Clock, Indicators	1	51
Map, Quarter, License	3	63
Stop & Tail	21-3	1154
Dome	15	87

NOTE—In states where this bulb not legal, 32-32 cp., 2330 bulb used in both headlamps. Type 1154 bulb has stop pin which insures correct installation.

THERMOSTATIC RELAY:—Part No. 1866707. Mounted on lighting switch. Contacts open in 1 minute with load of 38 amperes. Not adjustable.

HORNS:—Delco-Remy Model K-33-D, Type 1965 (low note), 1966 (high note). Vibrator type, twin horns with blended tone. Operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
1965	12-14 amperes	.045-.050"
1966	11-13 amperes	.036-.040"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.014" with contacts closed.

SERIAL NUMBER:—Same as engine number. Stamped on generator drive chain housing on crankcase (visible from right side with engine hood up). First number 5110001 (1936) 5130301 (1937).

COMPRESSION:—Ratio—6.0-1 Std. 5.65-1 Optl.

Pressure—154 lbs. at 1000 R.P.M., 172 lbs. at 3200 R.P.M., or approximately 100-105 lbs at cranking speed for standard 6.0-1 head.

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 320 R.P.M.

IGNITION:—Coil Model 553-E. Two coil unit assembled with ignition switch.

Ignition Current—(For each coil)—2.2 amperes idling, 4.4 amperes stopped.

Ignition Switch:—Delco-Remy Model 431-F (1936) 435-R (1937). Switch and cable assembly. Connected to coil unit by armored cable.

Ignition Lock—Briggs & Stratton No. 45792 (cylinder). **Key Series**—8000-9499.

Distributor Model 4118. Double breaker, 8 lobe cam, full automatic advance type. Contacts open alternately at regular 22½° intervals, corresponding to 45° firing intervals of engine. Contacts must be synchronized (see Timing).

Breaker Gap—Set at .016". Limits .014-.018".

Cam Angle or Dwell—Closed 31°. Open 14° (distributor degrees). Each set operates independently and controls one coil.

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 1837963. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	2.5	400
8.25	600	16.5	1200
17	1100	34	2200

Distributor Removal:—Mounted between cylinder banks at front of engine. Take out two capscrews in mounting bracket.

NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting for all engines as follows. See Manual Adjustment section below.

	Flywheel Degrees	Piston Position
All engines	4° BTDC	.0058" BTDC

Timing (Stationary Contacts)—Loosen hold-down screw in advance arm, center distributor pointer on quadrant scale by rotating distributor, tighten hold-down screw, take off cover plate over inspection hole in flywheel housing. With #1 piston on compression, crank engine by jacking up one rear wheel, placing car in gear and turning wheel, stop with piston 4° before top dead center when flywheel mark 'IG/A' (which is 4° before top dead center mark 'C/1-15') lines up with indicator on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, check rotor position and spark plug cable connections (see diagram). Then synchronize movable contacts as directed below.

Synchronization (Movable Contacts)—1st method: Turn engine over 75° or slightly less than ¼ revolution to firing position of piston #4, stop when flywheel mark 'IG/A' lines up with indicator on housing, loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

Synchronization—2nd Method: Use synchronizing tool, Cadillac Part No. 109224. Install tool and adjust so that stationary contacts begin to open when pointer opposite farthest indicating point on quadrant 'R.H.', turn engine over until pointer is directly opposite '16 L.H.' mark on quadrant. Loosen lockscrews on movable sub-plate, turn eccentric adjusting screw until contacts open, tighten lockscrew.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Manual Adjustment—With ignition set as above, slight 'ping' should be noticeable when engine is accelerated with wide open throttle at speeds below 15 M.P.H. If ping is too severe, loosen hold-down screw on pointer, rotate distributor one gradution on scale clockwise to retard spark, repeat test. Adjustment permits advance or retard of 10° from center 'O' position.

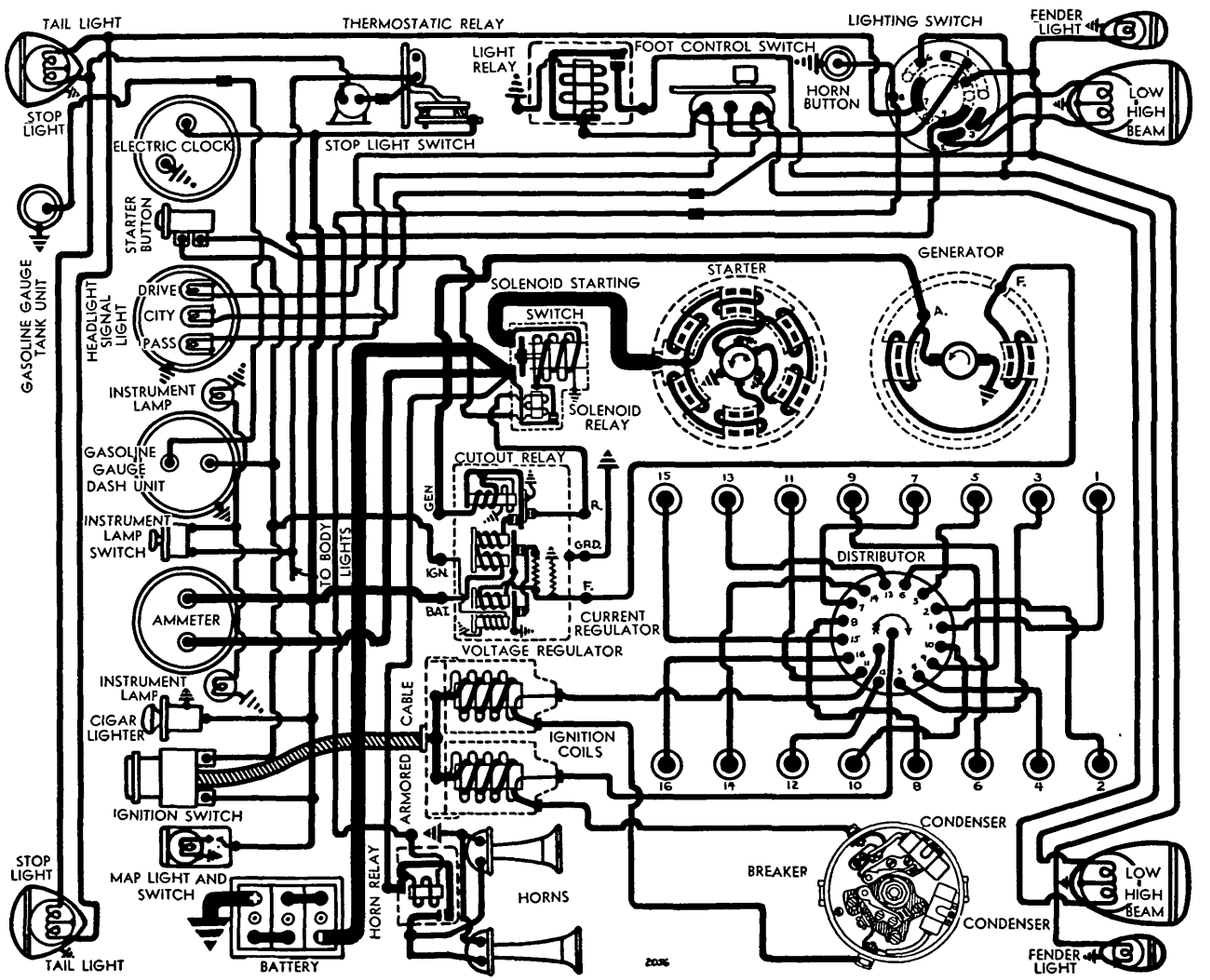
NOTE—Check engine for faulty spark plugs, excessive carbon deposits or localized 'hot spots' before changing the manual adjustment.

Firing Order:—1-8-9-14-3-6-11-2-15-10-7-4-13-12-5-16 (see diagram for cylinder numbering scheme). Spark plugs not connected in this order.

Spark Plugs:—AC. Type G-6. 18 MM. Metric type.

NOTE—G-6 discontinued by AC. Use No. 84.

Spark Plug Gap—.025-.027".



CARBURETION:—Carburetor—Detroit Model 51, 1½" expanding vane or air valve, updraft type. One carburetor used for each bank with interconnected throttles.

NOTE—Carburetor throttles must be synchronized.

See article in Carburetion Section for data.

Automatic Choke:—Detroit semi-automatic type.

See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1526626 oil-wetted type standard.

Fuel Pump:—AC. Type D #1522149. Diaphragm type.

See article in Carburetion Equipment Section.

NOTE—AC. Type K #1521542 vacuum pump mounted as separate unit.

Gasoline Gauge:—AC Electric. #1515135 (Dash unit—1936), #1515335 (Dash unit—1937), #1515059 (Tank unit—all models).

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Intake valve for #1 cylinder (front cylinder—left bank) should open with piston on top dead center when flywheel mark 'C/1-15' lines up with indicator on housing.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance—None in service (hydraulic tappet take-up used).

See article in Mechanical Equipment Section.

Valve Spring Pressure:—Inner spring—19.5 lbs. at 1.751" (valve closed), 51.5 lbs. at 1.407" (valve open). Outer spring—50 lbs. at 1.922" (valve closed), 115.5 lbs. at 1.578" (valve open).

LUBRICATION:—Crankcase Capacity—10 quarts.

Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 25-A. 6 volt, 25 plate, 196 ampere hour capacity (20 hour rate).

Starting Capacity—234 amperes for 20 minutes.

Zero Capacity—300 amperes for 9.5 minutes.

Ground Terminal—Positive (+) terminal.

Location—Under right front fender. Accessible from engine compartment with right hood raised.

STARTER:—Model 580. Armature No. 1837058.

Drive—Solenoid pinion shift and overrunning clutch type with reduction gears.

Rotation—Counter-clockwise (armature shaft) at commutator end.

Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2200	5.7	70
35 ft. lbs.	Lock	3.0	600

Removal:—Flange mounted on rear face of flywheel housing at right of transmission. To remove, take out 3 flange capscrews.

Starting Switch:—Solenoid Switch Type 1515. Push-button Switch 1379. Solenoid switch controlled through relay by push button on instrument board. Operative only with ignition 'on'.

See article in Electrical Equipment Section.

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

GENERATOR:—Model 933-M. Armature No. 1854448. Two brush, straight shunt, 'Peak Load' type with external voltage and current regulation. Air cooled type.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below.

Maximum Charging Rate—26 amperes (cold) with discharged battery as indicated on test ammeter connected in line at 'BAT' terminal on Control Unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1700 R.P.M. or 20 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
26	8.0	1450

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ounces.

Shunt Field Current—1.7-2.0 amperes at 6 volts.

Removal:—Flange mounted on rear face of timing chain case at right of engine. To remove, disconnect water pump drive coupling, take out flange mounting screws. Chain adjustment automatic, requires no attention during life of chain.

CONTROL UNIT (VOLTAGE-CURRENT REGULATOR) Model 5559 or 5818. On left side of dash. Consists of Cutout Relay, Vibrating Voltage Regulator, Vibrating Current Regulator in a single case.

See article in Electrical Equipment Section.

NOTE—Cover of regulator case is sealed. Units can be checked without breaking seals. Seals must be broken to remove cover for adjustments.

Cutout Relay

Cuts In—6.5-7.0 volts.

Cuts Out—3.0 ampere discharge current.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F. 7.45-7.55 volts at 150° F. Regulator over-compensated for temperature and must be checked at these points.

Checking—To check without breaking seal, disconnect lead at 'IGN' terminal on case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes. Voltmeter reading should agree with setting above.

NOTE—Cover should be in place when tests are made. Do not operate generator on open-circuit.

Adjusting—Seal must be broken and cover removed. With ammeter and voltmeter connected as above, set regulator by bending spring hanger at lower end of armature spring slightly until performance is correct (with cover in place). Remove jumper and restore original connections.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ozs. minimum.

Air Gap—.060-.070" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

Current Regulator

Setting—24-26 amperes.

Checking—To check without breaking seal, disconnect 'IGN' lead on regulator, connect test ammeter in charging line at 'BAT' terminal. Operate generator and check performance.

NOTE—Do not allow generator voltage to exceed 8.5 volts with voltage regulator inoperative.

Adjusting—Seal must be broken and cover removed. Set regulator by bending spring hanger at lower end of armature spring slightly until performance is as noted above (cover must be in place when testing). Restore original connections.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ounces minimum.

Air Gap—.070-.080" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

NOTE—Repolarize generator whenever Control Unit disconnected or removed by connecting jumper between 'GEN' and 'BAT' terminals momentarily after all leads connected. Disconnect 'BAT' lead first, connect this lead last.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type with special non-interchangeable lenses. Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in Country Driving position.

Headlamp Adjustment—With driving (upper beams) lighted and lenses in place, aim left hand headlamp so that upper edge of hot spot is at lamp center height and left edge is at lamp-center vertical line (entire hot spot to right of this line) at 25 feet. Aim right hand headlamp for same height but center hot spot on lamp-center vertical line with right hand cut-off of hot spot about 1 foot to right of center line.

Headlamp Indicators—Consists of 3 bulbs in special dial on instrument board which are lighted as follows:

Drive—Upper beam, both headlamps.
City—Lower beam, both headlamps.
Pass—Asymetrical passing beam (see above).

Switches

Lighting—Delco-Remy Model 487-H, K (Exp.).
Foot Selector—Delco-Remy Model 471-Z (1936) 471-T (1937).
Stop Light—Delco-Remy Model 474-R (1936 only).

Bulb Specifications

Position	Candlepower	Mazda No.
R.H. Headlamp (see Note)	32-50	2530
L.H. Headlamp	32-32	2330
Parking, Instrument	1½	55
Clock, Indicators	1	51
Map, Quarter, License	3	63
Stop & Tail	21-3	1154
Dome	15	87

NOTE—In states where this bulb not legal, 32-32 cp., 2330 bulb used in both headlamps. Type 1154 bulb has stop pin which insures correct installation.

THERMOSTATIC RELAY:—Model 411-A. Mounted on dash. Contacts remain closed with current of 25 amperes but open within one minute with load of 38 amperes at 70-80° F. Not adjustable.

HORNS:—Delco Model K-33-B Type 1855 (low note), 1856 (high note). Blended tone twin horns, operated by horn relay. Vibrator type.

Horn Type	Current at 6 volts	Air Gap
1855	12-14 amperes	.045-.050"
1856	11-13 amperes	.036-.040"

NOTE—Horns identified by letter stamped on front of power unit cover and projectors must be assembled as follows: 'S'—low note, short projector, 'L'—high note, long projector.

Horn Relay Model 266-TK (1936) 271-A (1937):—Contacts close at 2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.014" with contacts closed.

CHEVROLET

INTERNATIONAL MODEL AC (1929)
SERIAL NUMBERS (PASSENGER CARS AND ½ TON TRUCK) AC-1001 UP
SERIAL NUMBERS (1½ TON TRUCK) LQ-1001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

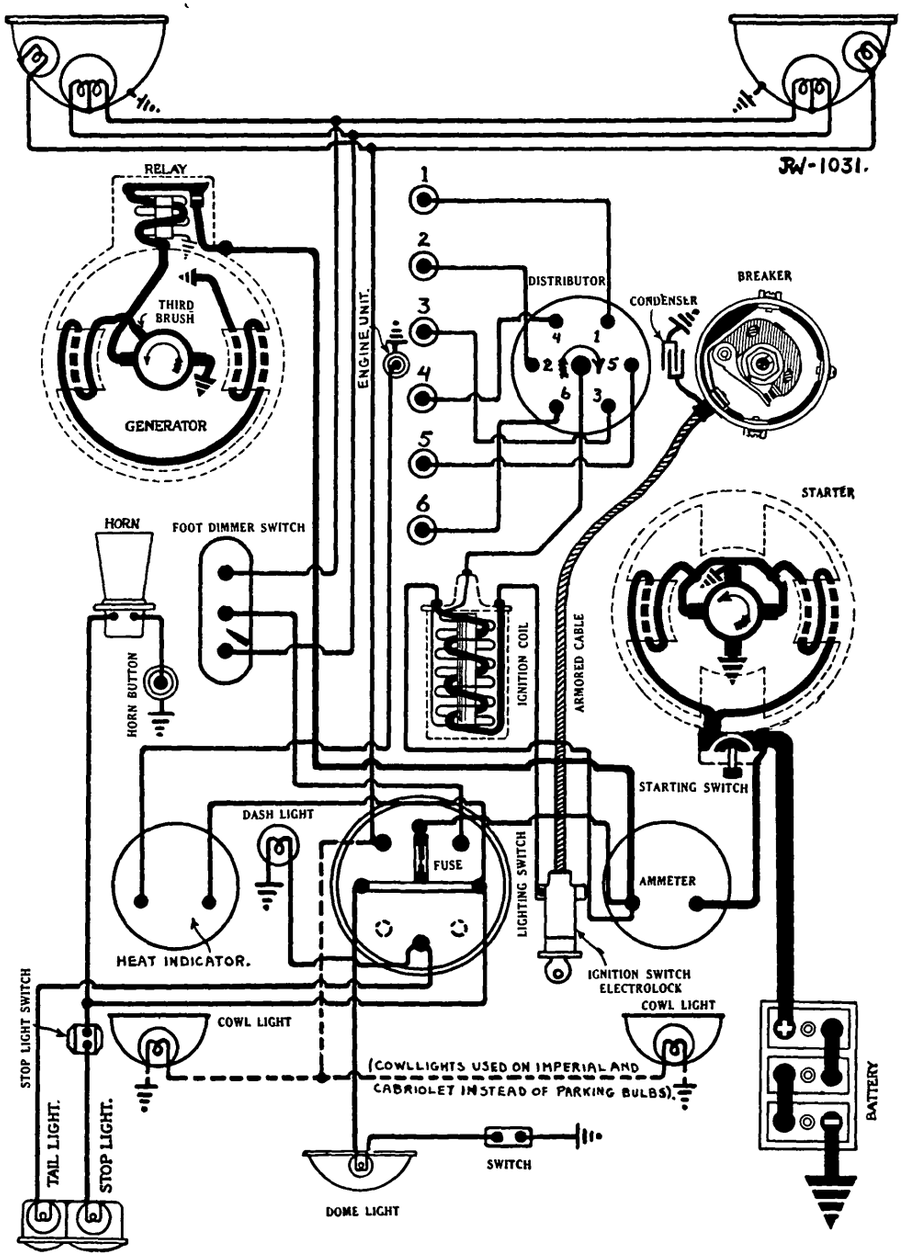
BATTERY:—Willard, U.S.L., Exide, Delco-Remy. The negative (—) terminal is grounded. Battery is mounted on right frame member under front floor boards.

IGNITION:—Coil Model 528-C. Coil is mounted on the dash. Ignition current is 1.9 amperes at 6 volts with engine running at 40 M.P.H. and 3 amperes at 6 volts with engine stopped. The ignition switch is a Model 427-B Delco-Remy Electrolock.

Distributor Model 633-G. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lockscrew on crescent shaped stationery contact mounting plate and turning eccentric adjusting screw until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 28 degrees at 2400 R.P.M. of the engine.

Mounting:—Distributor is mounted at right of engine and is driven by gears from the camshaft. To remove distributor, disconnect Electrolock at dash, disconnect manual advance rod and remove head with cables intact. Then loosen advance arm clamp screw and lift distributor out. The drive gear and slotted shaft for oil pump drive are integral with the distributor. To remove Electrolock from distributor housing, remove three screws on side of housing (two screws holding distributor head clips and one plain screw), tip the breaker plate and remove nut on end of Electrolock cable inside distributor housing. This releases cable and breaker plate.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down one half turn every month or each 1000 miles. At the same time remove the head and rotor and put light engine oil in the oiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15 degrees before top dead center with the spark control lever in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the upstroke with both vales closed). Fully advance spark lever. Continue to crank engine until the flywheel mark '15' is in line with pointer on the flywheel case in the peephole on the right side of the motor when the piston will be 15 degrees before top dead center. Loosen advance arm clamp screw and rotate distributor in a counter-clockwise direction until the contacts begin to separate. Tighten the clamp screw and connect the terminal directly opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4. No. 1 cylinder nearest the radiator.

Spark Plugs:—Spark plugs are Metric, AC. No. 140. Gaps are .025 inch.

VALVE TIMING:—Specifications: Head diameter, 1 13/32 inches. Stem diameter, 5/16 inch. Stem length, 4 23/32 inches. Valve lift, .277 inch. Spring pressure, 40 pounds. Tappet clearance, .006 inch (hot) inlet, and .008 inch (hot) exhaust.

Timing:—Inlet valves open 4 degrees after top dead center and close 42 degrees after lower dead center. Exhaust valves open 47 degrees before lower

CHEVROLET

INTERNATIONAL MODEL AC (1929)
SERIAL NUMBERS (PASSENGER CARS AND ½ TON TRUCK) AC-1001 UP
SERIAL NUMBERS (1½ TON TRUCK) LQ-1001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

dead center and close 4 degrees after top dead center. The flywheel is marked at top dead center. The inlet opening point should be .14 inch on the circumference after this point.

To Check Valve Timing. Turn engine over until No. 1 piston is on top dead center entering power stroke and set tappet clearance of No. 1 inlet valve at .006 inch. Crank engine over one complete revolution and stop with piston slightly past top dead center when the dead center mark on the flywheel is approximately one tooth past the indicator in the peephole in the housing at the right of the engine. The No. 1 inlet valve should begin to open at this point.

To Set Valve Timing. Camshaft is gear driven from the crankshaft at the front of the engine. Both the camshaft gear and crankshaft gear are marked. Mesh the gears so that these marks are directly opposite each other.

STARTER:—Model 714-L. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 175 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 943-J. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 18 amperes (cold) reached at 2100 R.P.M. or 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.2	1700	11-13	7.55-7.85	1750-1850

Motoring generator draws 3 amperes at 6 volts. Shunt field current is 4-5.9 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at left of engine by special hinge bracket and is driven by the fan belt. To remove generator, disconnect lead and remove cap screw in adjustment clamp at front of generator. Swing generator toward motor, slip off drive belt and remove bolts in generator end plates holding generator on bracket. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. or 8 M.P.H. when the generator voltage reaches 7-7.5 volts and open at 550 R.P.M. or 6 M.P.H. with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 478-C, D. Dimmer Switch Model 465-H. Double filament headlights are used controlled by the dimmer switch mounted on the toeboard. Lighting switch is mounted on the instrument panel. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Auxiliary headlights are 6-8 volt, 3 cp. S.C. Mazda 63. Side lights (used instead of auxiliaries on Imperial and Cabriolet models) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Stop light switch is Delco-Remy, Model 466-F.

FUSES:—Lighting fuse mounted on back of switch is 15 ampere capacity.

CHEVROLET

UNIVERSAL MODEL AD (1930), SERIAL NOS. AD-1001 UP
INDEPENDENT MODEL SERIES AE (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

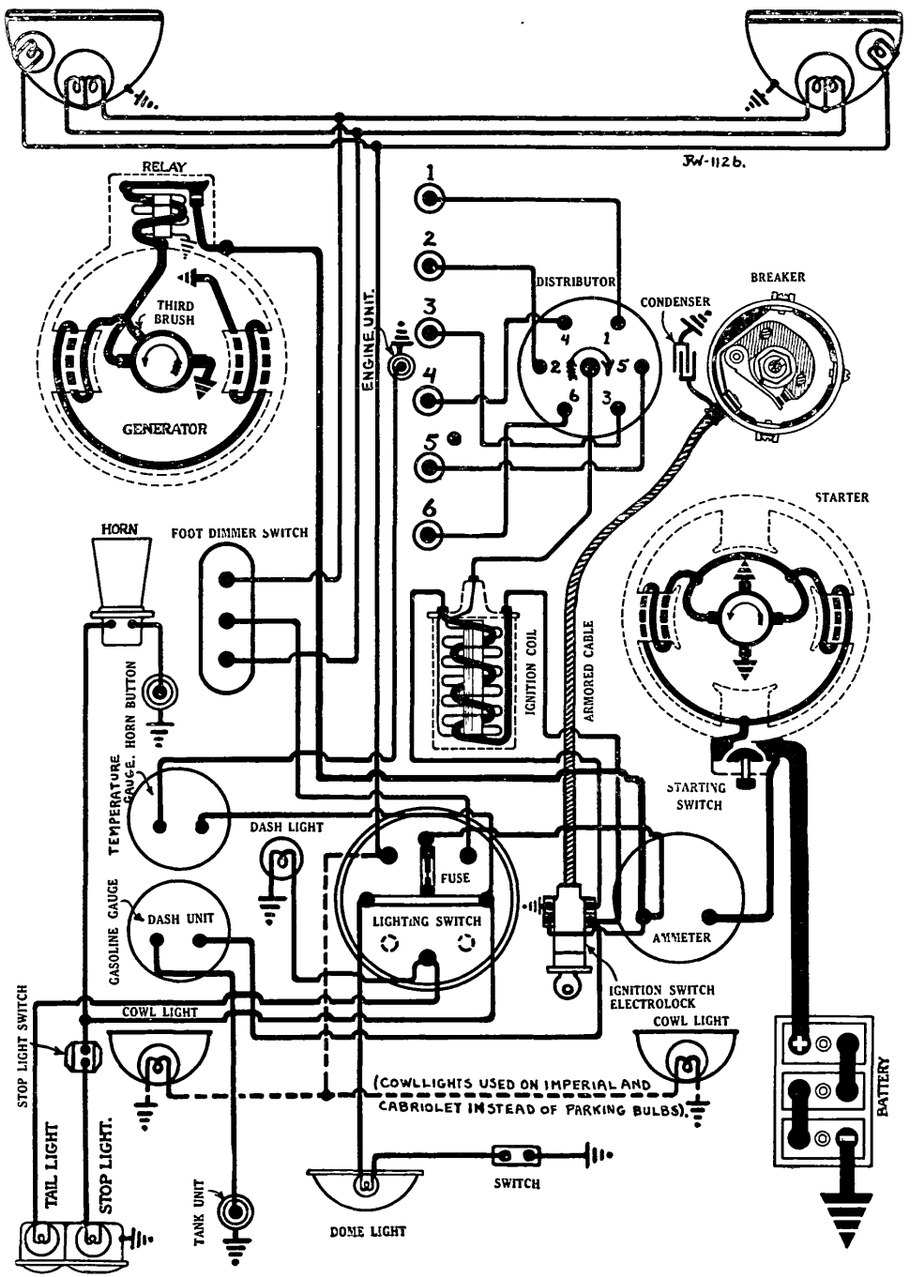
BATTERY:—Various types of batteries have been used. They are all six volt. The negative (—) terminal is grounded. Lighting capacity (5 ampere rate) is 5 amperes for 18 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 528-B, C. Coil is mounted on front of the dash. Ignition current is 1.9 amperes at 7.5 volts with engine running at 40 M.P.H. and 4 amperes at 6 volts with engine stopped. The ignition switch is a Delco-Remy Electrolock, Type 427-E (1930), 427-H (1931). The Electrolock must be removed with the distributor whenever the distributor is taken off the car. This Electrolock is fully described in the Equipment Section.

Distributor Model 633-G. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 700 R.P.M. of engine. Maximum automatic advance is 31 degrees reached at 2600 R.P.M.

Mounting:—Distributor is mounted at right of engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect Electrolock at dash, disconnect manual advance rod and remove distributor head with cables intact. Then loosen advance arm stop screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one half turn every month or each 1000 miles. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 12 degrees (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control and see that distributor is rotated counter-clockwise to the full extent of the advance arm slot. Turn engine over until the '12' mark on the flywheel will be opposite the indicator in the peep hole in the front face of the flywheel housing at the right of the engine. This is the firing position of No. 1 piston. Then loosen advance arm clamp screw and rotate distributor until breaker contacts begin to open. Tighten the clamp screw and check rotor position. The rotor must be directly opposite the segment connected to the spark plug in cylinder No. 1. Connect the remaining sparg plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type 140. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 15/32 inches (1930), 1 29/64 inches (1931). Stem diameter, 5/16 inch. Stem length, 4 23/32 inches. Valve lift, .277 inch. Spring pressure, 40 pounds (valve closed). Tappet clearance, .006 inch (hot). Inlet valves open 4 degrees after top dead center and close 42 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 11/32 inches. Stem diameter, 5/16 inch. Stem length, 4 23/32 inches. Valve life, .277 inch. Spring pressure, 40 pounds. Tappet clearance, .008 inch (hot). Exhaust valves open 47 degrees

CHEVROLET

UNIVERSAL MODEL AD (1930), SERIAL NOS. AD-1001 UP
INDEPENDENT MODEL SERIES AE (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

before lower dead center and close 4 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing. Turn engine over until No. 1 piston is on top dead center entering power stroke and set tappet clearance of No. 1 inlet valve at .006 inch. Crank engine over one complete revolution and stop with piston slightly past top dead center when the dead center mark on the flywheel is approximately one tooth past the indicator in the peephole in the housing at the right of the engine. The No. 1 inlet valve should begin to open at this point.

To Set Valve Timing. Camshaft is gear driven from the crankshaft at the front of the engine. Both the camshaft gear and crankshaft gear are marked. Mesh the gears so that these marks are directly opposite each other.

STARTER:—Model 714-L. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 26 ounces. Starter cranks engine at 160 R.P.M. drawing 150 amperes at 4.2 volts. The starting switch is mounted on the starter field frame and is operated by a pedal on the toeboard.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out the flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the starter every month or each 1000 miles.

GENERATOR:—Model 943-J. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 18 amperes (cold) reached at 1700 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
17-18	8.2	1700	12	7.7	1800

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at left of engine by special hinge bracket and is driven by the fan belt. To remove generator, disconnect lead and remove cap screw in adjustment clamp at front of generator. Then swing generator toward engine and slip off drive belt. Then take out bolts holding generator on bracket and lift generator from place.

Fan Belt Adjustment. Fan belt tension is adjusted by loosening clamp screw on adjustment arm at front of generator and swinging generator away from the engine. The belt tension should be just sufficient to drive fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

Oiling:—Put 8 or 10 drops of light oil in the oiler at each end of the generator every month or each 1000 miles.

RELAY:—Model 265-H. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. or 7.5 miles per hour when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 478-E. Lighting switch is mounted on the dash. Double filament headlight bulbs are standard equipment using a second 21 cp. filament instead of dimmers. Headlights are controlled by a foot switch mounted on the toeboard. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Dimmer lights or parking lights in headlights are 6-8 volt, 3 cp. S.C. Mazda 63. Side lights (used on some models) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

Dimmer switch mounted on toe board is Delco-Remy Model 465-H. Stop light switch is Model 466-J, M.

NOTE:—The electric temperature gauge was used only on 1930 models. The 1931 models are equipped with a 'Vapor Tension' type temperature gauge (see Equipment Section). The horn used on 1931 models is a Klaxon Type 16 flat type vibrator horn. The 1930 models were equipped with a Klaxon Type K-8-C, as shown.

FUSES:—Lighting fuse mounted on back of lighting switch is 15 ampere capacity.

CHEVROLET

CONFEDERATE SERIES BA (1932) AND SERIES BB (COMMERCIAL CARS)
PRODUCTION STARTED DECEMBER, 1931
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right front seat frame (open cars) or on right front sill (closed cars).

ENGINE NUMBER:—Stamped on boss on right side of cylinder block directly back of fuel pump.

BATTERY:—Various types used, including Delco, Type 13-H, 6 volt, 90 ampere hour capacity. Negative (—) terminal grounded. Battery mounted on right frame member under front compartment floor boards.

IGNITION:—**Coil Model 528-B.** Coil mounted on engine side of dash. Ignition current 1.9 amperes at 7.5 volts (engine running at 40 M.P.H.), 4 amperes at 6 volts (engine stopped). Ignition switch is Delco-Remy Electrolock, Model 427-H. See Equipment Section for description of Electrolock.

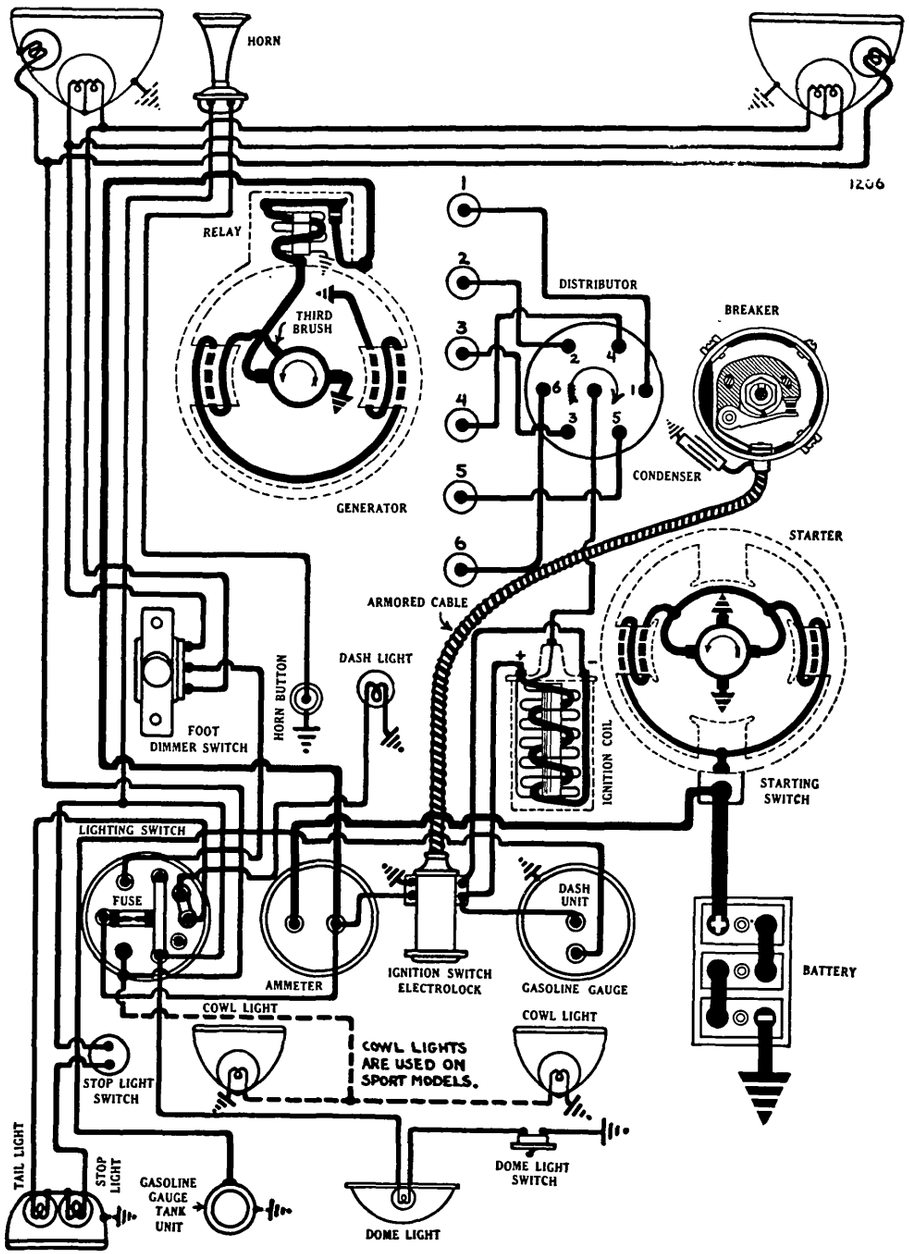
Distributor Model 633-J. Single breaker arm, 6-lobe cam type with semi-automatic advance. Manual advance controlled by button at lower right of instrument panel. Ordinary running position with button pushed in, spark advanced. Pull out button to retard spark. Breaker gap set at .018-.024 inch. To set gap, loosen lock screw on stationary contact plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Maximum manual advance 15 degrees (engine).

Cam Angles—Closed 36°, open 24° (distributor degrees).

Distributor		Automatic Advance		Engine	
Degrees		R.P.M.	Degrees		R.P.M.
Start	.....	350	3	.....	700
11.5	.....	900	23	.....	1800
15.5	.....	1300	31	.....	2600

Mounting:—Distributor mounted at right of engine. Driven by inclined shaft from the camshaft. Electrolock must be removed as a unit with distributor whenever distributor is taken off car (see Equipment Section for complete details on Electrolock). To remove distributor, disconnect all wiring on Electrolock and free Electrolock from dash. Disconnect manual spark control wire, take off distributor cap, take out hold-down screw in advance arm, lift out distributor and Electrolock.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing ¼-1 turn. Keep cup filled with No. 2½ cup grease.



1000 Miles. Take off distributor cap and rotor. Fill wick oiler in center of shaft with light engine oil, put one drop oil on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 12° (on flywheel) before top dead center with full manual advance. To set timing, advance spark control button (push button in toward dash) and see that distributor is rotated counter-clockwise to limit of advance arm slot. With No. 1 piston on compression stroke, turn engine over until flywheel mark '12°/' (which is 12° before top dead center mark 'U.C./' is directly in line with indicator in peephole in right front face of flywheel housing, loosen advance arm clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric A.C. Type G-12 (use Type G-10 for replacement). Set gaps at .024 inch.

VALVE TIMING:—Valves located in cylinder head (overhead valve engine) operated by rocker arms and pushrods at right of engine. Tappet adjustment

CHEVROLET

CONFEDERATE SERIES BA (1932) AND SERIES BB (COMMERCIAL CARS)
PRODUCTION STARTED DECEMBER, 1931
DELCO-REMY SYSTEM

in end of rocker arm directly above pushrods. Camshaft at right of engine and gear driven from crankshaft. Crankshaft gear steel. Camshaft gear fabric.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 15/32"	5/16"	4¾"	45°	.309"
Exhaust	1 11/32"	5/16"	4¾"	45°	.309"

Tappet Clearance		Spring Pressure	
Intake	.006" (hot)	Closed	45 pounds
Exhaust	.008" (hot)	Open	80 pounds

Timing

Intake valves open 4° before top dead center. Close 34° after lower dead center.

Exhaust valves open 47° before lower dead center. Close 4° after top dead center.

To Set Valve Timing. Tooth on crankshaft gear and space between teeth on camshaft gear are marked. Mesh gears so that marked tooth is directly opposite marked space with both marks in line with center between shafts. Mark on camshaft gear is 11 spaces clockwise around the gear from the keyway. Mark on crankshaft gear is 4½ teeth counter-clockwise around gear from keyway (keyway directly opposite space between teeth). These directions should be followed in marking new gears.

STARTER:—Model 714-L. Starter drives engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter switch mounted on starter field frame operated by foot pedal on toeboard.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Starter flange mounted on right front face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 2 flange mounting screws, pull starter forward to clear Bendix housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler.

GENERATOR:—Model 943-J. Third brush regulation. To adjust generator output, loosen small round headed screw on commutator end plate, take off cover band, shift third brush counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. Maximum charging rate 18 amperes (cold) at 8.2 volts reached at 1700 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.2	1700	11-13	7.55-7.85	1750-1850

Brush spring tension 14-18 ounces. Shunt field current 3.5-4.5 amperes at 6 volts. Motoring generator draws 3 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove generator, disconnect lead, loosen adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out adjustment bolt and two bolts under generator forming bracket hinge, lift generator out.

Belt Adjustment. To take up drive belt, loosen adjustment clamp bolt, swing generator out from engine, tighten adjustment bolt. Belt tension should be just sufficient to drive fan and generator without slipping.

Oiling:—500 Miles. Put 4-5 drops light engine oil in oiler at each end of generator.

RELAY:—Model 265-H. Relay mounted on generator field frame. Relay contacts close at 750 R.P.M. of generator with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch Model 478-E. Dimmer Switch Model 465-H or Z. Lighting switch mounted on back of instrument board controlled by push-pull button at lower left of instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated dimmer switch on toeboard.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Lights	6-8	3	S.C.	63
Cowl Lights (when used	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	3	S.C.	63

NOTE:—Stop light switch is Model 474-Y.

FUSES:—20 ampere capacity fuse mounted on back of lighting switch.

GASOLINE GAUGE:—A.C. Electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical fuel pump mounted at right front of engine (see Carburetion Section).

TEMPERATURE GAUGE:—A.C. 'Vapor Tension' type (see Equipment Section).

HORNS:—Klaxon Model K-31, Type 1355 (vibrator type), standard equipment. When twin horns (matched tone) are furnished this horn is used as the low note unit with Model K-31 Type 1356-A for the high note. Type 1356-A is sold separately. Current draw 4.0-6.5 amperes at 6 volts. Model K-16 horn used on Series BB commercial cars.

CHEVROLET

STANDARD SIX SERIES CC, MASTER SIX (EAGLE) SERIES CA (1933)
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right hand body sill at right front seat.

ENGINE NUMBER:—Stamped on pad on right hand side of crankcase at fuel pump. First serial number for Master Six, 3,367,317.

ENGINE:—Standard Six. Six cylinder, overhead valve type, 3 5/16x3½" bore and stroke, 181 cubic inch displacement, rated at 26.3 H.P., develops 60 H.P. at 3000 R.P.M. Standard compression ratio 5.2-1.

Master Six. Six cylinder, overhead valve type, 3 5/16x4" bore and stroke, 206.8 cubic inch displacement, rated at 26.3 H.P., develops 65 H.P. at 2800 R.P.M. Standard compression ratio 5.2-1. No optional compression ratio is offered. Both engines fitted with special 'Octane Selector' for timing to permit special adjustment for individual fuel characteristics (see Timing).

BATTERY:—Delco, Type 13-N-CU (passenger cars), 13-NF (export), 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate). Starting capacity 102 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—In cradle on right hand frame side rail under front floor.

Dimensions:—Width, 7 1/16". Length, 9 11/16". Height, 8 11/16".

IGNITION:—Coil Model 536-W, P. Coil mounted on engine side of dash and connected to ignition switch by means of armored cable (primary lead).

Ignition Current:—1.9 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).

Ignition Switch:—Delco-Remy Electrolock, Model 428-A (switch and cable) assembled as unit with coil (by armored cable connecting coil and switch).

Distributor Model 622-L (Standard), 644-D (Master). Single breaker, 6 lobe cam, full automatic advance type with supplementary Vacuum Spark Control and 'Octane Selector'.

Breaker Gap:—Set at .018". Hold within limits of .018-.024".

Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Vacuum Spark Control:—Model 680-F. Consists of a spring-loaded vacuum operated diaphragm mounted on Octane Selector bracket and linked to distributor advance plate. It is designed to advance spark up to 12° (engine) at idling speeds. It is entirely automatic and requires no service attention.

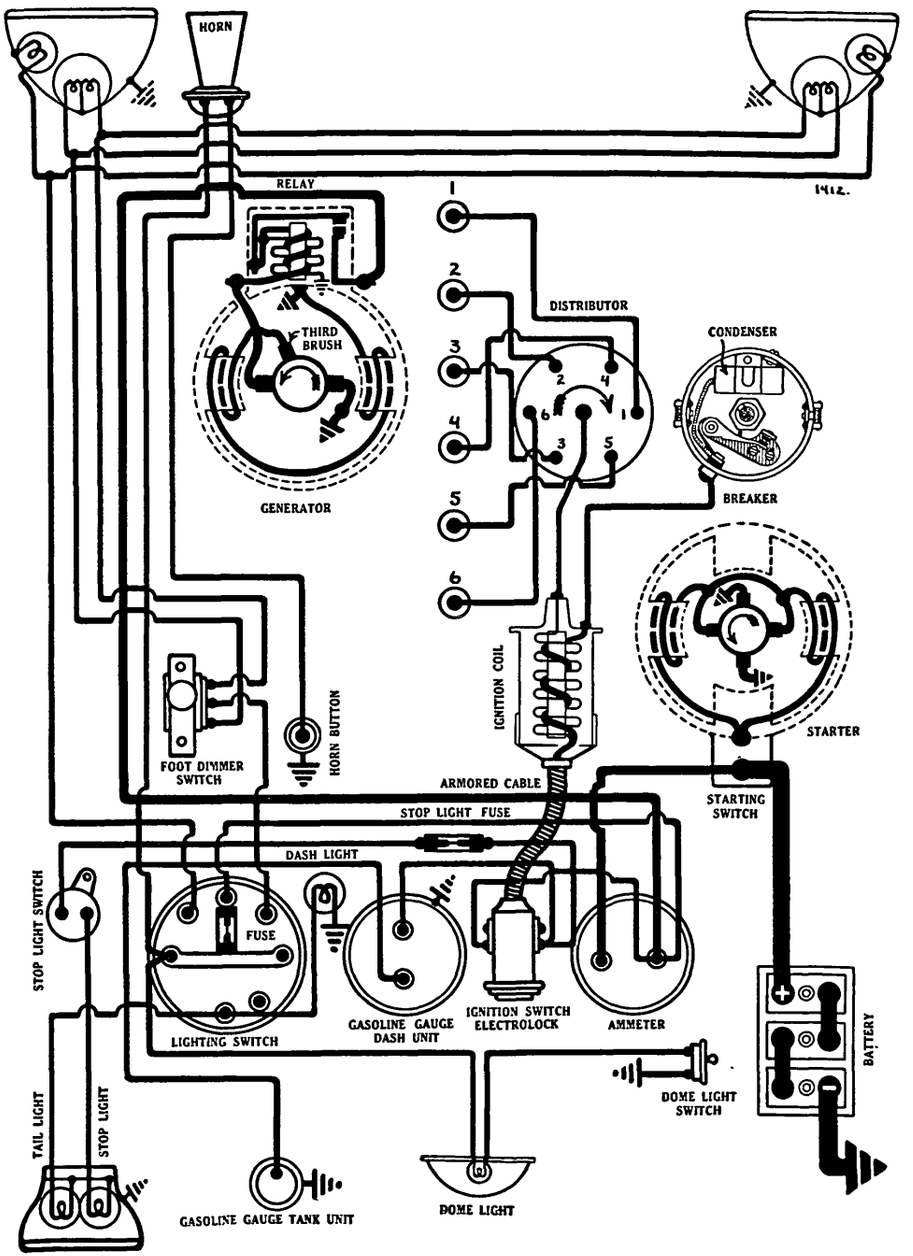
Cam Angles—Closed 36°, open 24° (distributor degrees).

Automatic Advance—Model 622-L

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2		600
16		1350	32		2700

Automatic Advance—Model 644-D

Start		275	2		550
14.25		1200	28.5		2400
19.25		1400	38.5		2800



Mounting:—Distributor mounted at right center of crankcase and driven from the camshaft. To remove, disconnect primary lead, take off distributor cap, loosen clamp bolt in advance plate, lift distributor out.

Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with No. 2½ cup grease.

1000 Miles. Take off distributor cap and rotor, fill wick oiler in center of shaft with light engine oil, put one drop oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting for both models 10° (flywheel) or .0337" (Standard Six), .0385" (Master Six) piston travel before top dead center with Octane Selector set at zero on scale.

To Set Ignition Timing. First set Octane Selector at zero on scale by turning knurled adjusting nuts. See that Vacuum Spark Control is in retarded position with distributor rotated clockwise to limit of advance linkage movement. With No. 1 piston on compression, turn engine over by hand until flywheel mark '10' (which is 10° before top dead center) is directly

CHEVROLET

STANDARD SIX SERIES CC, MASTER SIX (EAGLE) SERIES CA (1933)

DELCO-REMY SYSTEM

under pointer in inspection hole in left hand front face of flywheel housing. Then loosen advance plate clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

These cars are serviced with the regular 1932 flywheel which is marked for ignition by a '12' mark located 12° before top dead center. On cars with this flywheel the ignition should be set in the usual manner with the '12' mark at the indicator.

Octane Selector Setting. After setting ignition as above, Octane Selector should be adjusted for minimum knock (maximum advance setting without spark knock). Octane Selector Scale is graduated in 2-degree units for a total of 10 degrees advance and retard from the standard ignition setting as above (ignition should always be set with Octane Selector set at zero of scale). The standard setting is for fuel of approximately 60 octane rating and spark should be advanced for premium or anti-knock fuel and retarded for fuels which do not come up to this rating.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-9. Set gaps at .032 inch.

VALVE TIMING:—Camshaft Setting. Valves located in cylinder head are operated by rocker arms on head and pushrods from camshaft at right of engine. Tappet adjustment on rocker arm directly above pushrod. Camshaft is gear driven from the crankshaft. Camshaft gear (fabric) is marked in space between teeth. Crankshaft gear (steel) has one marked tooth. Mesh gears so that marked tooth meshes with marked space.

When new or unmarked gears are installed they should be marked as follows: The mark on the camshaft gear should be after the eleventh tooth counted clockwise from the tooth in line with the keyway on the gear (that is, start count with tooth in line with keyway, count off eleven teeth (Standard) or fifteen teeth (Master) clockwise around the gear and punch mark the next following space. On the crankshaft gear the keyway is directly opposite the space between two teeth. The mark should be on the fourth tooth (Standard) or fifth tooth (Master) counter-clockwise from this space (begin count with tooth to left of space in line with keyway and punch mark the fourth (Standard) or fifth (Master) tooth counter-clockwise around the gear).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 29/64"	5/16"	4 15/16"	45°	.314"
Exhaust	1 11/32"	5/16"	4 15/16"	45°	.314"

Tappet Clearance		Valve Springs	
Intake	.006" (hot)	Closed	57 pounds
Exhaust	.008" (hot)	Open	95 pounds

NOTE:—Valve springs are painted yellow to distinguish them from previous designs. They are not interchangeable with 1932 valve springs.

Intake Valves	Timing	Exhaust Valves
Open—4° before top dead center		Open—47° before lower dead center
Close—34° after lower dead center		Close—4° after top dead center

CARBURETION:—Carter Downdraft Carburetor, Model W1, Type 260-S (Standard Six), 259-S (Master Six). See Carburetor Section for complete data. Manifold heat control is automatically operated by thermostatic spring (Master Six) and can be manually adjusted at manifold (Standard Six).

Air Cleaner:—Oil-wetted wire mesh type. Remove at 2500 mile intervals or oftener, take off felt silencer pad on top of unit, clean wire mesh by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase and driven from the camshaft (see Carburetion Section).

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—Model 714-L, 734-J (R.H.D.). Starter drive, Bendix. Starter switch is mounted on starter field frame operated by foot pedal (Standard Six) or special 'Starterator' connected to accelerator pedal (Master Six). See Equipment Section for complete data on Starterator. Starter rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter draws 90 amperes at 5.75 volts while cranking engine with armature speed of 1900 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out flange mounting cap screws, pull starter forward to clear Bendix, lift out.

GENERATOR:—Model 943-J. Third brush regulation. Rotation counter-clockwise at commutator end. With standard setting maximum charging rate is 17 amperes (cold) at 8.2 volts reached at 1700 R.P.M. or 19 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, loosen lock screw on outside of end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lock screw.

Cold Test		Generator Data	Hot Test	
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.2	1700	11-13	7.5-7.8	1750-1850

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—3.5-4.5 amperes at 6 volts across field terminals.

Motoring:—Approximately 5 amperes at 6 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment:—Loosen adjustment clamp bolt and mounting bolts, pull generator away from engine until generator pulley can just be turned by hand, tighten adjustment clamp bolt before slacking off on generator, tighten mounting bolts.

Oiling:—500 Miles. Put 4-5 drops light engine oil in oiler at each end.

RELAY:—Model 265-H. Mounted on generator field frame. Contacts close at 660 R.P.M. with generator voltage of 7.2 volts at approximately 6 M.P.H. and open with 1 ampere discharge current (limits 0-2.5 amperes).

Contact Gap:—.015-.025". **Air Gap:**—.012-.017" (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 478-H. Dimmer Switch Model 465-Z. Lighting switch mounted on back of instrument board and controlled by button at lower left hand corner of instrument panel. Lighting system uses 'depressed beam' dimming with double filament bulbs controlled by foot operated dimmer switch on toeboard. Stop light switch Model 474-Z (Standard), 474-L, Y (Master).

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs	6-8	3	S.C.	63
Cowl Lights (Special)	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	3	S.C.	63
Dome Light	6-8	3	S.C.	63

FUSES:—15 ampere capacity fuse mounted on back of lighting switch. A 15 ampere capacity fuse is connected in the stop lamp lead. Fuse is mounted in a metal cartridge located under the cowl.

HORNS:—Klaxon Model K-31. Type 1355. Vibrator horn mounted under right headlight. Current draw 4.0-6.5 amperes at 6 volts. Model K-31, Type 1356 sold separately and used with Standard horn for twin horn installation.

SERIAL NUMBER:—First number, 1001. Stamped on plate on right front sill.

COMPRESSION:—**Ratio**—5.35-1. No optional ratios. **Pressure**—Should be 75 lbs. or better.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil 538-C, 539-J.** Ignition switch is assembled as part of coil (connected by armored cable).

Ignition Current—4 amperes (engine stopped), 1.9 amperes (to 40 M.P.H.).

Distributor Model 622-L. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector.

Breaker Gap—Set gap at .018". Limits, .018-.024".

Breaker Arm Spring Tension—17-21 ozs.

Cam Angles (Distributor Degrees) — Closed, 36°. Open, 24°.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2	600
16	1350	32	2700

Vacuum Spark Control — Model 680-F. Vacuum control provides additional spark advance except when engine is suddenly accelerated or is pulling heavily (when spark will be retarded by return spring in unit). Vacuum is cut off by carburetor throttle valve shaft at high speed (wide open throttle) so that spark is retarded for high speed operation. Max. vacuum advance, 12° (engine).

Octane Selector—Adjustable at distributor to provide maximum of 10° advance or retard from standard setting for various fuel characteristics. Should be adjusted to provide maximum advance without spark knock.

Octane Rating of Fuel	Octane Selector Setting
40	8° Retard
52	6° Retard
58	4° Retard
64-66	0 on Scale
72	3° Advance
78	6° Advance
80	8° Advance

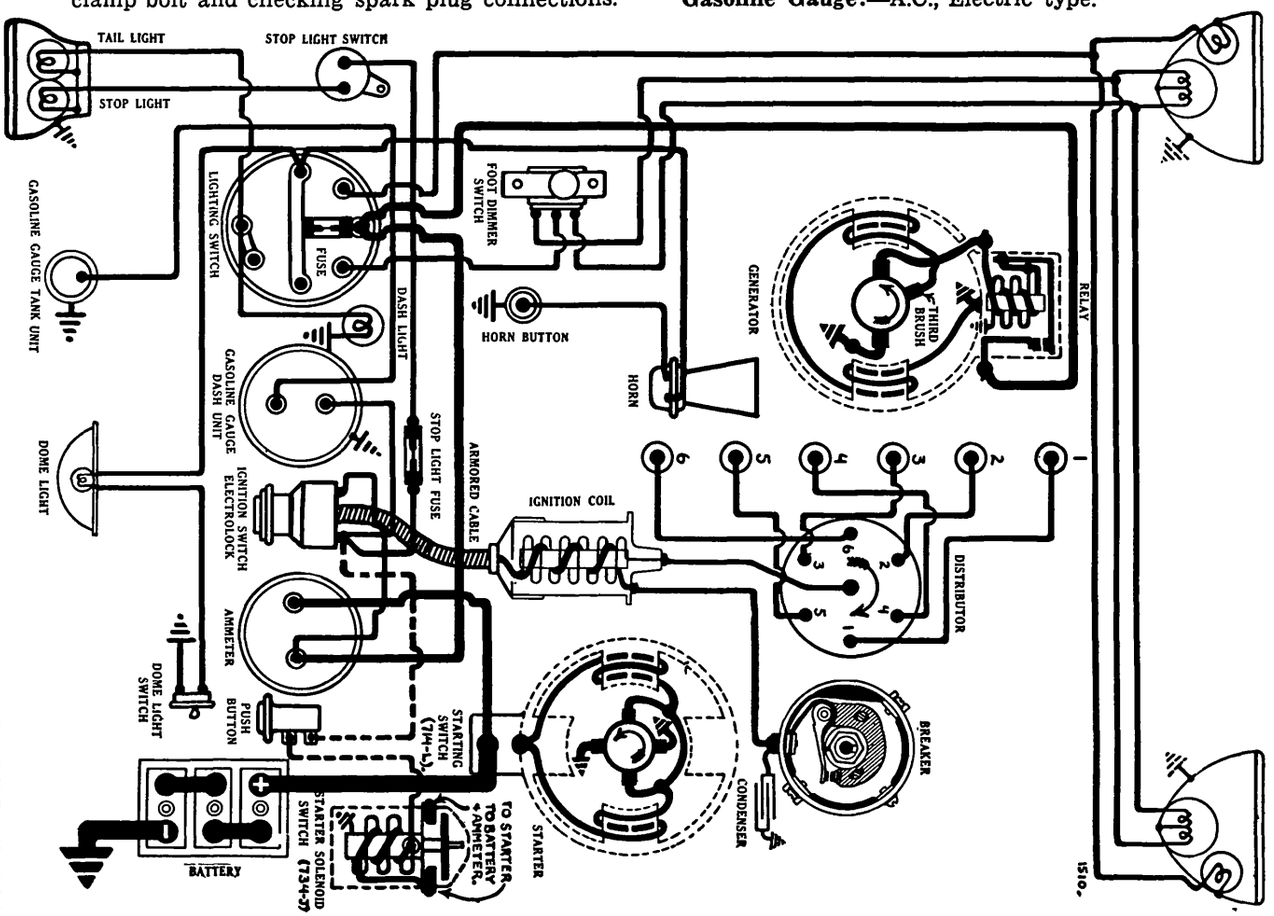
IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....10° BTDC. ..... .0337" BTDC.

Timing (using Neon Timing Light)—Set Octane Selector at '0'. See that vacuum spark control is in retard position. Connect Neon timing light to #1 spark plug, place Neon light so that it will illuminate flywheel inspection hole (right front face of flywheel housing). Run engine at idling speed, loosen distributor advance arm clamp bolt, rotate distributor until steel ball on flywheel appears to be directly opposite pointer on housing (Neon light will make the ball appear to stand still so that position can be checked), tighten clamp bolt.

Timing (without Neon Light)—The manufacturer states that the Neon Timing Light is an absolute necessity to properly time the engine. Setting can be checked or temporarily set in emergency by revolving crankshaft until steel ball is directly opposite pointer on housing with #1 piston slightly before top dead center on compression stroke, loosening advance arm clamp bolt, rotating distributor until contacts begin to open, tightening clamp bolt and checking spark plug connections.

Motor Gauge—Weidenhoff Adapter #113 (with #151 attachment), Rod #19.

Firing Order:—1-5-3-6-2-4 (see diagram).



Spark Plugs:—A.C., Type K-9. 14 MM. Metric type. **Spark Plug Gaps**—.032".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Carter W-1, Model 284-S 1¼" plain tube, downdraft type.

Fuel Pump:—A.C., Type R.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—No flywheel mark provided for valve timing check. With intake tappet clearance set at .006" (engine hot), #1 intake valve should open with piston 4° or .0054" BTDC. when a point on the flywheel approximately 1½ teeth before the dead center point lines up with the indicator in the inspection hole.

Motor Gauge—Weidenhoff Adapter #113 (with #151 attachment). Rod #19.

Tappet Clearance:—.006" Int., .013" Exh., engine hot.

Valve Spring Pressure:—57 lbs. (valve closed). 95 lbs. (open).

LUBRICATION:—Crankcase Capacity—4½ qts. (refill).

Normal Oil Pressure—12 lbs. at 50 M.P.H.

BATTERY:—Delco, Type 13-NW, 13-PW (RHD.), 6 volt, 13 plate, 90 A.H. capacity (20 hour rate).
Starting Capacity—102 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Under front floor boards on right side.

STARTER:—Model 714-L, 734-J (RHD). Armature No. 816163.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Cranking Performance — (Normal) 175 amperes, 2000 R.P.M. (armature speed).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—714-L. Starter switch mounted on field frame, operated by foot pedal. 734-J—electrical solenoid Type 1503. Mounted on field frame controlled by pull switch, Delco Type 1378.

Mounting:—Flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 943-J. Armature No. 817221. Third brush control type.

Charging Rate Adjustment—Loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Standard Charging Rate—12 amperes (hot), 7.6 volts, 2200 R.P.M. or 22½ M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	16-18	8.2	1700
Hot	11-13	7.55-7.85	1750-1850

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—3.5-4.5 amperes at 6.0 volts.
Brush Spring Tension—14-18 ounces each.

Mounting:—Pivot mounting at left front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator out from engine, tighten clamp bolt and pivot bolts. Belt should have small amount of slack.

RELAY CUT-OUT:—Model 265-G. On generator.
Contacts Close——7.2 volts or 7½ M.P.H.
Contacts Open—1 ampere discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 478-H. Foot Control Switch, Model 465-Z, 465-P (RHD.). Foot control switch on toeboard used to control upper and lower headlamp beams.

Bulb Sizes

Position	Candlepower	Mazda No.
Headlights	21-21	1110
Park., Instrument, Tail, Stop	3	63
Dome	6	81

FUSES:—Lighting—15 ampere capacity on switch.

Stop Light—15 ampere capacity cartridge type in stop light lead.

SERIAL NUMBER:—First number 1001. Stamped on plate on right front sill.

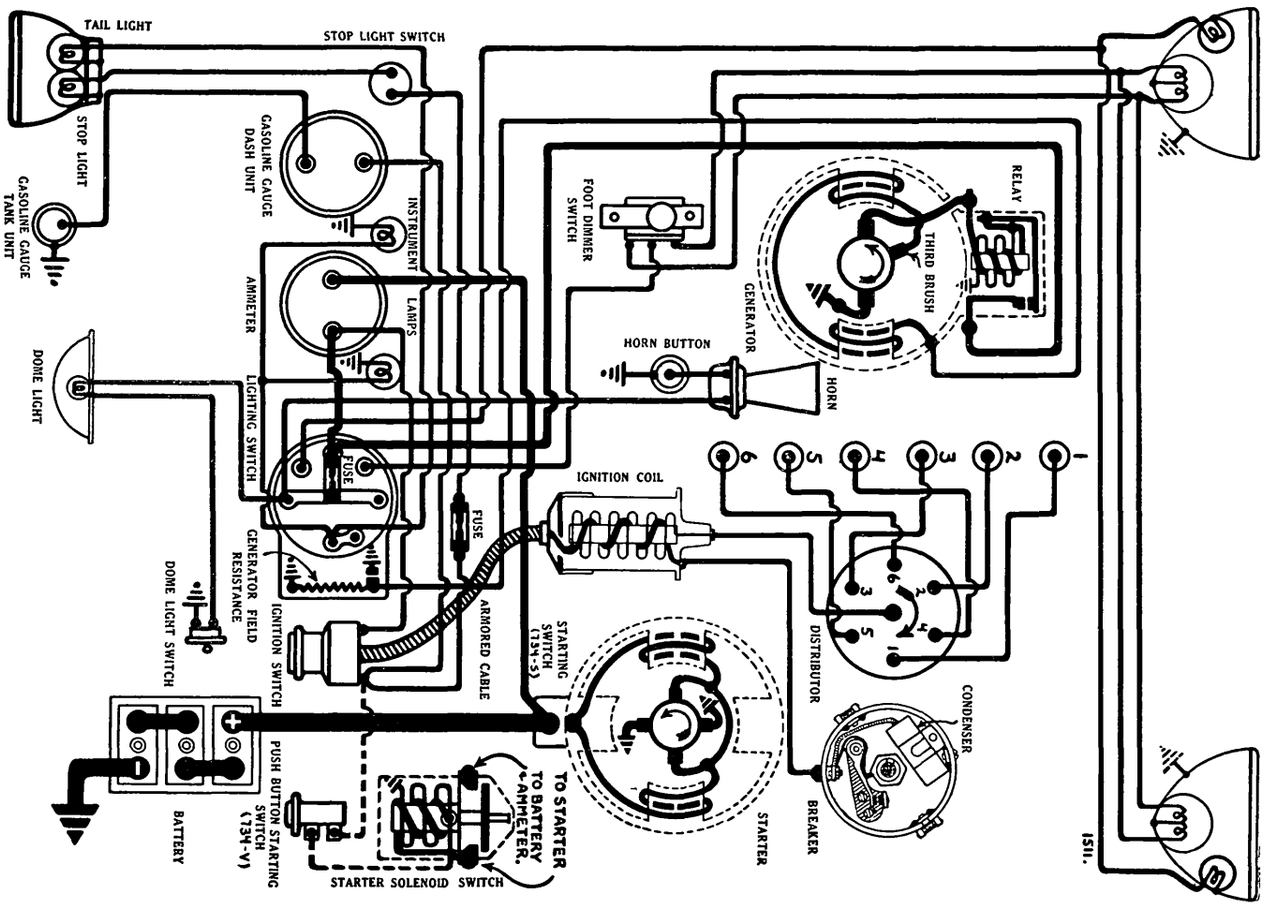
COMPRESSION:—**Ratio**—5.45-1. No optl. ratios.
Pressure—Should be 75 lbs. or better.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil 538-C, 539-J.** Ignition switch is part of coil assembly (connected by armored cable).
Ignition Current—4 amperes (engine stopped), 1.5 amperes (to 40 M.P.H.).
Distributor Model 644-R. Single breaker, 6 lobe cam, full automatic advance type with auxiliary Vacuum Spark Advance and Octane Selector.
Breaker Gap—Set gap at .018". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles (Distributor Degrees) — Closed, 36°. Open, 24°.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	1½	600
10¾	1100	21½	2200
18½	1550	37	3100



Vacuum Spark Control:—Model 680-L. Vacuum control provides additional spark advance except when engine is suddenly accelerated or is pulling heavily (when spark is retarded by return spring in unit). Vacuum is cut off by carburetor throttle valve shaft at high speed (wide open throttle) so that spark is retarded for high speed operation. Maximum vacuum spark advance, 17° (engine).
Octane Selector:—Adjustable at distributor to provide maximum of 10° advance or retard from standard ignition setting for various fuel characteristics. See Std. Model DC for setting.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....10° BTDC..... .0385" BTDC.
Timing (using Neon Timing Light):—Set Octane Selector at '0'. See that Vacuum Spark Control is in retard position. Connect Neon timing light to #1 spark plug, place Neon light so that it will illuminate flywheel inspection hole (right front face flywheel housing). Run engine at idling speed, loosen distributor advance arm clamp bolt, rotate distributor until steel ball on flywheel appears to be directly opposite pointer on housing (Neon light will make ball appear to stand still so that position can be checked), tighten clamp bolt.
Timing (without Neon Light): — Manufacturer states that Neon Timing Light is an absolute necessity to properly time the engine. Setting can be checked or set in an emergency by turning engine over until steel ball on flywheel is directly opposite pointer on housing with #1 piston slightly before top dead center entering power stroke. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open (use a timing light), tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).

Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33.

Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—A.C., Type K-10. 14 MM. Metric type.
Spark Plug Gaps—.032".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge).
Carburetor:—Carter W1, Model 285-S, 1¼" plain tube, downdraft type.
Fuel Pump:—A.C., Type R (right side of crankcase).
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Check tappet clearance #1 intake valve. This valve should open with piston 4° or .0061" before top dead center when a point on the flywheel approximately 1½ teeth before dead center mark lines up with pointer in inspection hole in right front face of flywheel housing.

Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33.

Tappet Clearance—.006" (intake), .013" (exhaust) engine hot and idling.

Valve Springs—	Pressure	Length
Valve Closed	45 lbs.	1⅞"
Valve Open	98 lbs.	1 9/16"

LUBRICATION:—Normal Oil Pressure—12 lbs. at 50 M.P.H.

Capacity and Oil—5 qts. (refill). Use SAE. #30 (summer—after 2000 miles, use #20-W for first 2000 miles with new engine), #20-W (winter 32° to 0°F.), #10-W (winter 0° to —15°F.).

BATTERY:—Delco, Type 15-PW, 15-Q, 6 volt, 15 plate, 94 A.H. capacity (20 hour rate).

Starting Capacity—115 amperes for 20 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Under front floor boards, right side.

STARTER:—Model 734-S, 734-V (RHD.). Armature No. 1847432.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Cranking Performance—(Normal) 175 amperes, 1750 R.P.M. (armature speed).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—734-S—Chevrolet Starterator with Delco-Remy Type 1575 Vacuum Unit. See Equipment Section for complete data. 734-V—Electrical solenoid Type 1503 mounted on starter field frame controlled by pull switch Type 1378.

Mounting:—Flange mounted on flywheel housing, right front side. To remove, take out flange mounting cap screws.

GENERATOR:—935-B (Std.). Armature No. 1854856. Third brush regulation, lighting switch control. Field resistance on lighting switch is shorted out by switch when lamps are turned on, increasing generator output. See 'Lamp Control' generators in Equipment Section.

Field Resistance—Standard, 1 ohm. Optional units, ¾ ohm and 1½ ohm. Change unit only for unusual driving conditions, such as night operation.

Charging Rate Adjustment—Ground field terminal on generator to frame. Use test ammeter to check output, shift third brush counter-clockwise to increase, or clockwise to decrease charging rate. Standard setting should be approximately 2 commutator bars (exposed) between third brush and nearest main brush. Charging rate will ordinarily not require adjustment.

Standard Charging Rate—12 amperes (hot), 7.7 volts, 2400 R.P.M. or 23 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—2.3-2.6 amperes at 6.0 volts.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Model 967-E (cars with radio). Armature No. 1836971. Third brush regulation, thermostat control. Thermostat contact opening inserts resistance in field circuit, reducing output approximately 40%.

Charging Rate Adjustment:—Take off commutator cover band, loosen lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Maximum Charging Rate:—12 amperes (hot), 7.7 volts, 2400 R.P.M. or 23 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.3-8.7	2000
Hot	11-14	7.5-7.9	2200-2600

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—2.1-2.5 amperes at 6.0 volts.

Brush Spring Tension—20-26 ounces each.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment—Loosen mounting bolts, swing generator away from engine, tighten calmp bolt before slacking off on generator, tighten pivot bolts. Belt should have slight amount of slack.

RELAY CUT-OUT:—Model 265-H (used on 935-B, 967-E). Mounted on generator.

Cuts in—7.2 volts, 7 M.P.H.

Cuts out—1 ampere discharge. Limits, 0-2.5 amperes.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

LIGHTING:—Light Switch Model 478-P. Foot Control Switch Model 465-Z, 465-P (RHD.). Stop Light Switch Model 474-L. Foot control switch on toeboard used to control upper and lower headlamp beams. Headlight bulbs are pre-focused type.

Bulb Sizes

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Cowl, Instrument	3	63
Stop, Tail, Dome	3	63

FUSES:—Lighting—15 amps. (on lighting switch).

Stop Light—15 ampere capacity, cartridge type, in stop light lead.

HORNS:—Klaxon, Model K-26-L, vibrator type.

FLEET MODEL NOTE:—A special engine is available for fleet use where maximum economy is desired. Engines are standard except for cylinder head (identified by letter 'F' cast above #1 exhaust port), carburetor with economy throttle stop, and vacuum spark control. Rear axle ratio with this engine is 3.82-1 (42-11 ring gear and pinion).
All specifications are the same except:

Spark Plug Gap—Set at .040".

Intake Tappet Clearance—.010" Hot.

Exhaust Tappet Clearance—.016" Hot.

Ignition Setting—At TDC.

Carburetor—Carter Model 321-S downdraft type. These models may be identified by special name plate on instrument panel and plate on valve pushrod cover listing these specifications.

COMPRESSION:—Ratio—5.45-1. No optional ratios.
Pressure—Should be 75 lbs. or better.

VACUUM READING:—Gauge should show steady reading of 20-22" with engine idling at 400 R.P.M.

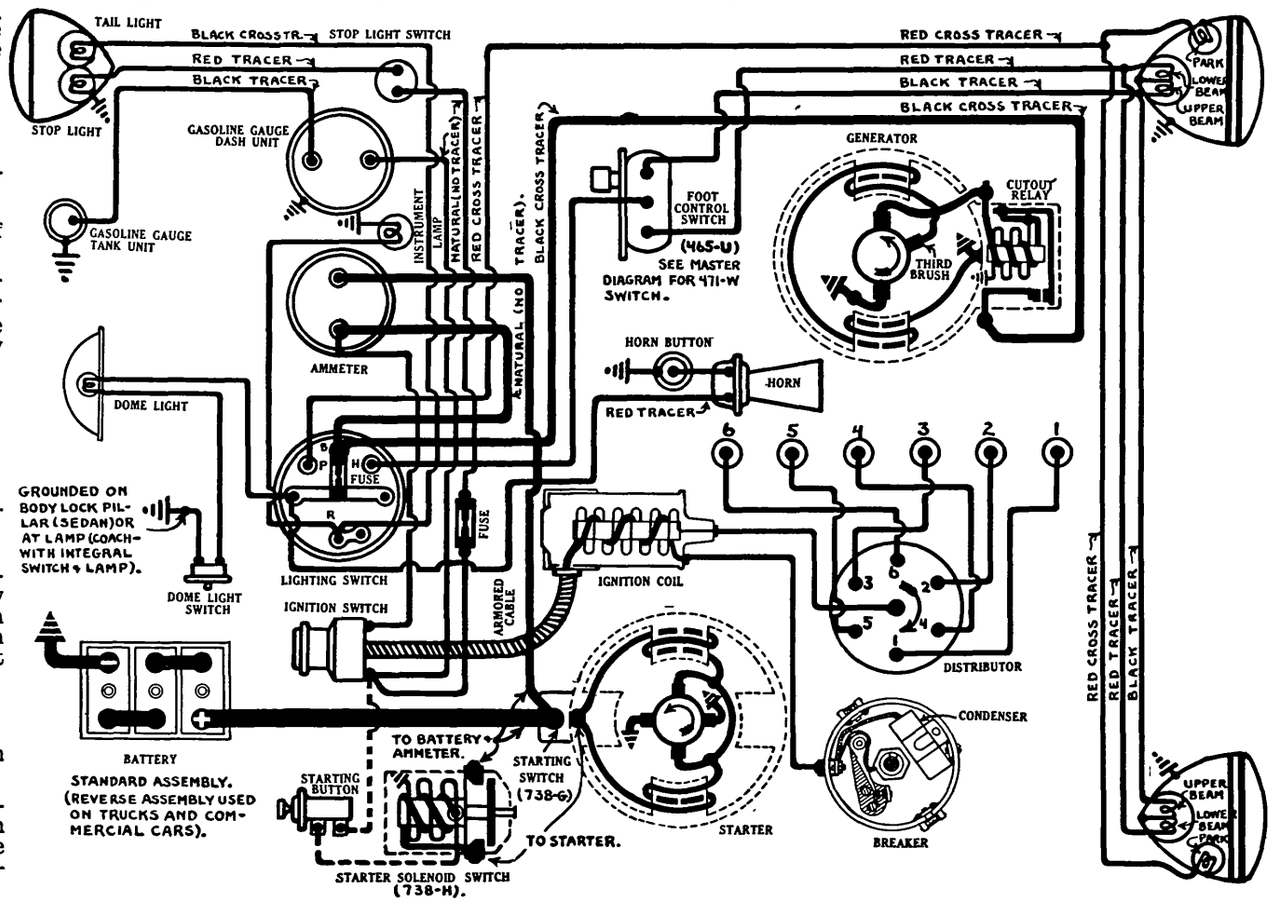
IGNITION:—Coil Model 536-D. Mounted on side of engine above distributor.
Ignition Current—2.5 amperes idling, 4.8 stopped.
Ignition Switch—Model 431-P (switch and cable).

Distributor Model 645-G. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector.
Breaker Gap—Set at .018". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 36°. Open 24° distributor.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	1.5	600
16	1500	32	3000

Vacuum Spark Control Model 680-L—Provides additional advance except when engine is suddenly accelerated (when spark is retarded by return spring in unit) or at high speed with wide open throttle (when vacuum port in carburetor is cut off by carburetor throttle valve shaft).



Vacuum Spark Advance

Engine Degrees	Vacuum
Start	5" of HG minimum
16-18°	9-11" of HG

Octane Selector—Adjustment at distributor providing maximum of 10° advance or retard from center '0' position. Should be adjusted to provide maximum advance without spark knock for particular fuel being used.

IGNITION TIMING:— Flywheel Degs. Piston Position
First 100,000 cars.....10° BTDC. ..... .0385" BTDC.
After 100,000 cars ..... 5° BTDC. ..... .0097" BTDC.
Timing (using Neon Timing Light)—This method recommended by manufacturer. Mount timing light so that it is directed on flywheel through timing inspection hole in right front face of flywheel housing. Clip one lead to #1 spark plug, ground other lead to engine. Set Octane Selector at '0'. Run engine at idling speed, loosen advance arm clamp bolt, rotate distributor until steel ball on flywheel appears to be directly in line with pointer on housing, tighten clamp bolt.
Timing (without Neon Light)—With #1 piston on compression, turn engine over until steel ball set in flywheel lines up with pointer in inspection hole in right front face of flywheel housing (piston will be 10° BTDC. on first cars, or 5° BTDC. on later cars). Adjust as above.
Octane Selector Setting—Adjust as above
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33.
Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—A.C., Type K-11. 14 MM. Metric.
Spark Plug Gaps—Set at .032". Limits .032-.035".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter, Model 284-S, 1¼" downdraft type.

Fuel Pump:—A.C., Series W, Type 1521798, superseded by Type 1521812. Diaphragm type pump.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Valve Timing—No flywheel mark provided for valve timing check. With intake tappet clearance set at .006" (engine hot), #1 intake valve should open with piston 4° before top dead center when a point on the flywheel approximately 1½ teeth before the dead center point lines up with the indicator in the inspection hole.

Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33. Piston position .0061" BTDC.

Tappet Clearance:—.006" minimum (.006-.008") Int., .013" minimum (.013-.015") Exh., with engine hot.

Valve Spring Pressure:—45 lbs. at 1⅞" (valve closed). 98 lbs. at 1 9/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—12 lbs. at 50 M.P.H.

BATTERY:—(EC) Delco, Type 13-AC or 13-P. 6 volt, 13 plate, 86 A.H. capacity (20 hour rate).

Starting Capacity—102 amperes for 20 minutes.

Grounded Terminal—Negative (—) terminal.

Location—On right side under front floor boards.

(Q Truck) Delco, Type 15-P. 6 volt, 15 plate, 94 A.H. capacity (20 hour rate).

STARTER:—Model 738-G, 738-H (R.H.D.). Armature No. 1847432.

Starter Drive—Barrel type Bendix drive.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Cranking Performance—65 R.P.M. 175 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—(738-G). Mounted on starter and operated by starter pedal. (738-H) Type 1503 solenoid type mounted on starter and controlled by switch on instrument panel.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 943-J. Armature No. 817221. Third brush control type.

Charging Rate Adjustment—Loosen small round lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Maximum Charging Rate—16-18 amperes, 1700 R.P.M., 23 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	16-18	8.0-8.3	1700
Hot	11-13	7.5-7.8	1800

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—14-18 ounces each.

Field Current—3.5-4.5 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Belt tension adjusted in usual manner by swinging generator away from engine.

CUTOUT RELAY:—Model 265-G. Mounted on generator. See Equipment Section for complete article.

Cuts In—6.75-7.5 volts, 720 R.P.M., 8 M.P.H.

Cuts Out—0-2.5 ampere discharge current.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

LIGHTING:—Light Switch Model 478-H. Foot Control Switch Model 465-U, 471-W. Foot operated control switch on toeboard controls upper and lower beams.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	21-21	1110
Park, Inst., Tail, Stop	3	63
Dome	6	81

FUSES:—Lighting—15 ampere on back of switch.

Stop Light—15 ampere, cartridge type, in lead on back of instrument panel.

HORNS:—Klaxon, Model K-31, Type 1359 (EC), Model K-26-L, Type 1601 (EB, Q). Vibrator type.

SERIAL NUMBER:—First number, 1001. Prefix 1EA, 1ED, etc., indicates model and assembly plant. On plate on right front sill (passenger cars), or on front of dash (trucks).

COMPRESSION:—Ratio—5.6-1. No optional ratios.
Pressure—75 lbs. or better.

VACUUM READING:—Gauge should show steady reading of 20-22" with engine idling at 400 R.P.M.

IGNITION:—Coil Model 536-D. Mounted on side of engine above distributor.
Ignition Current—2.5 amperes idling, 4.8 stopped.
Ignition Switch—Model 431-P (switch and cable).
Distributor Model 645-G. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector.
Breaker Gap—Set at .018". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 36°. Open 24° distributor.

Automatic Advance

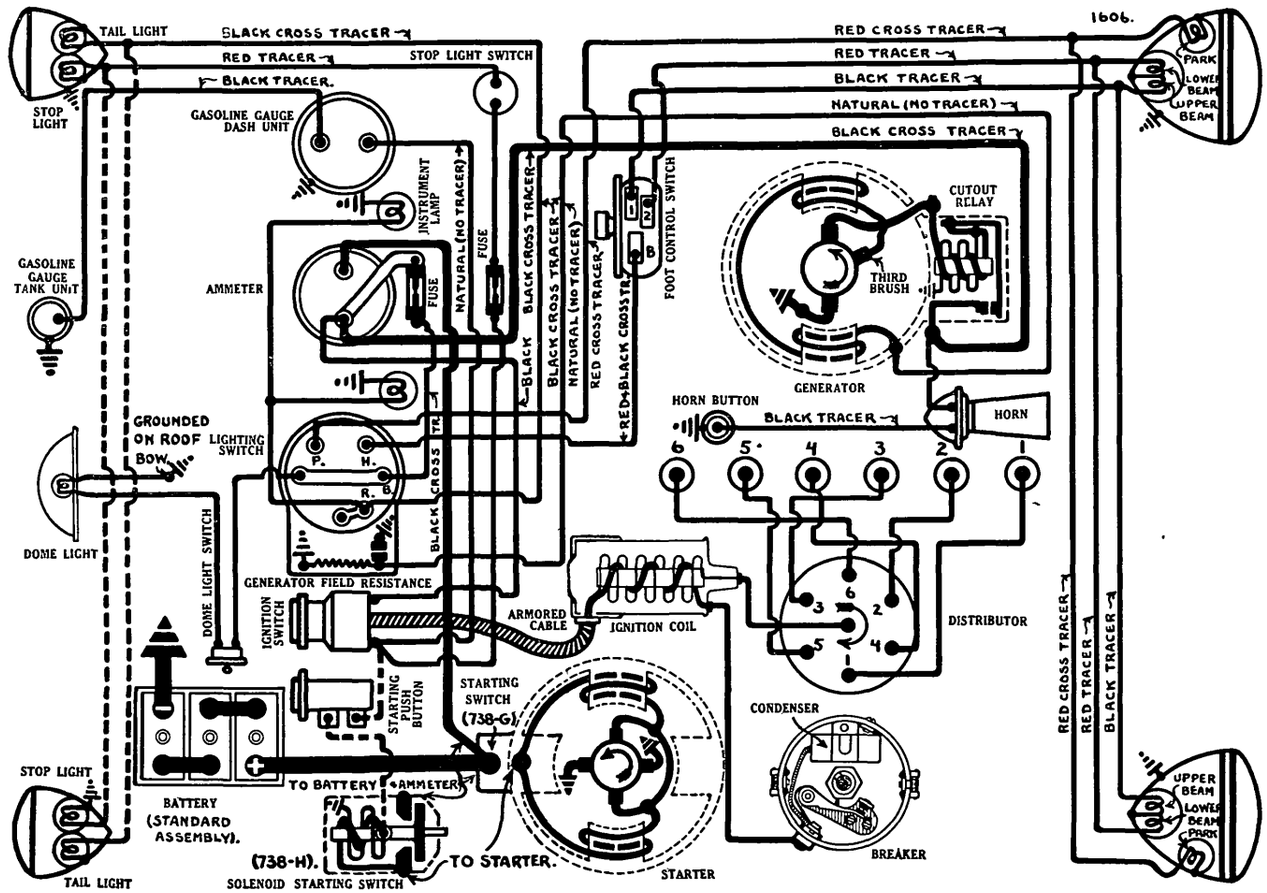
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1.5	600
16	1500	32	3000

Vacuum Spark Control Model 680-V—Provides additional spark advance except when engine is suddenly accelerated (when spark is retarded by return spring in unit) or at high speeds with wide open throttle (when vacuum port in carburetor is cut off by carburetor throttle valve shaft).

Vacuum Advance

Engine Degrees	Vacuum
Start	5" of HG. Minimum
11-13°	9-11" of HG.

Octane Selector:—Adjustment at distributor providing maximum of 10° advance or retard from center '0' position. Should be adjusted to provide maximum advance without spark knock for particular fuel being used.
Removal:—Distributor mounted on right side of engine. To remove, loosen clamp bolt in advance plate.



IGNITION TIMING:— Flywheel Degs. Piston Position
First 100,000 cars.....10° BTDC. ..... .0385" BTDC.
After 100,000 cars..... 5° BTDC. ..... .0097" BTDC.
Timing (using Neon Timing Light)—This method recommended by manufacturer. Mount timing light so that it is directed on flywheel through timing inspection hole in right front face of flywheel housing. Clip one lead to #1 spark plug and ground other lead to engine. Set Octane Selector at '0'. Run engine at idling speed, loosen advance arm clamp bolt, rotate distributor until steel ball on flywheel appears to be directly in line with pointer on housing, tighten clamp bolt.
Timing (without Neon Light)—With #1 piston on compression, turn engine over until steel ball set in flywheel lines up with pointer in inspection hole in right front face of flywheel housing (piston will be 10° BTDC. on first cars, or 5° BTDC. on later cars). Set Octane Selector at '0', loosen distributor clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.
Octane Selector Setting—Advance Octane Selector as much as possible without spark knock after setting ignition.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—A.C., Type K-11. 14 MM. Metric.
Spark Plug Gaps—Set at .032". Limits .032-.035".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter, Model 284-S, 1¼" downdraft.
Fuel Pump:—A.C., Series W, Type 1521798, superseded by Type 1521812. Diaphragm type pump.
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—No flywheel mark provided for valve timing check. With intake tappet clearance set at .006" (engine hot), #1 intake valve should open when a point on the flywheel approximately 1½ teeth before dead center point lines up with the indicator in the inspection hole.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33. Piston position .0061" BTDC.

Tappet Clearance:—.006" minimum (.006-.008") Int., .013" minimum (.013-.015") Exh., with engine hot.

Valve Spring Pressure—45 lbs. at 1⅞" (valve closed), 98 lbs. at 1 9/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—12 lbs. at 50 M.P.H.

BATTERY:—Delco, Type 15-Y or 15-X. 6 volt, 15 plate, 94 A.H. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On right side under front floor boards.

STARTER:—Model 738-G, 738-H (R.H.D.). Armature No. 1847432.

Starter Drive—Barrel type Bendix drive.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Cranking Performance—65 R.P.M., 175 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—(738-G). Starterator operated by accelerator pedal with Type 1575 vacuum unit control. See Equipment Section. (738-H). Type 1503 solenoid mounted on starter and controlled by switch on instrument panel.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 935-V. Armature No. 1854856. Third brush regulation, lighting switch control. Field resistance on switch is shorted out with lamps turned on, increasing generator output. Special switch position between 'Off' and 'Park' provides this high charging rate with lamps off. See 'Lamp Control Generators' in Equip. Section.

Charging Rate Adjustment—Manufacturer recommends that position of third brush not be changed as brush is set for maximum safe output at factory. To check charging rate, ground field terminal on generator to frame, use test ammeter to check output, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, remove field ground.

Maximum Charging Rate—20 amperes (cold), 15 amperes (hot), 2400 R.P.M. 26-27 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—2.3-2.6 amperes at 6.0 volts.

Field Resistance—Std. 1 ohm. Optional ¾ ohm and 1½ ohm. Should be changed only for unusual operating conditions, excessive night driving, etc.

SPECIAL GENERATORS:—Model 936-A (Canada), 935-U (Government), 931-R (City Delivery, Taxicab), 933-H (City Police), 936-J (State Police), 933-J (School Bus) also used. See Equipment Section for complete data.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Belt tension adjusted in usual manner by swinging generator away from engine. Belt should have small amount of slack.

CUTOUT RELAY:—Model 265-G. Mounted on generator. See Equipment Section for complete article.

Cuts In—6.75-7.5 volts, 720 R.P.M., 8 M.P.H.

Cuts Out—0-2.5 ampere discharge current.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

LIGHTING:—Light Switch Model 479-Y, 479-R (Canada). Foot Control Switch Model 471-W. Foot operated control switch on toeboard controls upper and lower beams.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Park, Inst., Tail, Stop	3	63
Dome	6	81

FUSES:—Lighting—15 amperes above ammeter.
Stop Light—15 amperes in lead behind instrument board.

HORNS:—Klaxon, Model K-26-L, Type 1601. Vibrator type.

FLEET 'ECONOMY' MODEL NOTE:—All models available with special Economy Engine and rear axle ratios as follows:

Model	Axle Ratio	Top Speed (No Governor)
FB, FC	4.11-1	
FC	3.82-1	65 M.P.H.
FB	3.82-1	60 M.P.H.
R	6.16-1	
R	5.43-1	51 M.P.H.

These models identified by special name plate on instrument panel stating that performance curtailed in interest of economy and by plate on valve rocker arm cover listing special tune up specifications (see note) and by prefix 'V' on engine number.

NOTE—Economy engine fitted with special carburetor (painted gray) which has throttle stop pin limiting throttle opening to half-throttle and requires special spark plug gap, tappet clearance, and engine oil. See data below. Throttle stop pin may be removed to permit top speed if necessary. See article on carburetor in Carburetion Section.

SERIAL NUMBER:—First number—1001. Prefixes 1-FA-03 indicate assembly plant (1 to 21), Model (FB, FC, RA, RB, RC, RD), and month (01 to 12). Located on right front sill (passenger cars), or on dash (trucks).

COMPRESSION:—Ratio 6.0-1 Std. Pressure 102 lbs. actual pressure at cranking speed or 90 lbs. minimum with all cylinders alike within 5-10 lbs.

VACUUM READING:—Gauge should show steady reading of 20-22" of HG. with engine idling at 400 RPM or 9.7 M.P.H.

IGNITION:—Coil Model 536-D. Mounted on right side of block directly above distributor.
Coil Draw—2.5 amperes idling, 4.8 stopped.

Ignition Switch:—Delco-Remy Model 431-P. Connected to coil by armored cable. See article in Electrical Equipment Section.
Ignition Lock—Briggs & Stratton.

Distributor Model 645-T. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Octane Selector.
Breaker Gap—.018". Limits .018-.024".
Cam Angle or Dwell—36° (closed), 24° (open).
Breaker Arm Spring Tension—17-21 ozs.
Condenser—Part No. 1861709. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2.25	600
14	1500	28	3000

Vacuum Spark Control Model 680-L—Mounted on Octane Selector and linked to distributor advance arm. Provides additional advance except when engine is suddenly accelerated (retarded by return spring within unit) or at high speeds with wide open throttle (vacuum port in carburetor cut off by throttle valve shaft).

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5"
17° Max.	9-11"

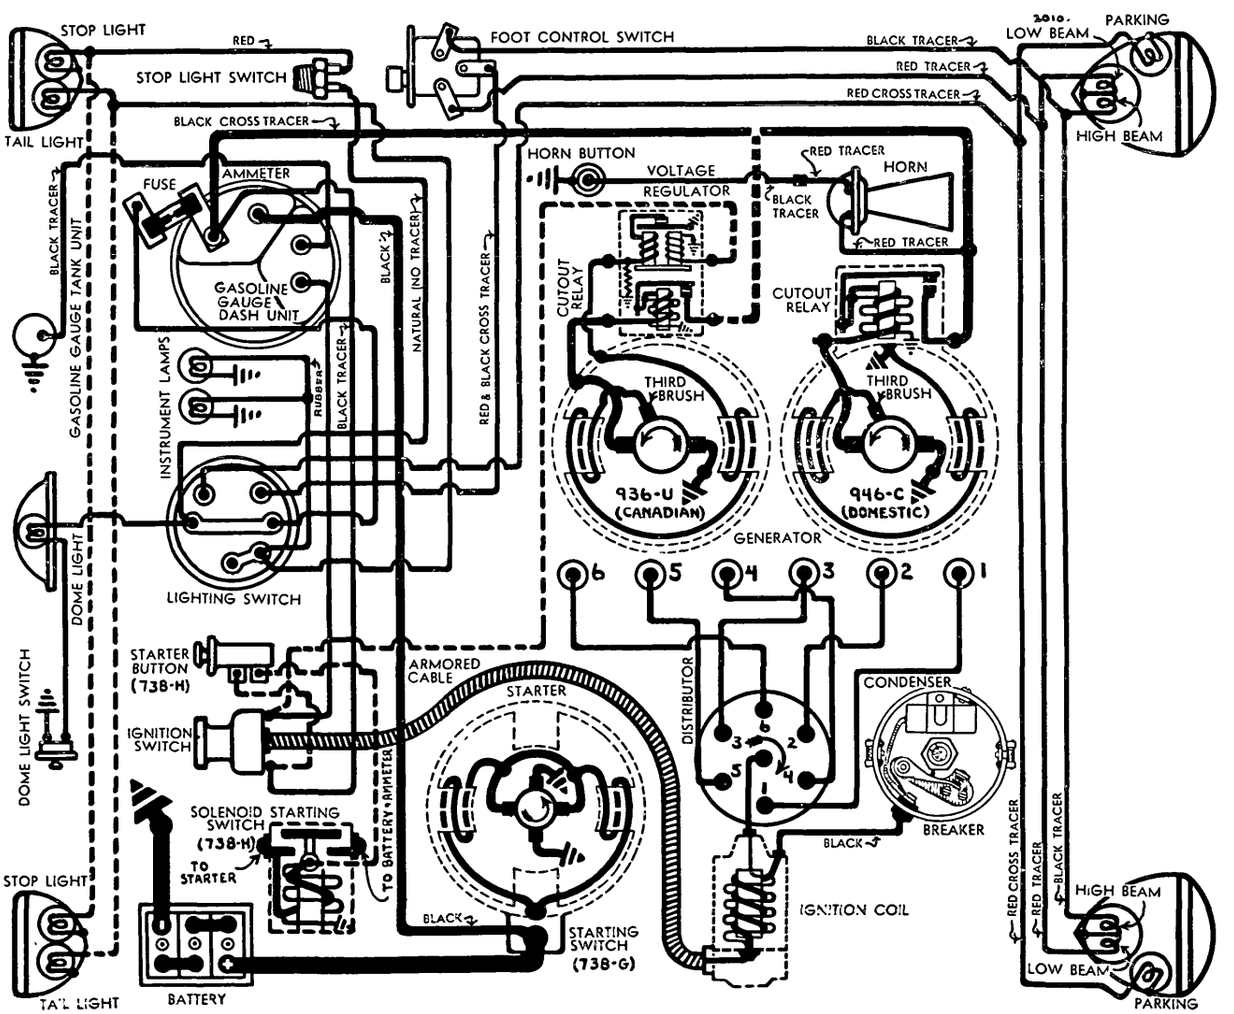
NOTE—Spark control spacer or stop may be installed to limit vacuum advance to 12° to overcome pinging. See Octane Selector under Ignition Timing below.

Octane Selector—Consists of adjustment at distributor providing 10° advance or retard from standard ignition setting to compensate for fuel rating. See Ignition Timing below.

Removal:—Distributor mounted on right side of crankcase. To remove, loosen clamp bolt in advance arm (does not disturb Octane Selector mounting).

IGNITION TIMING:—Initial setting with Octane Selector set at 'O' as follows. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All engines	5° BTDC	.0097" BTDC.



To Set Timing (Neon Light)—Recommended by manufacturer. Mount timing light so that it is directed on flywheel through inspection hole in right front face of housing. Clip one lead to #1 spark plug. Set Octane Selector at 'O' on scale by turning thumb nut. Idle engine, loosen advance arm clamp bolt, rotate distributor until steel ball timing mark on flywheel lines up with pointer on housing. Tighten clamp bolt.

Timing (Without Neon Light)—With #1 piston on compresion, turn engine over until piston is 5° or .0097" before top dead center, stop when steel ball timing mark on flywheel lines up with pointer in inspection hole in right front face of housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.

Timing (Motor Gauge)—Use Weidenhoff #113 Adapter and 152 attachment, #33 Rod. Settings given above.

Final Setting (Octane Selector)—Provides 10° advance or retard from standard setting to compensate for fuel. For maximum performance and economy, road test car, advance Octane Selector setting until slight ping is noticeable when accelerating with wide open throttle.

NOTE—If ping is objectionable at 20-25 MPH speed, this can be eliminated by installing Vacuum Spark

Control Stop or Spacer No. 602111. Provides 5° retard without same loss of economy resulting from retarding Octane Selector setting.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-11. 14 MM. Metric type.
Spark Plug Gap (Standard Engines)—.032-.035".
Spark Plug Gap (Economy Engines)—.040".

CARBURETION:—Carburetor—Carter Model 319-S superseded by Model 334-S (Std. Engines), Mod. 335-S (Economy Engines). 1¼" downdraft type. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.

Idle Adjustment—With engine warm, adjust throttle stopscrew so that speed is 400 R.P.M. Turn idle adjusting screw in until engine begins to miss, turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct speed.

Accelerating Pump Setting—Pump lever (under dust cover) has three holes for pump link engagement. Change setting for seasonal requirements as follows:

Outer Hole—Normal summer weather.
Inner Hole—Extremely hot weather or high altitude
Upper Hole—Extremely cold weather.

NOTE—Lean and extra-lean metering rods available to compensate for fuel or altitude requirements. See Jet Specification table in Carburetion Section.

Air Cleaner:—AC. #1525978 (FB, R), #1526603 (FC), oil-wetted type standard, #1526764 (1525983 for cars with governors) oil-bath type optional.

Fuel Pump:—AC. Type W #1521812. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric #1515207 dash unit; #1515405 tank unit (FC), #862723 tank unit (FB, R), #1515427 tank unit (FB). See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance (Stand. Engines)—.006" Min. (.006-.008") Int., .013" Min. (.013-.015") Exh. with engine hot.

Tappet Clearance (Economy Engine)—.010" Int. .016" Exh. with engine hot.

To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 4° or .0061" before top dead center when point on flywheel approximately 1½ teeth before dead center mark lines up with pointer in inspection hole in right front face of flywheel housing.

Using Motor Gauge—See Ignition section for rod and adapter data. Gauge reading should be .0061" BTDC.

LUBRICATION:—Crankcase Capacity—5 qts. refill.
Normal Oil Presure—12 lbs. at 50 M.P.H.
NOTE—SAE #10-W oil recommended for Economy engine. Oil heavier than #20 must not be used in this engine at any time.

BATTERY:—(Std. Model FC) Delco, Type 13-AA. 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate).
Starting Capacity—102 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.0 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On right side under front floor.

(Comm. Mod. FB, Truck Mod. R) Delco Type 15-X, T. 6 volt, 15 plate, 94 amp. hour capacity (20 hr. rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes.

STARTER:—Model 738-G, 738-H (RHD). Armature No. 1847432.
Drive—Bendix Barrel Type No. A-1718.
Cranking Engine—65 R.P.M.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.
Starting Switch:—Part No. 362941. Mounted on starter. Operated by starting pedal on toeboard.

GENERATOR—STANDARD:—Model 946-C. Armature No. 1841027. Third brush control type. Ventilated by fan on drive pulley.
Charging Rate Adjustment—Loosen lockscrew on commutator end plate, remove cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw.
Maximum Charging Rate—15 amperes (cold), 1600 R.P.M. or 20-25 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	15-17	7.9-8.0	1600
Hot	11-13	7.5-7.8	1750-1850

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—4.0-5.9 amperes at 6.0 volts.

GENERATOR—CANADIAN:—Model 936-U. Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.

NOTE—Third brush is set for maximum safe output and must not be disturbed.

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below and special article in Equipment Section. Do not operate generator on open circuit.

Maximum Charging Rate—As given in table below. To check charging rate, connect ammeter in charging line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.

Removal (All models):—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment (All models):—Belt adjusted in usual manner by loosening clamp bolt and swinging generator away from engine.

CUTOUT RELAY:—Model 265-G (946-C). Mounted on generator. See article in Equipment Section for complete data.
Cuts In—6.75-7.5 volts, 675 R.P.M., 8 M.P.H.
Cuts Out—0-2.5 amperes discharge current.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5588 (936-U). Mounted on generator. Consists of Cutout Relay and vibrating type Voltage Regulator. See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.75-7.25 volts.
Cuts Out—3 ampere maximum discharge at 6.3 volts
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open circuit.

Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type. Headlamps aimed straight ahead. Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Delco-Remy Model 479-R (FC), 479-P (FB, R).

Foot Selector—Delco-Remy Model 471-P.

Stop Light—Delco-Remy Model 476-U (FC), 474-Y (FB, R). Hydraulic type mounted at rear of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1½	55
Instrument	1	51
Stop, Tail	3	63
Dome	6	81

FUSES:—Lighting—15 ampere on back of ammeter.
Stop Light (R-1½ ton model)—15 ampere in cartridge type holder in stop light lead (lead taken from ignition switch on this model).

HORNS:—Klaxon Model K-31 Type 1359 (FC), K-26-L Type 1601 (FB, R). Vibrator type horns.

Type	Current at 6 volts	Air Gap
K-31-1359	5.0-7.5	.020-.022"
K-26L-1601	6.5-8.5	.025-.029"

FLEET 'ECONOMY' MODEL NOTE:—All models available with special Economy Engine and special rear axle ratios of 4.11-1 and 3.82-1. See Fleet Note on Standard Model (preceeding page).

NOTE:—Master Models FA and FD are identical except that 'Knee Action' is standard on Model FA only. All data below applies to both models.

SERIAL NUMBER:—First No.—1001. Prefixes 1-FA-03 indicate assembly plant (1 to 21), Model (FA, FD) and month (01 to 12). Located on right front sill.

COMPRESSION:—Ratio 6.0-1 Std. Pressure 102 lbs. actual pressure at cranking speed or 90 lbs. min. with all cylinders alike within 5-10 lbs.

VACUUM READING:—Gauge should show steady reading of 20-22" of HG. with engine idling at 400 R.P.M. or 9.7 M.P.H.

IGNITION:—Coil Model 536-D. Mounted on right side of block directly above distributor.

Coil Draw—2.5 amperes idling, 4.8 stopped.

Ignition Switch:—Delco-Remy Model 431-P. Connected to coil by armored cable. See article in Electrical Equipment Section.

Ignition Lock—Briggs & Stratton.

Distributor Model 645-T. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Octane Selector.

Breaker Gap—.018". Limits .018-.024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ozs.

Condenser—Part No. 1861709. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2.25	600
14	1500	28	3000

Vacuum Spark Control Model 680-L:—Mounted on Octane Selector and linked to distributor advance arm. Provides additional advance except when engine is suddenly accelerated (retarded by return spring within unit) or at high speeds with wide open throttle (vacuum port in carburetor cut off by throttle valve shaft).

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5"
17° Max.	9-11"

NOTE—Spark control spacer or stop may be installed to limit vacuum advance at 12° to overcome pinging. See Octane Selector under Ignition Timing below.

Octane Selector—Consists of adjustment at distributor providing 10° advance or retard from standard ignition setting to compensate for fuel rating. See Ignition Timing below.

Removal:—Distributor mounted on right side of crankcase. To remove, loosen clamp bolt in advance arm (does not disturb Octane Selector mounting).

IGNITION TIMING:—Initial setting with Octane Selector set at 'O' as follows. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0097" BTDC.

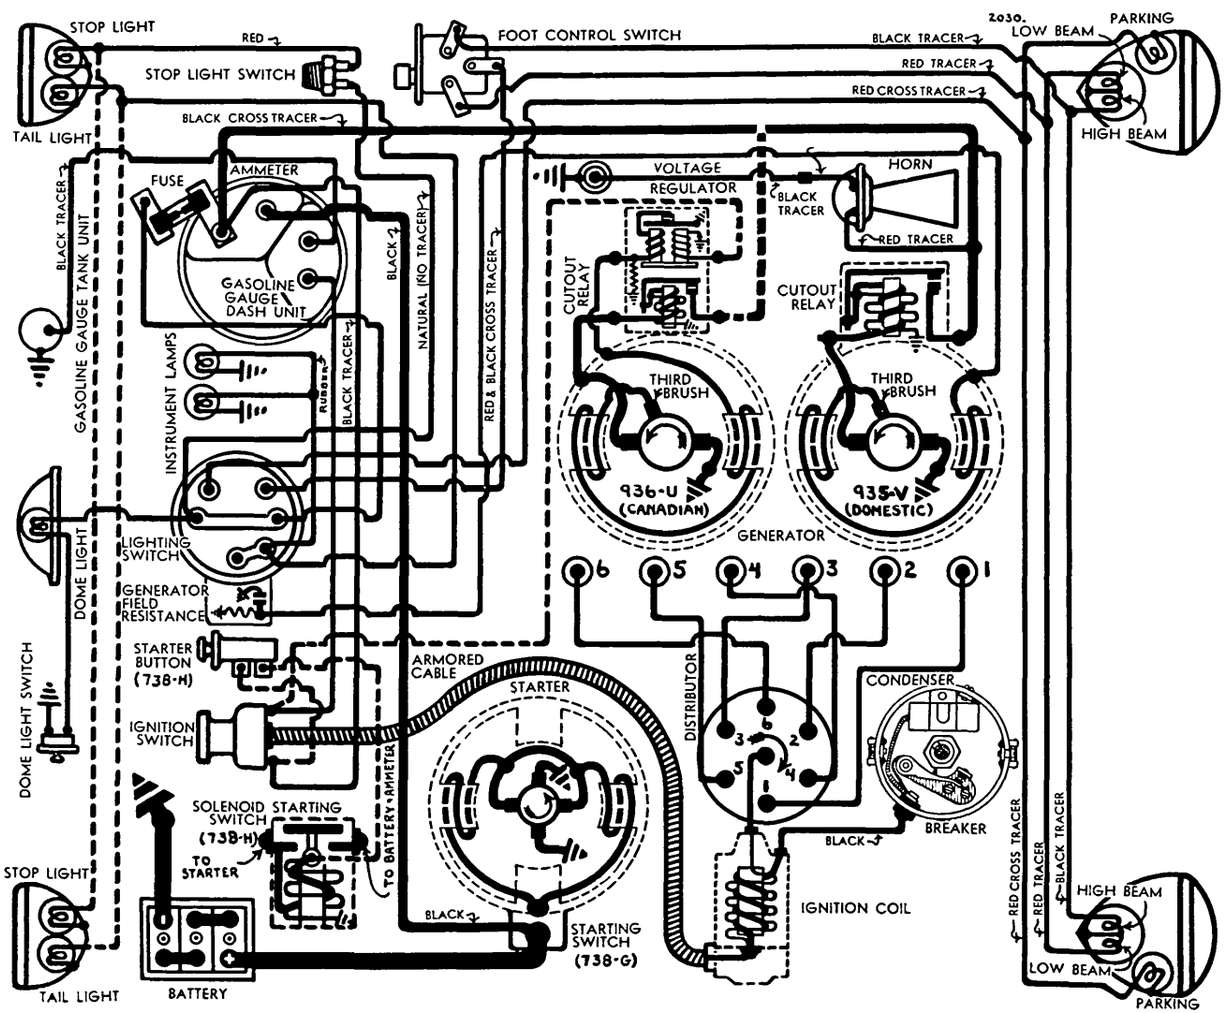
To Set Timing (Neon Light)—Recommended by manufacturer. Mount timing light so that it is directed on flywheel through inspection hole in right front face of housing. Clip one lead to #1 spark plug. Set Octane Selector at 'O' on scale by turning thumbnut. Idle engine, loosen advance arm clamp bolt, rotate distributor until steel ball timing mark on flywheel lines up with pointer on housing. Tighten clamp bolt.

Timing (Without Neon Light)—With #1 piston on compression, turn engine over until piston is 5° or .0097" before top dead center, stop when steel ball timing mark on flywheel lines up with pointer in inspection hole in right front face of housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.

Timing (Motor Gauge)—Use Weidenhoff #113 Adapter and 152 attachment, #33 Rod. Settings given above.

Final Setting (Octane Selector)—Provides 10° advance or retard from standard setting to compensate for fuel. For maximum performance and economy, road test car, advance Octane Selector setting until slight ping is noticeable when accelerating with wide open throttle.

NOTE—If ping is objectionable at 20-25 M. P. H. speed, this can be eliminated by installing Vacuum Spark Control Stop or Spacer No. 602111. Provides 5° retard without same loss of economy resulting from retarding Octane Selector setting.



Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-11. 14 MM. Metric type.

Spark Plug Gap (Standard Engines)—.032-.035".

Spark Plug Gap (Economy Engines)—.040".

CARBURETION:—Carburetor—Carter Model 319-S superseded by Model 334-S (Std. Engines), Mod. 335-S (Economy Engines). 1¼" downdraft type. See Car-

buretion Section for complete adjustment, overhaul and Jet Specifications.

Idle Adjustment—With engine warm, adjust throttle stopscrew so that speed is 400 R.P.M. Turn idle adjusting screw in until engine begins to miss, turn screw out until engine begins to roll, finally turn screw slowly in until engine fires smoothly. Readjust throttle stopscrew for correct speed.

Accelerating Pump Setting—Pump lever (under dust cover) has three holes for pump link engagement. Change setting for seasonal requirements as follows:

Outer Hole—Normal summer weather.
Inner Hole—Extremely hot weather or high altitude.
Upper Hole—Extremely cold weather.

NOTE—Lean and extra-lean metering rods available to compensate for fuel or altitude requirements. See Jet Specification table in Carburetion Section.

Accelerator Linkage Adjustment:—⅛" clearance between top of accelerator slot and Starterator lever and ⅜-½" free travel between end of Starterator link and starter switch spring seat must be maintained to provide proper accelerator lead for easy starting. See article on Starterator in Equipment Section.

Air Cleaner:—AC. #1526603 oil-wetted type standard, #1526764 (1525983 for cars with governors) oil-bath type optional.

Fuel Pump:—AC. Type W #1521812. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric #1515207 dash unit, #1515405 tank unit. See article in Carburetion Sect.

VALVE TIMING:—Tappet Clearance (Stand. Engines)—.006" Min. (.006-.008") Int., .013" Min. (.013-.015") Exh. with engine hot.
Tappet Clearance (Economy Engine)—.010" Int., .016" Exh. with engine hot.
To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 4° or .0061" before top dead center when point on flywheel approximately 1½ teeth before dead center mark lines up with pointer in inspection hole in right front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #113 with #152 attachment, Rod #33.

LUBRICATION:—Crankcase Capacity—5 qts. refill.
Normal Oil Pressure—12 lbs. at 50 M.P.H.

NOTE—SAE #10-W oil recommended for Economy engine. Oil heavier than #20 must not be used in this engine at any time.

BATTERY:—Delco, Type 15-T, X. 6 volt, 15 plate, 94 ampere hour capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Right side under front floor.

STARTER:—Model 738-G, 738-H (RHD). Armature No. 1847432.
Drive—Bendix Barrel Type No. A-1718.
Cranking Engine—65 R.P.M.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (738-G):—Starterator operated by accelerator pedal with Type 1575 vacuum unit control (start—2" of HG., full travel 5/16" at 6.5" of HG.). See article in Equipment Section.
(738-H)—Type 1503 magnetic switch controlled by pull switch (Model 1378) on instrument panel.

GENERATOR:—Model 936-V. Armature No. 1854856. Third brush regulation, lighting switch control. Field resistance on switch is shorted out with lamps turned on, increasing generator output. Special switch position between 'Off' and 'Park' provides this high charging rate with lamps off. See 'Lamp Control Generators' in Equipment Section. Ventilated by fan on drive pulley.
Charging Rate Adjustment—Third brush set for maximum safe output at factory. Manufacturer recommends that position of third brush not be changed. To check charging rate, ground field terminal on generator to frame, use test ammeter to check output, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, remove field ground.
Maximum Charging Rate—20 amperes (cold), 15 amperes (hot), 2400 R.P.M., 26-27 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	12-15	7.6-8.0	2900

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.
Field Resistance—Std. 1 ohm. Optional ¾ ohm and 1½ ohm. Should be changed only for unusual operating conditions, excessive night driving, etc.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Belt adjusted in usual manner by loosening clamp bolt and swinging generator away from engine.

GENERATOR—CANADIAN:—Mod. 936-U. See Standard Model (preceeding page) for all data, including Control Unit (Voltage Regulator Model 5588) used with this generator.

CUTOUT RELAY:—Mod. 265-G. Mounted on generator. See article in Equipment Section for complete data.
Cuts In—6.75-7.5 volts, 720 R.P.M., 8 M.P.H.
Cuts Out—0-2.5 amperes discharge current.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type. Headlamps aimed straight ahead. Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Delco-Remy Model 479-Y.
Foot Selector—Delco-Remy Model 471-P.
Stop Lamp—Delco-Remy Model 476-U. Hydraulic type mounted at rear of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1½	55
Instrument	1	51
Stop, Tail	3	63
Dome	6	81

FUSES:—Lighting—15 ampere on back of ammeter.

HORNS:—Klaxon Model K-26-L Type 1601. Vibrator type. Current draw 6.5-8.5 amperes at 6 volts. Air Gap .025-.029".

FLEET 'ECONOMY' MODEL NOTE:—Special economy engine available for all models. May be identified by prefix 'V' on engine number, and special Service Plate on valve rocker cover listing special service specifications for this model. Carburetor used on this model has stop-pin which limits throttle opening to half-throttle. See article in Carburetion Section for complete data on this carburetor (tune up instructions given below).

SERIAL NUMBER:—First number 1001. Prefixes 1-GA-05, indicate assembly plant (1-21), Model (GA, GB, GC, SA, SB, SC, SD) and month (01-12). Located on right side of cowl under hood.

COMPRESSION:—Ratio—6.25-1 cast-iron head.
Pressure—112 lbs. at 65 R.P.M. cranking speed, 159 lbs. maximum at 2000 R.P.M.

VACUUM READING:—Gauge should show steady reading of 20-22" with engine idling at 400 R.P.M.

IGNITION:—Coil Model 536-D. Mounted on right side of engine directly above distributor.
Coil Draw—2.5 amperes idling, 4.8 stopped.

Ignition Switch:—Delco-Remy Model 435-F (pass.), 431-Y (commercial and truck). Connected to coil by armored cable.
See Article in Electrical Equipment Section.
Ignition Lock—Briggs & Stratton No. 45792 (cylinder), #80203 (case). **Key Series**—8000-9499.

Distributor Model 649-G. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Octane Selector.
Breaker Gap—Set at .018". Limits .018-.024".
Cam Angle or Dwell—36° (closed), 24° (open).
Breaker Arm Spring Tension—17-21 ounces.
Condenser—Part No. 1861709. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1.75	600
25	1800	50.0	3600

Vacuum Spark Control Model 681-F. Mounted on Octane Selector and linked to distributor advance arm. Provides additional advance except when engine is suddenly accelerated (retarded by return spring within unit) or at high speeds with wide open throttle (vacuum port in carburetor cut off by throttle valve shaft).

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5" min.
16-18°	9-11"

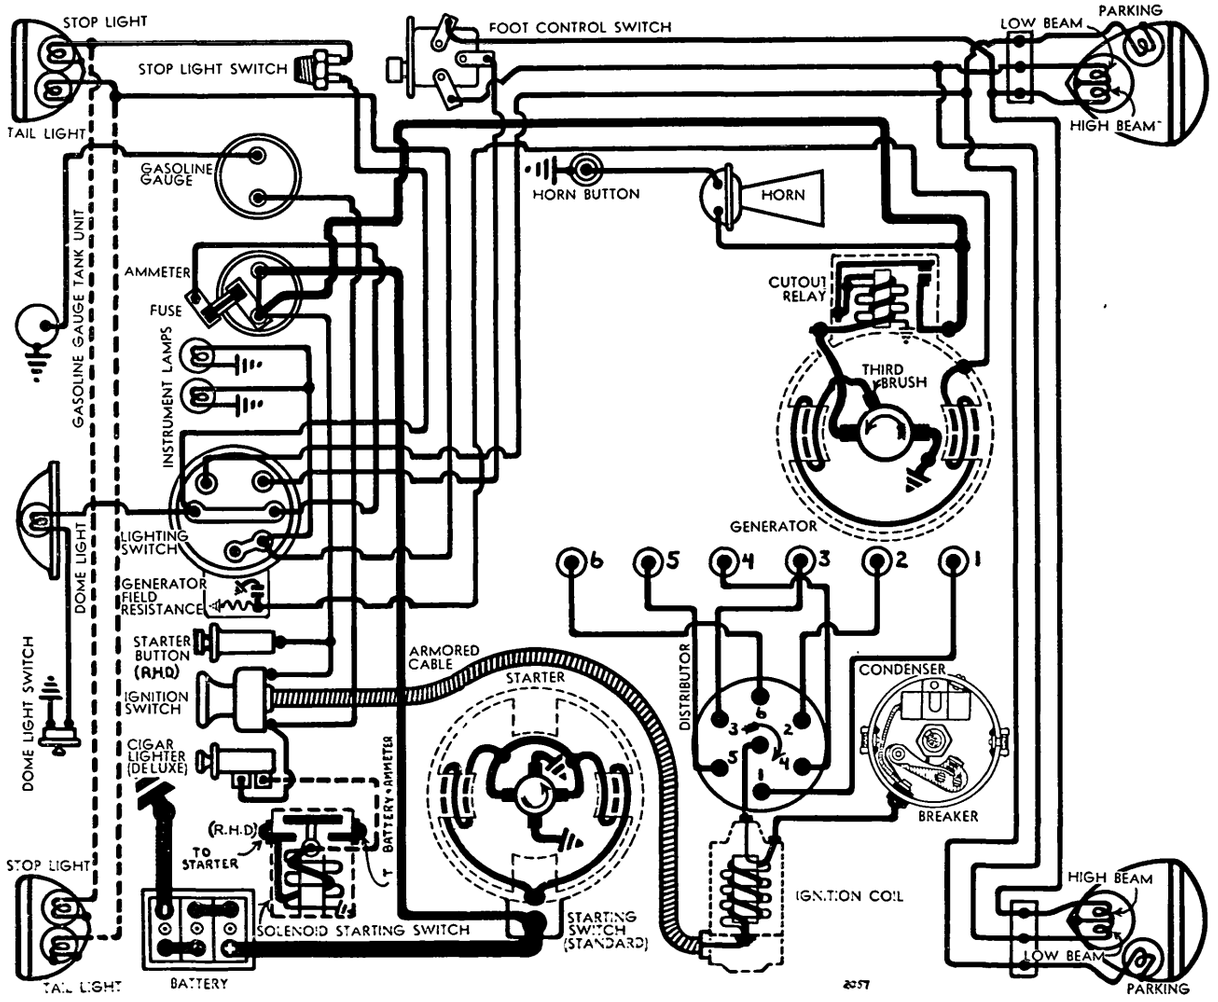
Octane Selector—Consists of adjustment at distributor providing 10° advance or retard from standard ignition setting to compensate for fuel rating. See Ignition Timing below.

Removal:—Distributor mounted on right side of crankcase. To remove, loosen clamp bolt in advance arm (Octane Selector mounting not disturbed).

IGNITION TIMING:—Initial setting with Octane Selector set at '0' as follows. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0091" BTDC.

To Set Timing (Neon Light)—Recommended by manufacturer. Mount timing light so that it is directed on flywheel through inspection hole in right front face of housing. Clip one lead to #1 spark plug. Set Octane Selector at '0' on scale by turning thumbnut. Idle engine, loosen advance arm clamp bolt, rotate distributor until steel ball timing mark on flywheel lines up with pointer on housing. Tighten clamp bolt.



Timing (Without Neon Light)—With #1 piston on compression, turn engine over until piston is 5° or .0091" before top dead center, stop when steel ball timing mark on flywheel lines up with pointer in inspection hole in right front face of housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.

Motor Gauge—Weidenhoff Adapter #113, Rod #33.
Final Setting (Octane Selector)—Provides 10° advance or retard from standard setting to compensate for fuel. For maximum performance and economy, road test car, advance Octane Selector setting until slight ping is noticeable when accelerating with wide open throttle.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-11. 14 MM. Metric type.
NOTE—K-11 discontinued by AC. Use No. 47.
Spark Plug Gap—Set at .040".

CARBURETION:—Carburetor—Carter Model 346-S. 1¼" downdraft type.
Economy Carburetor—Carter Model 358-S. 1¼" downdraft type.
See Articles in Carburetion Section on each model.
Idle Adjustment—With engine warm, adjust throttle stopscrew so that speed is 400 R.P.M. Turn idle adjusting screw in until engine begins to miss, turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct speed.
Accelerating Pump Setting—Pump lever (under

dust cover) has three holes for pump link engagement. Change setting for seasonal requirements as follows:

Outer Hole—Normal summer weather.
Inner Hole—Extremely hot weather or high altitude
Upper Hole—Extremely cold weather.
NOTE—Lean and rich metering rods available to compensate for fuel or altitude requirements. See Jet Specification table in Carburetion Section.

Air Cleaner:—AC. #1528013 (GA, GB), #1525978 (GC, SA, SB, SC, SD), oil-wetted type standard. #1526764 (GA, GB, GC, SA, SB, SC, SD, no governor), #1525983 (GC, SA, SB, SC, SD—with governor).
NOTE—On cars with governors, different type oil-wetted and oil-bath air cleaners used.

Fuel Pump:—AC. Type AF #1523089. Diaphragm type. **See Article in Carburetion Equipment Section.**

Gasoline Gauge:—AC. Electric. Dash unit—#1515322 (GA), #1515536 (GB), #1510163 (GC, SA, SB, SC, SD). Tank unit—#1515405 (GA, GB—except 2 pass. coupe), #1515441 (GA, GB—2 pass. coupe only). #1515438 (GC). #1515427 (SA, SB, SC, SD). **See Article in Carburetion Equipment Section.**

VALVE TIMING:—To Check—No flywheel marks provided. With intake tappet clearance set at .006", #1 intake valve should open with piston 9° or .0294" BTDC. when point on flywheel approximately 3.475 teeth before dead center mark lines up with indicator in inspection hole in right front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance—.006" Min. (.006-.008") Intake, .013" Min. (.013-.015") Exhaust with engine hot.

Valve Spring Pressure:—Check by compressing springs to 1½". Pressure should be 104-112 lbs. Valve closed—42-48 lbs. at 1⅞". Valve open—94-102 lbs. at 1 9/16".

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—13.5 lbs. at 50 M.P.H.

BATTERY (GA, GB):—Delco, Type 17-M. 6 volt, 17 plate, 100 AH. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Right side under front floor.

(GC, SA, SB, SC, SD) Delco, Type 15-X. 6 volt, 15 plate, 94 AH. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes.

STARTER:—Model 739-A, C (RHD). Armature No. 1847432.
Drive—Bendix Barrel Type A-1718.
Cranking Engine—65 R.P.M.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (GA):—Starterator operated by accelerator pedal with Type 1576 vacuum unit control (start—2" of HG.; full travel 5/16"—6.5" of HG.). See article in Electrical Equipment Section for complete data and adjustment.

Starting Switch (GB, GC, S):—No. 1859020. Mounted on starter. Operated by starting pedal on toeboard.

Starting Switch (739-C):—Type 1528 Magnetic Switch controlled by Pull Switch Type 1378 on instrument panel.

Magnetic Switch Specifications

Close contacts with 7.5-8.5 amperes draw at 3 volts and holds contacts closed with .85-.95 amperes draw at 1.5 volts (hold-in coil only).

GENERATOR:—Model 948-R. Armature No. 1853593. Third brush regulation, lighting switch control. Field resistance on switch is shorted out with lamps turned on, increasing generator output. Special switch position between 'Off' and 'Park' provides this high charging rate with lamps off. Ventilated by fan on drive pulley.
NOTE—Lighting Switch Control Spacer (Part. No. 596831) may be installed on switch for cars requiring high charging rate (winter driving or high accessory load). Spacer holds switch button out in first position.
See article on Lamp Control Generators in Electrical Equipment Section.

Charging Rate Adjustment—Third brush set for maximum safe output at factory. Manufacturer recommends that position of third brush not be changed. To check charging rate, ground field terminal on generator to frame, use test ammeter to check output, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, remove ground.

Maximum Charging Rate—21 amperes (cold), 18 ampere (hot), 2400 R.P.M., 26-30 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third).
Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Belt adjusted in usual manner by loosening clamp bolt and swinging generator away from generator.

GENERATOR—CANADIAN:—Model 960-G. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is set for maximum safe output and must not be disturbed.
See article in Electrical Equipment Section.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below.
Maximum Charging Rate—As given in table below. To check charging rate, connect ammeter in charging line at 'BAT' terminal of regulator, voltmeter between 'BAT' terminal and ground, ground 'F' terminal to eliminate regulator action.
NOTE—Do not operate generator on open circuit.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	18	8.0	3500

All other data as given above for 948-R Generator.

CUTOUT RELAY:—Model 265-G. Mounted on generator. See article in Electrical Equipment Section for complete data.
Cuts In—6.75-7.5 volts, 800 R.P.M., 8-9 MPH.
Cuts Out—0-2.5 amperes discharge current.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5814 (960-G):—Consists of Cutout Relay and Vibrating Voltage Regulator.
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—3 ampere maximum discharge at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be check at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide, Multi-beam, pre-focused type. Upper and lower beams controlled by foot selector switch with lighting switch in full out position.

Adjustment—Aim headlamps straight ahead. Top of beam should be 36¼" (passenger cars), 39½" (GC trucks), 43½" (S trucks—or 42" if state law requires) above floor at 25 feet. Large adjusting nut located inside radiator shell in back of radiator core. Three small mounting bolts on headlamp bracket should not be disturbed unless headlamp has been removed.

Switches

Lighting—Delco-Remy Model 485-Z.
Foot Selector—Delco-Remy Model 471-P.
Stop Light—Delco-Remy Model 476-U. Hydraulic type mounted at rear of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking, Instrument	1½	55
Stop, Tail	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on back of ammeter.

HORNS:—Klaxon Model K-16-2301 (GB), K-26-H-2251 (all others). Single horn, vibrator type.

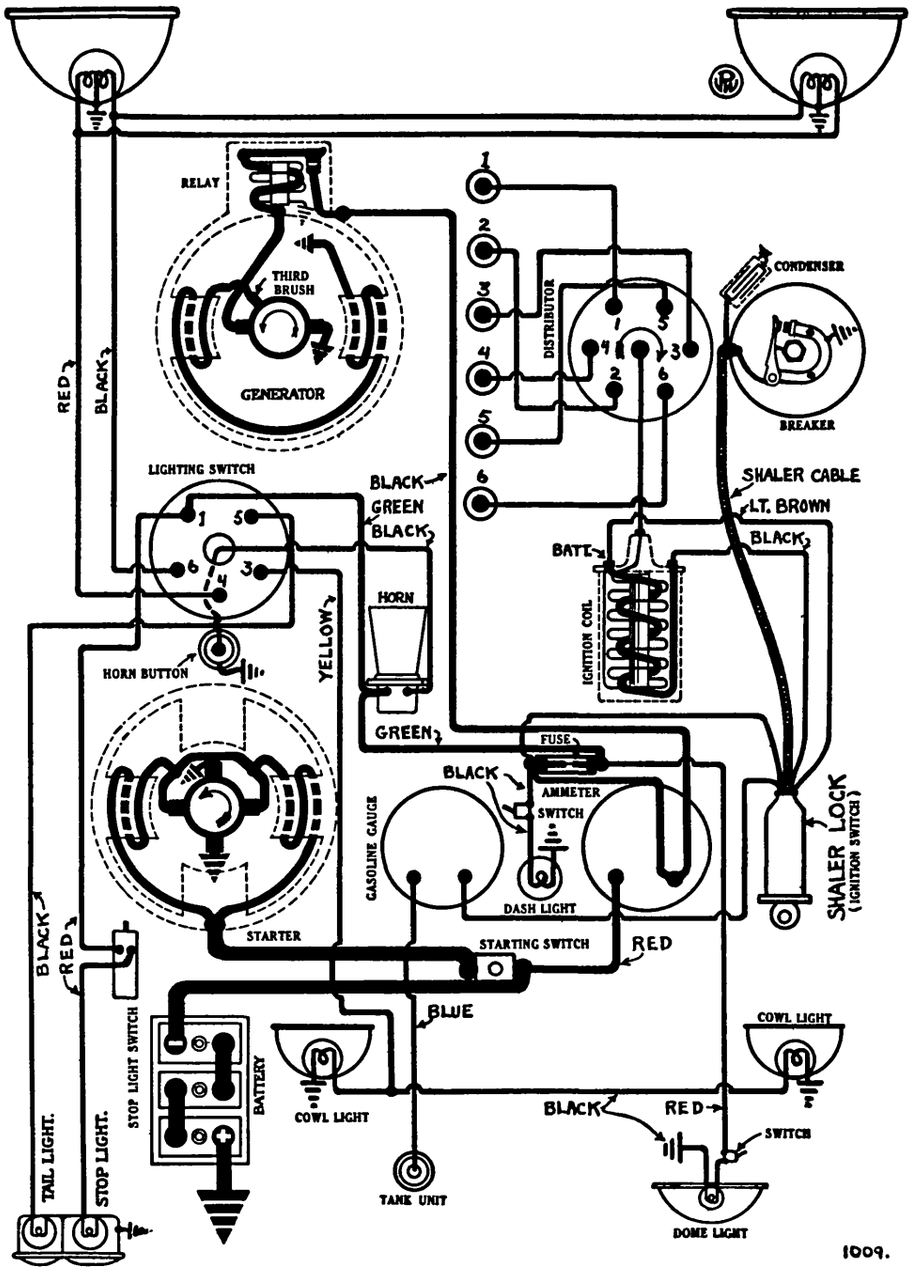
Type	Current at 6 volts	Air Gap
K-16-2301	5-7.5 amperes	.020-.022"
K-26-H-2251	6.5-8.5 amperes	.025-.029"

CHRYSLER

MODEL "65" (1929), SERIAL NOS. LS400P
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type CWR-15. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. The battery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model 525-E. Distributor Model 631-B. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. Maximum automatic advance is 20 degrees reached at 2600 R.P.M. Breaker arm spring tension is 17.5-20.5 ounces. The ignition switch is a Shaler Lock.



NOTE:—Late cars may be found equipped with a Model 528-U ignition coil and Model 639-X distributor. This type coil has the ignition switch built in the base of the coil and does not use a Shaler Lock. The Model 639-X distributor is similar to the 631-B.

Mounting:—Distributor is mounted on top of the cylinder head. To remove distributor disconnect manual advance rod and remove manual advance stop screw. Free Shaler Lock at the dash. Then lift distributor and Shaler Lock out as a unit. See Equipment Section for a complete description of the Shaler Lock.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles a month.

Timing:—To time the distributor to the engine remove the ⅛ inch pipe plug from the cylinder head, above No. 6 piston, and screw a micrometer gauge into the tapped hole. Take a small 6 volt test lamp and connect one terminal to the distributor primary terminal and the other side to the battery terminal of the relay. If the relay is not connected to a battery, connect lamp to one terminal of a battery and ground the other terminal of the battery to the engine. When the points are closed the test lamp will burn, but when they are open the circuit is broken and the lamp will go out. Set the distributor at the full manual advance point. Turn the engine over and locate the dead center point, setting the micrometer gauge on zero at the dead center point. Next, turn the engine over, coming up on the compression stroke on No. 1 cylinder and stop with the piston .020 inch before top dead center, on a standard head engine with a ratio of 5.2 to 1 or .015 inch before top dead center on a high compression head engine with a ratio of 6 to 1. While doing this press the distributor rotor back against the direction of rotation so as to remove all back lash in the driving mechanism. See that the rotor is opposite the segment connected to spark plug No. 1. Loosen the screw which clamps the distributor timing lever to the distributor and rotate the distributor until No. 1 cam begins to open the breaker points, i.e., until the lamp goes out. Tighten the clamp and reinstall the spark plug wires. To check timing, turn engine over two or three times then come up again on No. 1 compression stroke, tapping the crank lightly until the lamp goes out. If the dial gauge reads within the limits of .015-.025 inch on a standard head engine and .010-.020 inch on a high compression head engine the timing is satisfactory. If outside these limits it should be reset.

NOTE:—If the new type gauge (with a spark gap built in the face of the gauge dial) is used, it will not be necessary to use a test lamp. Connect one guage lead to the coil high tension lead at the distributor and

CHRYSLER

MODEL "65" (1929), SERIAL NOS. LS400P
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

ground the other gauge lead to the engine block. Turn on the ignition. A spark will be seen at the gauge spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are A.C. ⅞ inch. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 15/32 inches; stem diameter, 11/32 inch; stem length, 4 31/32 inches. Tappet clearance is .004 inch (hot). Spring pressure is 72 pounds with valves open and 44 pounds with valves closed. Valve lift is 5/16 inch. Inlet valves open at 6 degrees after top dead center and close at 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/32 inches; stem diameter, 11/32 inch; stem length, 4 31/32 inches. Tappet clearance is .006 inch (hot). Spring pressure is 72 pounds with valves open and 44 pounds with valves closed. Exhaust valves open at 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .008". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .004" with engine hot.

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 714-D. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 24-28 ounces. Starter switch is Model 404-T.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
3 "	1500	5	200
6 "	800	4.5	300
9.4 "	350	4	400
12 "	Lock	3.6	475

Mounting:—Starter is barrel mounted at left of flywheel housing. To remove starter, remove pilot screw on top of housing and slide starter from position.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model 943-H. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen small round headed screw on generator end plate and remove commutator cover band. Then shift third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7.4	7.4	1000	6	7.05	1100
13	7.8	1375	10	7.45	1500
16	8.2	1700	12	7.7	1800
11.8	7.65	2750	10.4	7.5	2500

Shunt field is 5 amperes at 6 volts. Brush spring tension is 24-28 ounces. Motoring generator draws 6 amperes at 6 volts.

Mounting:—Generator is mounted on the left to the front of the engine and is driven by a belt from the crankshaft. To remove generator, loosen nut on adjustment clamp bolt and swing generator toward engine. Slip off drive belt. Then take out two bolts under generator forming bracket hinge and lift generator from place.

Belt Adjustment. To take up drive belt, loosen adjustment clamp bolt and pull generator away from the engine. The belt tension should be just tight enough to drive the generator and fan without slipping.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate ,020 inch. Air gap between relay armature and coil core is .016 inch with contacts closed.

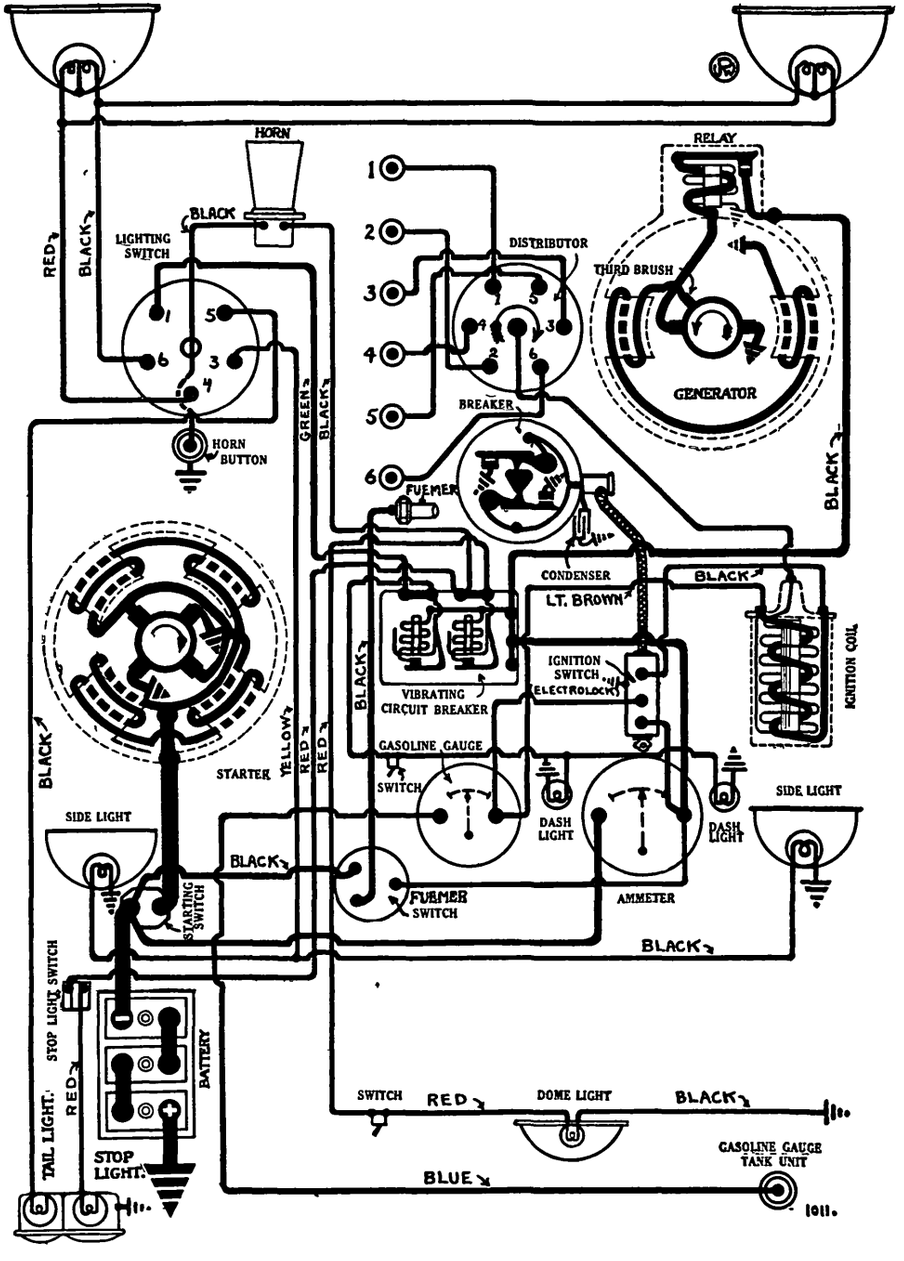
LIGHTING:—Clum Switch, Model 10738. Lighting switch is mounted at the base of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact). Side lights are 6-8 volt, 3 cp. D.C. Dash light is 6-8 volt, 3 cp. D.C. Tail and stop lights are 6-8 volt, 21-2 cp. D.C. Dome light is 6-8 volt, 15 cp. S.C.

FUSES:—Lighting fuses are mounted on the dash and are 20 ampere capacity.

CHRYSLER

MODEL "75" (1929), SERIAL NOS. CY050P
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type CWR-17. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 23.4 hours. The battery is mounted under the front floor boards on the left frame member.



IGNITION:—Coil Model 525-E, 528-E. Distributor Model 659-B. Contacts separate .022 inch with breaker arm on lobe of cam. To set contact opening, loosen lock screw on stationary contact plate and turn eccentric adjusting screw until proper contact opening is secured. Resurface contacts with a fine flat contact file or on a medium hard oil stone. Breaker arm spring tension is 17.5 to 20.5 ounces. The breaker has two sets of breaker contacts on a three sided cam opening alternately at intervals of 60 degrees corresponding to 120 degrees of crankshaft rotation. This firing interval is very important and must be accurately set. See Timing. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 24 degrees (engine) reached at 3000 R.P.M. An Electrolock is used on the distributor. Whenever the distributor requires service, the entire distributor and Elctrolock should be removed as a unit and replaced. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Coil is mounted on the dash.

Mounting:—The distributor is mounted on top of the cylinder block. To remove distributor, disconnect manual advance rod and remove head with cables intact. Remove manual advance stop screw and lift distributor from place. The distributor and Electrolock must be removed as a unit.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every 500 miles. Put a small bit of vaseline on the face of the breaker cam every 500 miles.

Timing:—Synchronization of Contacts:—Use Delco-Remy Tool, Part No. 820751, and follow directions in Equipment Section. Connect a six volt lamp in primary circuit at coil to accurately determine when contacts open. The lamp will go out at the instant the contacts separate. After synchronizing contacts, check contact opening. If it is not within the limits of .018-.024 inch, reset at .022 inch and repeat synchronization. Contacts can be synchronized with regular timing gauge after distributor has been timed to the engine. See next paragraph.

Timing Distributor to Engine:—Remove the ⅛ inch pipe plug from the cylinder head, above No. 6 piston, and screw a micrometer gauge into the tapped hole. Connect the 6 volt test lamp to the distributor primary terminal and the battery terminal of the relay. If the relay is not connected to a battery, connect lamp to one terminal of a battery and ground the other terminal of the battery to the engine. When the points are closed the test lamp will burn, but when they are open the circuit is broken and the lamp will go out. Set the distributor at the full manual advance point. Turn the engine over and locate the dead center point, setting the micrometer gauge on zero at the dead center point. Turn the engine over again till it is coming up on the compression stroke on piston No 1 and stop with the piston .067 inch before top dead center on standard head engines with a ratio of 5.1 to 1 and .004 inch before top dead center on high compression head engines with a ratio of 6.2 to 1. While doing this press the distributor rotor back against the direction of rotation so as to remove all back lash in the drive mechanism. Make sure the rotor is opposite the segment connected to spark plug No. 1. Loosen the screw which clamps the distributor timing lever to the distributor and rotate

CHRYSLER

MODEL "75" (1929), SERIAL NOS. CY050P
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

the distributor until No 1 cam begins to open the breaker points, i.e., until the lamp goes out. Then tighten the screw and reinstall the spark plug wires. To check ignition timing turn over engine two or three times then come up again on No. 1 compression stroke, tapping the crank lightly until the lamp goes out. If the dial reads between the limits of .060 to .075 inch on a standard head engine or .002 to .005 inch on a high compression head engine the timing is satisfactory. If outside these limits, it should be reset.

To synchronize contacts, crank engine over one complete revolution and stop when piston No. 6 reaches firing position (.067 or .004 inch before top dead center with manual spark control fully advanced). Then loosen the lock screws on the movable sub-plate and turn the eccentric adjusting screw until the second set of contacts (mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap.

NOTE:—If the new type gauge (with a spark gap built in the face of the gauge dial) is used, it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension lead at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be seen at the gauge spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Champion ⅞-18 S.A.E. Std. Spark plug gaps are .027-.030".

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inch; stem diameter, 11/32 inch; stem length, 6 7/16 inches. Tappet clearance is .005 inch (hot). Spring pressure is 82 pounds with valves open and 52 pounds with valves closed. Valve lift is 5/16 inch. Intake valves open at 6 degrees after top dead center and close at 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches; stem diameter, 11/32 inch; stem length, 6 7/16 inches. Tappet clearance is .007 inch (hot). Spring pressure is 82 pounds with valves open and 62 pounds with valves closed. Valve lift is 5/16 inch. Exhaust valves open at 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .008". This valve should open with piston .017" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 728-B. Starter is connected to the engine through reduction gears and a manual pinion shift. The direction of rotation is clockwise (armature shaft), looking at the commutator end. Brush spring tension is 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove the large pilot mounting screw and lock nut. Then slide starter forward and lift from place.

GENERATOR:—Model 955-F. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
6	7.1	775	6	7.1	1000
13.2	7.8	1125	11	7.6	1500
16	8.1	1700	12	7.7	1800
14	7.8	2000	9.6	7.4	2500

Shunt field current is 4-6.1 amperes at 6 volts. Generator brush tension should be 16-18 ounces.

Mounting:—Generator is mounted at right of engine by a No. 3 S.A.E. flange mounting to the timing gear chain case. To remove generator, remove cover plate on front of case and remove three nuts holding generator in place. Then slide generator to the rear, lifting the chain off the generator sprocket. Tie up the timing chain. The generator can be removed without disturbing the sprocket if the nut on the end of the generator shaft is taken off.

Chain Adjustment. To take up timing chain, loosen the generator mounting screws and back off the nut on the adjustment screw. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting screws and the lock nut.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator oilers every month or each 1000 miles if the car is run more than 1000 miles a month.

RELAY:—Model 265-B. Relay is mounted on top of generator. Relay closes when generator reaches 600 R.P.M. with a terminal voltage of 7.25 volts and opens at approximately 500 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap is .016 inch with contacts closed.

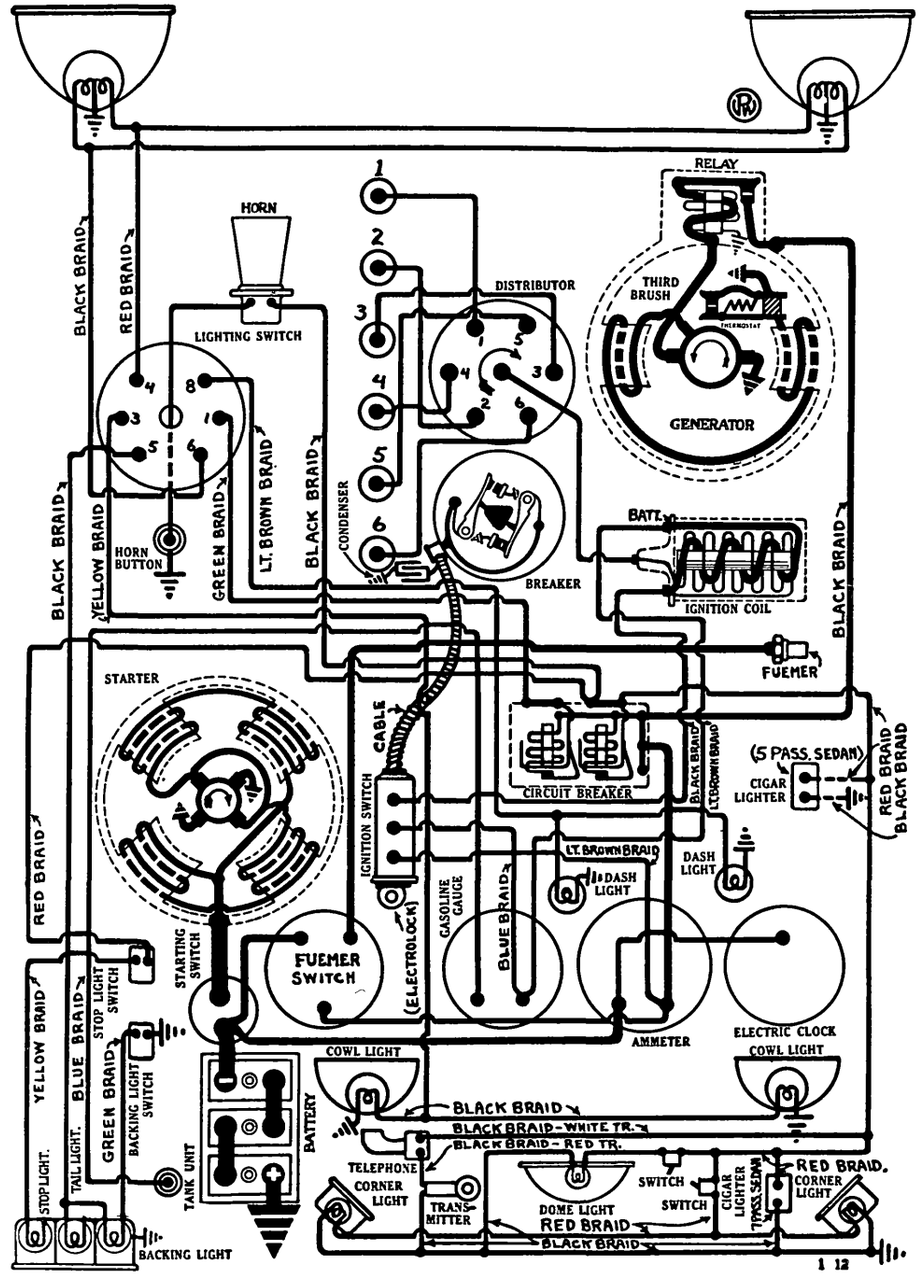
LIGHTING:—Clum Switch, Model 10738. Lighting switch is mounted at the base of the steering column. Head light are 6-8 volt, 21-21 cp. (double filament-double contact). Mazda 1110. Side lights are 6-8 volt, 3 cp. D.C. Mazda 64. Dash light is 6-8 volt, 3 cp. D.C. Mazda 64. Tail light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome and corner lights are 6-8 volt, 15 cp. S.C. Mazda 87.

CIRCUIT BREAKER:—Model 410-B, E. Lighting circuits are protected by a circuit breaker mounted on the dash. Circuit breaker begins to operate with a current of 25-30 amperes limiting the current to 15 amperes.

CHRYSLER

MODEL "80-L" (1929-30), SERIAL NOS. CONTINUED
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-6. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 166 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30.6 hours. The battery is mounted under the front floor boards on the left frame member.



IGNITION:—Coil Model 525-G. Distributor Model 659-B. Breaker contacts separate .022 inch with breaker arm on lobe of cam. To set contact opening, loosen lock screw on stationary contact plate and turn eccentric adjusting screw until proper contact opening is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17.5-20.5 ounces. The breaker has two sets of breaker contacts on a three sided cam opening alternately at intervals of 60 degrees corresponding to 120 degrees of crankshaft rotation. This firing interval is very important and must be accurately set. See Timing. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 24 degrees (engine) reached at 3000 R.P.M. An Electrolock is used on the distributor. Whenever the distributor requires service, the entire distributor and Electrolock should be removed as a unit and replaced. The ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Mounting:—The coil is mounted on the dash. Distributor is mounted on top of cylinder block. To remove distributor, disconnect manual advance rod and remove head with cables intact. Remove manual advance stop screw and lift distributor from place. The distributor and Electrolock must be removed as a unit.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every 500 miles. Put a small bit of vaseline on the face of the breaker cam every 500 miles.

Timing:—Synchronization of Contacts. Use Delco-Remy Tool, Part No. 820751, and follow directions in Equipment Section. Connect a six volt lamp in primary circuit at coil to accurately determine when contacts open. The lamp will go out at the instant the contacts separate. After synchronizing contacts, check contact opening. If it is not within limits of .018-.024 inch, reset at .022 inch and repeat synchronization. The regular timing gauge can be used to synchronize the contacts after the distributor has been timed to the engine. See next paragraph.

Timing Distributor to Engine:—Remove the ⅛ inch pipe plug from the cylinder head, above No. 6 piston, and screw a micrometer gauge into the tapped hole. Connect the 6 volt lamp to the distributor primary terminal and the battery terminal of the relay. If the relay is not connected to a battery, connect lamp to one terminal of a battery and ground the other terminal of the battery to the engine. When the points are closed the test lamp will burn, but when they are open the circuit is broken and the lamp will go out. Set the distributor at the full manual advance point. Turn the engine over again till it is coming up on the compression stroke on piston No. 1 and stop with the piston .035 inch before top dead center on standard head engines with a ratio of 4.75 to 1 and at top dead center on high compression head engines with a ratio of 6 to 1. While doing this press the distributor rotor back against the direction of rotation so as to remove all back lash in the drive mechanism. Make sure the rotor is opposite the segment connected to spark plug No. 1. Loosen the screw which clamps the distributor timing lever to the distributor and rotate the distributor until No. 1 cam begins to open the breaker points,

CHRYSLER

MODEL "80-L" (1929-30), SERIAL NOS. CONTINUED
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

i.e., until the lamp goes out. Then tighten the screw and reinstall the spark plug wires. To check ignition timing turn over engine two or three times then come up again on No. 1 compression stroke, tapping the crank lightly until the lamp goes out. The gauge reading must be between .030-.040 inch before top dead center (standard 4.75-1 compression heads) or .0005 inch before or after top dead center (6-1 compression 'Red Heads'). If outside these limits the timing operation must be repeated.

To synchronize contacts, crank the engine over one complete revolution and stop with piston No. 6 at firing position (.035 inch before or at top dead center with manual spark control fully advanced). Loosen the lock screws on the movable sub-plate and turn the eccentric adjusting screws until the second set of contacts (mounted on this plate) begin to open. Tighten the lock screws and check the contact gap.

NOTE:—If the new type gauge (with a spark gap built in the face of the gauge dial) is used it will not be necessary to use a test lamp. One gauge lead should be clipped to the coil high tension lead at the distributor and the other gauge lead should be grounded to the engine block. Turn on the ignition. A spark will be visible at the spark gap on the gauge at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Champion ⅞ inch. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 15/16 inches; stem diameter, ⅜ inch; stem length, 6 3/16 inches. Tappet clearance is .006 inch (hot). Spring pressure is 94 pounds with valves open and 57 pounds with valves closed. The valve lift is 5/16 inch. The inlet valves open at 6 degrees after top dead center and close at 46 degrees after lower dead center. EXHAUST VALVES:—Head diameter, 1 13/16 inches; stem diameter, ⅜ inch; stem length, 6 3/16 inches. Tappet clearance is .008 inch (hot). Spring pressure is 94 pounds with valves open and 57 pounds with valves closed. The valve lift is 5/16 inch. The exhaust valves open at 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .010". This valve should open with piston .017" past top dead center on intake stroke. Reset tappet clearance at .006" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 728-B. Starter is connected to the engine through a manual pinion shift. The direction of rotation of the armature shaft is clockwise, looking at the commutator end. Starter cranks the engine at 110 R.P.M. drawing 130 amperes at 5.2 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
1 "	1520	5.5	100
4 "	760	5	200
10 "	460	4.5	300
15.5 "	260	4	400
19.5 "	120	3.5	500
28 "	Lock	3	600

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and shift lever and remove large pilot mounting screw from housing directly above starter sleeve. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the starter bearing oiler every 1000 miles.

GENERATOR:—Model 949-Q. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. cutting the resistance across the thermostat contacts into the field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 19 amperes (cold) reached at 1450 R.P.M. or 27 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	575	0	6.4	700
4	6.8	675	5	6.9	1000
10	7.4	850	10	7.4	1500
16	8.1	1150	12	7.7	2000
19-21	8.4	1450	10	7.6	2600
10	7.5	3250			

Motoring, generator draws 5 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case by standard S.A.E. No. 4 flange mounting. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then pull generator to the rear being careful not to disturb intermediate flange carrying sprocket and timing chain. Then lift generator from place.

Chain Adjustment. To take up timing chain, loosen the generator mounting screws and back off the nut on the adjustment screw. Then turn the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting screws and the lock nut.

Oiling:—Put 4 or 5 drops of light oil in the generator oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Clum Switch Model 10738. Lighting switch is mounted at the base of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact). Mazda No. 1110. Side and dash lights are 6-8 volt, 3 cp. D.C. Mazda No. 64. Tail, stop, dome and corner lights are 6-8 volt, 15 cp. S.C. Mazda No. 87. Backing light is 6-8 volt, 21 cp. S.C. Mazda No. 1129.

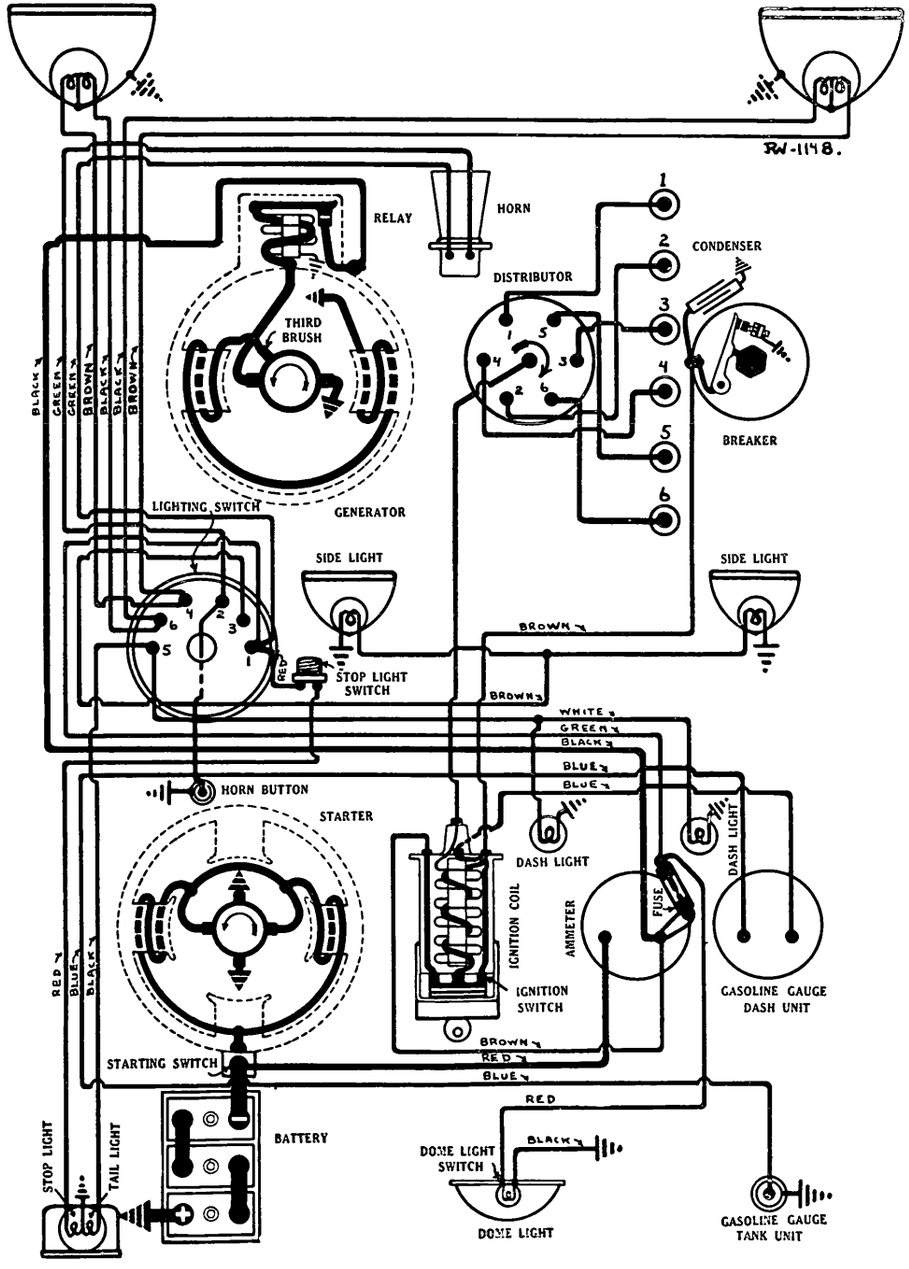
CIRCUIT BREAKER:—Model 410-E. Lighting circuits are protected by a circuit breaker mounted on the dash. Circuit breaker begins to operate with a current of 25-30 amperes limiting the current to 15 amperes.

CHRYSLER

NEW SIX SERIES CJ (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-13, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-K (Delco-Remy) or 21998 (North East). The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the switch extending through to the face of the instrument panel. Ignition current is 2.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Type 10843 (N. E.). Contacts separate .018-.023 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Maximum automatic advance is 13 degrees.

Distributor Model 632-D (Delco-Remy). Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 2200 R.P.M. Manual spark advance is controlled by a button on the dash. Pulling out the button retards the spark.

Mounting:—Distributor is mounted at left of engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every 500 miles of operation. Every 1000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pin. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing (N. E.):—Breaker contacts begin to open when piston entering power stroke reaches a position .009 inch before top dead center. To set timing, first set breaker gap at .020 inch. Then remove the small brass pipe plug in the cylinder head directly above No. 6 piston and screw the special micrometer timing gauge in place in the hole. Connect a small six volt test lamp in the ignition circuit by connecting one test lamp lead to the primary terminal on the distributor and connecting the other lead to the relay terminal of the generator. If the battery is out of the car, connect this lead to a battery and ground the other battery terminal to the car frame. With these connections the lamp will remain lighted while the contacts are closed and will go out as the contacts open. Then turn the engine over and set the micrometer gauge at '0' with No. 6 piston on top dead center. Then turn engine over until No. 1 piston enters compression stroke (the up stroke with both valves closed) and stop when the gauge reading is .009 inch before top dead center. This is the firing position of No. 1 cylinder. Then loosen the advance arm clamp screw and rotate the distributor until the test lamp goes out, indicating that the contacts have begun to open. Tighten the clamp screw and see that the rotor is directly opposite No. 1 segment in the distributor head (see diagram).

CHRYSLER

NEW SIX SERIES CJ (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Check ignition setting by cranking engine over several times and then stopping with No. 1 piston on compression stroke at the instant the test lamp goes out. The gauge reading must be within limits of .004-.014 inch before top dead center. If outside these limits the engine must be retimed.

Timing (Delco-Remy Distributor):—Breaker contacts begin to open when the piston entering power stroke reaches a position .028 inch before top dead center with manual spark control fully advanced. The allowable variation is .002 inch and the piston position must be held within limits of .026-.030 inch before top dead center.

Red Head Engines. The above timing directions apply to engines with standard compression heads. Engines with 6.2-1 compression 'Red Head' should be timed .020 inch before top dead center with manual spark control advanced and piston limits are .018-.022 inch before dead center.

NOTE:—If the new type timing gauge (with spark gap built in the face of the gauge) is used it will not be necessary to use a test lamp. One gauge lead should be clipped to the coil high tension lead at the distributor and the other gauge lead should be grounded to the engine block. Turn on the ignition. A spark will be visible at the spark gap on the gauge at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.469 inches. Stem diameter, .3405 inch. Valve length, 5¼ inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 5 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.469 inches. Stem diameter, .3405 inch. Valve length, 5¼ inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) 78 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 714-Q. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
.4 "	3250	5.5	100
3.0 "	1500	5.0	200
6.0 "	800	4.5	300
9.4 "	350	4.0	400
12 "	Lock	3.6	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out two flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

GENERATOR:—Model 943-L-R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
16	8.0	2300	12.5	7.7	2400
12	7.7	3200	10	7.5	3200

Shunt field current is 3.5-4.5 amperes at 6 volts. Generator motoring draws 3 amperes at 6 volts. Brush spring tension is 24-28 ounces.

North East Model LAB, Type 6530-D or E. This type generator was used on come cars. The adjustment and mounting of this generator is similar to the Delco-Remy model above. Brush spring tension is 16-20 ounces. Relay is Model 20220.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	675	0	6.4	725
5	6.9	875	5	6.9	1025
10	7.4	1150	10	7.5	1500
14	7.9	1475	12	7.7	2000
16	8.1	1800	9	7.3	3000
13.4	7.8	2500			

Mounting:—Generator is mounted at left of engine on special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 8821. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights (when used) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

NOTE:—Use Clum Model 9150 for replacement. Interchangeable with Soreng-Manegold Model 5520-A.

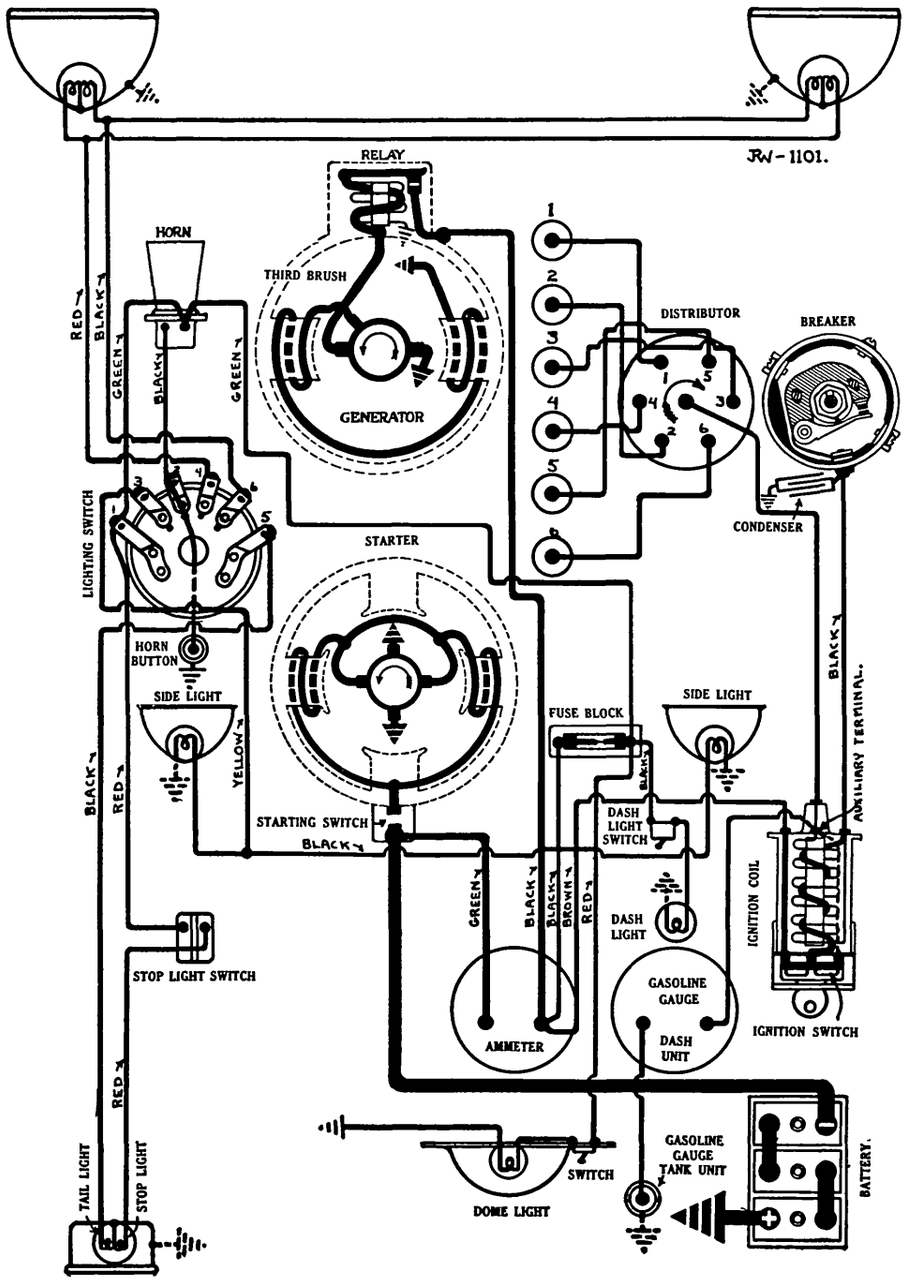
FUSES:—Lighting fuse mounted on back of ammeter is 20 ampere capacity.

CHRYSLER

MODEL 66, SERIES CC (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-Z. The ignition switch is built in the base of the coil. Coil is mounted on the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 639-X. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 15-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2600 R.P.M. of engine.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out stop screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every 500 miles of operation. Every 1000 miles remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pin. At the same time put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 10 degrees (on the flywheel) or .035 inch before top dead center with the manual spark control fully advanced. To set timing, first check distributor assembly. The rotor should be directly opposite No. 1 segment (see diagram) with slot in drive shaft parallel to the center line of the crankshaft when No. 1 piston is on top dead center. Set contact gap at .020 inch. Remove the ⅛ inch pipe plug in the cylinder head directly above No. 6 piston and screw a special timing micrometer in place. Connect one lead of a small six volt test lamp to the primary terminal of the distributor and connect the other lead to the relay terminal on the generator. If the battery is out of the car, connect this lead to one terminal of a battery and ground the other battery lead to the car frame. Then fully advance manual spark control. Turn the engine over until No. 6 piston reaches top dead center and set micrometer gauge at zero. Then turn engine over until No. 1 piston enters compression stroke (the up stroke with both valves closed). Stop when the gauge indicates the piston is .035 inch before top dead center. The test lamp should go out at this instant, indicating that the contacts are beginning to open. If it does not, loosen the advance arm clamp screw and rotate the distributor until the contacts open. Tighten the clamp screw and check the setting by turning the engine over several times and then stop with No. 1 piston on compression stroke at the point of contact opening when the lamp goes out. The gauge reading should be within limits of .030-.040 inch. If outside these limits, the timing operation must be repeated.

NOTE:—If the new type gauge is used with a spark gap built in the face

CHRYSLER

MODEL 66, SERIES CC (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

of the gauge it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension lead at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be visible at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type 110. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.594 inches. Stem diameter, .3405 inch. Valve length, 5 51/64 inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) and 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.531 inches. Stem diameter, .3405 inch. Valve length, 5 51/64 inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) and 78 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 714-P. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
.4 "	3250	5.5	100
3.0 "	1500	5.0	200
6.0 "	800	4.5	300
9.4 "	350	4.0	400
12 "	Lock	3.63	475

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkake and take out large pilot mounting screw and lock nut from flywheel housing directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every 1000 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 943-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes (cold) reached at 1750 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	650	0	6.4	720
4	6.8	800	4	6.8	900
8	7.3	920	10	7.5	1360
12	7.7	1080	13.5	7.8	1800
18	8.3	1700	10	7.5	3200
11.6	7.6	3200			

Brush spring tension is 14-18 ounces. Shunt field current is 3.5-4.5 amperes. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is mounted on special swinging bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then take out two bolts holding generator on bracket and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 8821. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights (when used) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Use Clum Model 9150 for replacement. Interchangeable with Soreng-Manegold Model 5520-A.

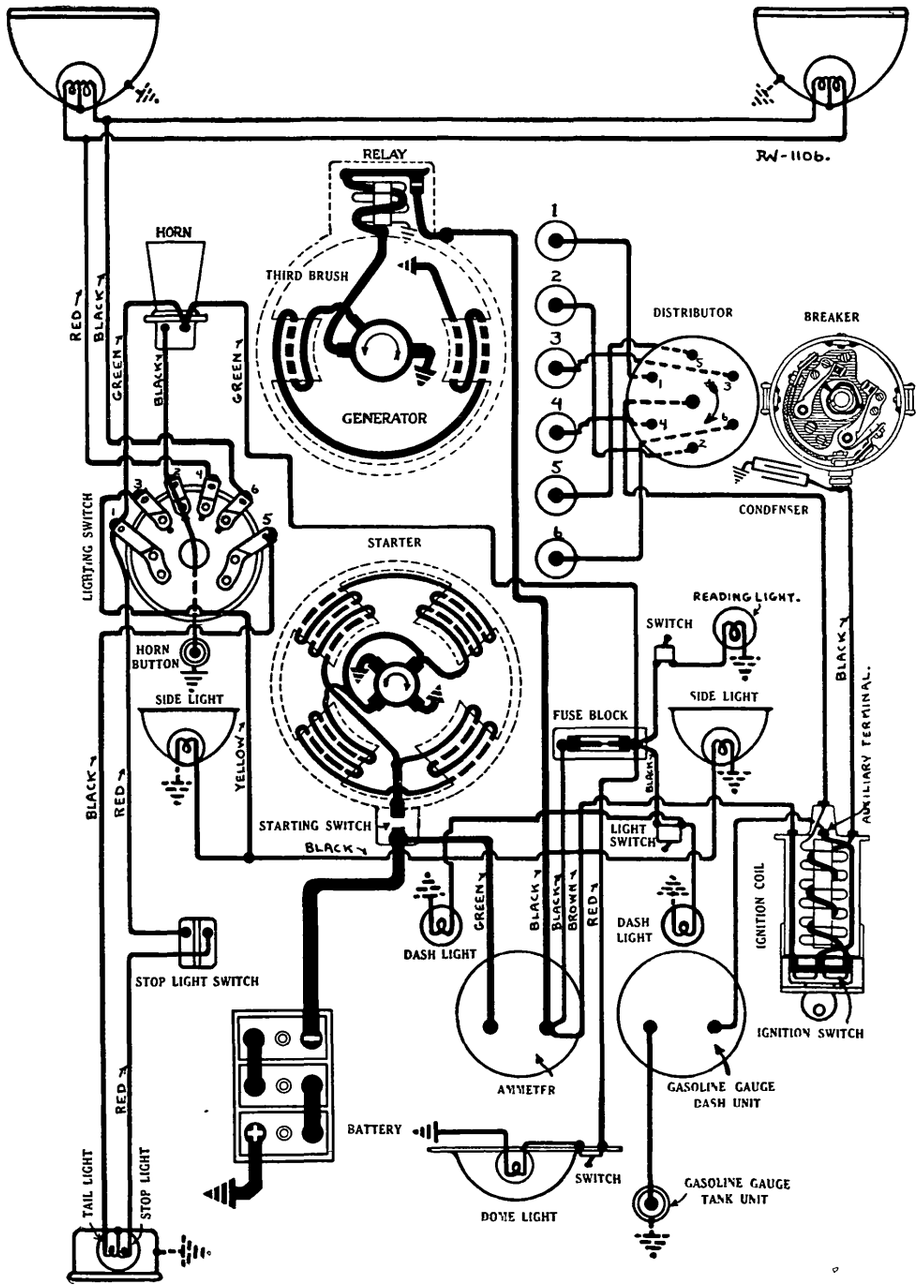
FUSES:—Lighting fuse mounted on back of ammeter is 20 ampere capacity.

CHRYSLER

MODEL 70, SERIES V (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-17, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22.5 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-T. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 ampere at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 650-G. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until contact gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 22 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 2750 R.P.M. of engine. Breaker has two sets of contacts operating on a single three sided cam. Contacts open alternately at intervals of 60 degrees corresponding to the 120 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and may be removed from the right side. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Timing:—Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position .067 inch before top dead center with the manual spark control in the fully advanced position. To set timing, first set breaker contacts at .022 inch. Then remove the small brass pipe plug in the cylinder head directly above No. 6 piston and screw the special timing micrometer gauge in place. Connect a small six volt test lamp in series with the primary circuit by connecting one test lamp lead to the primary terminal and the other lead to the relay terminal on the generator. If the battery is out of the car connect this lead to a six volt battery and ground the other battery terminal to the car frame. Then crank the engine over and set the micrometer gauge at '0' with No. 6 piston on top dead center. Fully advance the manual spark control and see that distributor is turned counter-clockwise to the full extent of the advance arm slot. Turn engine over until piston No. 1 enters compression stroke and stop when the gauge reading is .067 inch before top dead center. Then loosen advance arm clamp screw and rotate distributor until the test light goes out, indicating that the contacts are opening. Tighten the clamp screw and see that the rotor is directly opposite the segment in the distributor head connected to the spark plug in cylinder No. 1 (see diagram).

Check the ignition setting by turning the engine over several times and then stopping with piston No. 1 on compression stroke at the instant the test lamp goes out, indicating that the contacts have opened. The gauge reading should be within limits of .060-.084 inch. If outside these limits the timing operation must be repeated.

On the first cars, using a Model 639-X distributor, the ignition timing should be set with the piston .035 inch before top dead center with manual spark control fully advanced. The piston should be held within limits of .030-.040 inch before top dead center. This model distributor has only one

CHRYSLER

MODEL 70, SERIES V (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

breaker arm and no synchronization is necessary.

To synchronize the Model 650-G distributor on the car without special equipment, turn the crankshaft over one complete revolution after setting the timing and stop with piston No. 6 at firing position (.067 inch before top dead center). Then loosen the lock screws on the movable sub-plate (on which the second set of contacts is mounted) and turn the eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Synchronization of Contacts. Contacts can be synchronized on a rotary spark gap or by using special Delco-Remy tool, Part No. 820751, and following complete directions in Equipment Section.

NOTE:—If the new type timing gauge is used, which has a spark gap built in the face of the gauge dial, it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be visible at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type 130. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.719 inches. Stem diameter, .3405 inch. Stem length, 7 1/16 inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.656 inches. Stem diameter, .3405 inch. Stem length, 7 1/16 inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) 78 pounds (valve open). Tappet clearance, .008 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .017" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 714-P, 728-B. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch and a set of reduction gears (Model 728-B only). The direction of rotation (armature shaft) is counter-clockwise (714-P) or clockwise (728-B), viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data—Model 714-P

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
.4 "	3250	5.5	100
3.0 "	1500	5.0	200
6.0 "	800	4.5	300
9.4 "	350	4.0	400
12.0 "	Lock	3.63	475

Model 728-B

0 lb. ft.	2500	5.6	75
.6 "	1550	5.5	100
5 "	780	5.0	200
10 "	460	4.5	300
15.4 "	270	4.0	400
28 "	Lock	3.0	600

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out the large pilot mounting screw and lock nut in flywheel housing directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the armature shaft every 1000 miles of operation. Every six months remove the grease plug in the reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 959-D, 957-G. The direction of rotation is counter-clockwise, viewed from the commutator end. Current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes (cold) at 8.3 volts reached at 1400 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	520	0	6.4	600
6	7.0	720	4	6.8	760
10	7.4	820	8	7.7	1000
14	7.8	1020	14	7.8	1750
18	8.3	1400	10	7.4	3200
11.4	7.6	3200			

Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is mounted on special swinging bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and lift off drive belt. Then take out two bolts mounting generator on bracket and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 8821. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights (when used) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Use Clum Model 9150 for replacement. Interchangeable with Soreng-Manegold Model 5520-A.

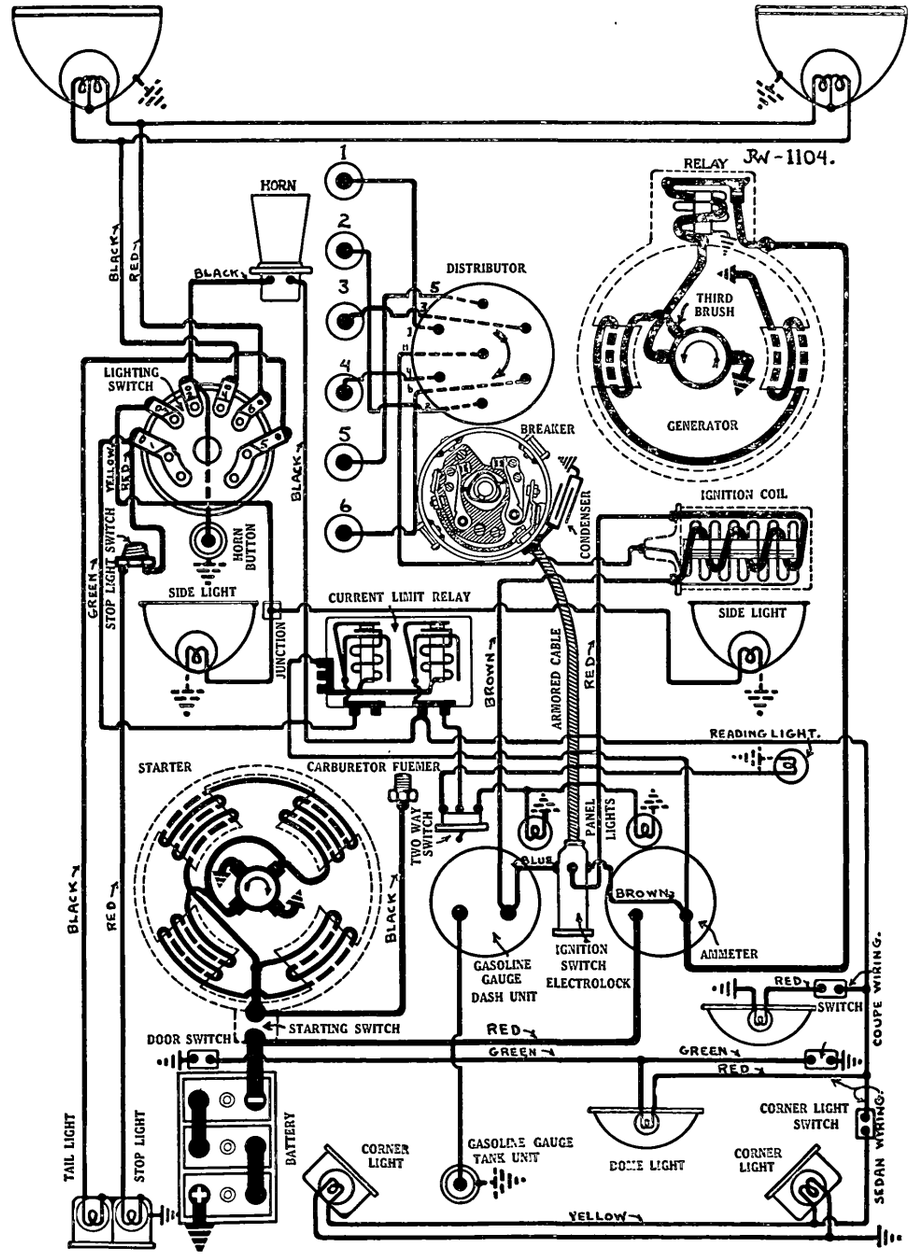
FUSES:—Lighting fuse mounted on back of ammeter is 20 ampere capacity.

CHRYSLER

MODEL 77, SERIES W (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, WSB-17, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22.5 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is a Type 8-B Electrolock. The Electrolock must be removed as a unit with the distributor whenever the distributor is taken off the car. A full description and service directions on the Electrolock are given in the Equipment Section.



Distributor Model 659-E. Breaker contacts separate .020-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until contact gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 2800 R.P.M. of engine. Breaker has two sets of contacts operating on a single three sided cam. Contacts open alternately at intervals of 60 degrees corresponding to the 120 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and may be removed from the right side. To remove distributor, disconnect Electrolock at dash, disconnect manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor and Electrolock from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every 500 miles of operation. Every 1000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pins. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820751, and follow complete directions in Equipment Section. Contacts can be synchronized with the regular timing gauge after distributor has been timed to the engine by cranking engine over one complete revolution and stopping when gauge indicates No. 6 piston is at firing position (.067 inch before top dead center with manual spark control fully advanced. Then loosen the lock screws on the movable sub-plate on which the second set of contacts is mounted and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position .067 inch before top dead center with the manual spark control in the fully advanced position. To set timing, first set breaker contacts at .022 inch. Remove the ⅛ inch pipe plug in cylinder head directly over No. 6 piston and screw the special micrometer timing gauge in place in the hole. Connect a small six volt test lamp in series with the primary circuit by connecting one test lamp lead to the coil lead to the Electrolock (Red wire) after disconnecting this lead from the Electrolock. Connect the other test lamp lead to the Electro-

CHRYSLER
MODEL 77, SERIES W (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

lock terminal. Turn on ignition. Crank engine over and set micrometer gauge at '0' with No. 6 piston on top dead center. Fully advance manual spark control. Turn engine over until No. 1 piston enters compression stroke (the up stroke with both valves closed) and stop when the gauge reading is .067, indicating that No. 1 piston is at firing position. Then loosen advance arm clamp screw and rotate distributor until the test lamp goes out, indicating that the contacts are beginning to open. Tighten the clamp screw and see that rotor is directly opposite No. 1 segment (see diagram). Connect the spark plugs as shown on the wiring diagram.

Check the ignition setting by cranking the engine over several times and then stopping with No. 1 piston on compression stroke at the exact point at which the test lamp goes out, indicating that the contacts have opened. The gauge reading should be within limits of .060-.084 inch. If outside these limits the timing must be reset.

NOTE:—If the new type timing gauge with a spark gap built in the face of the gauge dial is used, it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be visible at the gauge spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type 130. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.719 inches. Stem diameter, .3405 inch. Stem length, 7 1/16 inches (over all). Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) and 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.656 inches. Stem diameter, .3405 inch. Stem length, 7 1/16 inches (over all). Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed) and 78 pounds (valve open). Tappet clearance, .008 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .017" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 728-B. Starter is connected to the engine through a set of reduction gears and manual pinion shift interconnected with the starting switch pedal. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.6	75
.6 "	1550	5.5	100
5 "	780	5.0	200
10 "	460	4.5	300
15.4 "	270	4.0	400
28 "	Lock	3.0	600

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out large pilot mounting screw and lock nut on flywheel housing directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

GENERATOR:—Model 959-D, 943-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes (cold) reached at 1750 R.P.M. of the generator armature.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	520	0	6.4	600
6	7.0	720	4	6.8	760
10	7.4	820	8	7.7	1000
14	7.8	1020	14	7.8	1800
18	8.3	1750	10	7.4	3200
11.4	7.6	3200			

Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is mounted on special swinging bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp band. Swing generator toward engine and slip off drive belt. Then take out two bolts mounting generator on bracket and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 8821. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights (when used) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Use Clum Model 9150 for replacement. Interchangeable with Soreng-Manegold Model 5520-A.

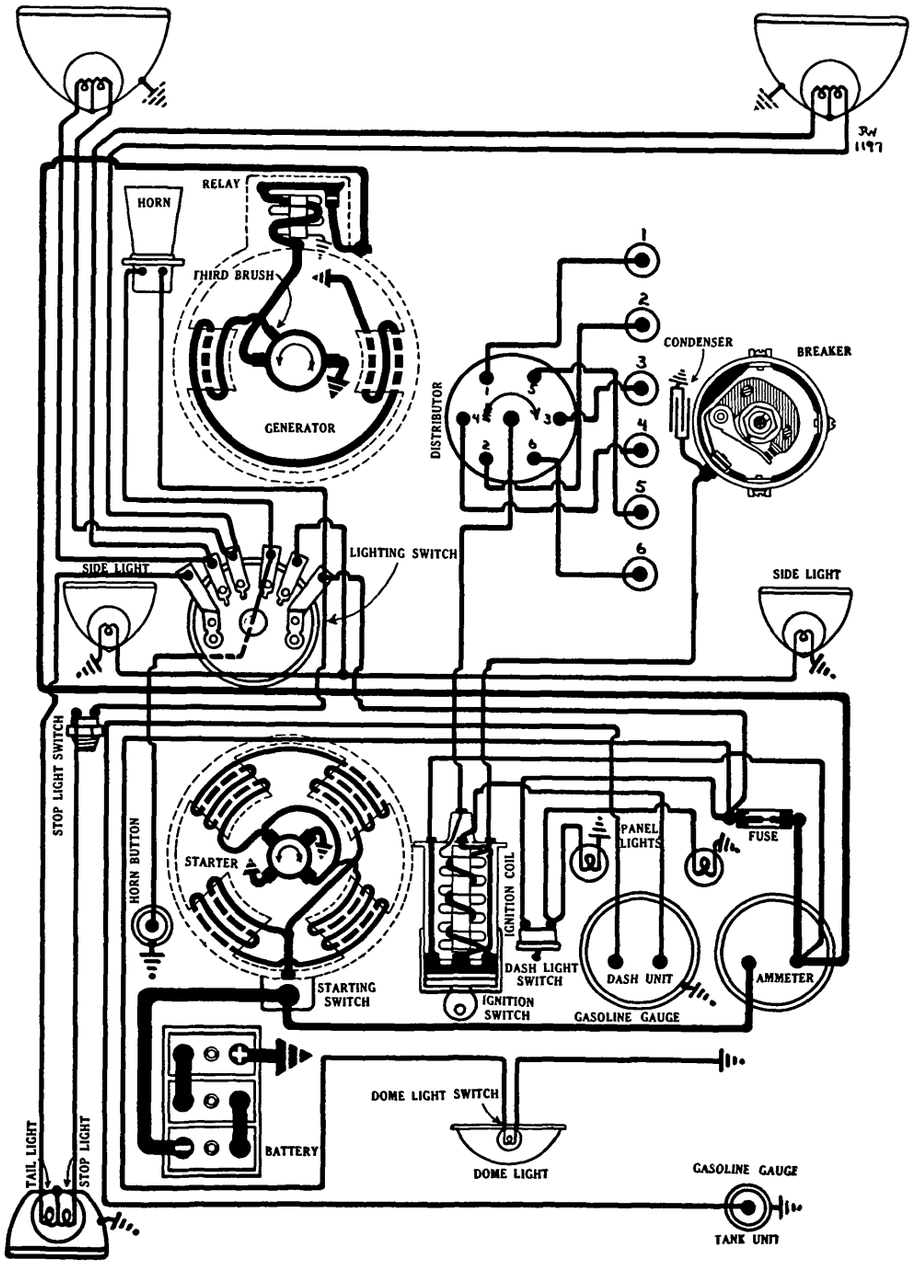
CURRENT LIMIT RELAY:—Model 410-E. This device consists of two vibrating circuit breakers mounted on the back of the dash and connected in the lighting circuits. They begin to operate when the current reaches 25-30 amperes and continue limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

CHRYSLER SIX

SERIES CM (1931) AFTER SERIAL NUMBER 6,520,501
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-1-13. 6 volt, 84 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-T. The ignition switch is built in the base of the coil. Coil is mounted on the rear of the dash with the ignition switch extending through to the face of the instrument board. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 632-K. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 18 degrees (engine) reached at 2500 R.P.M.

Mounting:—Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw at rear of advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .034 inch (Standard 5.2-1 Compression Head) or .026 inch (6.2-1 Compression Red Head Engine) before top dead center. To set timing, first set breaker contact gap .020 inch. Then remove the ⅛ inch pipe plug from the cylinder head directly above No. 6 cylinder and screw the special timing micrometer gauge in place in the hole. Connect a small six volt lamp in the primary circuit (this can be done by connecting one lamp lead to the primary terminal of the distributor and the other lamp lead to the relay terminal of the generator. If the battery is out of the car, connect the lamp lead to a battery and ground the other battery terminal to the engine). Turn engine over and set micrometer at zero on top dead center. Crank engine over until piston No. 1 is coming up on compression stroke (both valves will be closed) and stop when the gauge indicates that the piston is .034 inch (standard 5.2-1 Compression head) or .026 inch (6.2-1 Compression Red Head Engine) before top dead center. Remove distributor head and see that rotor is opposite No. 1 segment (see diagram). Loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open, when the lamp will go out. Tighten the clamp screw and connect the spark plug leads in order 1-5-3-6-2-4 clockwise around the distributor head. Check the setting by cranking the engine over several times and then stopping with piston No. 1 on compression stroke at the point where the lamp goes out, indicating that the contacts have begun to open. If the gauge reading is within limits of .032-036 inch (Std. 5.2 Head) or .024-.028 inch (6.2 Red Head) before top dead center, the setting is satisfactory. If outside these limits the engine should be retimed.

NOTE:—If the new type timing gauge (with a visible spark gap built in the face of the gauge) is used it will not be necessary to use a test lamp.

CHRYSLER SIX

SERIES CM (1931) AFTER SERIAL NUMBER 6,520,501
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

One gauge lead should be clipped to the high tension terminal in the center of the distributor head and the other gauge lead should be grounded to the engine. The ignition should be turned on. A spark will be visible at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-12 (Std. 5.2 Engines) or G-8 (6.2 Red Head Engines). Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 17/32 inches. Stem diameter, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed), 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 15/32 inches. Stem diameter, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed) 78 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—**Model 725-Q.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
15 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out two flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every 1000 miles of operation.

GENERATOR:—**Model 943-R.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

	Cold Test			Hot Test	
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850

12	7.7	3200	10	7.5	3200

Shunt field current is 3.5-4.5 amperes at 6 volts. Generator, motoring, draws 5.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted at left of engine on special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—**Model 265-G.** Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**Clum Switch Model 9150.** Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights (when used) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

NOTE:—This switch interchangeable with Soreng-Manegold Model 5520-A.

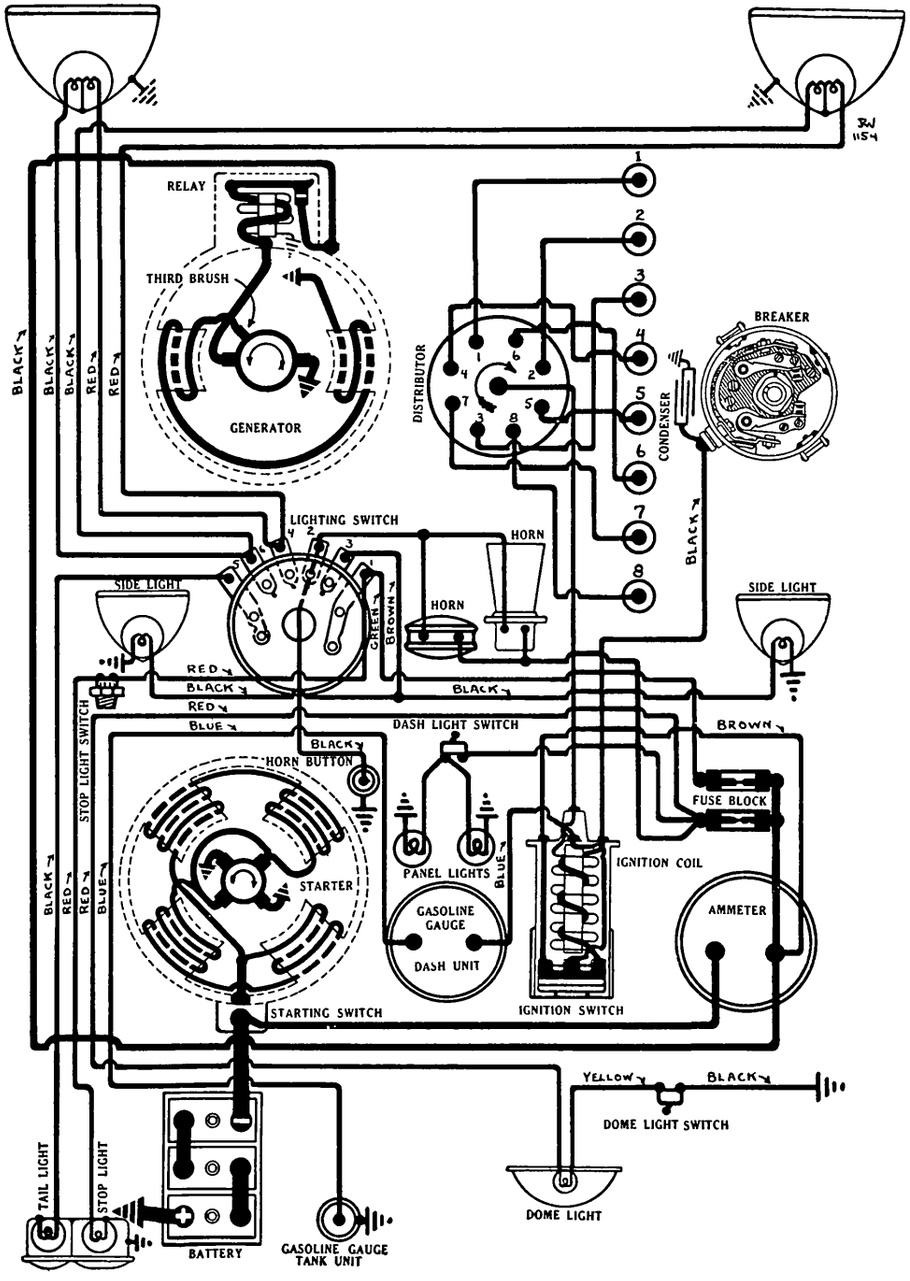
FUSES:—Lighting fuse mounted on back of ammeter is 20 ampere capacity.

CHRYSLER

EIGHT SERIES CD (1930-31), PRODUCTION STARTED JULY, 1930
SERIES CDX (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-2-15. 6 volt, 100 amperes hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Batery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model 526-T. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.



Distributor Model 660-G. Breaker contacts separate .018-.024 inch. Set contact gaps by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 3200 R.P.M. of the engine. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the left of the engine and is driven by an inclined shaft from the camshaft. The oil pump is located on the opposite end of the inclined shaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw in advance plate and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one full turn every 1000 miles of operation. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section to synchronize contacts. The contacts can be synchronized using the regular timing gauge if an adapter is available so that the gauge can be mounted in the spark plug port of cylinder No. 6. The gauge should be set at zero on top dead center and the piston turned to firing position exactly as for timing (see next paragraph) and the lock screws on the movable sub-plate should then be loosened and the eccentric adjusting screw turned until the second set of contacts (mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .018-.024 inch.

Timing Distributor to Engine. On the CD series cars, breaker contacts begin to separate when the piston entering power stroke reaches a position .060 inch (actual piston travel) before top dead center on cars with standard 5.2-1 compression cylinder head and .018 inch before top dead center with the optional 5.4-1 compression head or .010 inch before top dead center on Red Head Engines with 6.4 to 1 compression ratio. On the CDX series, contacts open with the piston .040 inch before top dead center (Standard 5.4 Head), .048 inch (5.3 A.S. Standard Head), or .040 inch (6.3 A.S. Red Head Engines) To set timing, remove the ⅛ inch pipe plug in the cylinder head directly over piston No. 8 and screw the special mi-

CHRYSLER

EIGHT SERIES CD (1930-31), PRODUCTION STARTED JULY, 1930
SERIES CDX (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

crometer timing gauge in the opening. Set breaker contact gap at .020 inch. Connect a six volt test lamp in series with the primary circuit by connecting one test lamp lead to the primary terminal on the distributor and the other lead to the relay terminal on the generator. If the battery is out of the car, connect this lead to one terminal of a six volt battery and ground the other battery lead to the engine block. The test lamp will remain lighted while the contacts are closed and will go out as the contacts open. Crank engine over and set micrometer gauge at zero with piston No. 8 on top dead center. Then turn engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed) and stop when the gauge indicates .060 inch (5.2-1 compression ratio), .018 inch (5.4-1 compression ratio) or .010 inch (6.4 Red Heads) on the CD series. On the CDX Series, gauge readings should be .040 inch (5.4 Standard Head), .048 inch (5.3 A.S. Standard Head) or .040 inch (6.3 A.S. Red Head) before top dead center. Loosen advance arm clamp screw and rotate distributor until lamp goes out, indicating that the first set of contacts (mounted directly on breaker plate) have begun to open. Tighten the clamp screw and check rotor to see that it is directly opposite No. 1 segment in the distributor head (see diagram). Check timing by cranking engine over several times and then stopping with No. 1 piston on compression stroke at the exact point at which the lamp goes out. The gauge reading should then be within limits of .055-.065 inch (standard 5.2 engines) or .016-.020 inch (5.4 engines) or .008-.012 inch (Red Head engines) on the CD series. On the CDX series, the timing limits are .037-.043 inch (5.4 standard engine), .045-.051 inch (5.3 A.S. standard) or .037-.043 inch (6.3 A.S. Red Head engine). If the contacts have been correctly synchronized the second set of contacts (mounted on the movable sub-plate) will begin to open 45 degrees after this point when piston No. 6 reaches firing position.

NOTE:—If the latest type timing gauge (with a spark gap built in the gauge) is used it will not be necessary to employ a test lamp. The ignition should be turned on and one gauge lead connected to the coil high tension lead (remove the cable from the center terminal of the distributor and clip the gauge lead to it) and the other gauge lead should be grounded to the engine. A spark will be visible in the gauge spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. A.C. Type G-11 (CD). 14 MM. Type K-12 (CDX). Gaps are .020-.025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 13/32 inches. Stem diameter, 11/32 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 40-44 pounds (valve closed), 75-81 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 4 degrees before top dead center and close 36 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 13/32 inches. Stem diameter, 11/32 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 40-44 pounds (valve closed), 75-81 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 52 degrees before lower dead center and close 2 degrees before top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .0035" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 728-K. Starter is connected to the engine through a set of reduction gears and a manual pinion shift interconnected with the starting switch. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.6	75
.6 "	1550	5.5	100
5 "	780	5.0	200
10 "	460	4.5	300
15.4 "	270	4.0	400
28 "	Lock	3.0	600

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

GENERATOR:—Model 943-R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush field. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes (cold) reached at 2300 R.P.M. or 20 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	520	0	6.4	600
6	7.0	720	4	6.8	760
10	7.4	820	8	7.7	1000
14	7.8	1020	14	7.8	2400
18	8.3	2300	10	7.4	3200
11.4	7.6	3200			

Shunt field current is 3.5-4.5 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted at left of engine on special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Then swing generator toward engine and slip off drive belt. Then take out the two bolts under the generator forming the bracket hinge and lift generator from place.

RELAY:—Model 265-G. Relay is mounted on the generator field frame. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current is approximately 2 amperes at closing of contacts. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 9150. Lighting switch is mounted at lower end of the steering column and is controlled by a lever on the steering wheel. Headlights are equipped with double filament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—This switch interchangeable with Soreng-Manegold Model 5520-A.

FUSES:—Two lighting fuses are mounted on the back of the ammeter. They are each 20 ampere capacity.

CHRYSLER

EIGHT DeLUXE SERIES ★CD (1931) AFTER JUNE, 1931
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

CAR SERIAL NUMBER:—Stamped on right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss left side of engine block between No. 1 and 2 cylinders.

BATTERY:—**Willard, Type WS-4-17.** 6 volt, 17 plate, 115 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size 7 1/16 inches wide, 11 11/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 526-T.** The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model 660-U. Breaker contacts separate .018-.023 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Breaker has two sets of contacts on a four lobe cam. Contacts open alternately at 45 degree intervals corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized—see Timing. Distributor is full automatic (manual advance not used).

Cam Angles—Closed 34°, open 11° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	RP.M.
Start		400	2		800
8.5		1100	17		2200

Mounting:—Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. The oil pump is located on the lower end of the shaft. To remove distributor, disconnect primary lead and take off distributor cap with cables intact. Then take out hold-down screw in advance plate and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one full turn every 1000 miles of operation. At the same time remove the distributor cap and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—**Synchronization of Contacts.** Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section to synchronize contacts. The contacts can be synchronized using the regular timing gauge if an adapter is available so that the gauge can be mounted in the spark plug port of cylinder No. 6. The gauge should be set at zero on top dead center and the piston turned to firing position exactly as for timing (see next paragraph) and the lock screws on the movable sub-plate should then be loosened and the eccentric adjusting screw turned until the second set of contacts (mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .018-.024 inch.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position .040 inch before top dead center (5.2-1 compression A.S. Standard head). To set timing, remove the ⅛ inch pipe plug in the cylinder head directly over No. 8 piston and screw the special timing gauge (see Equipment Section) in place. Connect one gauge lead to the coil high tension cable at the distributor and ground the other gauge lead to the cylinder block. Set breaker contact gap at .020 inch. Turn engine over until No. 8 piston is on top dead center and set gauge dial at zero. Then turn engine over until No. 1 piston enters com-

CHRYSLER

EIGHT DeLUXE SERIES ★CD (1931) AFTER JUNE, 1931
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

pression stroke (the up stroke with both valves closed) and stop when gauge indicates that piston is .040 inch before top dead center. See that distributor rotor is opposite No. 1 segment in the distributor head (see diagram). Then loosen advance plate clamp screw and rotate distributor until the contacts begin to open when a spark will be seen at the spark gap on the gauge dial. Tighten the clamp screw and connect the spark plugs as indicated on the diagram. The second set of contacts should open 45 degrees after this point when piston No. 6 reaches firing position.

Check timing by cranking engine over several times and stopping with No. 1 piston on compression stroke at the instant the spark is seen at the spark gap. The gauge reading must be within .037-.043 inch before top dead center.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 14MM. Metric. A.C. Type K-12. Gaps are .022 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 15/32"	3405"	5¼"	45°	3125"
Exhaust	1 13/32"	3405"	5¼"	45°	3125"

	Tappet Clearance Operating	Timing	Spring Pressure	
Intake	.005" (hot)	.011" (cold)	Closed	40-44 pounds (2 1/16")
Exhaust	.007" (hot)	.012" (cold)	Open	115 pounds (1¾")

Timing

Intake valves open 6° after top dead center with piston .014 inch down on intake stroke. Intake valves close 46° after lower dead center.

Exhaust valves open 42° before lower dead center. Exhaust valves close 8° after top dead center with piston .026 inch down on intake stroke.

To Check Valve Timing. Remove the pipe plug in the cylinder head over No. 8 piston and screw the special timing gauge in place. Turn engine over until No. 8 piston is on top dead center and set gauge dial at zero. Crank engine over until No. 1 piston is on top dead center entering power stroke and set tappet clearance at .011 inch (No. 1 inlet valve) and .012 inch (No. 1 exhaust valve). Turn engine over one complete revolution and stop with piston slightly past top dead center when the gauge reading is .014 inch. No. 1 inlet valve should begin to open at this point. Turn engine over 2 degrees until gauge reading is .026 inch. No. 1 exhaust valve should begin to close at this point. Reset tappet clearance with engine hot at .005 inch (inlet) and .007 inch (exhaust).

To Set Valve Timing. Turn crankshaft until No. 1 piston is on top dead center. Rotate camshaft until the mark on the camshaft sprocket is directly opposite the mark on the crankshaft sprocket with both marks in line with a straightedge laid across the two shaft centers. Assemble the timing chain.

STARTER:—Model 728-K. Starter is connected to the engine through a set of reduction gears and a manual pinion shift interconnected with the starting switch pedal. The direction of rotation (armature shaft) is clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
5 "	860	5.0	200
10 "	460	4.5	300
15.5 "	275	4.0	400
22 "	100	3.5	500
28 "	Lock	3.0	600

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out two flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at the commutator end of the armature shaft every 5000 miles of operation. Every 10,000 miles remove the grease plug in the reduction gear compartment and repack the reduction gears with medium grease.

GENERATOR:—Model 943-R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush field. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 18 amperes (cold) reached at 2300 R.P.M. or 20-22 M.P.H. On cars equipped with 21 cp. headlight bulbs, the maximum charging rate should be set at 16 amperes.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	875
4	6.8	920	4	6.8	1075
8	7.2	1075	8	7.2	1400
12	7.65	1250	12	7.7	2400
18	8.3	2300	10.8	7.5	3000

Shunt field current is 3.5-4.5 amperes at 6 volts. Generator motoring draws 5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted at left of engine on a special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Then swing generator toward engine and slip off drive belt. Then take out the two bolts under the generator forming the bracket hinge and lift generator from place.

Belt Adjustment. To take up drive belt, loosen mounting bolts and adjustment clamp bolt and swing generator away from the engine. Tighten the adjustment bolt to hold setting. The belt tension should be just sufficient to drive the generator and fan without slipping.

Oiling:—Fill the oiler at each end of the generator with light engine oil every 2000 miles of operation.

RELAY:—Model 265-G. Relay is mounted on the generator field frame. Relay closes at 8-10 M.P.H. when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current is approximately 2 amperes at closing of contacts. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch, Model 9150. Lighting switch is mounted at lower end of the steering column and is controlled by a lever on the steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	32-32	DC	1000
Cowl lights	6-8	3	SC	63
Dash and tail lights	6-8	3	SC	63
Stop and dome lights	6-8	15	SC	87
Corner lights	6-8	3	SC	63

FUSES:—Two lighting fuses are mounted on the back of the ammeter. They are each 20 ampere capacity.

GASOLINE GAUGE:—Motometer electrical type (see Carburetion Section).

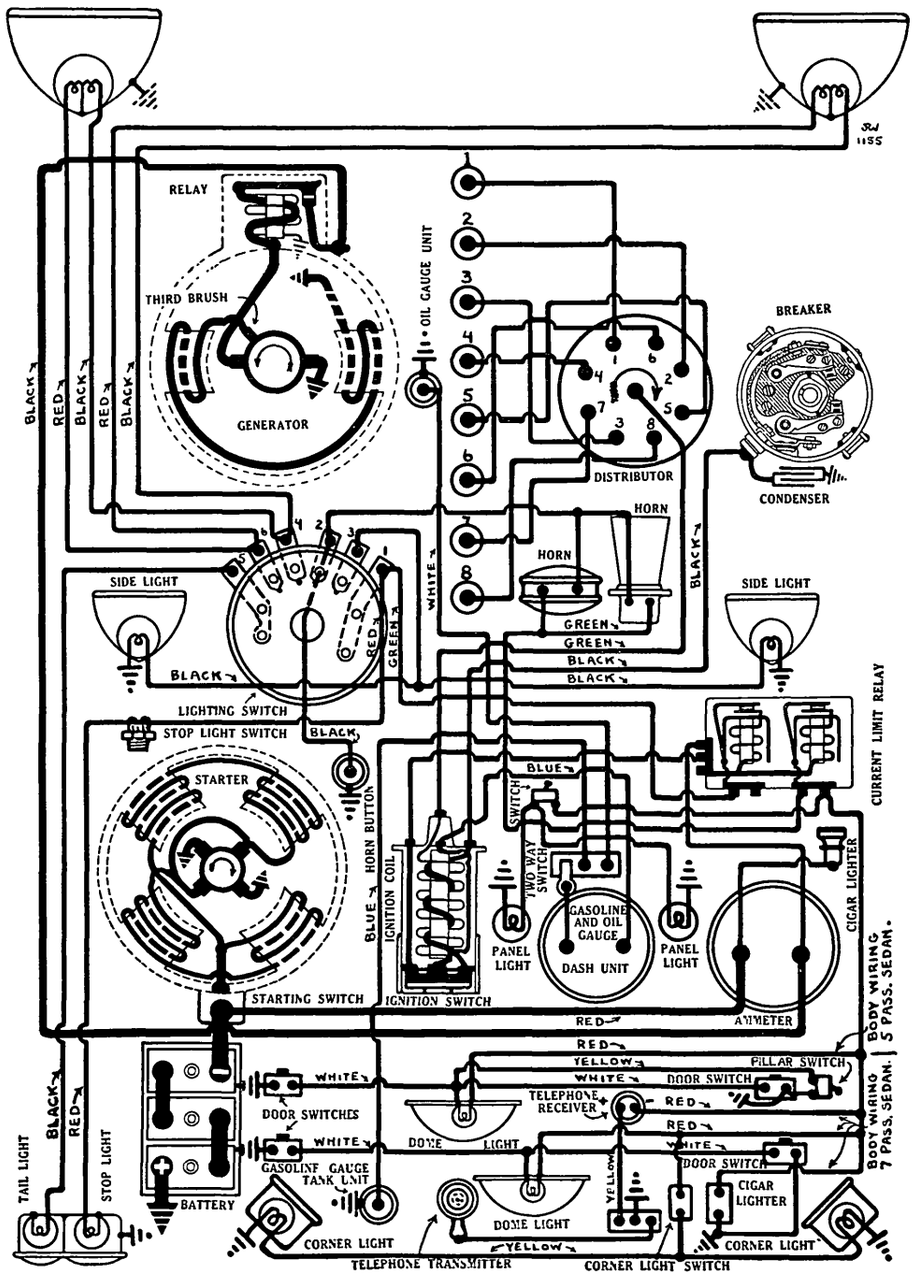
FUEL PUMP:—AC mechanical fuel pump mounted at right of engine (see Carburetion Section).

CHRYSLER

IMPERIAL EIGHT MODEL CG (1931)
PRODUCTION STARTED JULY, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-6, 6 volt, 153 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 160 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30 hours. Battery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model 526-T. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.



Distributor Model 660-F, S. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate (directly behind breaker arm) and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 22 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 22 degrees reached at 2800 R.P.M. of the engine on the Model 660-F, and 27 degrees reached at 2200 R.P.M. on the Model 660-S. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the right side of the cylinder head and is driven by a vertical shaft from the camshaft. The oil pump is mounted on the lower end of the shaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every 1000 miles of operation. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section to synchronize contacts. The contacts can be synchronized using the regular timing gauge if an adapter is available to permit the gauge to be mounted in the spark plug port of cylinder No. 6. The gauge should be set at zero on top dead center and the piston turned to firing position exactly as for timing (see next paragraph). Then loosen the lock screws on the movable sub-plate and turn the eccentric adjusting screw until the second set of contacts (mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .018-.024 inch.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position .038 inch (5.0-1 and 6.0-1 compression A.S. heads—first cars) or .047 inch (5.0-1 compression A.S. head—after January, 1931) (actual piston travel) before top dead center with the manual spark control in the fully advanced position. To set timing, remove the ⅛ inch pipe plug in the cylinder head directly over No. 8 piston and screw the special micrometer timing gauge in place in the open-

CHRYSLER

IMPERIAL EIGHT MODEL CG (1931)
PRODUCTION STARTED JULY, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

ing. Set breaker gap at .020 inch and fully advance manual spark control. Connect a six volt test lamp in series with the primary circuit by connecting one lamp lead to the primary terminal on the distributor and the other lamp lead to the relay terminal on the generator. If the battery is out of the car, connect this lead to one terminal of a six volt battery and ground the other battery terminal to the engine block. The lamp will remain lighted while the contacts are closed and will go out as the contacts open. Crank engine over and set micrometer gauge at zero with piston No. 8 on top dead center. Then turn engine over until piston No. 1 enters compression stroke and stop when the gauge indicates .047 or .038 inch before top dead center. Loosen advance arm clamp screw and rotate distributor until the lamp goes out, indicating that the first set of contacts (mounted directly on the breaker plate) have begun to open. Tighten the clamp screw and check position of rotor to see that it is directly opposite No. 1 segment in the distributor head (see diagram). Check timing by cranking engine over several times and then stopping with No. 1 piston on compression stroke at the exact instant the lamp goes out. The gauge reading should be within limits of .035-.041 inch before top dead center (first cars with .038 inch setting), or .044-.050 inch (later cars with .047 inch setting). If the contacts are correctly synchronized the second set of contacts (mounted on the movable sub-plate) will begin to open exactly 45 degrees after this point when piston No. 6 reaches firing position.

NOTE:—If the latest type timing gauge is used (which has a spark gap built in the face of the gauge), it will not not be necessary to employ the test lamp. The ignition should be turned on and one lead from the gauge spark gap should be clipped to the coil high tension cable at the terminal in the center of the distributor head. The other gauge lead should be grounded to the engine. A spark will be visible in the gauge spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. A.C. Type G-14 (before 7,801,739), G-12 after 7,801,739). Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 23/32 inches. Stem diameter, 11/32 inch. Stem length, 6 9/16 inches. Valve lift, .3125 inch. Spring pressure, 50-55 pounds (valve closed), 80-85 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 21/32 inches. Stem diameter, 11/32 inch. Stem length, 6 9/16 inches. Valve lift, .3125 inch. Spring pressure, 50-55 pounds (valve closed), 80-85 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .008". This valve should open with piston .017" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks on sprockets are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 728-L, N. Starter is connected to the engine through a set of reduction gears and a manual pinion shift interconnected with the starting switch. The direction of rotation (armature shaft) is clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
1 "	1520	5.5	100
4 "	760	5.0	200
10 "	460	4.5	300
15.5 "	260	4.0	400
19.5 "	120	3.5	500
28 "	Lock	3.0	600

Mounting:—Starter is sleeve mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out large pilot screw in flywheel housing directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

GENERATOR:—Model 957-G, U. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 16 amperes (cold) reached at 1700 R.P.M. or 20 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
17-19	7.9-8.1	1700	13-15	7.7-8.0	1800

Shunt field current is 1.75-2.25 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special swinging bracket at the left of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then take out two bolts under generator which form bracket hinge and lift generator from place.

RELAY:—Model 265-B. Relay contacts close at 600 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 9150. Lighting switch is mounted at the lower end of the steering column and is controlled by a lever on the steering wheel. Headlights are equipped with double filament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop lights are 6-8 volt, 15 cp. S.C. Mazda 87. Dash, tail and corner lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 15 cp S.C. Mazda 87.

NOTE:—This switch interchangeable with Soreng-Manegold Model 5520-A.

CURRENT LIMIT RELAY:—Model 410-E, H. This device consists of two vibrating circuit breakers mounted on the dash and connected in the lighting circuits. Circuit breakers begin to operate when the current reaches 25-30 amperes and continue limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

CHRYSLER

SIX CYLINDER MODEL CI (1932)
SERIAL NUMBERS 6,557,401 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post. This series 6,557,401 up.

ENGINE NUMBER:—Stamped on boss left side of cylinder block between Nos. 1 and 2 cylinders.

BATTERY:—**Willard, Type WS-2-15,** 6 volt, 100 ampere hour (20 hour rate). Starting capacity 122 amperes for 20 minutes. Positive (+) terminal grounded to transmission case. Battery mounted under driver's seat. Battery size 7 1/16 inches wide, 10 5/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 534-Z.** Lock coil type with ignition switch in base. Coil mounted on back of instrument panel at extreme left. Ignition current is .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 632-K (first cars), 632-L (later cars). Single breaker arm type with semi-automatic advance (manual advance set in timing and not controllable by driver). Breaker gap set at .020 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact mounting plate and turn eccentric adjusting screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with scale at right angles to contact surface). Maximum manual advance 20 degrees (engine).

Cam Angles—Closed 36°, open 24° (distributor degrees).

Automatic Advance—Model 632-K

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	2		800
9		1250	18		2500

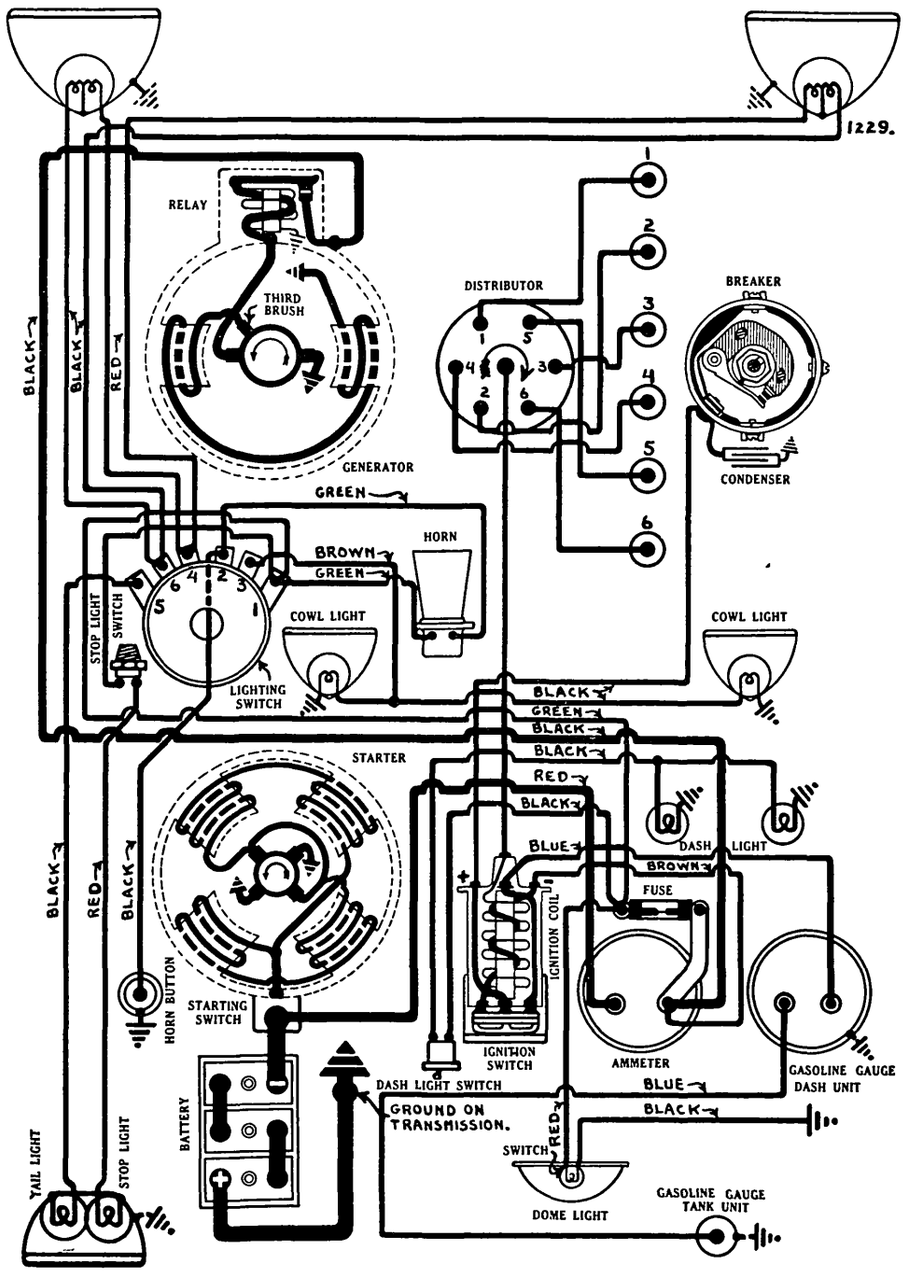
Automatic Advance—Model 632-L

Start		400	2		800
8		1300	16		2600

Mounting:—Distributor mounted left side of engine driven by inclined shaft from camshaft. To remove, disconnect lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light oil in wick oiler in center of shaft. Apply thin film vaseline to face of breaker cam.



Timing:—Standard setting 10° ('Silver Dome' Head), 8° (Red Head engines) before top dead center with full manual advance. To set timing, remove inspection cover left front face flywheel housing directly under starter. Turn engine over with No. 1 piston on compression until mark 'D/C' is opposite upper pointer on housing. Loosen advance plate clamping bolt, rotate distributor cup until contacts begin to open (use test lamp), tighten clamp bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).

NOTE:—No special directions necessary for timing engine with high compression 'Red Heads'. Ignition pointer properly set at factory on all engines equipped with high compression heads. No provision made for timing engines where heads are changed in the field.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest the radiator.

Spark Plugs:—14 MM. A.C. Type K-12. Set gap at .028 inch. Hold within limits of .025-.030 inch.

VALVE TIMING:—Valves on right side of engine with camshaft driven by two-sprocket non-adjustable chain drive.

CHRYSLER

SIX CYLINDER MODEL CI (1932)
SERIAL NUMBERS 6,557,401 UP
DELCO-REMY SYSTEM

	Head Diameter	Stem Diameter	Stem Lgth.	Seat Angle	Lift
Inlet	1.521" (1⅜" clear)	.340-.341"	5¼"	45°	5/16"
Exhaust	1.459" (1 5/16" clear)	.340-.341"	5¼"	45°	5/16"

Tappet Clearance	Operating	Timing	Spring Pressure
Inlet	.005" (hot)	.011" (cold)	Closed .....40-44 pounds (2 1/16")
Exhaust	.007" (hot)	.012" (cold)	Open .....75-81 pounds (1¾")

SPECIAL NOTE:—Do not compress springs to over-all length of less than 1¾" to avoid damage through springs taking on permanent set. Valve stem clearance in guide, .001-.003" (inlet), .002-.004" (exhaust).

Timing

Intake valves open 6 degrees past top dead center, close 46 degrees past lower dead center.

Exhaust valves open 42 degrees before lower dead center and close 8 degrees past top dead center with piston .0265 inch down on intake stroke.

To Check Valve Timing. Remove ⅛ inch pipe plug in cylinder head over No. 6 piston and install regular Chrysler timing gauge. Set gauge at '0' on top dead center. Set tappet clearance No. 1 inlet valve at .011 inch, No. 1 exhaust valve at .012 inch (cold). Rotate crankshaft until No. 6 piston on compression stroke is .015 inch past top dead center. No. 1 inlet valve should be tight and about to open. Turn crankshaft 2 degrees and stop with piston .0265 inch past top dead center. No. 1 exhaust valve should be closing. Reset tappet clearance at .005 inch (inlet), .007 inch (exhaust) with engine hot.

To Set Valve Timing. Remove inspection cover on left forward face of flywheel housing directly under starter. Rotate crankshaft until flywheel mark 'D/C' is directly opposite lower pointer on housing (the dead center position for pistons Nos. 1 and 6). Rotate camshaft until mark between teeth on camshaft sprocket is directly opposite crankshaft mark with both marks in line with a straightedge across the shaft centers. Mesh chain. Camshaft sprocket mounting cap screws offset so that sprocket can only be mounted in one position.

Valve Grinding. Inlet valves chrome nickel steel. Exhaust valves are silchrome. Manufacturer recommends that valves be refaced in valve grinder and then lapped in in cylinder block with compound.

STARTER:—Model 725-Q or 728-N. Manual engagement hooked up with starting switch lever (switch mounted on field frame). Starter drives through overrunning clutch. Rotation clockwise at commutator end (728-N with reduction gears) or counter-clockwise at commutator end (725-Q without gear reduction). Brush spring tension 24-28 ounces.

725-Q Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	6000	5	60
15 "	Lock	3	600

728-N Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	2500	5	70
28 "	Lock	3	600

Mounting:—Flange mounted on left front face of flywheel housing. To remove, disconnect cables, take out cotter pin and clevis pin in switch linkage, take out two flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—5000 Miles. Put 8-10 drops light oil in oiler on commutator end (725-Q) or oiler at each end of armature shaft (728-N).

10,000 Miles. Remove grease plug in reduction gear case. Repack gears with graphite grease (728-N only).

GENERATOR:—Model 943-R or S. Third brush control. To adjust, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush counter-clockwise to increase output, clockwise to decrease output, tighten locking screw. Manufacturer recommends that charging rate be set at 8 amperes to battery (with all lights on—headlights bright), maximum output at 20 M.P.H. or 10 amperes on cars equipped with radio. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

943-R Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-17	8.0-8.2	2300	11-14	7.3-7.6	2400

943-S Generator Data

15-18	7.9-8.3	2000	13-15	7.7-8.0	2400

Shunt field current 3.5-4.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove, disconnect lead, loosen adjustment clamp bolt and mounting bolts, swing generator toward engine, slip off drive belt, take out mounting bolts forming bracket hinge and lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt. Attach spring scale by wire looped over generator field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp. Pull generator away from engine until scale reading is 45-50 pounds. Tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Fill oiler at each end of generator with light oil.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 6.75-7.5 volts (generator) and open with 0-2.5 ampere discharge. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9271. Mounted at lower end of steering column controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. Switch positions:

1. Vertical—All lights off.
2. Right—Parking (cowl) and tail lights on. Headlights off.
3. No. 1 Left—Bright headlights and tail light on. Cowl lights off.
4. No. 2 Left—Dim (depressed beam) head and tail lights on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Cowl Lights	6-8	3	S.C.	63
Dash Lights	6-8	3	S.C.	63
Tail Light	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	15	S.C.	87

FUSES:—20 ampere capacity mounted on bracket under ammeter.

HORN:—Klaxon Model K-14. Vibrator type mounted under engine hood. Current draw 7 amperes.

GASOLINE GAUGE:—Motometer electric type (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer 'vapor tension' type (see Equipment Section).

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

CHRYSLER

EIGHT CYLINDER MODEL CP (1932)
SERIAL NUMBERS 7,523,601 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between Nos. 1 and 2 cylinders.

BATTERY:—**Willard, Type WS-4-17,** 6 volt, 17 plate, 115 ampere hour (20 hour rate.) Starting capacity 140 amperes for 20 minutes. Positive (+) terminal grounded to transmission case. Battery mounted under driver's seat. Battery size, 7 1/16 inches wide, 11 11/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 534-Z.** Lock coil type with ignition switch in base. Coil mounted on back of instrument panel at extreme left. Ignition current, .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 661-G. Single breaker arm type with semi-automatic advance (manual advance set in timing and not controllable by driver). No synchronization necessary. Set breaker gap at .018". Hold within limits of .017-.022". To set gap, loosen lock screw on stationary contact mounting plate and turn eccentric adjusting screw. Breaker arm spring tension 19-23 ounces (measured behind contacts with scale at right angles to back of breaker arm).

Cam Angles—Closed 31°, open 14° (distributor degrees).

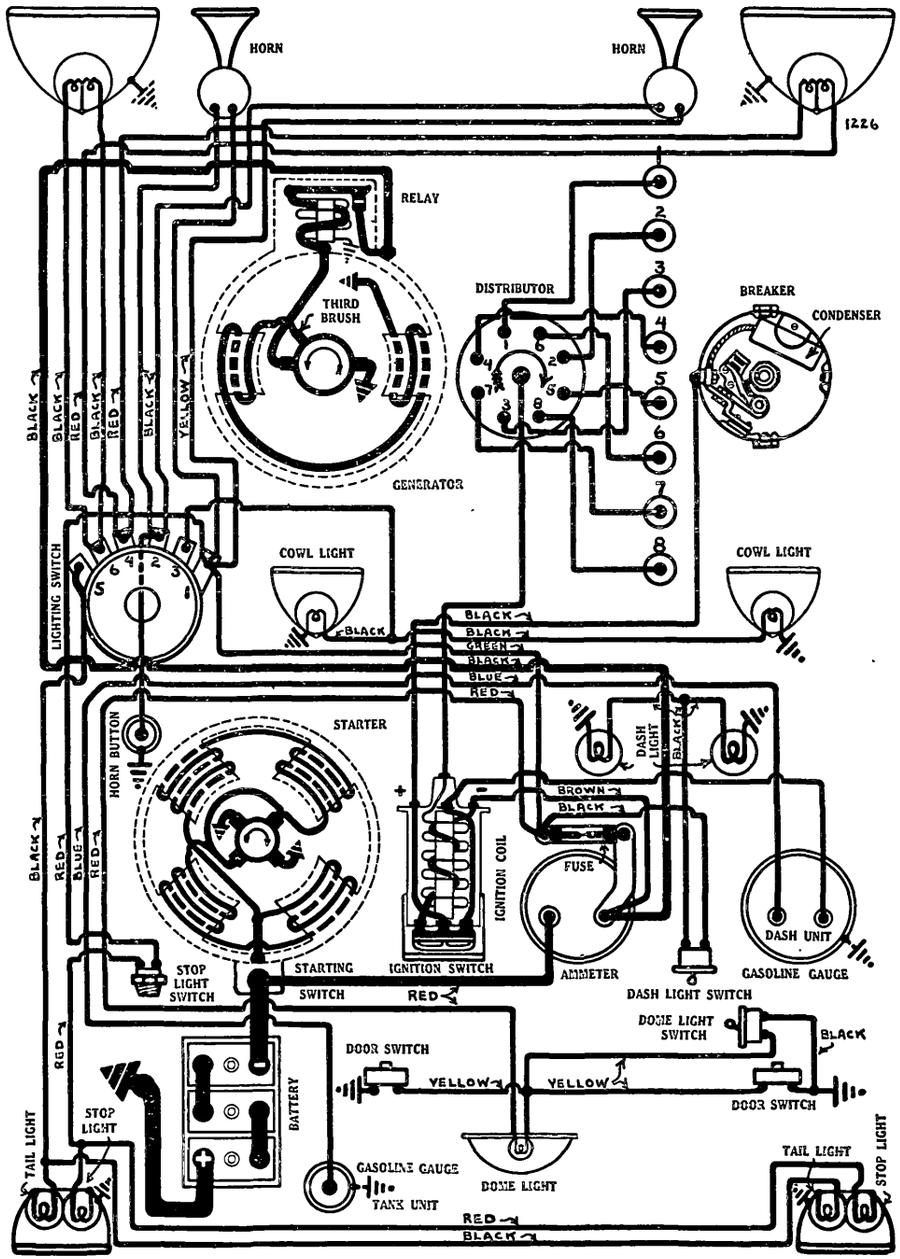
Distributor	Automatic Advance		Engine
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	2	800
7	1300	14	2600

Mounting:—Distributor mounted on left side of engine. Driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light oil in wick oiler in center of shaft. Apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 10° (Silver Dome Head), 7° (Red Head engines) before top dead center with full manual advance. To set timing, remove inspection cover on left front face of flywheel housing directly below starter. Turn engine over with No. 1 piston on compression until flywheel mark 'D/C' is opposite upper pointer on housing. Loosen hold-down screw in advance plate, rotate distributor cup until pointer is opposite '0' on scale (center of scale), tighten hold-down screw. Loosen advance plate clamp bolt, rotate distributor cup until contacts begin to open (use test lamp), tighten clamp bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).



Synchronization of Contacts. No synchronization necessary.

NOTE:—No special directions necessary for timing 'Red Head' engines as ignition pointer is properly placed at factory on all engines equipped with high compression heads. No provision made for timing where heads are changed in the field.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. A.C. Type K-12. Set gap at .028 inch. Hold within limits of .025-.030 inch.

VALVE TIMING:—Valves on right side of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

CHRYSLER

EIGHT CYLINDER MODEL CP (1932)
SERIAL NUMBERS 7,523,601 UP
DELCO-REMY SYSTEM

	Head Diameter	Stem Diameter	Stem Lgth.	Seat Angle	Lift
Inlet	1 15/32" (1 5/16" clear)	.340-.341"	5½"	45°	5/16"
Exhaust	1 13/32" (1¼" clear)	.340-.341"	5½"	45°	5/16"

	Tappet Clearance Operating	Timing	Spring Pressure
Inlet	.005" (hot)	.011" (cold).	Closed .....40-44 pounds (2 1/16")
Exhaust	.007" (hot)	.012" (cold)	Open .....75-81 pounds (1¾")

SPECIAL NOTE:—Do not compress springs to over-all length of less than 1⅝" to avoid damage through springs taking on permanent set. Valve stem clearance in guide, .001-.003" (inlet), .004" (exhaust).

Timing

Inlet valves open 6° after top dead center with piston .014" down on intake stroke. Intake valves close 46° after lower dead center.

Exhaust valves open 42° before lower dead center. Exhaust valves close 8° after top dead center with piston .025" down on intake stroke.

To Check Valve Timing. Remove ⅛ inch pipe plug in cylinder head over No. 8 piston and install regular Chrysler timing gauge. Set gauge dial at '0' with piston on top dead center. Set tappet clearance of No. 1 inlet valve at .011" (cold) and No. 1 exhaust valve at .012" (cold). Rotate crankshaft until No. 8 piston on compression stroke is .014" past top dead center. No. 1 inlet valve should be tight and about to open. Turn crankshaft 2 degrees until piston is .025" past top dead center. No. 1 exhaust valve should be closing. Reset tappet clearance at .005" (inlet) and .007" (exhaust) with engine hot.

To Set Valve Timing. Remove inspection cover on left front face of flywheel housing below starter. Rotate crankshaft until flywheel mark 'D/C' is directly opposite lower pointer on housing (top dead center position for pistons 1 and 8). Rotate camshaft until mark on camshaft sprocket between teeth is directly opposite marked tooth on crankshaft sprocket with both marks in line with straightedge across the shaft centers. Mesh chain. Camshaft sprocket mounting cap screws are offset so that sprocket can only be assembled in one position.

Valve grinding. Inlet valves chrome nickel steel. Exhaust valves silchrome. Manufacturer recommends that valves be refaced on valve grinder and then lapped in in cylinder block with compound.

STARTER:—Model 728-K. Manual pinion shift connected to starting switch lever (switch mounted on field frame). Starter drives through reduction gears and overrunning clutch. Rotation clockwise (armature shaft) at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Flange mounted on left front face of flywheel housing. To remove, disconnect cables, take out cotter pin and clevis pin in switch linkage, take out 2 flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—5000 Miles. Put 8-10 drops light oil in oiler at each end of armature shaft.

10,000 Miles. Remove grease plug in reduction gear case. Repack gears with graphite grease.

GENERATOR:—Model 943-S. Third brush control. To adjust, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase charging rate, clockwise to decrease charging rate, tighten lock screw. Manufacturer recommends that charging rate be set at 8 amperes maximum to battery at 20 M.P.H. with all lights on (headlights bright), or 10 amperes on cars equipped with radio. Rotation counter-clockwise at commutator end.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-18	7.9-8.3	2000	13-15	7.7-8	2400

Brush spring tension 24-28 ounces. Shunt field current 3.5-4.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove, disconnect lead, loosen adjustment clamp bolt and mounting bolts, swing generator toward engine, slip off drive belt, take out adjustment bolt and mounting pivot bolts, lift generator from place.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt. Attach spring scale by wire looped over generator field frame so that force of scale is tangent to top of generator and parallel to slot in adjustment arm. Pull generator away from engine until scale reading is 45-50 pounds. Tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Fill oiler at each end of generator with light oil.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 6.75-7.5 volts of generator and open with 0-2.5 ampere discharge current. Contact gap limits .015-.025 inch. Air gap limits .014-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9271. Mounted at lower end of steering column, controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. Switch positions:

1. Vertical—All lights off.
2. Right—Cowl lights and tail lights on. Headlights off.
3. No. 1 Left—Bright headlights and tail lights on. Cowl lights off.
4. No. 2 Left—Dim (depressed beam) headlights and tail lights on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C	1000
Cowl Lights	6-8	3	S.C	63
Dash Lights	6-8	3	S.C	63
Tail Light	6-8	3	S.C	63
Stop Light	6-8	15	S.C	87
Dome Light	6-8	15	S.C	87

FUSES:—20 ampere capacity mounted on bracket under ammeter.

GASOLINE GAUGE:—Motometer electric type (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer 'vapor tension' type (see Equipment Section).

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

HORNS:—Klaxon Model K-26 twin horns (matched tone) Type 1397, (low note) Type 1398 (high note). Current draw 6.0-8.5 amperes at 6 volts (Type 1397), 5.0-6.5 amperes at 6 volts (Type 1398).

CHRYSLER

IMPERIAL EIGHT MODEL CH, CUSTOM IMPERIAL MODEL CL, (1932)
SERIAL NOS. (CH) 7,900,001 UP, (CL) 7,803,301 UP
PRODUCTION STARTED JANUARY, 1932
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss left side of engine block between Nos. 1 and 2 cylinders above water jacket cover plate.

BATTERY:—**Willard, Type SJWR-6,** 6 volt, 147 ampere hour capacity (20 hour rate). Starting capacity 160 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted under driver's seat and grounded to transmission (CH) or in right front fender grounded to right frame member (CL). Battery size 7 1/16 inches wide, 13 inches long, 9¾ inches high.

IGNITION:—**Coil 534-Z.** Lock coil type with ignition switch in base. Coil is mounted on back of instrument panel at extreme left. Ignition current is of instrument panel. Ignition current .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 661-F (CH), 661-E (CL). Single breaker arm, 8-lobe cam type with semi-automatic advance (manual advance set in timing and not controllable by driver). No synchronization necessary. Breaker gap set at .020 inch. Hold within limits of .017-.022 inch. To set gap, loosen lock screw on stationary contact mounting plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 19-23 ounces (measured directly behind contacts with spring scale at right angles to back of breaker arm). Maximum manual advance 25 degrees (engine).

Cam Angles—Closed 31°, open 14° (distributor degrees).

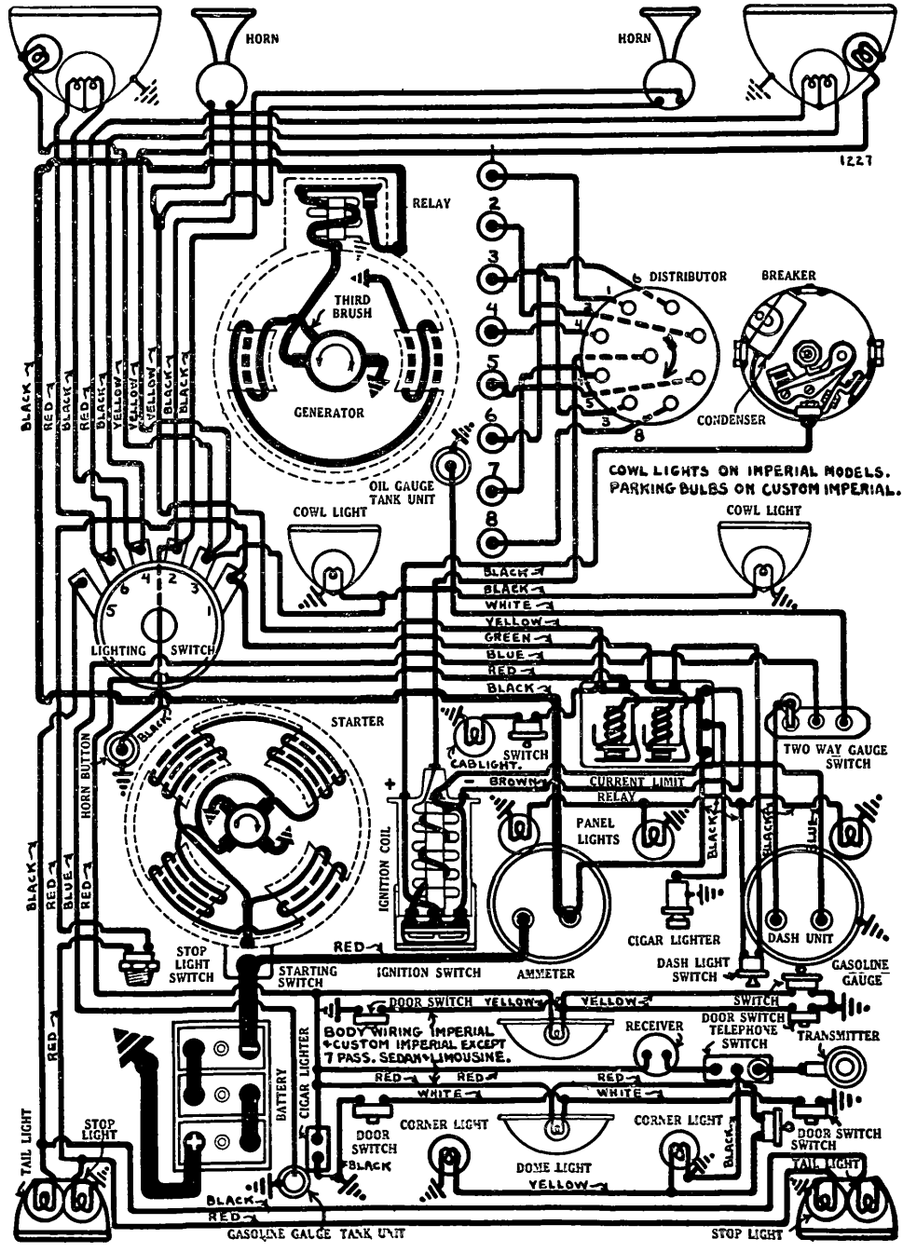
Distributor Degrees	Automatic Advance R.P.M.	Degrees	Engine R.P.M.
Start	400	2	800
10	1250	20	2500

Mounting:—Distributor mounted on cylinder head at right of engine. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light oil in wick oiler in center of shaft. Apply thin film vaseline to face of breaker cam.

Timing:—Standard setting all engines .038 inch (piston travel) before top dead center. To set timing, remove ⅛ inch pipe plug in cylinder head directly over No. 8 piston, install regular Chrysler timing gauge, set gauge dial at '0' with piston on top dead center. With No. 1 piston on compression stroke, turn engine over until gauge dial indicates piston is .038 inch before top dead center, loosen advance arm clamp bolt, rotate distributor until contacts begin to open (use test lamp), tighten clamping bolt, connect spark plugs as indicated on diagram.



Synchronization of Contacts. No synchronization necessary.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator. Distributor Model 661-F side outlet type with spark plug cable connections as shown. Model 661-E connected as shown on Chrysler Eight diagram (previous page).

Spark Plugs:—14 MM. Metric. A.C. Type K-12. Set gaps at .028 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Lgth.	Seat Angle	Lift
Intake	1 23/32" (1 9/16" clear)	.340-.341"	6 9/16"	45	5/16"
Exhaust	1 21/32" (1 7/16" clear)	.340-.341"	6 9/16"	45°	5/16"

CHRYSLER

SERIAL NOS. (CH) 7,900,001 UP, (CL) 7,803,301 UP
PRODUCTION STARTED JANUARY, 1932
DELCO-REMY SYSTEM

Tappet Clearance

	Operating	Timing
Intake	.005" (hot	.008" (cold)
Exhaust	.007" (hot)	.009" (cold)

Spring Pressure

Closed .....50-55 pounds (2¾")
Open .....80-85 pounds (2 7/16")

NOTE:—Do not compress valve springs to over-all length of less than 2⅛" to avoid possible damage through springs taking on permanent set. Valve stem clearance in guide .001-.003" (intake), .002-.004" (exhaust).

Timing

Intake valves open 6° after top dead center with piston .017" down on intake stroke. Intake valves close 46° after lower dead center.

Exhaust valves open 42° before lower dead center. Exhaust valves close 8° after top dead center with piston .030" down on intake stroke.

To Check Valve Timing. Take out ⅛ inch pipe plug in cylinder head directly over No. 8 piston, install regular Chrysler timing gauge, set gauge dial at '0' with piston on top dead center, set tappet clearance No. 1 intake valve at .008 inch, No. 1 exhaust valve at .009 inch. Turn engine over until No. 8 piston on compression stroke is .017 inch past top dead center. No. 1 intake valve should begin to open at this point. Turn crankshaft 2° and stop with gauge reading of .030 inch past top dead center. No. 1 exhaust valve should close at this point. Reset tappet clearance at .005 inch (intake) and .007 inch (exhaust) with engine hot.

To Set Valve Timing. Use gauge rod and turn crankshaft to top dead center position pistons Nos. 1 and 8. Turn camshaft until mark on camshaft sprocket is directly opposite mark on crankshaft sprocket with both marks in line with a straightedge across the shaft centers. Mesh chain. Camshaft sprocket mounting cap screws offset so that sprocket can only be mounted in one position.

Valve Grinding. Intake valves chrome nickel steel. Exhaust valves CNS steel. Manufacturer recommends that valves be refaced in valve grinder and then lapped in in cylinder block with compound.

STARTER:—Model 728-L (CH), 728-S (CL). Manual pinion engagement connected to starting switch lever (switch mounted on starter field frame). Starter drives through reduction gears and over running clutch. Rotation clockwise (armature shaft) at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
28 "	Lock	3.0	600

Mounting:—Starter sleeve mounted in front of flywheel housing at left of engine. To remove, disconnect cable, disconnect starting pedal linkage, take out large pilot mounting screw in flywheel housing directly above starter sleeve, pull starter forward to clear drive housing, lift out.

Oiling:—2000 Miles. Put 8-10 drops light oil in oiler at each end of armature shaft.

10,000 Miles. Take out plug in reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 957-G (CH), 957-U (CL). Third brush regulation. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten lock screw. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes maximum charge to battery at 20 M.P.H. with all lights on (headlights bright) or 10 amperes on cars equipped with radio.

Generator Data

Cold Test Amperes	Cold Test Volts	Cold Test R.P.M.	Hot Test Amperes	Hot Test Volts	Hot Test R.P.M.
17-19	7.9-8.1	1700	13-15	7.7-8.0	1800-2000

Brush spring tension 24-28 ounces. Shunt field current 1.75-2.25 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove, disconnect lead, take out adjustment clamp bolt, loosen mounting bolts, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt. Attach spring scale by wire looped over generator field frame so that force on scale is tangent to top of generator and parallel to slot in adjustment arm. Pull generator away from engine until scale reading is 45-50 pounds, tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Fill oiler at each end of generator with light oil.

RELAY:—Model 265-B. Relay mounted on generator field frame. Relay contacts close at 600 R.P.M. of generator when voltage reaches 7.0-7.5 volts and open with discharge current of 0-2.5 amperes. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9271. Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. Cowl lights used on Model CH or parking bulbs (in headlights) on Model CL. Lighting switch positions:

1. Vertical—All lights off.
2. Right—Cowl lights (or parking bulbs) on, tail lights on.
3. No. 1 Left—Bright headlights and taillights on. Cowl lights off.
4. No. 2 Left—Dim (depressed beam) headlights and tail lights on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Cowl or Parking Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	15	S.C.	87
Corner Lights	6-8	3	S.C.	63

CURRENT LIMIT RELAY:—Model 410-H. Mounted on dash, consists of two vibrating circuit breakers. Circuit breakers begin to vibrate with current load of 25-30 amperes limiting load to 2-15 amperes with direct short-circuit. Contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring tension 5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

GASOLINE GAUGE:—Combination gasoline and oil gauge. Gasoline gauge registers whenever ignition is turned on. Oil reading obtained by pressing selector switch button under instrument board. Gauge is electrical type. Motometer design (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer 'vapor tension' type (see Equipment Section).

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

HORNS:—Klaxon Model K-26 matched tone twin horns Type 1397 (low note), Type 1398 (high note). Current draw 6.0-8.5 amperes at 6 volts (Type 1397), 5.0-6.5 amperes at 6 volts (Type 1398).

CHRYSLER

SIX CYLINDER MODEL CO (1933), SERIAL NUMBERS 6,576,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post .

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block between No. 1 and No. 2 cylinders.

ENGINE:—Six cylinder, 'L' head type, 3¼x4½" bore and stroke, 223.98 cubic inch displacement, rated at 25.35 H.P., develops 83 H.P. at 3400 R.P.M. (standard compression Silver Dome head engine), or 89 H.P. at 3400 R.P.M. (optional high compression Red Head engine). Standard compression ratio (Silver Dome head), 5.35-1. Optional high compression ratio (Red Heads), 6.2-1. Special spark plugs and ignition setting used for Red Head engines (see Timing).

BATTERY:—Willard, Type WS-2-15, 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate). Starting capacity 122 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded on left hand rear corner of transmission.
Mounting:—In cradle on left hand side of frame under driver's seat.
Dimensions:—Width, 7 1/16". Length, 10 5/16". Height, 8 13/16".

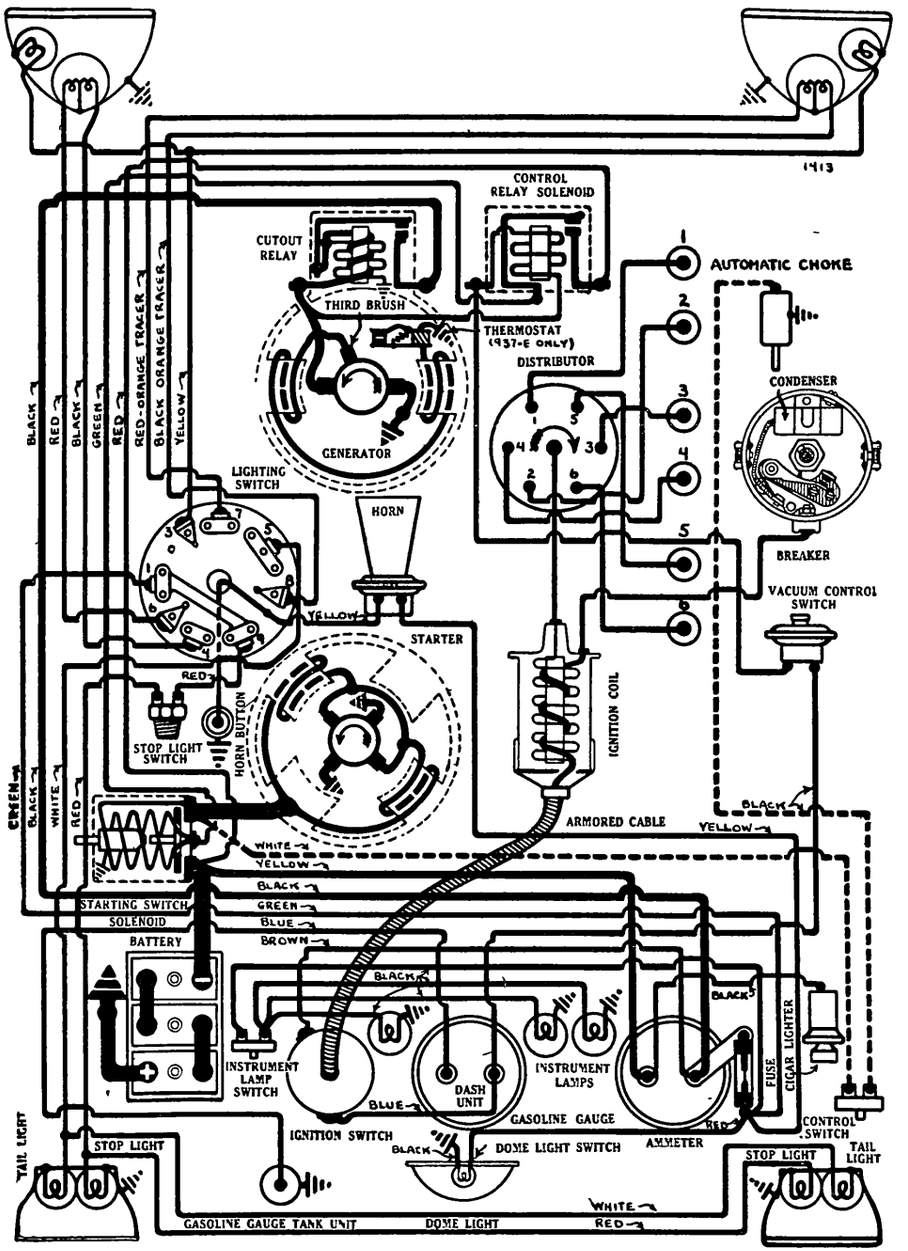
IGNITION:—Coil Model 537-U, 538-K, L. Mounted on dash and connected to ignition switch through armored cable (primary lead).
Ignition Current:—.5-1.5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).
Ignition Switch:—Unit with coil. Switch mounted on instrument panel and connected to coil by armored cable. Gasoline gauge and starter control solenoid circuit connected to ignition switch and operative only with switch turned 'on'.

Distributor Model 622-C (first cars), 644-L (later cars). Single breaker, 6 lobe cam, full automatic advance type. Condenser mounted on breaker plate. Contacts are adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.
Breaker Gap:—Set at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm.
Cam Angles—Closed 36°, open 24° (distributor degrees).

Automatic Advance—Model 622-C

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	2		800
8		1300	16		2600

Automatic Advance—Model 644-L



Start		250	2		500
7		400	14		800
13		1100	26		2200

Mounting:—Distributor mounted at left center of crankcase and driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift out.
Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with medium cup grease.
2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light engine oil in wick oiler in center of shaft, oil breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard settings for all engines as follows:

Engine Type	Distributor Type	Flywheel Degrees	Piston Travel
Silver Dome Head	622-C	10° before TDC	.043"
Silver Dome Head	644-L	At top dead center	TDC.
Red Head Engine	622-C	8° before TDC	.027"
Red Head Engine	644-L	5° after TDC	.011"

To Set Ignition Timing. First remove cover plate over inspection hole in left front face of flywheel housing below starter. With No. 1 piston on compression stroke turn engine over until flywheel mark 'D/C' is directly opposite ignition pointer (where setting is before top dead center this will be above the dead center pointer) or opposite the dead center pointer when setting is at top dead center. Then loosen clamp bolt in advance plate, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.
Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.
Spark Plugs:—14 MM. Metric. A.C. Type K-12 (standard compression Silver

CHRYSLER

SIX CYLINDER MODEL CO (1933), SERIAL NUMBERS 6,576,001 UP
DELCO-REMY SYSTEM

Dome engines), Type K-10 (high compression Red Head engines). Set spark plug gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked. To set timing, turn crankshaft so that pistons Nos. 1 and 6 are on top dead center with flywheel mark 'D/C' at indicator. Mesh sprockets in chain so that marks on sprockets are adjacent and in line with a straightedge laid across the shaft centers. Camshaft mounting cap screws are offset so that camshaft sprocket can only be mounted in correct position.

To Check Valve Timing. Take out ⅛ inch pipe plug in cylinder head directly over No. 6 cylinder and install regular Chrysler Timing Gauge. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 cylinder valves at .011" (intake), .012" (exhaust). Turn engine over one complete revolution and stop when gauge indicates piston is .013" past top dead center. No. 1 intake valve should open at this point. Turn engine over 2° more and stop when gauge reading is .030". No. 1 exhaust valve should close at this point. Reset tappet clearance at .005" (intake), .007" (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 17/32" (1⅜" clear)	11/32"	45°	5/16"
Exhaust	1 15/32" (1 5/16" clear)	11/32"	45°	5/16"

Tappet Clearance		Valve Springs
	Operating	Timing	
Intake	.005" (hot)	.011" (cold)	Closed—40-44 pounds—2 1/16"
Exhaust	.007" (hot)	.012" (cold)	Compression Limit—1¾"

Intake Valves	Timing	Exhaust Valves
Open—6° after top dead center		Open—42° before lower dead center
Close—46° after lower dead center		Close—8° after top dead center

Valve Grinding:—Valve material chrome nickel steel (intake valves), silchrome steel (exhaust valves). Special alloy exhaust valve seat inserts are used in the cylinder block. Valves should be refaced on valve grinder and then lapped in block. Ordinary reseating tool cannot be used on exhaust valve inserts and these must be ground when necessary. Install valves with .001-.003" stem clearance in guides (intake valves), .003-.005" (exhaust valves). Valve stem guides are removable.

CARBURETION:—Stromberg Downdraft Carburetor, Model EX-32 (see Carburetor Section for complete data). Manifold heat control is automatic. Choke is controlled manually by button on dash (Sisson Automatic Choke is optional—see Carburetor Section).

Air Cleaner:—Oil-wetted wire mesh type integral with silencer. Remove complete unit from engine at 2000 mile intervals or oftener, clean by dipping wire mesh end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type mounted at right of engine and driven by an eccentric on the camshaft. Remove glass sediment bowl at three-month intervals, empty water and sediment, clean filter screen, located directly above bowl before reassembling (see Carburetion Section).

Gasoline Gauge:—Motometer electric type (see Carburetion Section).

STARTER:—Model 734-L, R, Model 727-B (R.H.D.). Starter drive, overrunning clutch and mechanical pinion shift operated by solenoid mounted on starter (734-R, 727-B) or directly by accelerator pedal through Type 1550 selector switch (734-L on first cars only). See Equipment Section for complete data on both types. Rotation is counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data—Model 734-L, R

Torque	R.P.M.	Volts	Amperes
0 lb ft	5000	5.0	65
12 "	Lock	3.63	475

Starter Data—Model 727-B

0 lb. ft.	5500	5.0	65
15 "	Lock	3.0	600

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect all wires on solenoid, take out flange mounting cap screws, pull starter forward to clear pinion housing, lift out.

Oiling:—6000 Miles. Put 8-10 drops light engine oil in commutator end oiler and oil connections of pinion shifting linkage.

GENERATOR:—Model 943-S, 937-D (RHD.) (first), 937-D J, L (later), 937-E, F (with radio). Third brush regulation, thermostat control (937-E, F, L). Thermostat contacts open at 175°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (943-S, 937-D), 10 amperes (937-E) maximum charge to battery as indicated on dash ammeter with all lights on and engine operating at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data—Models 943-S, 937-D, J

	Amperes	Volts	R.P.M.		Amperes	Volts	R.P.M
Cold	15-18	7.9-8.3	2000	Hot	13-15	7.7-8.0	2400

Generator Data—Models 937-E, F, L

Cold	20-22	8.2-8.4	2100	Hot	12-14	7.7-8.0	2800-3000

Brush Spring Tension—24-28 ozs. on all brushes (943-S, 937-D, E, F). 22-26 ozs. (main), 16-20 ozs. (third brush) on Models 937-J, L.

Field Current:—3.5-4.5 amperes at 6 volts across field terminals.

Field Fuse:—6 ampere capacity (943-S after Serial No. 30,000; 937-D after Serial No. 12,000).

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment:—Attach spring scale to generator by wire looped over field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp arm. Loosen adjustment clamp bolt, pull generator away from engine until scale reading is 45-50 pounds, tighten clamp bolt before slacking off on scale.

Oiling:—2000 Miles. Put 8-10 drops light engine oil in oiler at each end.

CUTOUT RELAY:—Model 265-G (943-S, 937-E), 264-D (937-D, F, J, L). Model 264-D has solenoid relay in addition to Cutout Relay in same case and is used on cars with 734-R or 727-B starter. See Equipment Section for complete data on these types. Cutout Relay specifications are identical for both types. Contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025". **Air Gap:**—.012-.017" with contacts closed.

Relay Solenoid:—Contacts close at 3.2 volts max. and will remain closed until battery voltage drops to 2.0 volts or less (when starter is cranking engine). Contacts open when difference in voltage between generator and battery is 2.0 volts or less. Contact gap limits .030-.045". Air gap limits .010-.014" with contacts closed.

LIGHTING:—Clum Switch, Model 9454. Lighting switch mounted at lower end of steering column is controlled by lever on steering wheel. Lighting system uses standard double filament bulbs but switch has special 'passing' position with depressed beam (upper filament) of left hand headlight and driving beam (lower filament) of right hand headlight lighted (see wiring diagram).

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C	1116
Parking Bulbs	6-8	3	S.C	63
Instrument and Tail Lights	6-8	3	S.C	63
Stop Lights	6-8	15	S.C	87
Dome Lights	6-8	15	S.C	87

FUSES:—20 ampere capacity fuse mounted on back of instrument board near ammeter.

HORNS:—Klaxon Model K-31, Type 1364 Vibrator Horn standard equipment. Current draw 4.0-6.5 amperes at 6 volts. Model K-26, Type 1505 (low note), 1506 (high note) matched tone, twin horns are optional. Current draw 6.0-8.5 amperes at 6 volts (Type 1505), 5.0-6.5 amperes at 6 volts (Type 1506).

NOTE:—Twin horns are connected through 20 ampere fuse to battery terminal of starter solenoid switch.

CHRYSLER

ROYAL EIGHT MODEL CT (1933), SERIAL NUMBERS 7,000,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block between No. 1 and No. 2 cylinders.

ENGINE:—Eight cylinder, 'L' head type, 3¼x4⅛" bore and stroke, 273.8 cubic inch displacement, rated at 33.80 H.P., develops 90 H.P. at 3400 R.P.M. (standard compression Silver Dome head engine), or 98 H.P. at 3400 R.P.M. (optional high compression Red Head engine). Standard compression ratio (Silver Dome engines), 5.2-1. Optional high compression ratio (Red Head engines), 6.2-1. Special ignition setting and spark plugs are used for high compression engines (see Timing).

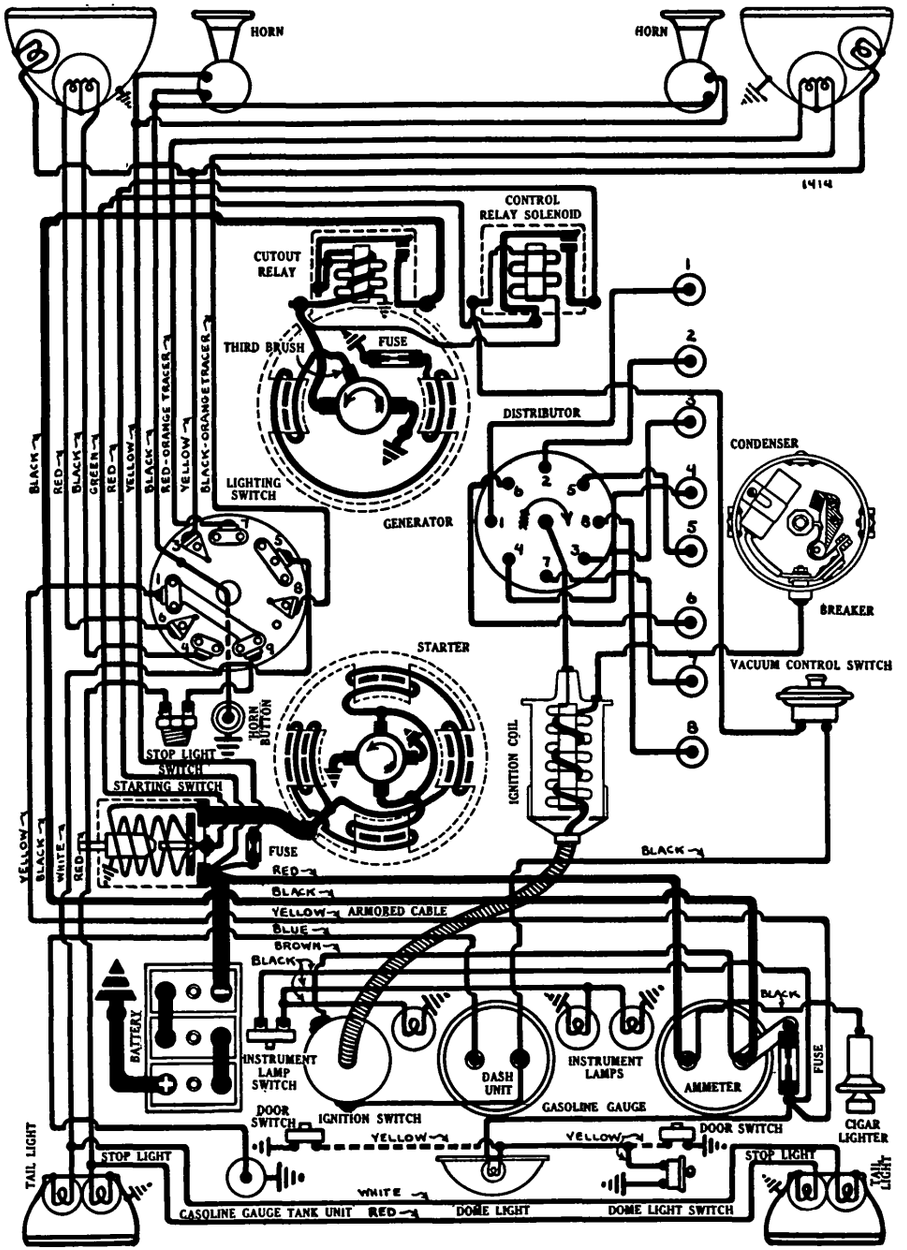
BATTERY:—Willard, Type WH-2-15, 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to transmission cover.
Mounting:—In cradle on left hand side of frame under driver's seat.
Dimensions:—Width, 7 1/16". Length, 10 5/16". Height, 9 5/16".

IGNITION:—Coil Model 537-U, L, M, 538-L, M (RHD.). Coil mounted on dash and connected to ignition switch through armored cable (primary lead).
Ignition Current:—.5-1.5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).
Ignition Switch:—On instrument panel connected to coil by armored cable. Gasoline gauge and starter control solenoid circuit connected to switch and operative only with switch turned 'on'.

Distributor Model 661-R (all cars). Single breaker, 8 lobe cam, full automatic advance type. No synchronization of contacts is necessary. Contact gap adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.
Breaker Gap:—Set contact gap at .018". Hold within limits of .017-.022".
Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm.
Cam Angles—Closed 31°, open 14° (distributor degrees).

Distributor Degrees	Automatic Advance R.P.M.	Engine Degrees	R.P.M.
Start	250	2	500
7	400	14	800
14	1200	28	2400

Mounting:—Distributor mounted at left center of crankcase and driven by inclined shaft from camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.



Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with medium cup grease.
2000 Miles. Take off distributor cap and rotor, put 4-5 drops light engine oil in wick oiler in center of shaft, oil breaker arm pivot pins, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting Silver Dome Engines—2° (flywheel) or .001" (piston travel) before top dead center. **Red Head Engines**—top dead center.

To Set Ignition Timing. First take off cover plate over inspection hole in left hand front face of flywheel housing below starter. With No. 1 piston on compression stroke, turn engine over until flywheel mark 'D/C' is directly opposite ignition pointer in inspection hole with piston .001" before top dead center (Silver Dome engines) or at top dead center (Red Head engines). Then loosen clamp bolt on advance plate, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-12 (Standard Silver Dome engines), Type K-10 (Red Head engines). Set spark plug gaps at .025 inch.

CHRYSLER

ROYAL EIGHT MODEL CT (1933), SERIAL NUMBERS 7,000,001 UP
DELCO-REMY SYSTEM

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. To set timing, with crankshaft turned so that pistons Nos. 1 and 8 are on top dead center with flywheel mark 'D/C' at indicator in inspection hole, mesh chain so that marks on sprockets are adjacent and in line with strightedge laid across shaft centers. Camshaft sprocket bolt holes offset.

To Check Valve Timing. Take out ⅛ inch pipe plug in cylinder head directly over No. 8 piston and install regular Chrysler Timing Gauge. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 cylinder valves at .011″ (intake), .012″ (exhaust). Turn engine over one complete revolution and stop with piston slightly past top dead center (6°) when gauge reads .013″. No. 1 intake valve should open at this point. Turn engine over 2° and stop when gauge reading is .024″. No. 1 exhaust valve should close at this point. Reset tappet clearance at .005″ (intake), .007″ (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 15/32″ (1 5/16″ clear)	11/32″	45°	5/16″
Exhaust	1 13/32″ (1¼″ clear)	11/32″	45°	5/16″

Tappet Clearance

	Operating	Timing
Intake	.005″ (hot)	.011″ (cold)
Exhaust	.007″ (hot)	.012″ (cold)

Valve Springs

Closed—40-44 pounds—2 1/16″
Compression Limits—1¾″

Timing

Intake Valves	Exhaust Valves
Open—6° after top dead center	Open—42° before lower dead center
Close—46° after lower dead center	Close—8° after top dead center

Valve Grinding:—Valves should be refaced on valve grinder and then lapped in block. Special alloy exhaust valve seat inserts are used. These must be ground when necessary as ordinary reseating tools cannot be used. Install valves with .001-.003″ stem clearance in guides (intake valves), .004″ (exhaust valves). Valve stem guides are removable.

CARBURETION:—Stromberg Downdraft Carburetor, Model EX-32 (see Carburetor Section for complete data). Manifold heat control is automatic. Choke is controlled manually by button on dash.

Air Cleaner:—Oil-wetted wire mesh type integral with silencer. Remove complete unit from engine at 2000 mile intervals or oftener, clean by dipping wire mesh end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of heavy engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase and driven by eccentric on camshaft (see Carburetion Section for complete data). Remove glass sediment bowl at three-month intervals, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer electric type (see Carburetion Section).

STARTER:—Model 725-Z, 727-B (R.H.D.). Starter drive, overrunning clutch and mechanical pinion shift operated by solenoid mounted on starter field frame. Solenoid is controlled automatically by vacuum switch connected to throttle linkage and relay solenoid in cut-out relay case on generator (see 'Starter Controls' in Equipment Section for complete data on this equipment). Starter rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	60
15 "	Lock	3.0	600

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect all wires on solenoid, take out flange mounting screws, pull starter straight forward to clear pinion housing, lift out.

Oiling:—5000 Miles. Put 8-10 drops light engine oil in oiler on commutator end. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—Model 937-D, J L (Std.), 937-F (cars with radio). Third brush regulation, thermostat control (937-F only). Thermostat contacts open at 175°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (937-D) or 10 amperes (937-F) maximum charge to battery as shown on dash ammeter with all lights on and engine operated at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data—Models 937-D, J

	Amperes	Volts	R.P.M.		Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000	Hot	13-15	7.7-8.0	2400

Generator Data—Models 937-F, L

Cold	20-22	8.2-8.4	2100	Hot	12-14	7.7-8.0	2800-3000

Brush Spring Tension—24-28 ozs. on all brushes (937-D, F), 22-26 ozs. (main), 16-20 ozs. (third) on Models 937-J, L.

Field Current:—3.4-4.5 amperes at 6 volts across field terminals.

Field Fuse:—6 ampere capacity (after Serial No. 12000).

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment:—Attach spring scale to generator by wire looped over field frame so that force of spring is tangent to top of generator and par allel to slot in adjustment clamp arm. Loosen adjustment clamp bolt, pull generator away from engine until scale reading is 45-50 pounds, tighten clamp bolt before slacking off on scale.

Oiling:—2000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 264-D. On generator. Consists of cut-out relay and special relay solenoid for control of starter operating solenoid. See article in Equipment Section for complete data on relay solenoid. Cut-out relay contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025″. **Air Gap:**—.012-.017″ with contacts closed.

Relay Solenoid:—Contacts close at 3.2 volts max. and will remain closed until battery voltage drops to 2.0 volts or less (when starter is cranking engine). Contacts open when difference in voltage between generator and battery is 2.0 volts or less. Contact gap limits .030-.045″. Air gap limits .010-.014″ with contacts closed.

LIGHTING:—Clum Switch, Model 9454. Lighting switch mounted at lower end of steering column is controlled by lever on steering wheel. Lighting system uses standard double filament bulbs but switch has special 'passing' position with depressed beam (upper filament) of left hand headlight and driving beam (lower filament) of right hand headlight lighted (see wiring diagram).

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116

Instrument and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	15	S.C.	87
Dome Lights	6-8	15	S.C.	87

FUSES:—20 ampere capacity fuse mounted on back of instrument board near ammeter. A second 20 ampere fuse is assembled in a connector in the horn cable (see wiring diagram).

HORNS:—Klaxon, Model K-26, Type 1505 (low note), 1506 (high note), matched tone twin horns are standard. Current draw 6.0-8.5 amperes at 6 volts (Type 1505), 5.0-6.5 amperes at 6 volts (Type 1506).

CHRYSLER

IMPERIAL EIGHT MODEL CQ (1933), SERIAL NUMBERS 7,529,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right hand front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block between No. 1 and No. 2 cylinders.

ENGINE:—Eight cylinder, 'L' head type, 3¼x4½" bore and stroke, 298.6 cubic inch displacement, rated at 33.80 H.P., develops 108 H.P. at 3400 R.P.M. (Standard Red Head Engine), or 100 H.P. at 3400 R.P.M. (optional Silver Dome head engine). Standard compression ratio (Red Head engine), 6.2-1. Optional low compression ratio (Silver Dome head engine), 5.2-1. Special spark plugs and ignition settings are used for each engine (see Timing).

BATTERY:—Willard, Type WS-4-17, 6 volt, 17 plate, 115 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to transmission.
Mounting:—In cradle on left hand side of frame under driver's seat.
Dimensions:—Width, 7 1/16". Length, 11 11/16". Height, 8 13/16".

IGNITION:—Coil Model 537-U, 538-U (Std.), 537-M, 538-M (RHD.). Coil mounted on dash and connected to switch by armored cable.
Ignition Current:—.5-1.5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).
Ignition Switch:—Unit with coil. Gasoline gauge and starter solenoid control circuit connected to switch and operative only with ignition turned 'on'.
Distributor Model 661-G (first cars), 661-T (later cars). Single breaker, 8 lobe cam, full automatic advance type. No synchronization of contacts is necessary. Contact gap adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.
Breaker Gap:—Set contact gap at .018". Hold within limits of .017-.022".
Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm.
Cam Angles—Closed 31°. Open 14° (distributor degrees).

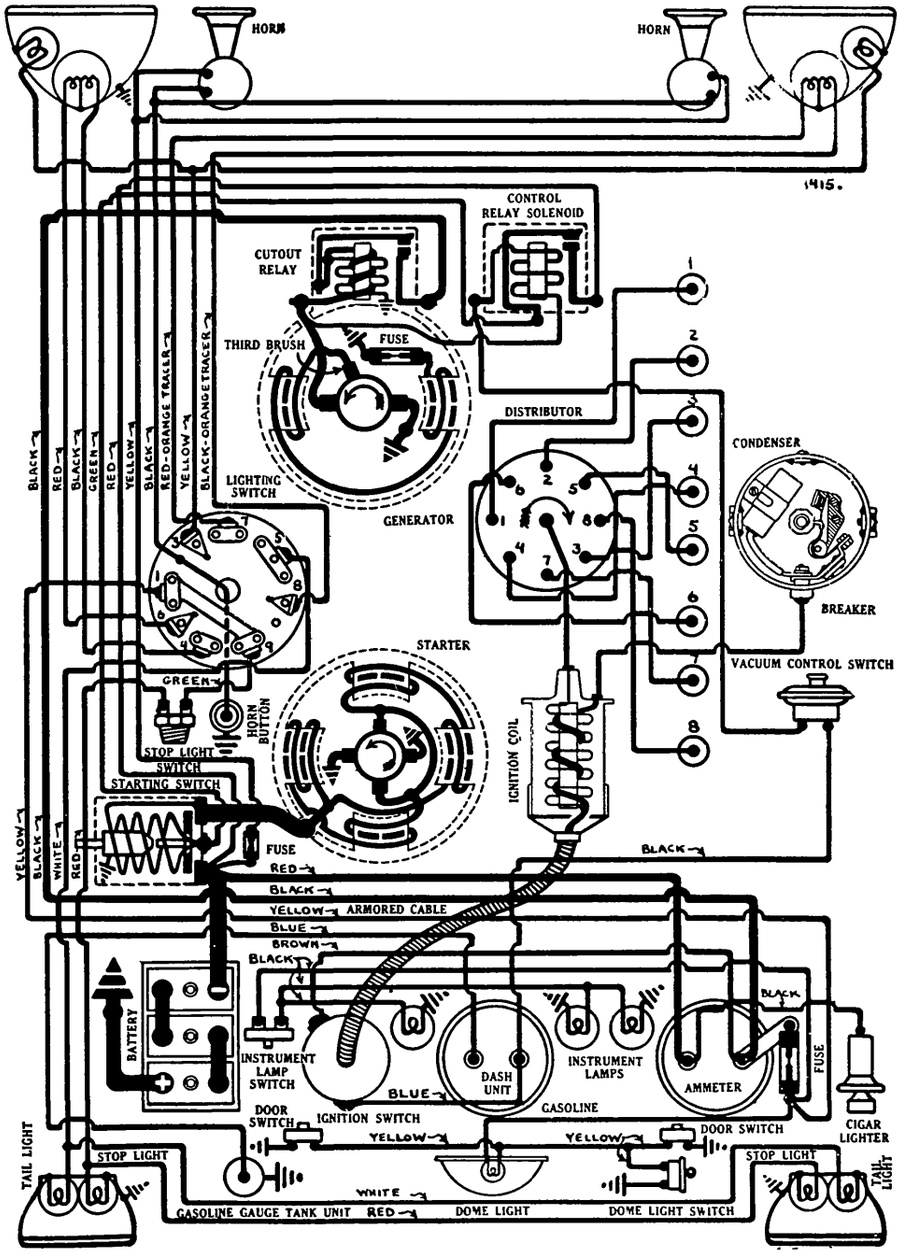
Automatic Advance—Model 661-G

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	400	2	800
7	1300	14	2600

Automatic Advance—Model 661-T

Start	250	4	500
7	400	14	800
13	1500	26	3000

Mounting:—Distributor mounted at left center of crankcase and driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.
Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with medium cup grease.
2000 Miles. Take off distributor cap and rotor, put 4-5 drops light engine oil in wick oiler in center of shaft, oil breaker arm pivot pins, apply thin film of vaseline to face of breaker cam.



IGNITION TIMING:—Special ignition settings are used for both Silver Dome and Red Head engines equipped with each type distributor as indicated in following table:

Engine Type	Distributor	Ignition Setting
Red Head Engine	661-G	.021" (piston) before top dead center
Silver Dome Engine	661-G	.043" (piston) before top dead center
Red Head Engine	661-T	.002" (piston) after top dead center
Silver Dome Engine	661-T	At top dead center.

To Set Ignition Timing:—First take off cover plate over inspection hole in left hand front face of flywheel housing below starter. With piston No. 1 on compression stroke, turn engine over by hand until flywheel mark 'D/C' is directly opposite ignition pointer in inspection hole (see above table—pointers are marked, no ignition pointer is provided where setting is on top dead center and dead center pointer should be used). Then loosen clamp bolt in advance plate, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-10 (Standard Red Head engine), Type K-12 (optional Silver Dome head engine). Set spark plug gaps at .025".

CHRYSLER

IMPERIAL EIGHT MODEL CQ (1933), SERIAL NUMBERS 7,529,001 UP
DELCO-REMY SYSTEM

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 8 are on top dead center with flywheel mark 'D/C' at indicator, mesh chain so that marks on sprockets are adjacent and in line with a straightedge laid across the shaft centers. Camshaft sprocket mounting holes are offset so that sprocket can only be mounted in correct position.

To Check Valve Timing. Take out ⅛ inch pipe plug in cylinder head directly over No. 8 piston and install regular Chrysler Timing Gauge. With piston No. 1 on top dead center entering power stroke, set tappet clearance of No. 1 cylinder valves at .011″ (intake), .012″ (exhaust). Turn engine over one complete revolution and stop with piston slightly past top dead center when gauge reading is .015″. No. 1 intake valve should open at this point. Turn engine over 2° and stop when gauge reading is .027″. No. 1 exhaust valve should close at this point. Reset tappet clearance at .005″ (intake), .007″ (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 15/32″ (1 5/16″ clear)	11/32″	45°	5/16″
Exhaust	1 13/32″ (1¼″ clear)	11/32″	45°	5/16″

Tappet Clearance

	Operating	Timing
Intake	.005″ (hot)	.011″ (cold)
Exhaust	.007″ (hot)	.012″ (cold)

Valve Springs

Closed—40-44 pounds—2 1/16″
Compression Limit—1¾″

Timing

Intake Valve	Exhaust Valves
Open—6° after top dead center	Open—42° before lower dead center
Close—46° after lower dead center	Close—8° after top dead center

Valve Grinding:—Valves should be refaced on valve grinder and then lapped in block. Special alloy exhaust valve seat inserts are used. These must be ground when necessary as ordinary reseating tool cannot be used on them. Install valves with .001-.003″ stem clearance in guides (intake valves), .003-.005″ (exhaust valves). Valve stem guides are removable.

CARBURETION:—Stromberg Carburetor, Model EX-32 (see Carburetor Section for complete data). Manifold heat control is automatic. Choke is controlled manually by button on instrument panel.

Air Cleaner:—Oil-wetter wire mesh type integral with silencer. Remove complete unit at 2000-mile intervals or oftener, clean wire mesh by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of heavy engine oil, drain before reassembling.

Fuel Pump:—A.C. Combination Fuel Pump and Vacuum Pump (windshield wiper booster)—see Carburetion Section for complete data. Remove glass sediment bowl under pump at three-month intervals, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer electric type (see Carburetion Section).

STARTER:—Model 725-Z, 727-B (R.H.D.). Starter drive, overrunning clutch and mechanical pinion shift operated by solenoid mounted on starter field frame. Solenoid is controlled automatically by vacuum switch connected to throttle linkage and relay solenoid in cut-out relay case on generator (see 'Starter Controls' in Equipment Section for complete data on this equipment). Starter rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	60
15 "	Lock	3.0	600

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect all wires on solenoid, take out flange mounting screws, pull starter straight forward to clear pinion housing, lift out.

Oiling:—5000 Miles. Put 8-10 drops light engine oil in oiler on commutator end. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—Models 937-D, J, L (Std.), 937-F (cars with radio). Third brush regulation, thermostat control (937-F only). Thermostat contacts open at 175°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (937-D) or 10 amperes (937-F) maximum charge to battery as shown on dash ammeter with all lights on and engine operated at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Brush Spring Tension—24-28 ozs. (all brushes) on Models 937-D, F, 22-26 ozs. (main), 16-20 ozs. (third) on Models 937-J, L.

Field Current:—3.4-4.5 amperes at 6 volts across field terminals.

Field Fuse:—6 ampere capacity (after Serial No. 12000).

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment:—Attach spring scale to generator by wire looped over field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp arm. Loosen adjustment clamp bolt, pull generator away from engine until scale reading is 45-50 pounds, tighten clamp bolt before slacking off on scale.

Oiling:—2000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 264-D. On generator field frame. Consists of cut-out relay and special relay solenoid for control of starter operating solenoid. See article in Equipment Section for complete data on relay solenoid. Cut-out relay contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025″. **Air Gap:**—.012-.017″ with contacts closed.

Relay Solenoid:—Contacts close at 3.2 volts max. and will remain closed until battery voltage drops to 2.0 volts or less (when starter is cranking engine). Contacts open when difference in voltage between generator and battery is 2.0 volts or less. Contact gap limits .030-.045″. Air gap limits .010-.014″ with contacts closed.

LIGHTING:—Clum Switch, Model 9454. Lighting switch mounted at lower end of steering column is controlled by lever on steering wheel. Lighting system uses standard double filament bulbs but switch has special 'passing' position with depressed beam (upper filament) of left hand headlight and driving beam (lower filament) of right hand headlight lighted (see wiring diagram).

FUSES:—20 ampere capacity fuse mounted on back of instrument board near ammeter. A second 20 ampere fuse is assembled in a connector in the horn cable (see wiring diagram).

HORNS:—Klaxon, Model K-26, Type 1505 (low note), 1506 (high note), matched tone twin horns are standard. Current draw 6.0-8.5 amperes at 6 volts (Type 1505), 5.0-6.5 amperes at 6 volts (Type 1506).

CHRYSLER

CUSTOM IMPERIAL EIGHT, MODEL CL* (1933)
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right hand front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block directly above water jacket cover between Nos. 1 and 2 cylinders.

ENGINE:—Eight cylinder, 'L' head type, 3½x5" bore and stroke, 384.84 cubic inch displacement, rated at 39.2 H.P., develops 135 H.P. at 3200 R.P.M. (standard compression Red Head engine), or 125 H.P. at 3400 R.P.M. (optional low compression Silver Dome engine). Standard compression ratio (Red Head engine) 5.8-1. Optional low compression ratio (Silver Dome engine) 5.2-1. Distinct ignition settings and spark plugs are used for each type engine and with each type distributor (see Timing).

BATTERY:—Willard, Type WH-5-19, 6 volt, 17 plate, 153 ampere hour capacity (20 hour rate). Starting capacity 180 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to engine.

Mounting:—In cradle on outside of right hand frame side rail under right front fender.

Dimensions:—Width, 7 1/16". Length, 13". Height, 9¾".

IGNITION:—Coil Model 534-R. Lock coil type with ignition switch in base. Coil mounted on back of instrument board at extreme left.

Ignition Current:—.5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Ignition Switch:—Located in base of coil. Gasoline gauge and starter coincidental control are connected to accessory terminal on coil and are operative only with ignition switch turned on.

Distributor Model 661-F (first cars), 661-U (later cars). Single breaker, 8-lobe cam, full automatic advance type (distributor fitted with manual advance of 25° (engine) but this is set in timing distributor and no means is provided for manually advancing or retarding distributor in service). No synchronization is required.

Breaker Gap:—Set contact gap at .018". Hold within limits of .017-.022".

Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm.

Cam Angles—Closed 31°, open 14° (distributor degrees).

Automatic Advance—Model 661-F

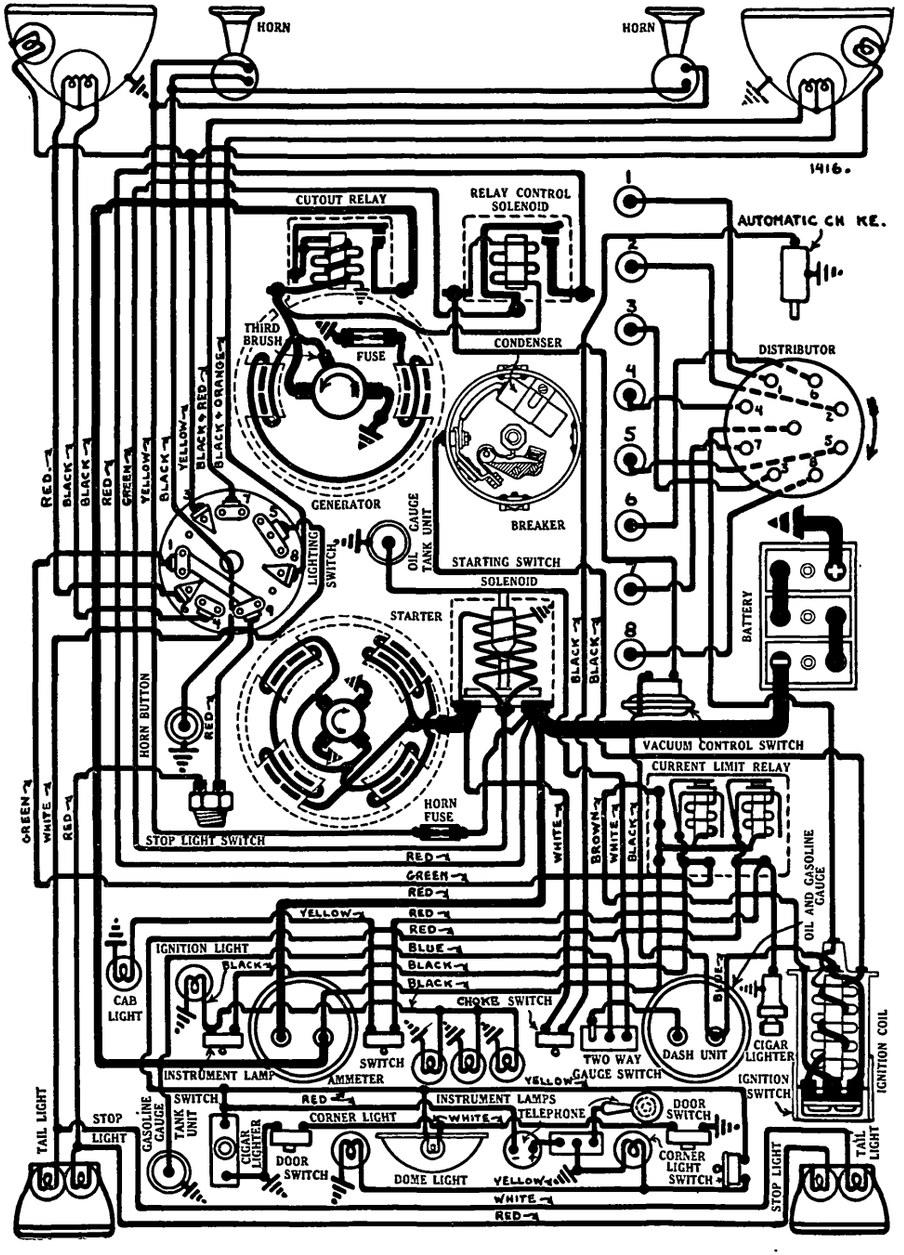
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		200	2		400
10		1250	20		2500

Automatic Advance—Model 661-U

Start		250	2		500
7		400	14		800
16		1400	32		2800

Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with short-fibre cup grease.



2000 Miles. Take off distributor cap and rotor, put 4-5 drops light engine oil in wick oiler in center of shaft, put one drop oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard settings for Red Head and Silver Dome engines with each type distributor are as follows:

Engine Type	Distributor Type	Ignition Setting
Red Head Engine	661-F	.038" before top dead center
Silver Dome Engine	661-F	.038" before top dead center
Red Head Engine	661-U	.004" after top dead center.
Silver Dome Engine	661-U	At top dead center.

To Set Ignition Timing. Take out ⅛-inch pipe plug in cylinder head directly over No. 8 piston and install regular Chrysler timing gauge. With No. 1 piston on compression stroke, turn engine over until piston reaches firing position with gauge reading as indicated in above table for the particular type engine. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

CHRYSLER

CUSTOM IMPERIAL EIGHT, MODEL CL* (1933)
DELCO-REMY SYSTEM

Spark Plugs:—14 MM. Metric. A.C. Type K-10 (Standard Red Head engines) or Type K-12 (optional Silver Dome engine). Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven from the crankshaft by a two-sprocket non-adjustable chain drive. Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 8 are on top dead center, mesh sprockets in chain so that marks on sprockets are adjacent and in line with a straightedge laid across the shaft centers. Camshaft sprocket cap screws are offset so that sprocket can only be mounted in correct position.

To Check Valve Timing. Take out ⅛-inch pipe plug in cylinder head over No. 8 piston and install regular Chrysler Timing Gauge. Set tappet clearance of No. 1 cylinder valves at .008″ (intake), .009″ (exhaust) with engine cold. With No. 8 piston on compression stroke, turn engine over until piston is slightly past top dead center and stop when gauge reading is .017″. No. 1 intake valve should open at this point. Turn engine over 2° and stop with gauge reading of .030″. No. 1 exhaust valve should close at this point. Reset tappet clearance at .005″ (intake), .007″ (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 23/32″ (1 9/16″ clear)	11/32″	45°	5/16″
Exhaust	1 21/32″ (1 7/16″ clear)	11/32″	45°	5/16″

Tappet Clearance

	Operating	Timing
Intake	.005″ (hot)	.008″ (cold)
Exhaust	.007″ (hot)	.009″ (cold)

Valve Springs

Closed .....50-55 pounds—2¾″.
Compression Limits.....2⅛″.

Timing

Intake Valves	Exhaust Valves
Open—6° after top dead center.	Open—42° before lower dead center.
Close—46° after lower dead center.	Close—8° after top dead center.

Valve Grinding. Valves should be refaced on a valve grinder and then lapped in the cylinder block. Ordinary reseating tool cannot be used on these inserts and they must be ground when necessary. Install valves with .001-.003″ (intake), .002-.004″ (exhaust) stem clearance in guides. Valve stem guides are removable.

CARBURETION:—Stromberg Downdraft Carburetor Model EE-3 (see Carburetion Section for complete data). A Sisson Automatic Choke is standard equipment. Manifold heat control is automatic.

Air Cleaner:—Oil-wetted wire mesh type integral with silencer. Remove complete unit at 2000-mile intervals, clean by dipping cleaner end in pan of gasoline, dry thoroughly, re-oil by dipping in No. 50 engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type combination fuel and vacuum pump mounted on right hand side of crankcase (see Carburetion Section). Remove glass sediment bowl under pump at three-month intervals, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer electric combination gasoline and oil gauge (see Carburetion Section). Gasoline gauge registers with ignition turned on. Oil reading is obtained by depressing button of selector switch at lower edge of instrument board.

STARTER:—Model 728-T. Starter drive—Through reduction gears, overrunning clutch, and mechanical pinion shift operated by solenoid mounted on starter field frame. Solenoid is controlled automatically by vacuum switch connected to throttle linkage and relay-solenoid mounted on generator (see 'Starter Controls' in Equipment Section for complete data on this equipment). Starter rotation clockwise (armature shaft) at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
28 "	Lock	3.0	600

Mounting:—Sleeve mounted on left hand front face of flywheel housing. To remove, disconnect cable and solenoid leads, loosen lock nut and take out large pilot mounting screw in flywheel housing directly above starter sleeve, Pull starter forward to clear pinion housing, lift out.

Oiling:—6000 Miles. Put 8-10 drops light engine oil in oiler at each end.
10,000 Miles. Take out grease plug in reduction gear case, repack gears with graphite grease.

GENERATOR:—Model 967-A. Third brush regulation. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (10 amperes on cars with radio) maximum charge to battery as indicated on dash ammeter with all lights on and engine operated at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
17-19	7.9-8.1	1700	13-15	7.7-8.0	1800-2000

Brush Spring Tension:—24-28 ounces on each brush.
Field Current:—1.75-2.25 amperes at 6 volts across field terminals.
Field Fuse:—6 ampere capacity (after Serial No. 200).

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect leads, loosen adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two mounting bolts under generator forming bracket hinge, lift generator out.

Belt Adjustment. Attach spring scale by wire looped over generator field frame so that force of scale is tangent to top of generator and parallel to slot in adjustment arm. Pull generator away from engine until scale reading is 45-50 pounds, tighten adjustment clamp bolt before slacking off on scale.

Oiling:—2000 Miles. Fill oilers at each end with light engine oil.

RELAY:—Model 264-F. On generator field frame. Consists of cut-out relay and special relay solenoid for control of starter pinion operating solenoid (see article in Equipment Section for complete data on relay solenoid). Cut-out relay contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.
Contact Gap:—.015-.025″. **Air Gap:**—.012-.017″ with contacts closed.
Relay Solenoid:—Contacts close at 3.2 volts max. and will remain closed until battery voltage drops to 2.0 volts or less (when starter is cranking engine). Contacts open when difference in voltage between generator and battery is 2.0 volts or less. Contact gap limits .030-.045″. Air gap limits .010-.014″ with contacts closed.

LIGHTING:—Clum Switch, Model 9454. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system uses standard double filament bulbs but switch has special 'passing' position with upper filament (depressed beam) of left hand headlight and lower filament (driving beam) of right hand headlight lighted (see wiring diagram).

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116
Parking Bulbs	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Lights	6-8	15	S.C.	87

CURRENT LIMIT RELAY:—Model 410-H. Consists of two vibrating circuit breakers mounted on the dash. Circuit breakers begin to operate with current load of 25-30 amperes limiting load to 2-15 amperes with direct short-circuit.
Contact Gap:—.012-.030″. **Air Gap:**—.015-.025″ with contacts closed.
Spring Tension:—5 ounces minimum measured at brass button with spring scale at right angles to contact arm.

HORNS:—Klaxon Model K-26, Type 1505 (low note), Type 1506 (high note). Vibrator type matched tone twin horns. Current draw 6.0-8.5 amperes at 6.0 volts (Type 1505), 5.0-6.5 amperes at 6.0 volts (Type 1506).

FUSES:—Horn. 20 ampere in horn lead near starter solenoid.

SERIAL NUMBER:—First number (CA) 6,650,001, (CB) 6,700,001. On right front door hinge pillar post.

COMPRESSION:—Ratio—5.4-1 std. cast-iron head. 6.2-1 optl. aluminum head.
Pressure—Approximately 94 lbs. (std. head), 106 lbs. (optl. head) at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling.

IGNITION:—Coil Model 540-J, K (540-H Exp.) . Ignition switch is part of coil assembly.
Ignition Switch—Delco-Remy Model 432-J (540-J), 432-K (540-K), 432-H (540-H).

Distributor Model 644-U (644-W Export). Single breaker, 6 lobe cam, full automatic advance type. Manual advance (at distributor), 20° (engine).

Breaker Gap—Set gap at .020". Limits, .018-.024".

Breaker Arm Spring Tension—19-23 ounces (behind contacts).

Cam Angles (Distributor Degrees) — Closed 36°. Open 24°.

Automatic Advance—Model 644-U

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	1	500
7	400	14	800
15	1400	30	2800

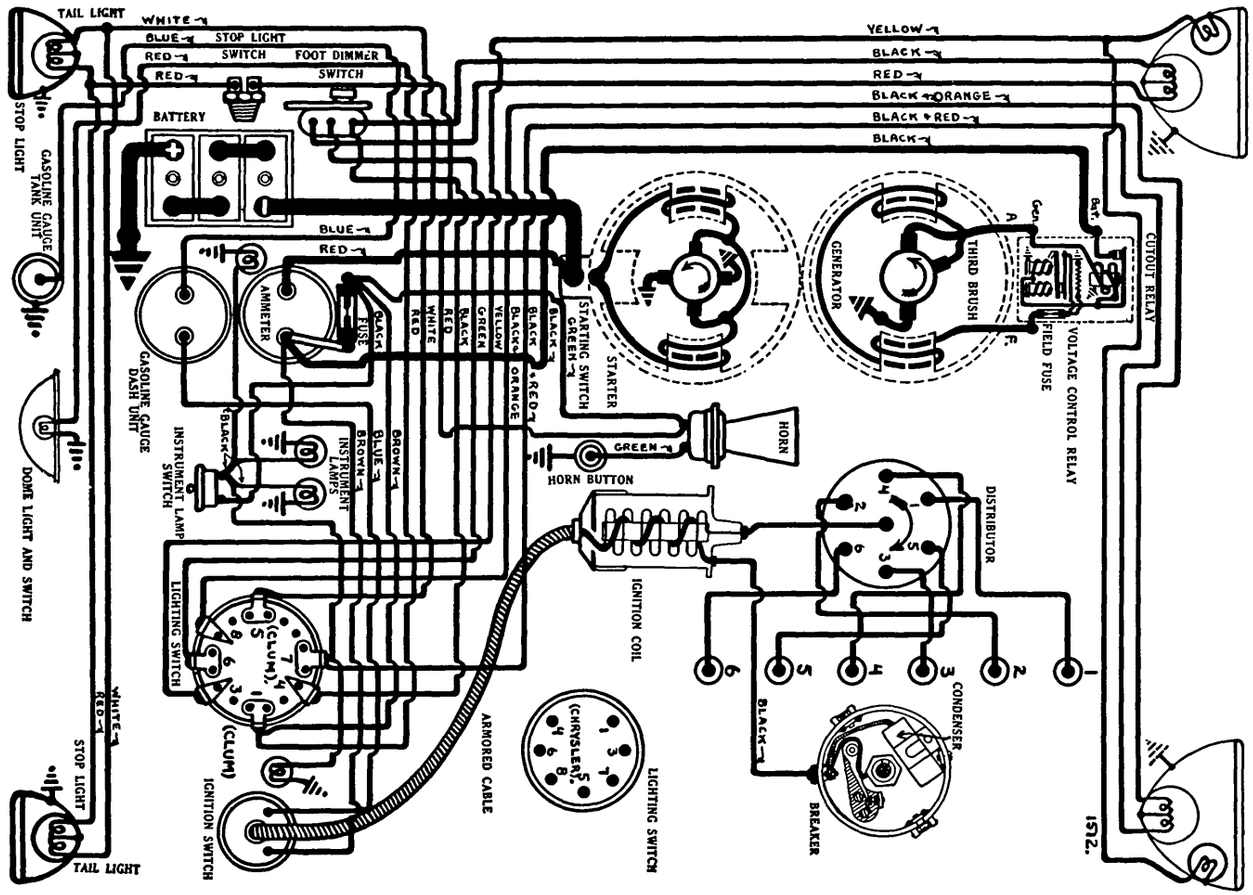
Automatic Advance—Model 644-W

Start	250	4	500
7	400	14	800
15	1600	30	3200

IGNITION TIMING:— Flywheel Degs. Piston Position Std. (Cast-iron) head.....AT TDC. .....0000" TDC. H.C. (Aluminum) head....3° ATDC. .....004" ATDC.
Timing (using Timing Light)—Connect timing light between distributor terminal and live terminal of generator relay. Turn engine over until #1 piston is on compression, stop with piston on top dead center when '0' center mark on impulse neutralizer at front of engine lines up with pointer on chain case (Std. Cast-iron head engines), or with piston slightly past top dead center when 3° mark on impulse neutralizer lines up with pointer (H.C. Aluminum head engines), loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp just goes out (contacts opening), tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Timing (using Gauge):—All cars can be timed using a motor gauge installed in timing plug hole over #6 piston. Use Weidenhoff Adapter #103, Rod #12.

NOTE:—Impulse neutralizer is marked in 1° graduatons for a total of 15° on each side of the '0' or dead center point.

Firing Order:—1-5-3-6-2-4 (see diagram).



Spark Plugs:—A.C., Type S-9 (Std. Cast-iron head), Type SL-9 (Aluminum head), 14 MM. Metric type. Type SL-9 plugs have a longer (7/16") thread length.
Spark Plug Gaps—.025".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke (optional equipment), Fuel Pump, Gasoline Gauge.

Carburetor:—Carter, Model E6C1, 1½" plain tube, downdraft type.
Automatic Choke—Sisson (special equipment).

Fuel Pump:—A.C., Type P (right hand side of crankcase).

Gasoline Gauge:—Motometer, Electric type.

VALVE TIMING:—To Check Timing—Use regular timing gauge installed over #6 piston. Set tappet clearance #6 intake valve at .010". This valve should open with piston on top dead center with gauge reading zero when center '0' mark on impulse neutralizer at front of engine registers with pointer on chain case. Reset tappet clearance at .005" with engine hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.005" Int., .007" Exh., engine hot.

Valve Spring Pressure:—40-50 lbs. at 2 1/16" (valve closed), 104-110 lbs. at 1 23/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.

Normal Oil Pressure—30-60 lbs. at normal driving speeds.

BATTERY:—Willard, Type WH-2-15, 6 volt, 15 plate, 119 A.H. capacity (20 hr. rate).

Starting Capacity—140 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under driver's seat.

STARTER:—Model 727-M, L (export). Armature No. 823881. Manual pinion shift and pedal operated switch (727-M) or Solenoid Switch Type 1516 (727-L). See Equipment Section for complete data.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Cranking Engine—Approx. 200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Starting switch pedal and accelerator are interconnected so that throttle is opened ¼-1/3 when pedal is depressed to start engine (see Equipment Section).

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.

GENERATOR:—Model 935-D. Armature No. 1854856. Third brush control type with external voltage regulation (regulator combined with cut-out relay in case on generator field frame.

Charging Rate Adjustment (using Meters):—Use test ammeter and voltmeter to check generator output. Connect jumper wire between 'F" generator terminal and ground (important as Voltage Regulator must be shorted out while adjustment being made). With generator at room temperature, remove commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts, tighten lock screw, remove jumper wire. See Equipment Section for complete data on Voltage Regulator.

Commutator Bar Method: — Remove generator from car, mount so that commutator can be seen, loosen lock screw on commutator end plate, shift third brush so that there are exactly 17/8 commutator bars exposed between third brush and nearest main brush, tighten locking screw. This setting provides maximum safe output and must not be exceeded.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—2.3-2.6 amperes at 6.0 volts.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Fuse—6 ampere capacity (in regulator case).

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Loosen pivot bolts and clamp bolt, pull generator away from engine, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

RELAY REGULATOR (CONTROL UNIT):—Model 5542. Consists of cut-out relay and voltage regulator in case on generator field frame. See Equipment Section for data on Voltage Control Relay.

Cut-out Relay

Cuts in—6.4-6.8 volts.

Cuts out—3 ampere discharge maximum.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.

Contacts Close—7.3-7.7 volts at 70°F.

Regulator Contact Gap—.008-.013".

Air Gap—.028-.040" between armature and core (with armature down against stop), armature travel (between armature and stop).

LIGHTING:—Clum Switch, Model 9556. Delco-Remy Foot Control Switch 465-S, Z. Foot control switch on toeboard used to control assymetric 'passing beam' (upper beam right hand headlight, lower beam left hand headlight).

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	A-1116
Park., Instr., Comptmt.	3	63
Stop and Tail	21-2	1158
Dome —	15	87

FUSES:—Lighting—20 amps. (on back of ammeter).

Generator Field—6 ampere capacity in regulator.

HORN:—Klaxon, K-26L, Type 1610. Vibrator type. Twin horns (optl.) connected through 20 ampere fuse at starting switch.

SERIAL NUMBER:—First number (CU) 6,593,001, (CV) 7,010,001. On right front door hinge pillar post.

COMPRESSION:—Ratio—Std. 6.5-1 al. head. No optl. ratios.

Pressure—145-155 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling.

IGNITION:—Coil Model 540-F. Ignition switch is part of coil assembly.

Ignition Switch—Delco-Remy Model 432-F.

Distributor Model 661-S (Model CU), 661-T (Model CV). Single breaker, 8 lobe cam, full automatic advance type. No synchronization required.

Breaker Gap—Set gap at .018". Limits, .017-.022".

Breaker Arm Spring Tension—19 23 ozs.

Cam Angles (Distributor Degrees) — Closed 31°. Open 14°.

Model 661-S—Automatic Advance

13	1300	26	2600

Model 661-T—Automatic Advance

Start	250	4	500
7	400	14	800
13	1500	26	3000

IGNITION TIMING:— Flywheel Degs. Piston Position Aluminum Head engines....at T.D.C. .... .0000" TDC.

Timing (using Light):—Connect timing light between distributor terminal and live terminal on generator relay. Turn engine over until #1 piston is on compression, stop when piston reaches top dead center when '0' mark on impulse neutralizer at front of engine lines up with pointer on chain case, loosen advance arm clamp bolt, rotate distributor until timing light goes out (contacts opening), tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).

Timing (using Gauge:—All engines can be timed using a Motor Gauge installed in timing plug hole over #1 piston. Use Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type SL-9. 14 MM. Metric.

Spark Plug Gaps—.025".

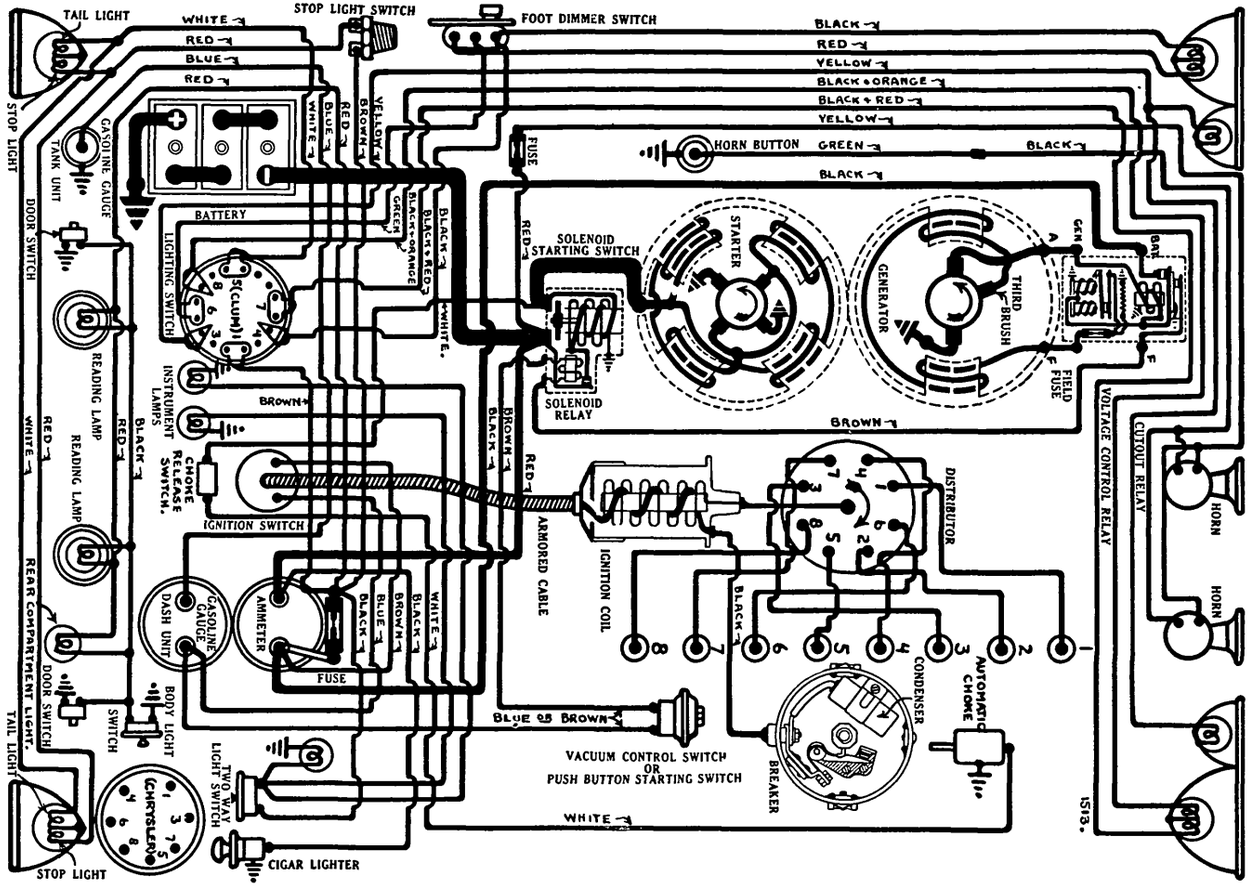
CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-22, 1¼" plain tube, dual, downdraft type.

Automatic Choke——Sisson.

Fuel Pump:—A.C., Type D.

Gasoline Gauge:—Motometer, Electric type.



VALVE TIMING:—To Check Timing—Use regular timing gauge installed over #1 piston. Set tappet clearance #1 intake valve at .011". This valve should open with piston (.0019") 2° before top dead center when 2° BTDC line on impulse neutralizer at front of engine lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.005" Int., .007" Exh., engine hot.

Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed). 104-110 lbs. at 1 11/16" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.

Normal Oil Pressure—30-60 lbs. at normal driving speeds.

BATTERY:—Willard, Type WH-4-17, 6 volt, 17 plate, 136 A.H. capacity (20 hr. rate).
Starting Capacity—160 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under driver's seat.

STARTER:—Model 727-J. Armature No. 823881. Solenoid operated pinion shift type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—Approx. 200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid Switch, Type 1516. Vacuum Switch Type 1592. Starting switch and pinion shift operated by solenoid on starter field frame. Solenoid circuit operated by solenoid relay and controlled by vacuum switch. Vacuum switch operated by accelerator pedal. See Equipment Section for complete data.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.

GENERATOR:—Model 935-G. Armature No. 1854856. Third brush control type with external voltage regulation (regulator combined with cut-out relay in case on generator field frame). Third brush setting adjusted by using test meters or by 'Commutator Bar' method.

Charging Rate Adjustment (using Meters):—Use test ammeter and voltmeter to check generator output. Connect jumper wire between 'F' terminal of generator and ground (important, as Voltage Regulator must be shorted out while adjustment is being made). With generator at room temperature, remove commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts, tighten lock screw, remove jumper wire.
Commutator Bar Method:—Remove generator from car, mount so that commutator can be seen, loosen lock screw on commutator end plate, shift third brush so that there are exactly 1⅞ commutator bars exposed between third brush and nearest main brush, tighten locking screw. This setting provides maximum safe output and must not be exceeded.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—2.3-2.6 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Fuse—6 ampere capacity (in regulator case).

Mounting:—Pivot mounted at left front of engine. Driven by water pump belt. To remove, take out two pivot bolts, one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator out or away from engine, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

RELAY REGULATOR (CONTROL UNIT):—Model 5544. Consists of Cut-out Relay and Voltage Regulator in case mounted on generator field frame. Relay has extra set of contacts for control of starter solenoid switch. See Equipment Section for complete data on Voltage Control Relay.

Cut-out Relay
Cuts in—6.4-6.8 volts.
Cuts out—3 ampere discharge (maximum).
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay
Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Air Gap—.028-.040" between armature and core (armature down against stop), armature travel (between armature and stop).

LIGHTING:—Clum Switch, Model 9556. Delco-Remy Foot Control Switch 465-S. Foot control switch on toeboard used to control assymetric 'passing beam' (upper beam right hand headlight, lower beam (left hand headlight).

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Stop and Tail	21-2	1158
Dome	15	87
All others	3	63

FUSES:—Lighting—20 amperes on back of ammeter.
Horn—20 ampere capacity cartridge type in horn lead near starter solenoid.
Generator Field—6 amperes in regulator case.

HORNS:—Klaxon, Model K-26G, Type 1779 (low note), 1780 (high note). Matched set, blended tone, vibrator type. Horn current, 6.0-8.5 amperes at 6.0 volts (1779), 5.0-6.5 amperes at 6.0 volts (1780).

SERIAL NUMBER:—First number, 6,800,001 (Detroit), 9,703,366 (Windsor, Canada). On right front door hinge pillar post.

COMPRESSION:—**Ratio**—6.0-1 Std. cast-iron head, 6.5-1 optional aluminum head.

Pressure—(6.0-1 std. head) 120-130 lbs. at 1000 R.P.M. or approx. 103 lbs. at cranking speed, (6.5-1 optl. head) 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—**Coil IG-4618 (Coupe), IG-4617 (Sedan).**
Ignition Switch—Mitchellock, Model 24-B, Type 6674 (Coupe), 6676 (Sedan). Model 24-R, Type 6498 (Coupe-Radio), 6499 (Sedan-Radio).
Distributor Model IGS-4001, A. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 38°. Open 22°.(distributor).
Manual Advance—20° (engine) adjustment only.

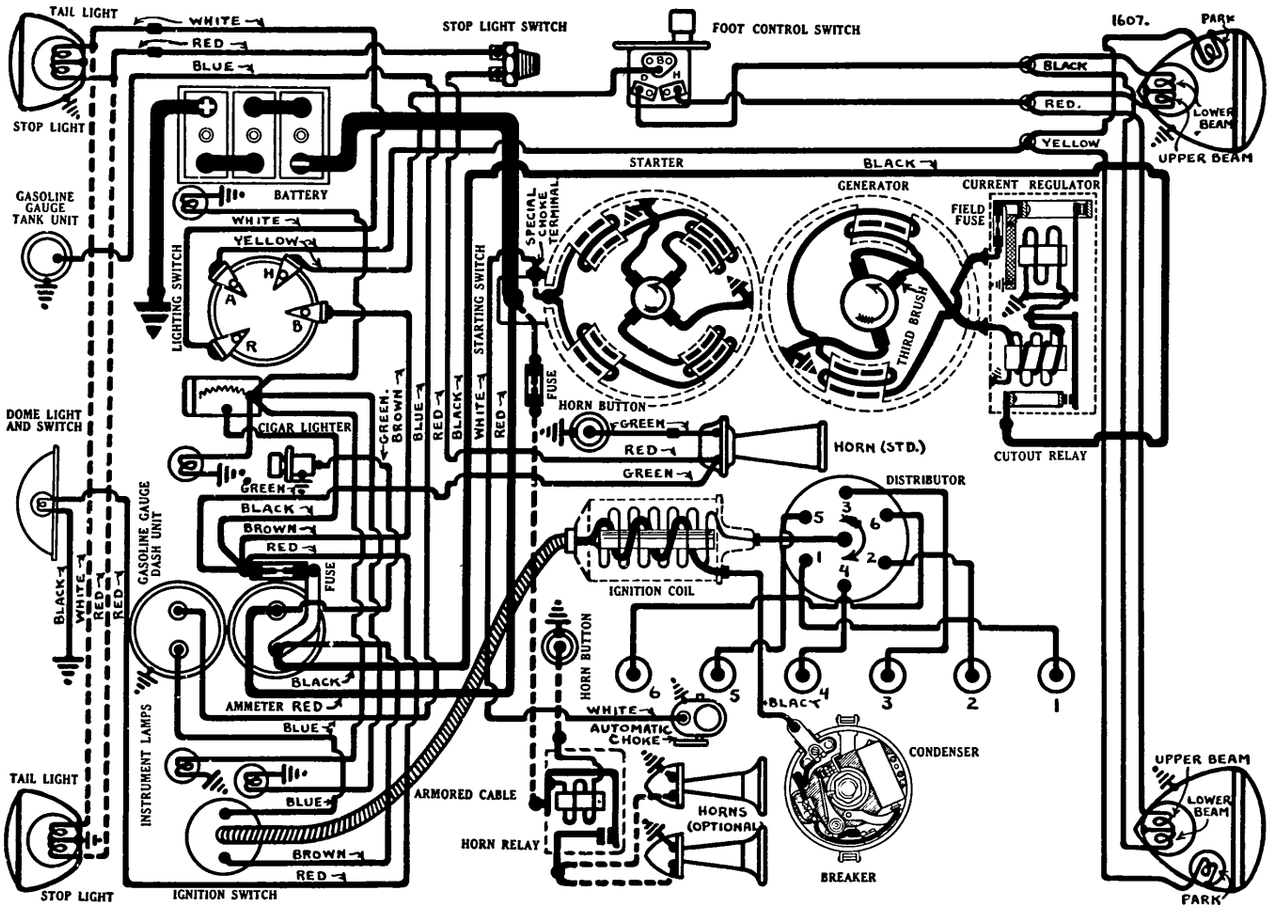
9	1160	18	2320
12	1530	24	3060

NOTE—Distributor changed to IGS-4001-A after 20,000. IGS-4001 distributors should be changed over by using new weight springs. Part #IG-884 and setting distributor to advance curve given for IGS-4001-A whenever advance mechanism requires attention. Type number on nameplate should be changed to IGS-4001-A.
Vacuum Spark Control—Provides additional advance for intermediate speed range above idling. Spark is retarded by return spring within unit when engine is accelerated or is operated with wide-open throttle.



Vacuum Spark Advance

Distributor Degrees	Vacuum
½°	4-5" of HG.
9° max.	12" of HG.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
6.0-1 Head Engines.....At TDC. ..... .0000" TDC.
6.5-1 Head Engines.....5° ATDC. ..... .0108" ATDC.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when center' '0' mark or 5° line to left of center '0' mark on impulse neutralizer at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale (lined up with '0' mark), tighten hold-down screw. Loosen advance clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.

Timing (Using Synchroscope)—Engine can be timed using a Synchroscope by directing light on impulse neutralizer. See Equipment Section.
Timing (Using Motor Gauge)—Engine can be timed with a motor gauge by installing gauge in

timing hole located directly over #6 piston. Use Weidenhoff Adapter #103, Rod #12.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—A.C., Type K-9 (Std. cast-iron head), KL-9 (aluminum head). Not interchangeable.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter (Ball & Ball), Model E6F1, E6F2, 1½" downdraft type.
Automatic Choke—Sisson.
Fuel Pump:—A.C., Type P-1521788 diaphragm type.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open at top dead center when '0' mark on impulse neutralizer at front of engine lines up with pointer on chain case. Reset tappet clearance at .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—.006" Int., .008" Exh., engine hot. Set exhaust clearance at .010" for sustained high speed driving. Valves excessible by removing right front wheel and housing cover.
Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed), 104-110 lbs. at 1 22/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).
Normal Oil Pressure—40-50 lbs. at driving speeds.

BATTERY:—Willard Type WH-2-15, RH-2-15 (Export), 6 volt, 15 plate, 119 A.H. cap. (20 hr. rate).
Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.

STARTER:—Model MAX-4002, MAX-4005 (RHD), Armature No. MAW-2030.
Starter Drive—Positive shift outboard pinion.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).
Cranking Engine—Approx. 200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300 Min.	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

NOTE—See Equipment Section for instructions on installing Field Equalizer on these starters.
Starting Switch:—(MAX-4002) Type SW-2813. See Equipment Section for pedal adjustment and for Type SS-4101 solenoid switch (MAX-4005).
Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model GAR-4608-5. Armature No. GAR-2116-F. Air-cooled. Third brush control in conjunction with Current Regulator (two-rate charging control). See Equipment Section.
Charging Rate Adjustment—Use test meters to check generator output. Connect jumper wire between fuse cup on regulator unit to ground on generator frame. Shift third brush by hand in counter-clockwise direction to increase, or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature. Third brush held in position by friction. Remove jumper wire.
Commutator Bar Method—Shift third brush until there are exactly 4 commutator bars exposed between the edge of the third brush and the nearest main brush.
Maximum Charging Rate—Above settings provide maximum safe output. Do not exceed.

Performance Data

Cold—Regulator Contacts Closed—Hot

Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts (½ amp. more if relay and regulator in circuit).
Field Fuse—5 ampere in knurled cup on side of regulator case.
Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment—Loosen pivot and clamp bolts, pull generator out or away from engine until tension as measured on spring scale is 45-50 lbs.

RELAY-REGULATOR:—Model TC-4301-A. Mounted on generator field frame. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Douglas Switch Model 5374. Clum Foot Control Switch Model 9579. Foot control switch is used to control headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Ig. Sw. Lamp	1½	55
Instrument	3	63
Stop and Tail	21-3	1158
Dome	15	87

NOTE—Lighting switch button and shaft are integral. To remove switch, pull out button to end 'on' position, insert thin bladed tool in hole in switch housing behind instrument panel, press tightly toward center of shaft to disengage operating bar from groove in shaft, pull out button and shaft, remove switch.

FUSES:—Lighting—20 ampere on back of ammeter.
Twin Horns—30 ampere in horn lead near starter.
Generator Field—5 ampere in regulator.

HORNS:—Klaxon Model K-26-L (Std). Model K-33-C Type 1899 (low note), 1900 (high note) Optional. Optional twin horns operated by horn relay.
Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Relay Contact Gap—.015.-025".
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number, 6,701,501 (Detroit), 9,755,421 (Windsor, Canada). On right front door hinge pillar post.

COMPRESSION:—Ratio—6.2-1 Std. cast-iron head, 7.0-1 optional aluminum head.
Pressure—(6.2-1 std. head) 125-135 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed. (7.0-1 optl. head) 130-140 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

IGNITION:—Coil CE-4603 (Coupe), CE-4604 (Sedan).
Ignition Switch—Mitchellock Model 24-B, Type 6674 (Coupe), 6676 (Sedan). Model 24-R, Type 6498 (Coupe-Radio), 6499 (Sedan-Radio).
Distributor Model IGT-4001. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .018".
Breaker Arm Spring Tension—18-20 ounces.
Cam Angles—Closed 27°. Open 18° (distributor).
Manual Advance—20° (engine). Adjustment only.

Automatic Advance

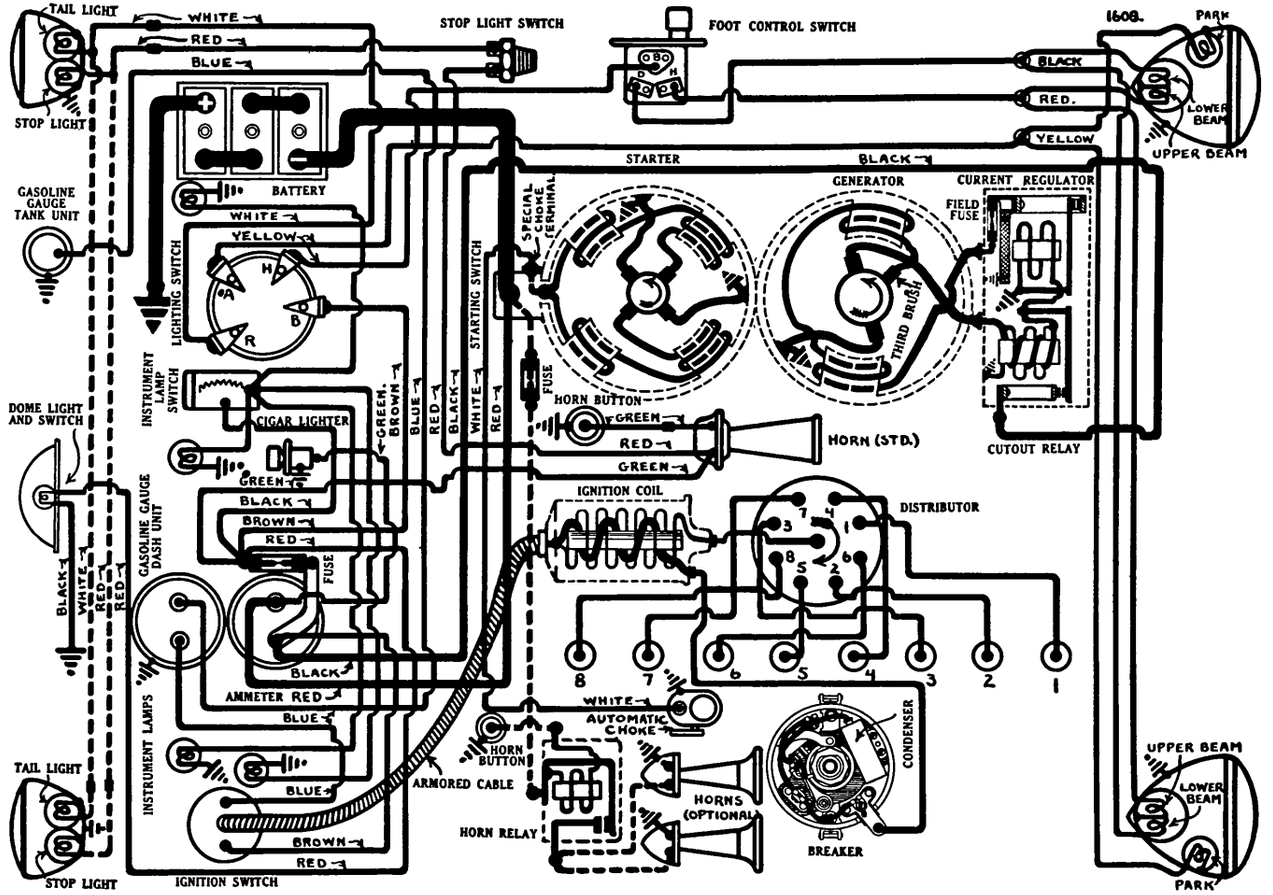
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
5	650	10	1300
8	1025	16	2050
11	1400	22	2800
13	1650	26	3300

Vacuum Spark Control—Provides additional advance for intermediate speed range above idling except when engine is accelerated or operated with wide-open throttle.

Vacuum Spark Advance

Distributor Degrees	Vacuum
½°	4-5" of HG.
7° Max.	12" of HG.

Removal:—Distributor mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in advance arm.



IGNITION TIMING:—

	Flywheel Degs.	Piston Posi.
All 6.2-1 head Engs.	At TDC.	.0000" TDC.
7.0-1 Engs. Std. Fuel	At TDC.	.0000" TDC.
7.0-1 Engs. Ethyl Fuel	4° BTDC.	.0062" BTDC.

Timing (Using Timing light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when center 'O' mark on impulse neutralizer at front of engine (all engines—Std. fuel) or 4° line to right of center '0' mark (7.0-1 Al. head engines—Ethyl fuel) lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale opposite 'O' mark, tighten hold-down screw. Then loosen advance arm clamp bolt, rotate distributor until timing lamp goes out, tighten clamp bolt.
Timing (Using Synchroscope)—Engine can be timed with synchroscope or neon timing light.
Timing (Using Motor Gauge)—Engine can be timed with a motor gauge by installing gauge in timing hole located directly over #8 piston. Use Weidenhoff Adapter #103, Rod #12.
Firing Order—1-6-2-5-8-3-7-4. See diagram.
Spark Plugs:—A.C., Type K-9 (cast-iron head), KL-9 (aluminum head). 14 MM. Metric. Not interchangeable.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data.
Carburetor:—Stromberg, Model EX-32, EXV-3, 1½" downdraft type.
Automatic Choke—Sisson.
Fuel Pump:—AC Type D-1521803 diaphragm type.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .011". This valve should open with piston 2° BTDC when 2° line on impulse neutralizer at front of engine lines up with pointer on chain case. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42. Piston position .0015" before top dead center.

Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh., recommended for sustained high speed driving. Valves accessible by removing right front wheel and wheel housing.

Valve Spring Pressure:—46-50 ybs. at 2 1/32" (valve closed). 104-110 lbs. at 1 22/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill). **Normal Oil Pressure**—40-50 lbs. at driving speeds.

BATTERY:—Willard, Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under drivers seat.

STARTER:—Model MAX-4002 (Coupe), MAX-4004 (Sedan), MAX-4005 (Export). Armature No. MAW-2030.

Starter Drive—Positive shift outboard pinion.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—31-42 ozs. (new brushes).

Cranking Engine—Approx. 200 amperes at 5 volts.

Performance Data

Torque		R.P.M.	Volts	Amperes

½°	4-5" of HG.
7° Max	12" of H.G

Removal: — Distributor mounted on left side of crankcase Accessible by removing left front wheel and housing cover under fender To remove, take out hold-down screw in advance arm

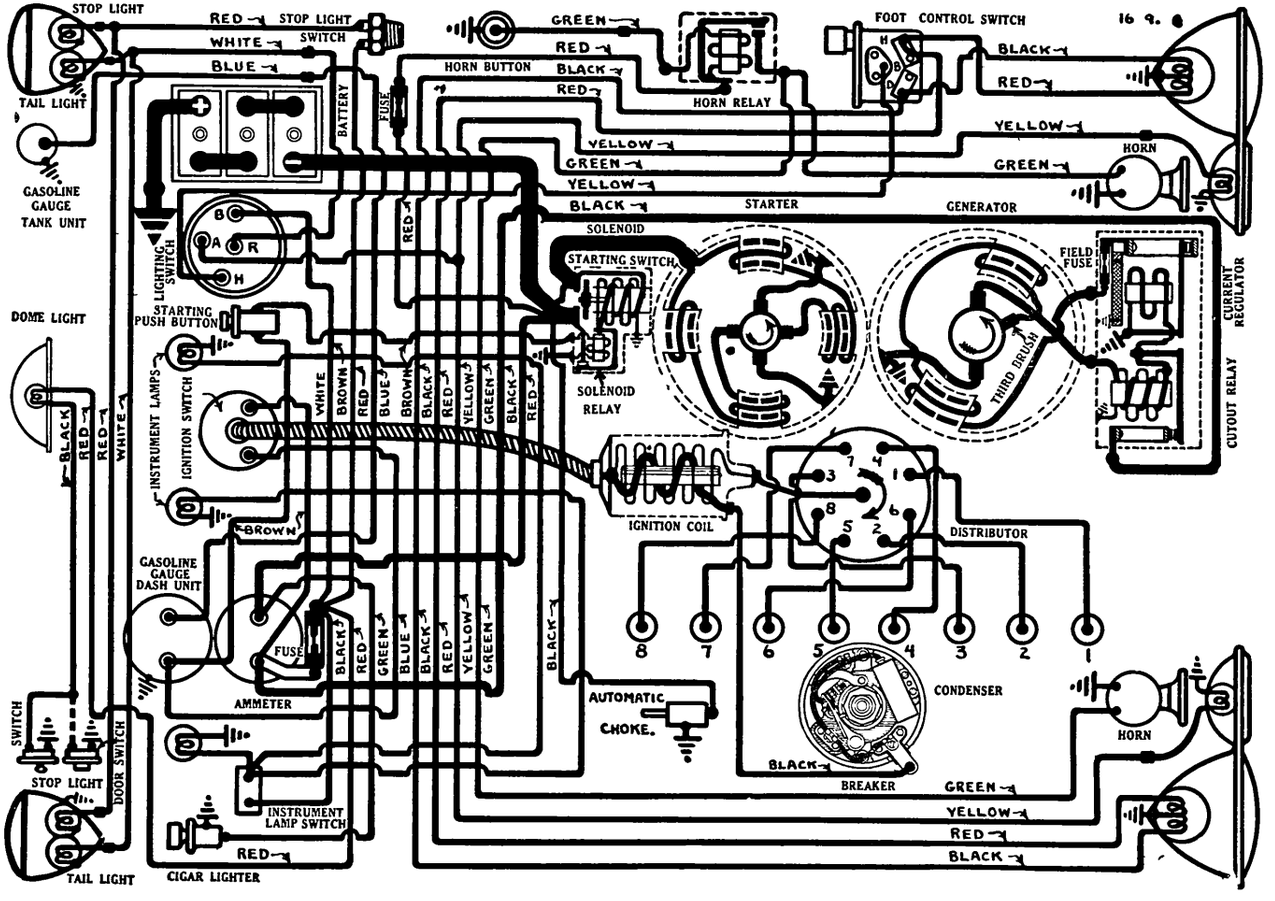
IGNITION TIMING:—

	Flywheel Degs	Piston Posi
6 2-1 Head (C1)	At TDC	0000" TDC
6 5-1 Head (C1, C3)	5° ATDC	0118" ATDC
6 5-1 Head (C1-Ethyl)	2° BTDC	0019" BTDC
7 45 Head (C3 only)	9° ATDC	0381" ATDC

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table) when mark on impulse neutralizer at front of engine lines up with pointer on chain case. Loosen hold-down screw in advance arm, center pointer on scale opposite '0' mark, tighten hold-down screw. Then loosen advance arm clamp bolt, rotate distributor until timing lamp goes out, indicating that contacts are opening, tighten clamp bolt
Timing (Using Synchroscope)—Engine can be timed with a synchroscope or neon light.

Timing (Using Motor Gauge)—Engine can be timed with a motor gauge by installing gauge in timing hole over #1 piston. Use Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-6-2-5-8-3-7-4 See diagram.



Spark Plugs:—A C., Type K-9 (cast-iron head), KL-9 (al head). 14 MM Metric. Not interchangeable.

Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data

Carburetor:—Stromberg, Model EX-32, 1½" downdraft type (C1), Model EE-22, 1¼" dual, downdraft type (C3)

Automatic Choke—Sisson.

Fuel Pump:—AC. Type D-1521790 diaphragm type. **Gasolin Gauge**—Motometer electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .011". This valve should open with piston 2° (.0019") before top dead center when 2° BTDC line on impulse neutralizer at front of engine lines up with pointer on chain case cover. **Motor Gauge**—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh. recommended for sustained high speed driving. Valves accessible by removing right front wheel and wheel housing.

Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed). 104-110 lbs. at 1 22/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill). **Normal Oil Pressure**—40-50 lbs. at driving speeds.

BATTERY:—Willard, Type WH-4-17, RH-4-17 (Export), 6 volt, 17 plate, 136 A.H. cap. (20 hr. rate). **Starting Capacity**—160 amperes for 20 minutes. **Grounded Terminal**—Positive (+) terminal. **Location**—On left side under drivers seat.

STARTER:—Model MAX-4003. Armature MAW-2030. Starter Drive—Magnetic shift outboard pinion. **Rotation**—Counter-clockwise at commutator end. **Brush Spring Tension**—31-42 ozs. (new brushes). **Cranking Engine**—Approx. 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300 Min.	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400

NOTE—Lighting switch button and shaft are integral. See Note on Model C-6 for instructions on removing switch.

FUSES:—Lighting—20 ampere on back of ammeter. **Horns**—30 ampere in horn relay lead near starter. **Generator Field**—5 ampere in regulator.

HORNS:—Klaxon Model K-33-D Type 1955 (low note), 1956 (high note). Matched tone, twin horns. Vibrator type. Operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.
Contact Gap—.015-.025".

NOTE:—See previous page for Auto-Lite equipment on Series C3 (used on some cars).

SERIAL NUMBER:—On right front door hinge pillar post. First number each model as follows:

	Detroit	Windsor,Canada
Model C-2	7,012,301	9,850,401
Model C-3	7,528,551	none

COMPRESSION:—Ratio—6.5-1 Std. aluminum head. 7.45-1 Optl. head.
Pressure—6.5-1 Std. hd. 145-155 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed. 7.45-1 optl. head 160-170 lbs. at 1000 R.P.M. or approx. 124 lbs. at cranking speed.

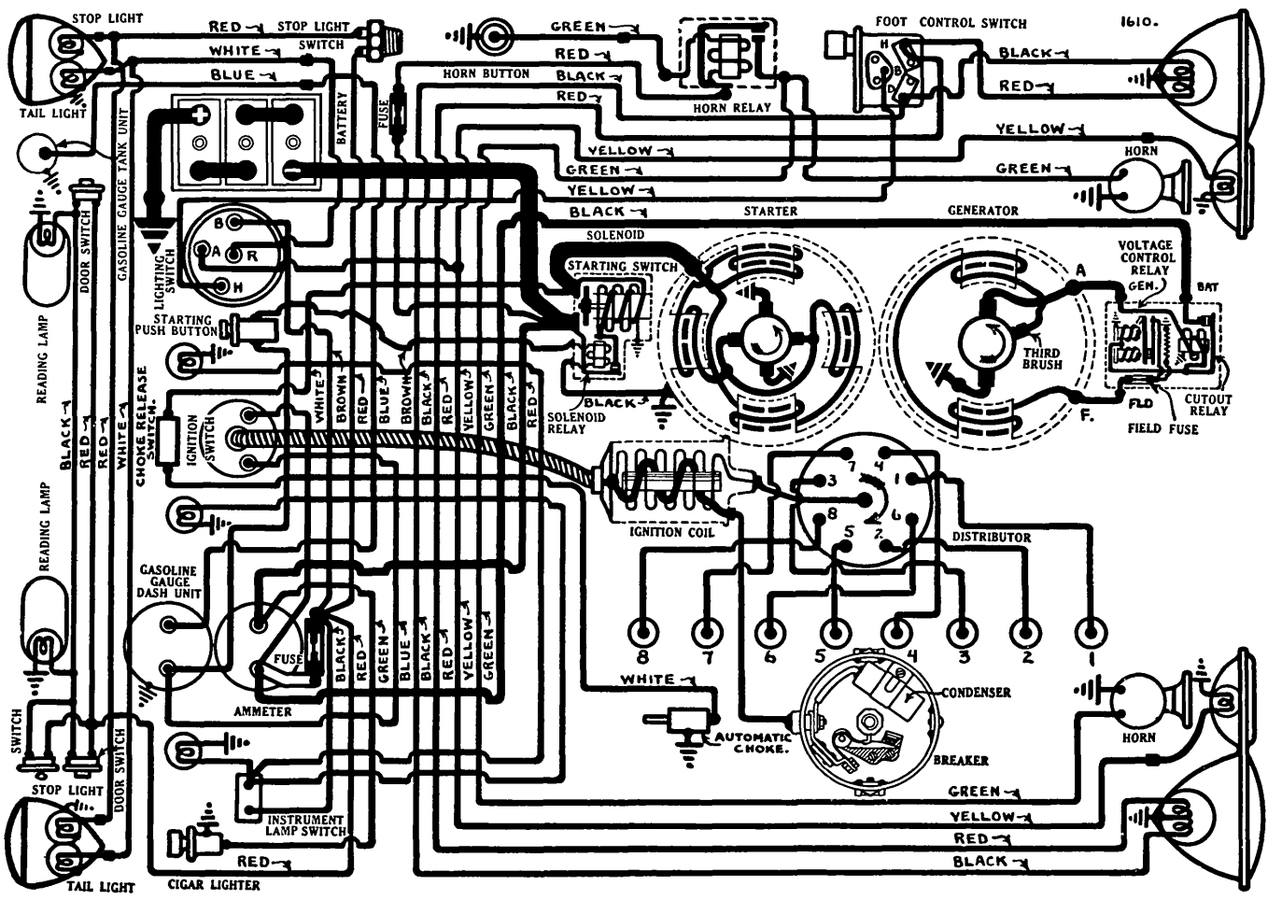
VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model 540-F. Mounted on hood ledge.
Ignition Switch—Delco-Remy Model 432-F. Part of coil assembly (connected to coil by armored cable).
Distributor Model 665-B, 665-C (with Tachometer drive). Single breaker, 8 lobe cam, full automatic advance type.
Breaker Gap—Set at .018". Limits .017-.022".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles—Closed 31°. Open 14° (distributor).
Manual Advance—22° (engine—adjustment only).

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	4	500
7	400	14	800
15	1600	30	3200

Removal:—Distributor mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, lift out. Distributor accessible by taking off cover plate under left front fender.



IGNITION TIMING:— Flywheel Degs. Piston Pos.
6.5-1 head engine .....5° ATDC. ..... .0118" ATDC.
7.45-1 head engine.....9° ATDC. ..... .0381" ATDC.
Timing (Using Test Lamp)—Connect test lamp between distributor terminal and 'live' terminal on generator control unit. With #1 piston on compression, turn engine over until piston is 5° or 9° past top dead center, stop when line marked '5' or '9' (left hand facing front of engine) on impulse neutralizer at front of engine is directly in line with pointer on chain case cover. Loosen advance arm hold-down screw, center pointer on scale (opposite '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until test lamp goes out indicating that contacts are just opening, tighten clamp bolt, check spark plug connections.
Timing (Using Synchroscope)—Engine can be timed using a Synchroscope by directing light flash on impulse neutralizer at front of engine.
Timing (Using Motor Gauge)—See ignition table above for settings if Motor Gauge used to set ignition timing. Use Weidenhoff Adapter #103, Rod #12.
Firing Order:—1-6-2-5-8-3-7-4. See diagram.
Spark Plugs:—AC. Type KL-9. 14 MM. Metric. These are special plugs with 7/16" thread length.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EE-22, 1¼" dual downdraft type.
Automatic Choke—Sisson.
Fuel Pump:—AC. Type D-1521790 diaphragm type.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—To Check Valve Timing—With engine cold set tappet clearance #1 intake valve at .011". This valve should open with piston 2° (.0019") before top dead center when 2° BTDC line on impulse neutralizer at front of engine lines up with pointer on chain case cover.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.006" Int., .008" Exh. with engine hot. .010" Exh. recommended for sustained high speed. Valves accessible by removing right front wheel and wheel housing.

Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed). 104-110 lbs. at 1 22/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).
Normal Oil Pressure—40-50 lbs. at driving speeds.

BATTERY:—Willard, Type WH-4-17, RH-4-17 (export). 6 volt, 17 plate, 136 A.H. capacity (20 hour rate).
Starting Capacity—160 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left hand front seat.

STARTER: — Model 727-J, L. Armature No. 823881. Solenoid operated pinion shift type. Starter drives through overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—Approx. 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid Type 1516. Switch and pinion shift operated by solenoid on starter field frame and controlled by pushbutton switch on instrument panel through solenoid relay in solenoid case. See Equipment Section for data.

Removal:—Starter flange mounted on left hand side of crankcase. To remove, take off cover plate under left front fender, take out flange mounting capscrews, pull starter out.

GENERATOR:—Model 935-G. Armature No. 1854856. Third brush control type with external voltage regulation (Voltage Control Relay) providing two-step charging rate to battery. See Equipment Section for complete data on Voltage Control Relay.

Charging Rate Adjustment (Using meters)—Connect test ammeter in charging circuit at 'Bat' terminal on control unit, connect voltmeter between this terminal and ground on generator frame. Short out Voltage Control Relay by connecting short jumper wire from 'F' terminal to ground on generator frame. Loosen lockscrew on commutator end plate, shift third brush by hand, counter-clockwise to increase or clockwise to decrease, until charging rate is 21 amperes at 8.6 volts. Tighten locking screw and remove jumper wire.

Charging Rate Adjustment (Commutator Bar Method)—With generator mounted so that commutator is visible, shift third brush until there are exactly 1⅞ commutator bars exposed between edge of third brush and nearest main brush.

Maximum Charging Rate—Above settings provide maximum safe output for generator and must not be exceeded.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Shunt Field Current—2.3-2.6 amperes at 6.0 volts.
Field Fuse—6 ampere capacity in control unit.

Removal:—Pivot mounted at left front of engine with water pump belt drive. To remove, take off cover plate under left front fender, take out two pivot bolts and one clamp bolt, lift generator out.

Belt Adjustment—Loosen generator pivot bolts and clamp bolt, pull generator out or away from engine until tension as measured on spring scale is 45-50 lbs., tighten clamp bolt.

CONTROL UNIT:—Model 5544. Mounted on generator field frame. Consists of Cutout Relay and Voltage Control Relay in single case. See Equipment Section for complete data on each unit.

Cutout Relay

Cuts in—6.4-6.8 volts.
Cuts out—3 ampere discharge maximum.
Relay Contact Gap—.015-.025".
Air Gap—.012"-.017" contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Douglas Switch Type 5394. Clum Foot Control Switch Type 9590—Foot control switch used to control driving and passing beams (upper and lower symmetrical beams). Headlight bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C.
Parking, Switch light	1.5	55
Instrument	3	63.
Stop & Tail	21-2	1158
Reading, Cab (C-3)	15	87.

NOTE—Lighting switch button and shaft are integral. See Note on Model C-6 for removal.

FUSES:—Lighting—20 ampere on back of ammeter.
Horn—30 ampere in fused connector in horn relay lead near starter.
Generator Field—6 ampere in control unit.

HORNS:—Klaxon, Model K-33-D, Type 1955 (low note), 1956 (high note). Matched tone, twin horns. Vibrator type. Operated by horn relay.
Horn Relay Model 266-TK:—Relay requires .25 amperes at 2 volts min. to close contacts. Current draw .8 ampere.
Contact Gap—.015-.025".
Air Gap—.012-.017".
Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—On right front door hinge pillar post.

COMPRESSION:—**Ratio**—6.5-1 Std. aluminum head. **Pressure**—135-140 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling.

IGNITION:—**Coil Model 540-L.** Mounted on hood ledge on right side.
Ignition Switch:—Part of coil assembly (connected to coil by armored cable).

Distributor Model 661-Z. Single breaker, 8 lobe cam, full automatic type. No synchronization required. Manual advance consists of adjustment at distributor.
Breaker Gap—Set gap at .018". Limits, .017-.022".
Breaker Arm Spring Tension—19-23 ounces.
Manual Advance—20° (engine—adjustment only).
Cam Angles (Distributor Degrees) — Closed 31°. Open 14°.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	4	500
7	400	14	800
16	1800	32	3600

Removal:—Distributor mounted on right side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
Aluminum Hed. engines 2° ATDC. ..... .002" ATDC.
Timing (Using Timing Light): — Connect timing light between distributor terminal and live terminal on generator relay. Turn engine over with #1 piston on compression, stop with piston 2° after top dead center when 2° mark on impulse neutralizer at front of engine lines up with pointer on chain case, loosen advance arm clamp bolt, rotate distributor until timing lamp goes out (contacts just opening), tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).

Timing (Using Gauge):—All engines can be timed using a motor gauge installed in timing plug hole over #1 piston. Ignition setting is .002" ATDC.

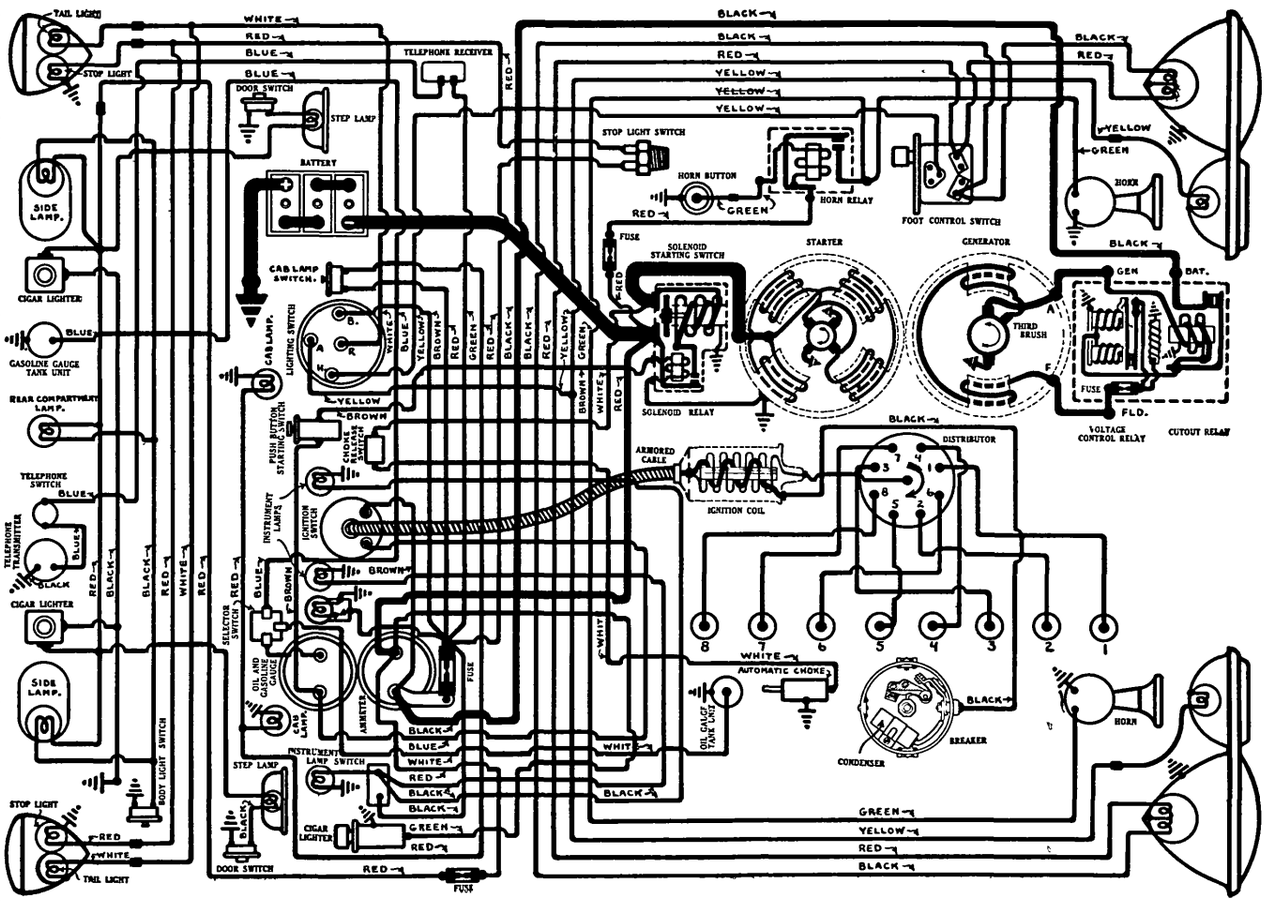
Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type KL-9. 14 MM. Metric type. These plugs have special longer (7/16") thread length.
Spark Plug Gaps—.025".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor: — Stromberg, Model EE-3. Dual, 1½" plain tube, downdraft type.
Automatic Choke—Sisson.

Fuel Pump:—A.C., Type I. Combination fuel and vacuum pump.



Gasoline Gauge:—Motometer, electric type. Combination fuel and oil gauge. Oil level reading obtained by pressing button on instrument panel.

VALVE TIMING:—**To Check Timing**—Use regular timing gauge installed over #1 piston. Set tappet clearance #1 intake valve at .008". This valve should open with piston 2° or .002" before top dead center. Reset tappet clearance at .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance.—.006" Int., .008" Exh., with engine hot. .010" Exh., recommended for sustained high speed. Valves accessible by removing right front wheel and wheel housing.

Valve Spring Pressure:—50-55 lbs. at 2¾" (valve (closed). 80-85 lbs. at 2 13/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—8 qts. (refill). **Normal Oil Pressure**—30-60 lbs. at normal driving speeds.

BATTERY:—Willard, Type RH-21, 6 volt, 21 plate, 170 A.H. capacity (20 hour rate).
Starting Capacity—200 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under driver's seat.

STARTER:—Model 728-W. Armature No. 818134.
Starter Drive—Through reduction gears and overrunning clutch to solenoid operated pinion.
Rotation — Clockwise (armature) at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2500	5.0	70
28 "	Lock	3.0	600

Starting Switch:—Solenoid Switch, Type 1518. Push-button Switch type. Starting switch and pinion shift operated by solenoid on starter field frame. Solenoid circuit operated by solenoid relay and controlled by pushbutton on instrument panel. Operative only with ignition on. See Equipment Section for complete data.

Removal:—Starter sleeve mounted on left front face of flywheel housing. Accessible by removing left front wheel and cover plate under fender. To remove, take out sleeve mounting pilot screws.

GENERATOR:—Model 967-P. Armature No. 1836971. Third brush control type with external voltage regulation (voltage control relay combined with cut-out relay in case on generator field frame). Use test meters or commutator bar method to set third brush.

Charging Rate Adjustment (using Meters):—Use test ammeter and voltmeter to check generator output. Connect jumper wire from 'F" generator terminal to ground (this is important as voltage control relay must be shorted out while adjustment is being made). With generator at room temperature, remove cover band, loosen lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 19 amperes at 8.6 volts, tighten lock screw, remove jumper wire. See Equipment Section for complete data on Voltage Control Relay.

Commutator Bar Method:—Remove generator from car, mount so that commutator can be seen, loosen lock screw on end plate, shift third brush so there are exactly 2¼ commutator bars exposed between third brush and nearest main brush, tighten locking screw. This setting provides maximum safe output and must not be exceeded.

Performance Data

	Amperes	Volts	R.P.M.
Cold	20-23	8.5-8.8	2000
Hot	16-19	8.0-8.4	2200

Rotation—Counter-clockwise at commutator end.
Field Current—2.1-2.5 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Fuse—6 ampere capacity (in regulator case).

Removal:—Generator pivot mounted at left front of engine. Driven by water pump belt. Accessible by removing left front wheel and cover plate under fender. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator out or away from engine, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

RELAY-REGULATOR (CONTROL UNIT):—Model 5550. Consists of Cut-out Relay and Voltage Control Relay in case on generator field frame. See Equipment Section for complete data on Voltage Control Relay.

Cut-out Relay
Cuts In—6.4-6.8 volts.
Cuts out—3 ampere discharge (maximum).
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay
Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.

Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—(1934) Clum Switch Model 9556. Delco-Remy Foot Control Switch Model 465-S. (1935) Douglas Switch Model 5394. Clum Foot Control Switch. For headlight wiring of 1934 model (assymetrical passing beam) see wiring diagram for Imperial Model CV (1934).

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Stop and Tail	21-2	1158
All others	3	63

FUSES:—Lighting—20 ampere capacity, one mounted on back of ammeter, one mounted in cartridge behind instrument board.

Horn—30 ampere in horn relay lead near starter.

Generator Field—6 ampere capacity in regulator case.

HORNS:—Klaxon, Model K-33-D, Type 1955 (low note), 1956 (high note). Matched tone, twin horns. Vibrator type. Operated by horn relay (1935 models only).

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—First number—6,823,301 (Detroit), 9,704,601 (Canada). Located on right front door hinge post.

COMPRESSION:—Ratio—6.0-1 Std. cast-iron head, 6.5-1 (optional aluminum head).

Pressure—(6.0-1 Std. head) 120-130 lbs. at 1000 RPM or approx. 103 lbs. at cranking speed, (6.5-1 Optl. head) 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—Coil Model IG-4638 (Conv. Sedan & Coupe) IG-4631 (all others). Service Winding (coil less switch and cable) IG-3224S. Mounted on dash.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6519. Connected to coil by armored cable.

Ignition Lock—Yale & Towne Mod. DP-108, Mitchell No. 6286.

Distributor Model IGS-4006-1, IGS-4006A-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .020".

Cam Angle or Dwell—38° closed, 22° open.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IG-2671F. Capacity. 20-.25 mfd.

Automatic Advance—IGS-4006-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
6	775	12	1550
9	1150	18	2300
12	1530	24	3060

Automatic Advance—IGS-4006A-1

Start	300	0	600
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	5.1"
1.4	6"
8	10-11"
16	15"

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, disconnect vacuum line.

IGNITION TIMING:

	Flywheel Deg.	Piston Position
6.0-1 Std. Head	At TDC	.0000" TDC.
6.5-1 Optl. Al. Head	5° ATDC	.0118" ATDC.

NOTE—Impulse neutralizer at front of engine marked 'O' at top dead center with 15 one degree graduations before and after this point.

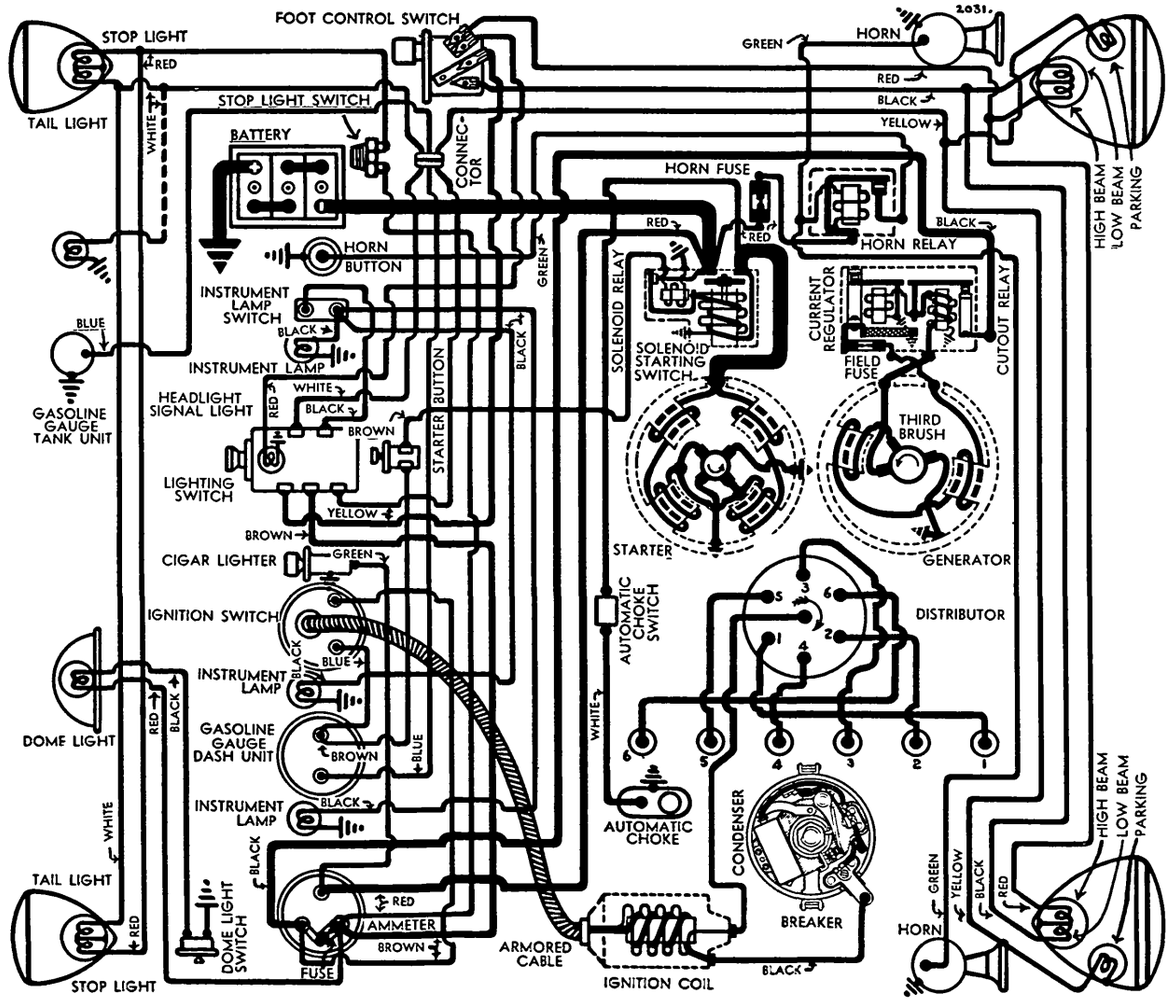
Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table), stop when correct line on impulse neutralizer lines up with pointer on chain case cover. Loosen distributor hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. **Timing (Using Synchroscope)**—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint. See Equipment Section.

Timing (Motor Gauge)—Weidenhoff #103 Adapter, #12 Rod. Timing hole located above #6 piston.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—(6.0-1 Cast-iron head) AC. Type K-9 superseded by Champion Type J-8. (6.5-1 Al. Head) AC. Type S-9 superseded by Champion Type H-10. 14 MM. Metric.

NOTE—Spark plugs used in aluminum head engines have longer thread length. Not interchangeable with standard plugs.



Spark Plug Gap—.025".

CARBURETION:—Carburetor—Carter (Ball & Ball) Model E6G1, 1½" downdraft type. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.

NOTE—Do not make carburetor adjustments until engine is warmed up with choke valve wide open and fast idle inoperative.

Idle Adjustment—Adjust throttle stopscrew so that idle speed is 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be ¼-1 turn of screw from inner closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in

proper hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Extremely warm weather.
Center Hole—Normal summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.
NOTE—5% and 10% lean main metering screws (high altitude calibration) may be used at lower altitudes for maximum fuel economy although with considerably reduced speed and power. See Carter (B & B) Jet Specifications in Carburetion Section.

Fast Idle:—Integral with carburetor. No adjustment.

Automatic Choke:—Sisson Type AC-751. See article in Carburetion Section for data and linkage adjustmt.

Air Cleaner:—Burgess oil-wetted type standard, AC. #1526838 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type B #1522237. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Motometer Electric No. NG-7781-D or NG-7879-D (dash unit), NG-7687-T (tank unit). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston on top dead center when 'O' mark on impulse neutralizer lines up with pointer on chain case cover. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff #103 Adapter, #12 Rod.

Tappet Clearance:—.006" Int., .008" Exh. with engine hot. .010" Exh. recommended for sustained high speed.

Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed), 104-110 lbs. at 1 11/16" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. refill.
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under drivers seat.

STARTER:—Model MAX-4016. Armature MAW-2030.
Drive—Magnetic shift outboard pinion.
Cranking Engine—Approx. 200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange screws.

Starting Switch:—Solenoid Switch Type SS-4104. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on'.

Solenoid Switch

Closes against 105 lb. pull with 3/8" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts.
Contact Gap—.025-.030". **Air Gap**—.005-.007" (closed)

GENERATOR:—Model GAR-4608A-5. Armature GAR-2116F. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Commutator Bar Method—Shift third brush until exactly 4 commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold Regulator Contacts Closed			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counterclockwise at commutator end.
Brush Spring Tension—24 ozs. min. (old brushes), 36 ozs. max. (new brushes).
Field Current—3.89-3.51 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts.
Field Fuse—5 ampere in plug on regulator case.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Swing generator away from engine until 45-50 lb. reading indicated on scale attached to generator frame.

RELAY-REGULATOR:—Model TC-4301A. Mounted on generator. Consists of Cutout Relay and Current Regulator two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall. Pre-focused type. Head lamps aimed straight ahead (upper beam, with lenses in place). Lower beam deflected slightly to right. Upper and lower beams controlled by foot selector switch.

Headlamp Beam Indicator—In light switch knob. Lighted when headlamp upper beams in use.

Switches

Lighting—Chrysler Part No. 655559. Douglas Switch which is available only through Chrysler Parts Dept
Foot Selector—Clum Model 9657.
Stop Light—R.B.M. No. 910. Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instrmt., Ign. Sw.	1½	55
Stop and Tail	21-3	1158
Dome	15	87

FUSES:—Lighting—20 amperes on back of ammeter.
Generator Field—5 ampere in plug on regulator.
Twin Horns—30 ampere in connector near starter.

HORNS:—Std. Motometer. Optl. Klaxon Model K-33-C Type 2151 (low note), 2152 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2151	11-13	.042-.046"
2152	10-12	.032-.036"

Horn Relay:—Model 266-TK. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amps.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number—6,710,501 (Detroit), 9,755,816 (Canada). Located on right front door hinge post.

COMPRESSION:—Ratio—6.2-1 Std. cast-iron hd, 7.0-1 (optional aluminum head).

Pressure—(6.2-1 Std. head) 125-135 lbs. at 1000 RPM or approx. 106 lbs. at cranking speed., (7.0-1 Optl. head) 130-140 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model CE-4621 (Conv.Sedan & Coupe) CE-4616 (all others). Service Winding (coil less switch and cable) CE-3224S. Coil mounted on dash.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6519. Connected to coil by armored cable.

Ignition Lock—Yale & Towne Mod. DP-108, Mitchell No. 6286.

Distributor Model IGT-4001-1, IGT-4001D-1. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .017".

Cam Angle or Dwell—27° closed, 18° open.

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part No. IG-2671G. Capacity .20-.25 mfd

Automatic Advance—IGT-4001-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
7	900	14	1800
11	1400	22	2800
13	1650	26	3300

Automatic Advance—IGT-4001D-1

Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
13	1900	26	3800

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	5.1"
1.4	6"
12	12"

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, disconnect vacuum line.

IGNITION TIMING:

	Flywheel Deg.	Piston Position
6.2-1 Std. Head	At TDC	.0000" TDC.
7.0-1 Opt. hd., std. fuel	At TDC	.0000" TDC.
7.0-1 Opt. hd., Ethyl fuel	4° BTDC	.0062 BTDC.

NOTE—Impulse neutralizer at front of engine marked 'O' at top dead center with 15 one degree graduations before and after this point.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table), stop when correct line on impulse neutralizer lines up with pointer on chain case cover. Loosen distributor hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing light goes out, tighten clamp bolt.

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint. See Equipment Section.

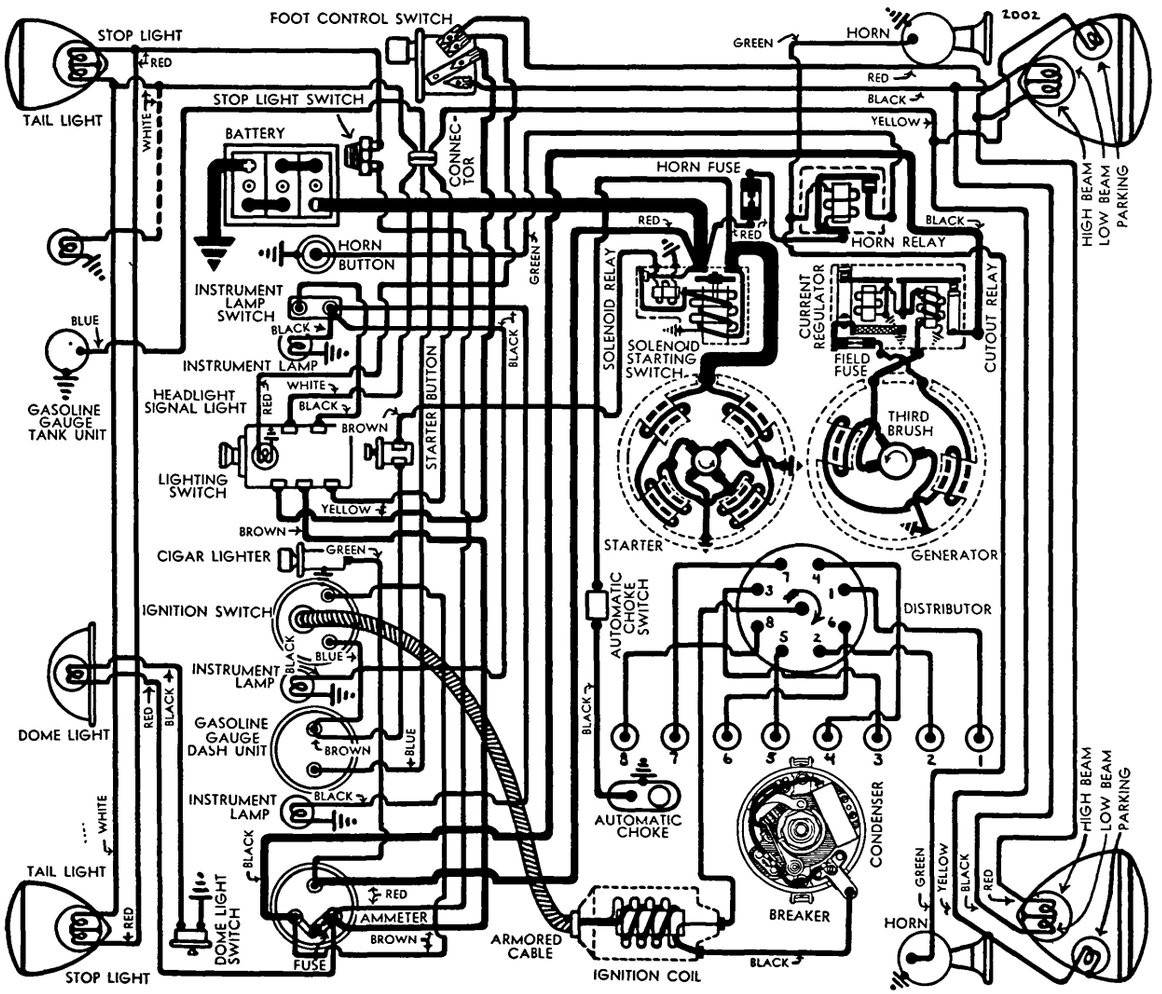
Timing (Motor Gauge)—Weidenhoff #103 Adapter, #12 Rod. Timing hole located above #8 piston.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—(6.2-1 Cast-iron head) AC. Type K-9 superseded by Champion Type J-8. (7.0-1 Al head)) AC. Type S-9 superseded by Champion Type H-10. 14 MM. Metric.

NOTE—Spark plugs used in aluminum head engines have longer thread length. Not interchangeable with standard plugs.

Spark Plug Gap—.025".



CARBURETION:—Carburetor—Stromberg Mod. EXV-3, 1½" downdraft type. See Carburetion Section for adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that engine will idle at hot or slow idling speed with choke valve wide open.

Idle Adjustment—With engine hot, set throttle stop screw to idle engine at 7-8 M.P.H. Turn idle adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed if necessary.

Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Center Hole (Med. stroke)—Standard setting.
Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—No adjustment required Throttle stopscrew should rest on high point of cam with choke valve closed.

Automatic Choke:—Sisson Type AC-751. See article in Carburetion Section for data and linkage adjustmt.

Air Cleaner:—AC. #1526374 oil-wetted type standard. #1526837 heavy duty oil bath type optional.

Fuel Pump:—AC. Type D #1521803 diaphragm type. Type I #1523023 combination fuel & vacuum pump (cars with overdrive). See separate articles in Carburetion Section for each type.

Gasoline Gauge:—Motometer Electric. Dash unit No. NG-7790-D. Tank unit No. NG-7687-T. See article in Carburetion Section.

VALVE TIMING:—To Check Timing—With engine cold set tappet clearance on #8 intake valve at .011". This valve should open with piston 2° or .0015" before top dead center when 2° BTDC line on impulse neutralizer at front of engine lines up with pointer on chain case cover.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.006" Int., .008" Exh. with engine hot. .010" Exh. recommended for sustained high speed.

Valve Spring Pressure:—104-110 lbs. at 1 11/16" (valve closed). 46-50 lbs. at 2 1/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. refill.
Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under drivers seat.

STARTER:—Model MAX-4020. Armature MAW-2030.
Drive—Magnetic shift outboard pinion.
Cranking Engine—Approx. 200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange screws.

Starting Switch:—Solenoid Switch Type SS-4106. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on'.

Solenoid Switch

Closes against 105 lb. pull with 3/8" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts.
Contact Gap—.025-.030". **Air Gap**—.005-.007" (closed)

GENERATOR:—Model GAR-4608A-5. Armature GAR-2116F. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Commutator Bar Method—Shift third brush until exactly 4 commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold Regulator Contacts Closed			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. min. (old brushes), 36 ozs. max. (new brushes).
Field Current—3.89-3.51 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts.
Field Fuse—5 ampere in plug on regulator case.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Swing generator away from engine until 45-50 lb. reading indicated on scale attached to generator frame.

RELAY-REGULATOR:—Model TC-4301A. Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall. Pre-focused type. Head lamps aimed straight ahead (upper beam, with lenses in place). Lower beam deflected slightly to right. Upper and lower beams controlled by foot selector switch.
Headlamp Beam Indicator—In light switch knob. Lighted when headlamp upper beams in use.

Switches

Lighting—Chrysler Part No. 655559. Douglas Switch which is available only through Chrysler Parts Dept.
Foot Selector—Clum Model 9657.
Stop Light—R.M.B. No. 910. Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instrmt., Ign. Sw.	1½	55
Stop and Tail	21-3	1158
Dome	15	87

FUSES:—Lighting—20 amperes on back of ammeter.
Generator Field—5 ampere in plug on regulator.
Twin Horns—30 ampere in connector near starter.

HORNS:—Std. Motometer. Optl. Klaxon Model K-33-C Type 2151 (low note), 2152 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2151	11-13	.042-.046"
2152	10-12	.032-.036"

Horn Relay:—Model 266-TK. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amps.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—On right front door hinge pillar post. First number each model as follows:

	Detroit	Canada
Model C-9	6,606,201	9,821,216
Model C-10	7,014,901	9,850,436
Model C-11	7,803,851	none

COMPRESSION:—Ratio—6.2-1 Cast-iron hd. (Std. C9), 6.5-1 Aluminum head (Optl. C9, Std. C10, 11), 7.45-1 Aluminum head (Optl. C10, 11).
Pressure—6.2-1 Cast-iron head 120-130 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed. **6.5-1 Al. head** 145-155 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed. **7.45-1 Al. head** 160-170 lbs. at 1000 R.P.M. or approx. 124 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model CE-4618. Service Winding (coil less switch and cable) CE-3224S. Mounted on hood ledge.
Ignition Current—2.5 amperes idling, 5.5 stopped.
Ignition Swith:—Mitchellock Model 24-B, Type 6744. Connected to coil by armored cable.
Ignition Lock—Yale & Towne Mod. DP-108 Mitchell No. 6286.
Distributor Model IGT-4001C-1, IGT-4001E-1. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .017".
Cam Angle or Dwell—27° closed, 18° open (distrib.).
Breaker Arm Spring Tension—18-20 ounces.
Condenser—Part No. IG-2671G. Capacity .20-.25 mfd.

Automatic Advance—IGT-4001C-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
11	1600	22	3200

Automatic Advance—IGT-4001E-1

Start	350	0	700
3	400	6	800
6	950	12	1900
9	1500	18	3000
11	1850	22	3700

Vacuum Spark Control—Provides additional advance for intermediate speed range above idling except when engine is accelerated or operated with wide open throttle.

Vacuum Spark Advance—IGT-4001C-1

Engine Degrees	Vacuum
1	6" of HG
10	14" of HG

Vacuum Spark Advance—IGT-4001E-1

1.4	6" of HG
12	12" of HG

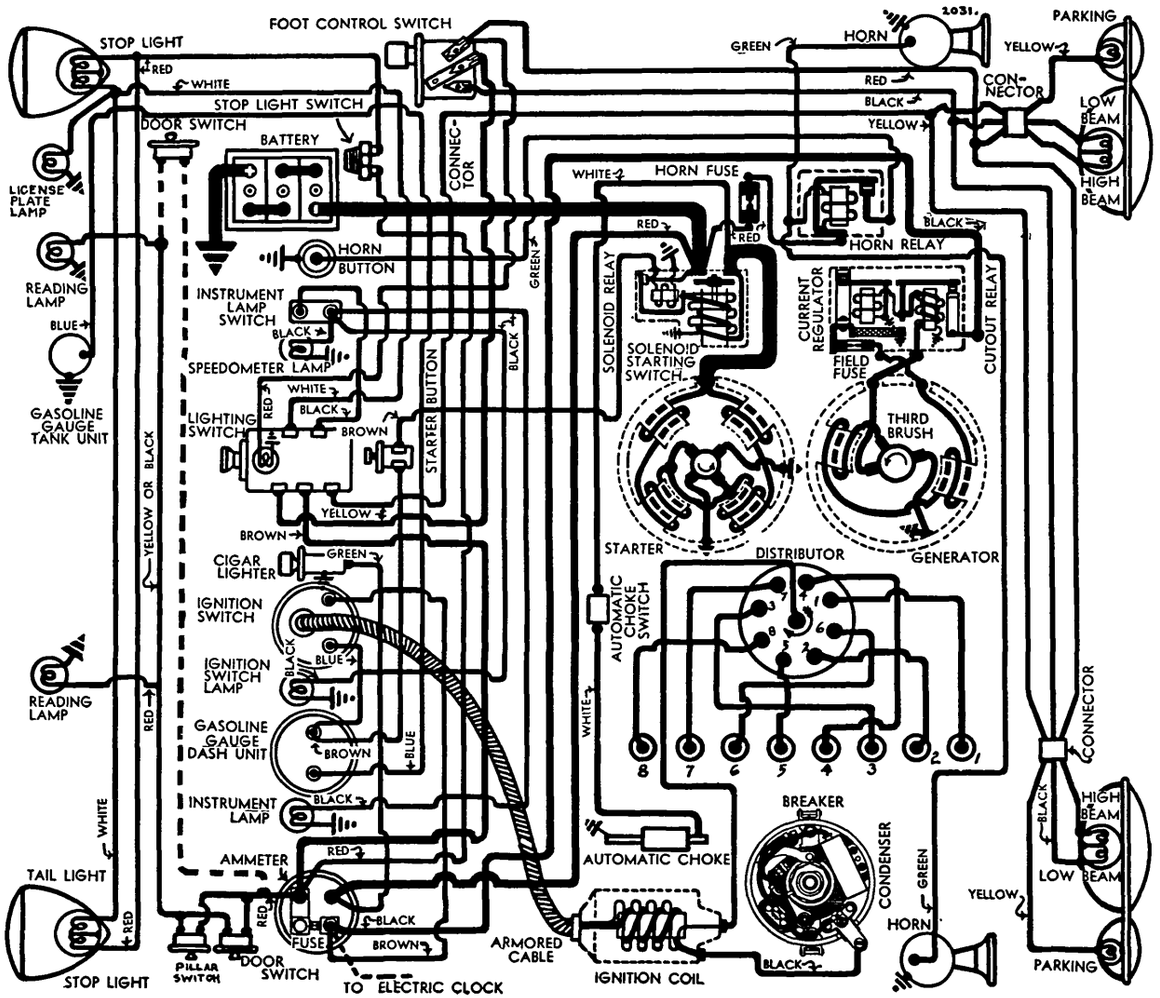
Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, lift out. Distributor accessible by taking off cover plate under left front fender.

IGNITION TIMING:—Settings for all engines as follows

	Flywheel Degs. Piston Position
6.2-1 Std C9 hd.	At TDC. .0000" TDC.
6.5-1 Optl. C9 hd. std. fuel	5° ATDC. .0118" ATDC.
6.5-1 Optl. C9 hd. Ethyl	" 2° BTDC. .0019" BTDC.
6.5-1 Std. C10, 11 hd.	5° ATDC. .0118" ATDC.
7.45-1 Optl.	" Ethyl fuel 9° ATDC. .0381" ATDC.

NOTE—Impulse neutralizer at front of engine marked with 15 one degree graduations before and after 'O' mark at top dead center.

Timing (Using Timing Light)—Connect timing light between distributor terminal and batery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table above), stop when correct mark on impulse neutralizer at front of engine is directly in line with pointer on chain case cover. Loosen advance arm hold-down screw, center pointer on scale (opposite 'O' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until test lamp goes out indicating that contacts are just opening, tighten clamp bolt, check spark plug conections.



Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint. See Equipment Section.

Timing (Motor Gauge)—Weidenhoff Adapter #103, Rod #12. Timing hole located over #1 piston.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion Type J-8 supersedes AC. Type K-9 (for C9 Std. 6.2-1 cast-iron head only). Champion Type H-10 (for all aluminum heads) supercedes AC. Type S-9. Plugs are 14MM. Metric type.
NOTE—On C9 only—do not interchange spark plugs as those used in aluminum heads have longer threads.
Spark Plug Gap—.025".

CARBURETION:—Carburetor—C9—Stromberg Model EXV-3, 1½" downdraft type. **C10, 11**—Stromberg Model EE-22, 1¼" dual downdraft type. See Carburetion Section for adjustment, overhaul and Jet Specifications.
NOTE—Do not adjust carburetor until engine is warmed up so that engine will idle at hot or slow idling speed with choke valve wide open.

Idle Adjustment—One idle adjusting screw on C9 carburetor, two on C10, 11 carburetor. Adjust C10, 11 screws simultaneously. With engine hot set throttle stopscrew to idle engine at 7-8 M.P.H. Turn one (C9) or both (C10, 11) idle adjusting screws in until engine begins to lag or miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Readjust throttle stopscrew for corect idling speed if necessary.

Accelerating Pump Setting—Pump lever has three (C9), two (C10, 11) holes for pump link engagement. Set as follows:

Inner Hole (Min. stroke)—Summer temperatures.
Center Hole (C9 only)—Standard setting.
Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—No adjustment required. Throttle stopscrew should rest on high point of cam with choke valve closed.

Automatic Choke:—Sisson Type AC-751 (C9), AC-600 (C10, 11). See article in Carburetion Section for data and linkage adjustment.

Air Cleaner:—AC. #1525933 (C9), #1526747 (C10, 11) oil-wetted type standard, #1526588 (C9), #1526589 oil-bath heavy duty type optional.

Fuel Pump:—AC. Type D #1521790 diaphragm type (C9 only). Type I #1523023 (C9 with overdrive), #1521549 (C10,11 std) combination fuel and vacuum pump. See separate articles in Carburetion Section on each type.

Gasoline Gauge:—Motometer Electric. Dash unit—NG-7808-D, Tank unit—NG-6876-T.

VALVE TIMING:—To Check Timing—With engine cold set tappet clearance on #1 intake valve at .011". This valve should open with piston 2° (.0019") before top dead center when 2° BTDC line on impulse neutralizer at front of engine lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff Adapter #103, Rod #12. Gauge hole over #1 piston.

Tappet Clearance:—.006" Int., .008" Exh. with engine hot. .010" Exh., recommended for sustained high speed.

Valve Spring Pressure:—104-110 lbs. at 1 11/16" (valve closed), 46-50 lbs. at 2 1/32" (valve open).

NOTE—Right front wheel and cover plate under fender should be removed for work on valves.

LUBRICATION:—Crankcase Capacity—6 qts. refill.
Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WH-4-17, RH-4-17 (Export). 6 volt, 17 plate, 136 ampere hour capacity (20 hour rate).

Starting Capacity—160 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.4 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left hand front seat.

STARTER:—Model MAX-4003. Armature MAW-2030.
Drive—Magnetic shift outboard pinion.
Cranking Engine—Approx. 200 amperes at 5.0 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face on flywheel housing. Accessible by removing left front wheel and housing cover under fender. To remove, take out two flange mounting screws.

Starting Switch:—Solenoid Switch Type SS-4101. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on'.

Solenoid Switch

Closes against 105 lb. pull with 3/8" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts.
Contact Gap—.025-.030" **Air Gap**—.005-.007"(closed)

GENERATOR:—Model GAR-4608B-5. Armature GAR-2116-F. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Commutator Bar Method—Shift third brush until exactly 4 commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold Regulator Contacts Closed			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. min. (old brushes), 36 ozs. max. (new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts.
Field Fuse—5 amperes in plug on regulator case.

Removal:—Pivot mounted at front of engine. Accessible by removing left front wheel and housing cover under fender. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen mounting bolts, pull generator out or away from engine until tension as measured on spring scale is 45-50 lbs.

RELAY-REGULATOR:—Model TC-4301A. Mounted on generator. Consists of Cutout Relay and Current Regulator (two rate chaging control). See article in Equipment Section.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 amperes discharge current.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Head lamps aimed straight ahead (upper beam, with lenses in place). Lower beam deflected slightly to right. Upper and lower beams controlled by foot selector switch.

Headlamp Beam Indicator—In light switch knob. Lighted when headlamp upper beams in use.

Switches

Lighting—Chrysler Part No. 655559. Douglas Switch which is available only through Chrysler Parts Dept.
Foot Selector—Clum Model 9661.
Stop Light—R.B.M. No. 910. Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.

Reading	15	87

FUSES:—Lighting—20 ampere on back of ammeter.
Generator Field—5 ampere in plug on regulator.
Twin Horns—30 ampere in connector near starter.

HORNS:—Klaxon Model K-33-D Type 1955 (low note), 1956 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
1955 (low note)	12-14	.045-.050"
1956 (high note)	11-13	.036-.040"

Horn Relay:—Model 266-TK. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amps.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

NOTE:—Engine hood hinged at cowl and lifts from forward end Turn radiator ornament counter-clockwise, raise hood about 1", push safety catch at front under lower edge of hood releasing catch and raise hood Side panels removed by freeing latches on inside lower edge of panels

SERIAL NUMBER:—First number 6,865,101 (Detroit), 9,706,386 (Canada) On right front door hinge post

COMPRESSION:—Ratio and pressure as follows

Ratio	Pressure at 1000 R.P.M.	At 100 R.P.M.
6 5-1 Std hd	125-130 lbs	Approx 110 lbs
7 0-1 Optl hd	130-140 lbs	Approx 117 lbs

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 6 M P H

IGNITION:—Coil Models IG-4642 or CL-4602. Service winding (coil less switch and cable) IG-3224S or CL-3224S Mounted on dash

Ignition Current—2 5 amperes idling, 5 5 stopped

Ignition Switch:—Mitchellock Model 24-B, Type 7055 Connected to coil by armored cable

Ignition Lock—Yale & Towne, Mitchell No 7075

Distributor Model IGS-4010-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control

Breaker Gap—Set at 020"

Cam Angle or Dwell—38° (closed), 22° (open)

Breaker Arm Spring Tension—18-20 ounces

Condenser—Part IG-3927-A Capacity— 20- 25 mfd

Automatic Advance

Distributor		Engine	
Degrees	R P M	Degrees	R P M
Start	350	0	700
3	400	6	800
7	1000	14	2000
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor Mounted on distributor housing and linked directly to breaker plate Provides additional advance for speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	4 75"
1 4	6"
8	10-11"
16	15"

Distributor Removal:—Mounted on left side of crankcase To remove, take out hold-down screw in advance arm, disconnect vacuum line

IGNITION TIMING:—

	Flywheel Deg.	Piston Position
6 5-1 Std hd	2° ATDC	002" ATDC
7 0-1 Optl Al hd	TDC	000" TDC

NOTE—Crankshaft pulley at frt of engine marked 'O' at top dead center with 15 one degree graduations before and after this point

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit With #1 piston on compression, turn engine over until piston reaches firing position (see table), stop when correct line on impulse neutralizer lines up with pointer on chain case cover Loosen distributor hold-down screw, center pointer on scale, tighten hold-down screw Loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint

See Article in Electrical Equipment Section.

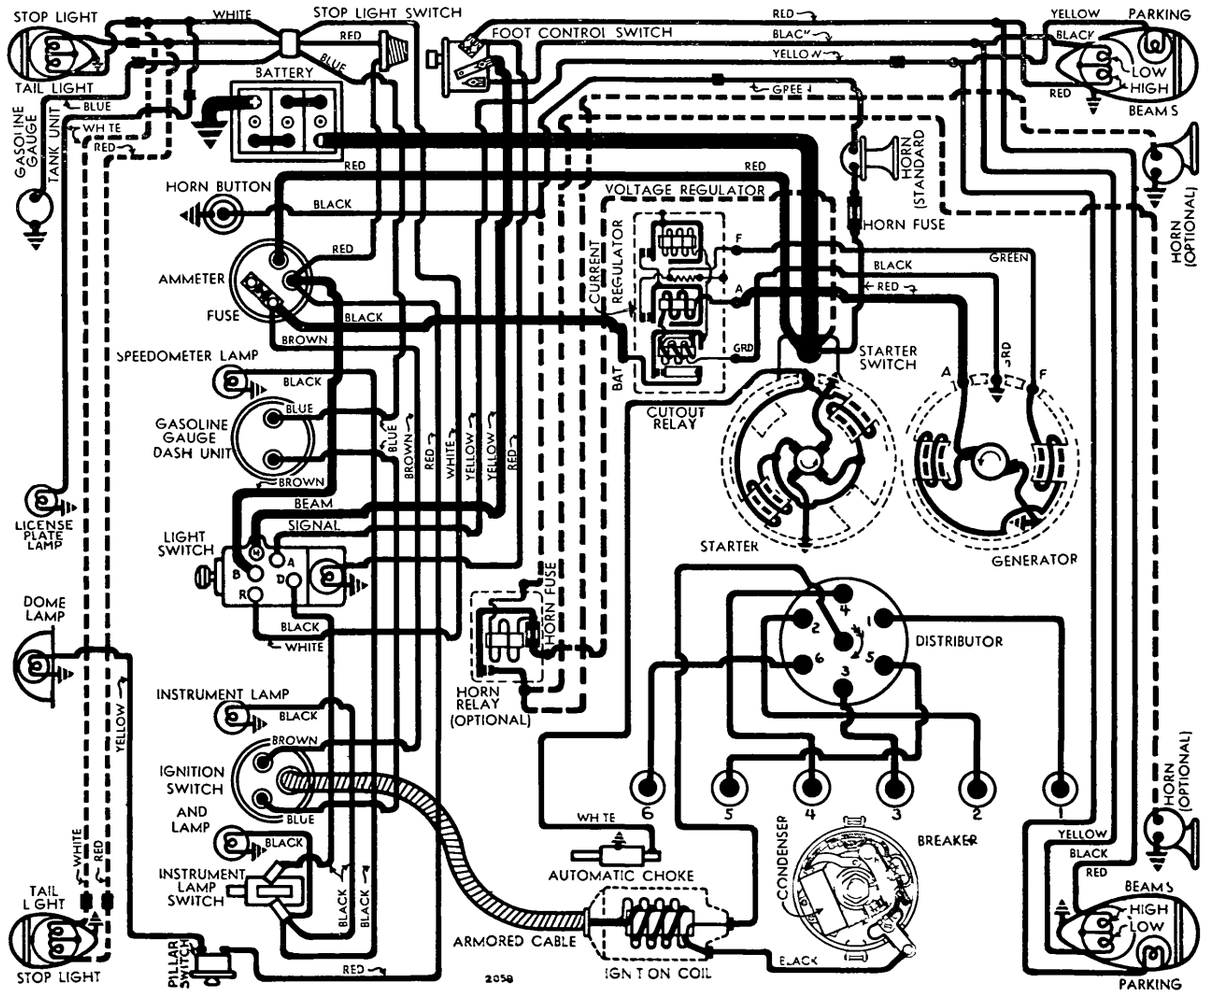
Motor Gauge—Weidenhoff Adapter #103, Rod #12

Firing Order:—1-5-3-6-2-4 See diagram

Spark Plugs:—Champion Type J-8 (cast iron head), H-10 (aluminum head) 14 MM Metric type

Spark Plug Gap—Set at 025"

CARBURETION:—Carburetor—Carter (Ball & Ball) Models E6I1, E6K1, E6K2, E6K3, E6K4, 1½" downdraft types



NOTE—See article in Carburetion Sec for recommended changes on first three models

Idle Adjustment—With engine warm and choke valve wide open (fast idle inoperative), adjust throttle stopscrew so that idle speed is 300 R P M or 6 M P H Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly Final setting should be ½-1¼ turns of screw from inner closed or seated position Readjust throttle stopscrew for correct idling speed

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows

Inner Hole (Min stroke)—Extremely warm weather.
Center Hole—Normal summer temperatures
Outer Hole (Max stroke)—Winter temperatures

NOTE—5% and 10% lean main metering jets (high altitude calibration) may be used at lower altitudes for maximum fuel economy although with considerable reduced speed and power See Carter (B & B) Jet Specifications in Carburetion Section

Fast Idle:—Integral with carburetor. No adjustment.

Automatic Choke:—Sisson Type AC-751B. See article in Carburetion Equipment Section for data and linkage adjustment.

Air Cleaner:—Burgess oil-wetted type standard. AC. #1526838 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type B #1522995. Diaphragm type. AC. Type AL #1523137 comb. fuel & vacuum pump used on cars with overdrive.

See Article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .014". This valve should open with piston on top dead center when '0' mark on crankshaft pulley lines up with pointer on chain case cover. Reset tappet clearance at .008" hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance—.008" Int., .010" Exh., hot.

Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed). 101-109 lbs. at 1 13/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WHT-2-105, RHT-2-105 (Exp.). 6 volt, 15 plate, 105 AH. capacity (20 hr. rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left side under drivers seat.

STARTER:—Mod. MAW-4010, MAW-4011 (Exp.). Armature No. MAW-2030.

Drive—Positive shift outboard pinion.

Cranking Engine—Approx. 175 amps. at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange screws.

Starting Switch:—(MAW-4010)—SW-2813. Mounted on starter field frame and operated by pinion shaft (starting pedal). See article in Electrical Equipment Section for pedal adjustment.

(MAW-4011)—Solenoid Switch Type SS-4104. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on'.

Solenoid Switch

Closes against 105 lb. pull with ⅜" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts.

Contact Gap—.025-.030". **Air Gap**—.005-.007" (closed)

GENERATOR:—Model GBW-4803-A, C (Exp.-Bolivia). Armature No. GBW-2006F. 2 brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—22 amperes, 8.0 volts, 1780 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.

Charging Rate Adjustment—No adjustment on Generator. See Regulator section below for Voltage and Current Regulator settings.

Cold Amps.	Cold Volts	Performance Data R.P.M.	Hot Amps.	Hot Volts	Hot R.P.M.
0	6.4	775	0	6.4	870
4	6.7	940	4	6.7	1065
10	7.1	1200	10	7.1	1385
16	7.6	1480	16	7.6	1780
20	7.85	1675	20	7.85	2125
22	8.0	1780	22	8.0	2400

NOTE—Current regulator limits maximum output to 22 amperes.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.71-1.89 amperes at 6.0 volts.

Motoring Current—2.94-3.26 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs., tighten bolts.

REGULATOR:—Model VRB-4005-A, Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator and Vibrating Current Regulator in case on dash.

See Article in Electrical Equipment Section.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold. **Contact Gap**—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed. Voltage should be within 7.4-7.8 volts (low limit hot, high limit cold). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 M.P.H., add load (use bank of headlamp bulbs or turn on car lights and discharge battery) so that generator will charge at peak rate bringing current regulator into action. Charging current should not exceed 22 amperes. If more than slight excess noted, Current Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Aim headlamps straight ahead (lenses in place, upper beams lighted and car unloaded) with center of hot spot 3" (5 pass.), 2" (7 pass.) below center horizontal line of headlamps at 25 ft. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in full out position.

Headlamp Beam Indicator—In light switch knob. Lighted when headlamp upper beams in use.

Switches

Lighting—Chrysler Part No. 667044.

Instrument Light—Chrysler Part No. 667043.

Foot Selector—Chrysler Part No. 659512.

Stop Light—Chrysler Part No. 661721.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Tail and Stop light	3-21	1158
Beam Indicator, Ign. Sw.	1	51
Parking, Instrument	1½	55
Dome	15	87
Rear License	3	63

FUSES:—Lighting—20 amperes on back of ammeter.

Horn—20 amp. (single) in connector near starter. 30 amp. (dual) in horn relay.

HORNS:—Auto-Lite Model HB-4002 single, standard. Twin horns Model HC-5103 with HR-4002 horn relay optional.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Turn radiator ornament counter-clockwise, raise hood about 1", push back safety catch at front under lower edge of hood releasing catch and raise hood. Side panels removed by freeing latches on inside lower edges of panels.

SERIAL NUMBER:—First number (C-14) 6,719,601 (Detroit), 9,756,331 (Canada). (C-15) 7,804,001 (Detroit). On right front door hinge pillar post.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure at: 1000 RPM	100 RPM
6.7-1 (C-14)	Std. ..... 150-160 lbs.	App. 114 lbs.
6.5-1 (C-15)	Std. ..... 145-155 lbs.	App. 112 lbs.
7.45-1 (C-15)	Optl. ..... 160-170 lbs.	App. 124 lbs.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Mod. CE-4624 (C-14), CE-4626 (C-15). Service winding (coil less switch & cable) CE-3224-S.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 7055 (C-14), 7057 (C-15). Connected to coil by armored cable.

Ignition Lock—Yale & Towne, Mitchell No. 7075.

Distributor Models IGT-4001-D-1, G-1, J-1 (C-14), D-1, G-1 (C-14 Exp.), IGT-4001-F-1 (C-15 LHD & RHD). Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .018".

Cam Angle or Dwell—27° (closed), 18° (open).

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part No. IG-2671-G. Capacity .20-.25 mfd

Automatic Advance—IGT-4001-D-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800

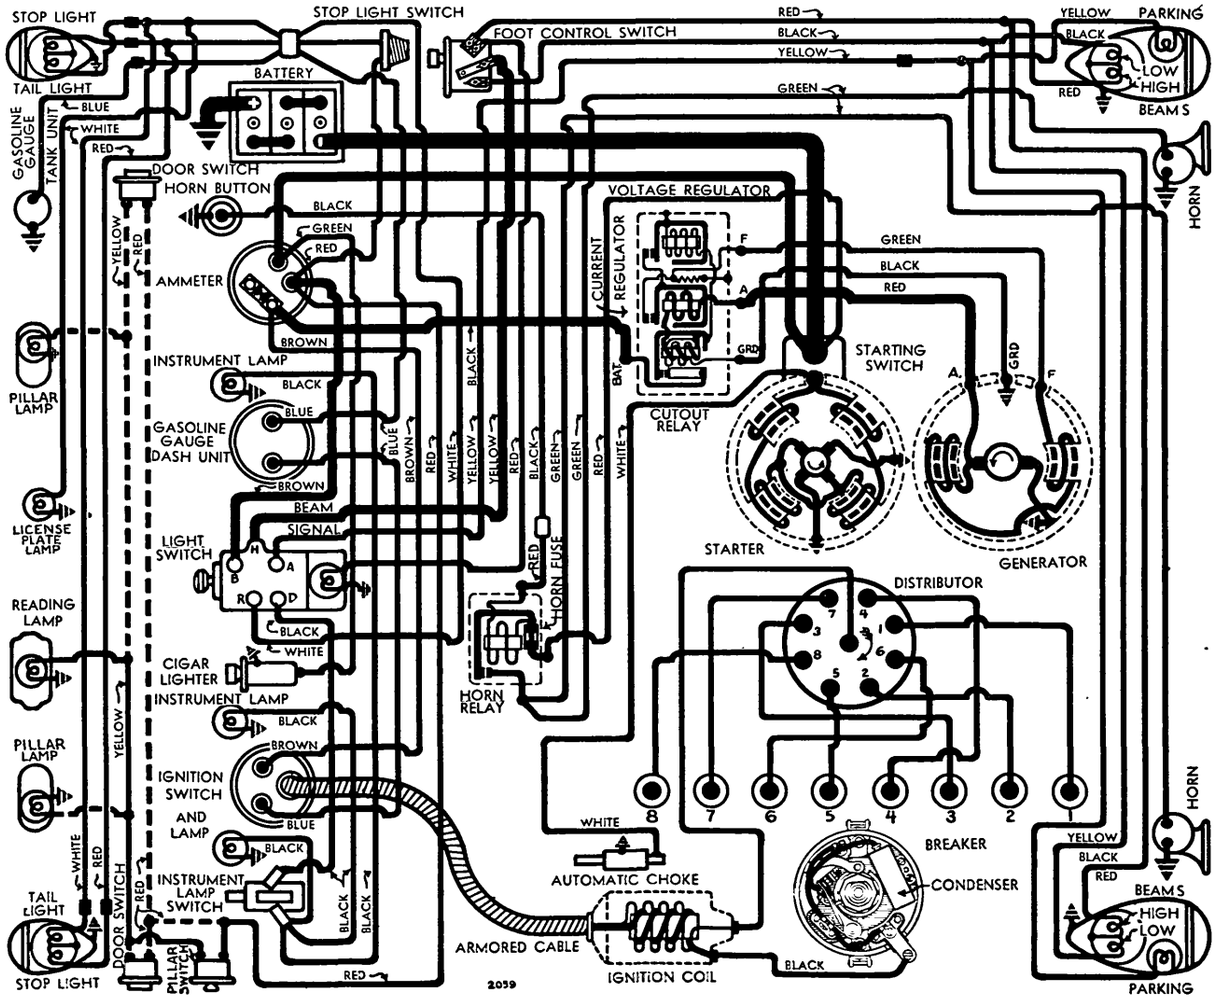
2°	6"
8°	9"
14°	12"



Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, disconnect vacuum line.

IGNITION TIMING:—Settings for all engines as follows:

	Flywheel Degrees	Piston Position
C-14, Std. 6.7-1 hd.	3° ATDC	.004" ATDC
C-15, Std. 6.5-1 hd.	5° ATDC	.012" ATDC
C-15, Optl. 7.45-1 hd.	9° ATDC	.038" ATDC

NOTE—Impulse neutralizer at front of engine marked with 15 one degree graduations before and after 'O' mark at top dead center.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see above table), stop when correct mark on impulse neutralizer at front of engine is directly in line with pointer on chain case cover. Loosen advance arm hold-down screw, center

pointer on scale (opposite 'O' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until test lamp goes out indicating that contacts are just opening, tighten clamp bolt, check spark plug connections.

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint. See article in Electrical Equipment Section.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion Type H-10, 14 MM. Metric.

Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Stromberg Model AAOV-1, aircraft type (C-15 all, C-14 first cars), Carter Model 373-S (C-14 later cars). Duplex or double barrel downdraft type.

See Article in Carburetor Section for data.

Idle Adjustment (All models)—With engine warm (Automatic choke & Fast Idle inoperative), set throttle stopscrew so that idle speed is 7 M.P.H. Turn one idling adjusting screw (for one barrel) in until engine begins to hesitate or miss, then turn out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with second idling adjusting screw (for other barrel). Adjust throttle lever stopscrew if necessary.

Accelerating Pump Setting—Throttle lever has two holes for pump link engagement. Set as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

NOTE—Carter model requires partial dismantling of carburetor to change setting (see article in Carburetor Section for complete directions).

Fast Idle:—Stromberg—Cam type, non-adjustable. With choke closed throttle screw should rest on high point of cam. Carter—hold choke valve tightly closed, adjust fast idle lever screw so that throttle opening is .018" as measured on side opposite idle ports.

See Article in Carburetion Equipment Section.

Automatic Choke:—Sisson Type AC-600. See article in Carburetion Sec. for data & linkage adjustment.

Air Cleaner:—AC. #1528199 standard oil-wetted type, #1528198 optional oil bath type.

Fuel Pump:—AC. Type D #1521803 diaphragm type. Type I #1523023 combination fuel & vacuum pump (optl. C-14). Type AN #1523188 vacuum pump only (C-15 with overdrive) used with D pump (above) except mounted separately on right side of engine at rear.

See Article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric.

VALVE TIMING:—To Check—With engine cold set tappet clearance #1 intake valve at .011". This valve should open with piston 2° (.002") before top dead center when 2° BTDC line on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" (hot).

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.006" Int., .010" Exh., (hot).

Valve Spring Pressure:—104-110 lbs. at 1 11/16" (valve closed), 46-50 lbs. at 2 1/32" (valve open).
Remove right fr. wheel & cover for valve adjustm't.

LUBRICATION:—Crankcase Capacity—6 qts. (refill).

Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY C-14:—Willard, Type WH-2-15, RH-2-15 (Exp.). See Model C-17 page for C-15 Battery Specifications. 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left side under drivers seat.

STARTER C-14:—Models MAX-4015, 4016 (Exp.) Armature No. MAW-2030. See C-17 page for C-15 data.

Drive—Positive shift outboard pinion.

Cranking Engine—Approx. 200 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange screws.

Starting Switch C-14:—(MAX-4015). SW-2813. Mounted on starter field frame and operated by pinion shift (starting pedal). See article in Electrical Equipment Section for pedal adjustment. **(MAX-4016).** Solenoid Switch Type SS-4104. See Model C-17 page for description and Switch Specifications.

GENERATOR:—Model GCO-4801-C (C-14, C-15 LHD & RHD), GCO-4801-D (C-14 Exp. Bolivia). Armature No. GCO-2006-F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—28 amps., 8.0 volts, 1850 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent upon battery condition.

Charging Rate Adjustment—No adjustment on Generator. See Regulator section below for Voltage and Current Regulator settings.

Cold			Performance Data	Hot	
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.

24	7.8	1610	24	7.8	1880
28	8.0	1850	28	8.0	2200

NOTE—Cur. regulator limits output to 28 amps. max.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ozs. (new brushes).
Field Current—1.47-1.63 amperes at 6.0 volts.
Motoring Current—3.85-4.25 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolts & pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs.

GENERATOR:—Model GCE-4804-A. C-14 Export. Description, Charging Rate Adjustment, Removal and Belt Adjustment as given above.

Maximum Charging Rate—30 amps., 8.0 volts, 1400 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.

Cold			Performance Data	Hot	
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.

30	8.0	1400	30	8.0	1580

NOTE—Cur. regulator limits output to 30 amps. max.

REGULATOR:—Models VRB-4004-A (GCE generator & GCO Exp. Bolivia), VRB-4004-B (all others), Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator and Vibrating Current Regulator in case on dash.

See Model C-17 page for Regulator Data.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Aim headlamps straight ahead (lenses in place, car unloaded, upper beams lighted) with center of hot spot 3" (C-14), 2" (C-15) below center horizontal line of headlamps at 25 feet. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in full out position.
Headlamp Beam Indicator—In light switch knob. Lighted whenever headlamp upper beams in use.

Switches

Lighting—Chrysler Part No. 667044.
Instrument Light—Chrysler Part No. 667043.
Foot Selector—Chrysler Part No. 659512.
Stop Light—Chrysler Part No. 661721.

FUSES:—Lighting—20 amperes, on back of ammeter. **Horn**—20 amp. (single) in connecter near starter or 30 amp. (dual horns) in horn relay.

HORNS:—Auto-Lite Mod. HC-5103. Twin horns, blended tone with horn relay.
Horn Relay—Auto-Lite Model HR-4002.

SERIAL NUMBER:—First number 7,019,401. Located on right front door hinge post.

COMPRESSION:—Ratio and Pressure as follows:

Ratio	Press. at 1000 R.P.M.	At 100 R.P.M.
6.50-1 std head	145-155 lbs.	Approx. 117 lbs.
7.45-1 optl. head	160-170 lbs.	Approx. 124 lbs.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Model CE-4618. Service Winding (coil less switch and cable) CE-3224S. Mounted on hood ledge.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6744. Connected to coil by armored cable.

Ignition Lock—Yale & Towne Mod. DP-108 Mitchell No. 6286.

Distributor Model IGT-4001C-1, IGT-4001E-1. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .017".

Cam Angle or Dwell—27° closed, 18° open (distrib.).

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part No. IG-2671G. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	950	12	1900
9	1500	18	3000
11	1850	22	3700

Vacuum Spark Control—Provides additional advance for intermediate speed range above idling except when engine is accelerated or operated with wide open throttle.

Vacuum Spark Advance

Engine Degrees	Vacuum
1.4	6" of HG
12	12" of HG

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, lift out. Distributor accessible by taking off cover plate under left front fender.

IGNITION TIMING:—Settings for all engs. as follows:

	Flywheel Degrees	Piston Position
6.50-1 std. head	5° ATDC	.0118" ATDC
7.45-1 optl. head	9° ATDC	.0381" ATDC

NOTE—Impulse neutralizer at front of engine marked with 15 one degree graduations before and after '0' mark at top dead center.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table above), stop when correct mark on impulse neutralizer at front of engine is directly in line with pointer on chain case cover. Loosen advance arm hold-down screw, center pointer on scale (opposite '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until test lamp goes out indicating that contacts are just opening, tighten clamp bolt, check spark plug connections.

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint. See article in Electrical Equipment Section.

Timing (Motor Gauge)—Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion Type H-10, 14 MM. Metric.

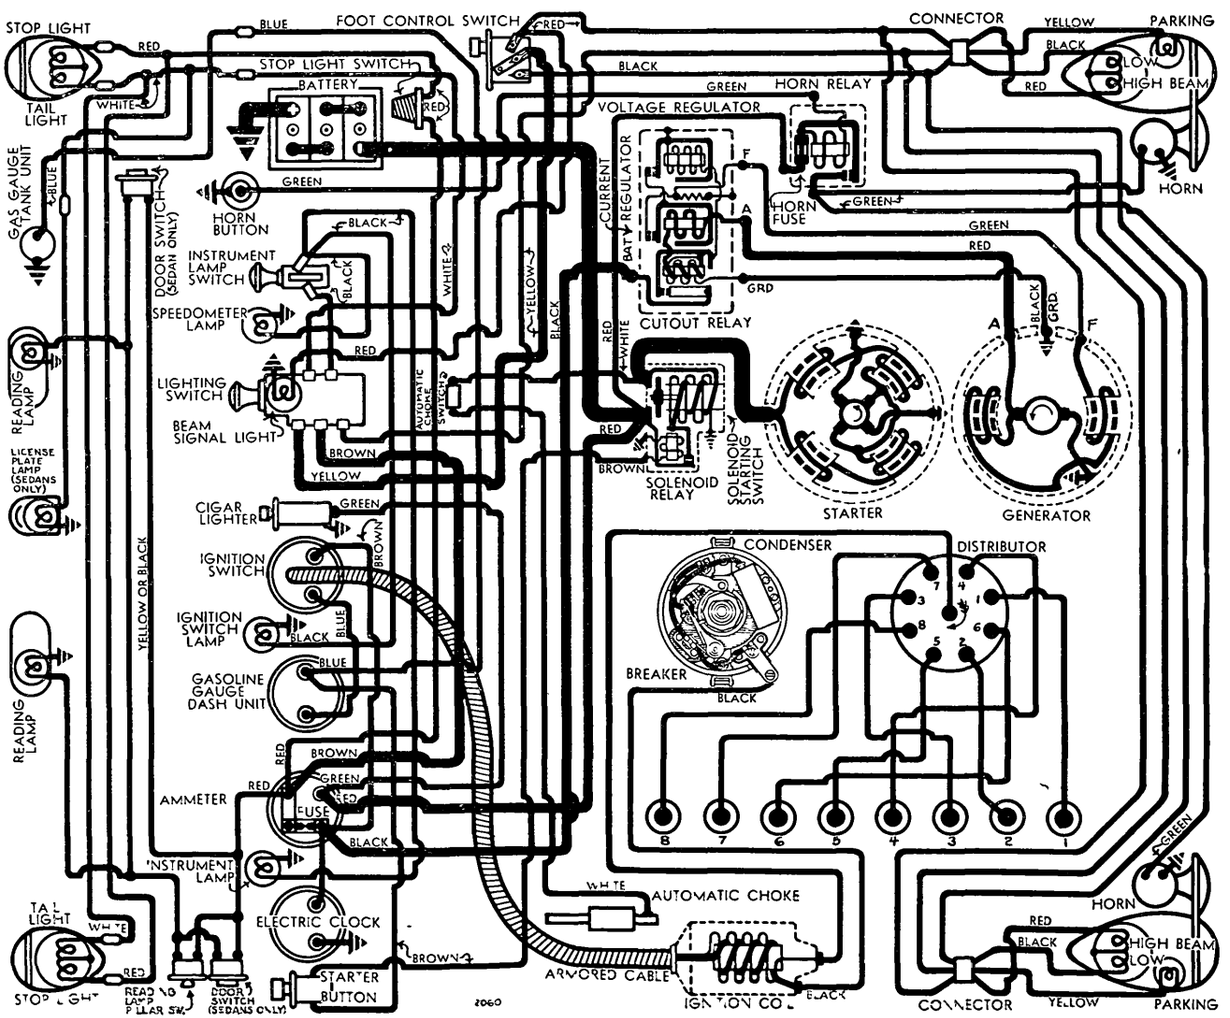
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Stromberg Mod. EE-22, 1¼" dual downdraft type.

See Article in Carburetion Section.

Idle Adjustment—With engine warm and choke valve wide open (fast idle inoperative), adjust throttle stopscrew so that idle speed is 7-8 M.P.H. Turn both idle adjusting screws (in succession) in until engine begins to lag or miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed if necessary.

Accelerating Pump Setting—Pump lever has two holes for pump link engagement. Set as follows: Inner Hole—Hot weather or alt. above 3000 feet. Outer Hole (Max. stroke)—Cold weather.



Fast Idle:—No adjustment required. Throttle should rest on high point of cam with choke valve closed.

Automatic Choke:—Sisson Type AC-600. See article in Carburetion Equipment Section for adjustments.

Air Cleaner:—AC. #1526747 oil-wetted type standard. #1526589 oil bath type optional.

Fuel Pump:—AC. Type I #1521549 combination fuel-and-vacuum pump. See article in Carburetion Equipment Section for complete data.

Gasoline Gauge:—Motometer Electric. Dash unit—NG-7808D. Tank unit—NG-6876T. See article in Carburetion Equipment Section for complete data.

CONTINENTAL

FOUR CYL. BEACON MODEL (1933), MODEL 41 (1934).
AUTO-LITE ELECTRICAL SYSTEM

CAR SERIAL NUMBER:—On plate on upper toeboard. First serial number 40-1001.

ENGINE NUMBER:—On plate on left hand side of crankcase. First serial number C400-101.

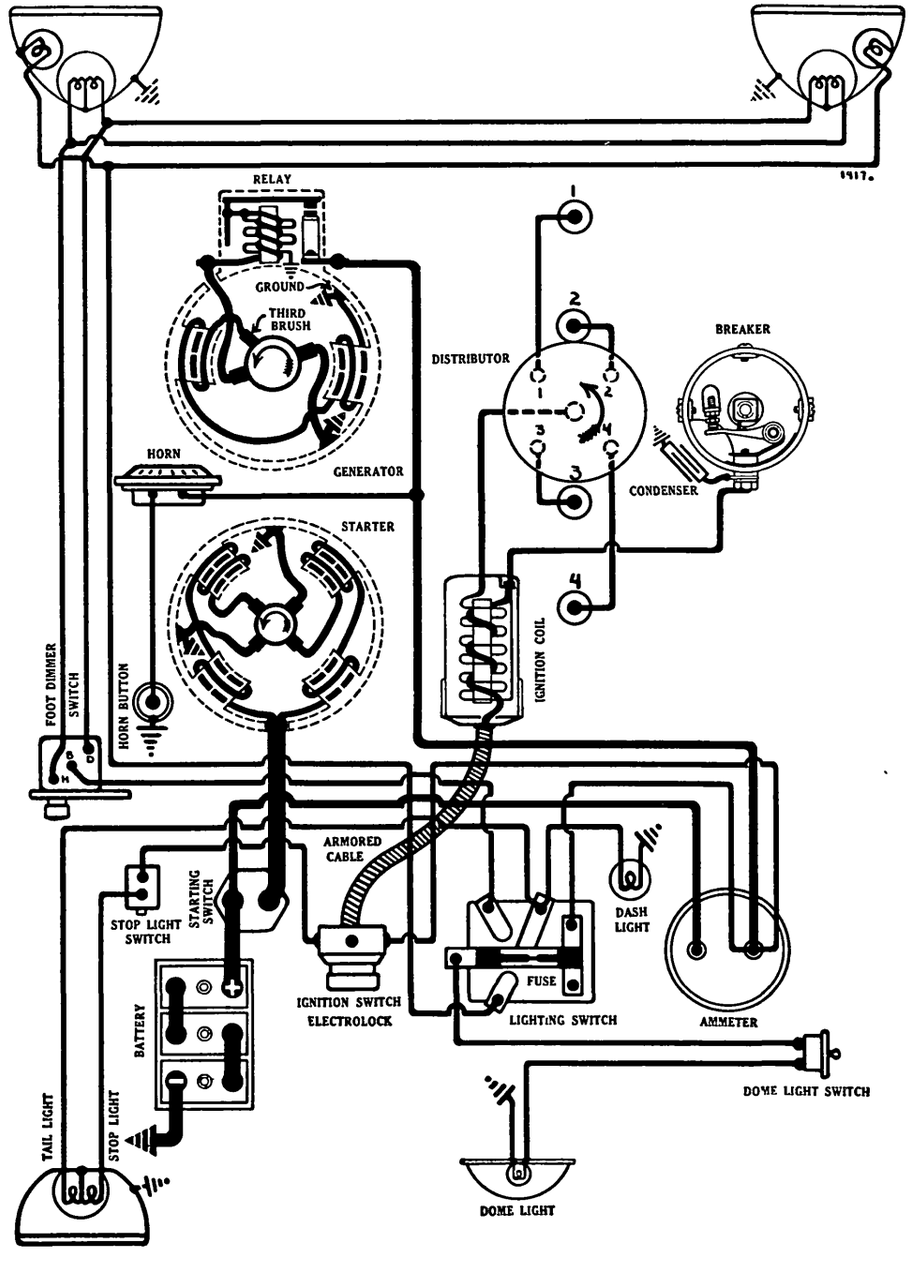
ENGINE:—Four cylinder, 'L' head type, 3⅜x4″ bore and stroke, 143.12 cubic inch displacement, rated at 18.22 H.P., develops 40 H.P. at 2800 R.P.M. Standard compression ratio 5.05-1. Optional compression ratios are not offered.

BATTERY:—U.S.L. Frontier ,Type A-13-A, 6 volt, 13 plate, 78 ampere hour capacity (5 ampere rate). Starting capacity 90 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to transmission.
Mounting:—In cradle on left hand frame side rail under front floor.
Dimensions:—Width, 7″. Length, 9″. Height, 8 ⅝″.

IGNITION:—Coil Model IG-4606. Coil mounted on dash. Assembled as unit with ignition switch by means of armored cable on primary lead.
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped).
Ignition Switch:—Electrolock Type 16-S. Assembled as unit with coil. Stop light connected to ignition switch and operative only with switch turned on.
Distributor Model IGB-4079 (first 100 cars), IGB-4201 (1370 cars). IGB-4202 (55 cars), IGB-4202-A. Single breaker 4 lobe cam, semi-automatic advance type (IGB-4079, 4201), full automatic advance type (IGB-4202, 4202-A).
Breaker Gap:—Set contact gap at .020″. Hold within limits of .018-.020″.
Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.
Manual Advance—(IGB-4079, 4201) 15° (engine).
Cam Angle or Dwell—(IGB-4079) Closed 46°, Open 44°. (IGB-4201, 2, 2A) closed 41°, Open 49° (distributor degrees).

Automatic Advance—Models IGB-4079, 4201, 4202

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	250	0	500
3	335	6	670
5	400	10	800
9	800	18	1600
13	1200	26	2400



Automatic Advance—Model IGB-4202-A

Start	350	0	700
4	540	8	1080
8	740	16	1480
14.5	1050	29	2100

Mounting:—Distributor mounted on cylinder head. To remove, disconnect breaker lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.
Oiling:—500 Miles. Put 4-5 drops S.A.E. #20 engine oil in oiler.
1000 Miles. Take off distributor cap and rotor, put one drop of oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard Settings are as follows:
First Cars—4° (flywheel), .00628″ (piston) before top dead center.
Later Cars—7° (flywheel), .01915″ (piston) before top dead center.
To Set Ignition Timing. With No. 1 poston on compression, turn engine oven by hand until flywheel mark 'IGN/' (which is 4° or .349″ before top dead center mark 'DC') registers with indicator on edge of inspection hole in left hand front face of flywheel housing. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.
Firing Order:—1-3-4-2. No. 1 cylinder nearest radiator.
Spark Plugs:—18 MM. Metric. AC Type G-10 ('33) G-12 ('34).

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked and camshaft settting "9 links" is stamped on front end plate in chain case. Mesh sprockets in chain so that there are 9 links or 10

CONTINENTAL

AUTO-LITE ELECTRICAL SYSTEM

chain pins between the marks on the sprockets (begin count with pin in line with tooth meshed opposite mark on crankshaft sprocket and mesh the tooth in line with the tenth pin opposite mark on camshaft sprocket.

To Check Valve Timing. With No. 1 piston on top dead center, set tappet clearance of No. 1 exhaust valve at .010". Turn engine over one complete revolution and stop with piston slightly past top dead center when flywheel mark 'EX.CL.#1' registers with indicator in inspection hole in left hand front face of flywheel housing. No. 1 exhaust valve should close at this point. Reset tappet clearance at .006-.008" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 31/64"	5/16"	3 29/32"	45°	.281"
Exhaust	1 17/64"	5/16"	3 29/32"	45°	.281"

Tappet Clearance

Operating Timing

Intake .....006-.008" (hot).

Exhaust .006-.008" (hot), .010" (cold).

Valve Springs

Closed .....33.2 pounds.

Open .....73 pounds.

Timing

Intake Valves

Open—At top dead center.

Close—40° after lower dead center.

Exhaust Valves

Open—35° before lower dead center.

Close—5° after top dead center.

CARBURETION:—Marvel Updraft Carburetor, Model AC (see Carburetor Section for complete data). Choke is controlled manually by button on instrument panel.

Air Cleaner:—Cap on air cleaner should be removed at 5000-mile intervals and screen cleaned by washing in gasoline. In replacing cap see that opening points toward rear of engine.

Fuel Pump:—A.C. Mechanical type fuel pump mounted on right hand side of crankcase and operated by eccentric on camshaft (see Carburetion Section) for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model MZ-4034, 35. Starter drive—Inboard Bendix. Starter Switch Model SW-4001 is mounted on upper right hand toeboard. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4300	5.5	70
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420
11.8 "	Lock	4.0	560

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, take out flange mounting cap screws, pull starter forward to clear Bendix, lift out.

Oiling:—500 Miles. Put 5-6 drops S.A.E. #20 engine oil in commutator end oiler. Drive end bearing is oilless.

GENERATOR:—Model GAM-4505. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amperes (cold) at 8.0 volts reached at 2400 R.P.M.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	700	0	6.4	760
4	6.9	880	4	6.9	1040

Brush Spring Tension:—18-22 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.

Motoring:—4.94-5.46 amperes at 6.0 volts.

Mounting:—Cradle mounted at left front of engine with fan belt drive. Water pump is driven by extension of generator shaft. To remove, disconnect water pump drive coupling, disconnect lead, loosen belt adjustment and slip off drive belt, loosen mounting clamp band and lift generator out.

Belt Adjustment:—To take up fan belt, loosen large nut holding fan on bracket, lift fan up until fan can just be turned with belt held stationary, tighten mounting nut.

Oiling:—500 Miles. Put 5-6 drops S.A.E. #20 engine oil in oiler at each end.

RELAY:—Model CB-4014. Mounted on generator field frame. Relay contacts close when generator voltage reaches 7.0-7.5 volts and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". **Air Gap:**—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5670-AA. Dimmer Switch Model C-2100-A. Lighting switch mounted on back of instrument board and controlled by push-pull button at lower right center of instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated dimmer switch on toeboard. Stop and tail light is fitted with double filament bulb.

12	7.4	3200	9.5	7.7	3200

Brush Spring Tension:—8-13 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.

Motoring:—4.27-4.73 amperes at 6.0 volts.

SPECIAL GENERATOR:—Model GAR-4602 (cars with Radio). This type generator used in conjunction with Type XA-414-AS Regulator (Owen-Dyneto Battery Charge Regulator). See Equipment Section for complete data.

Mounting:—Cradle mounted at left of engine with fan belt drive. Water pump is driven by extension of generator shaft. To remove generator, disconnect water pump drive coupling, disconnect lead, slack off belt adjustment and slip off drive belt, loosen mounting clamp band, lift generator out.

Belt Adjustment. To take up drive belt, loosen nut on rear of fan shaft stud, raise fan until fan can just be turned with belt held stationary, tighten mounting nut.

Oiling:—500 Miles. Put 5-6 drops S.A.E. #20 engine oil in oiler at each end. **5000 Miles.** Remove grease cup under bearing retainer on commutator end of generator, clean out all old grease, fill cup with medium cup grease, dip wick in light engine oil before reassembling.

RELAY:—Model CB-4014 (GAL-4330), CB-4021 (GAR-4602). Contacts close at 675 R.P.M. when generator voltage reaches 7.0-7.5 volts with charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". **Air Gap:**—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5670-AA. Dimmer Switch Clum Model 9251 or Soreng-Manegold Model C-2100-A. Lighting switch mounted on back of instrument board and controlled by push-pull button on instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated dimmer switch on toeboard. Stop and tail light is fitted with double filament bulb.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158
Dome Light	6-8	3	S.C.	63

FUSES:—20 ampere capacity lighting fuse mounted on back of lighting switch. 20 ampere capacity fuse mounted on fuse block on back of instrument board.

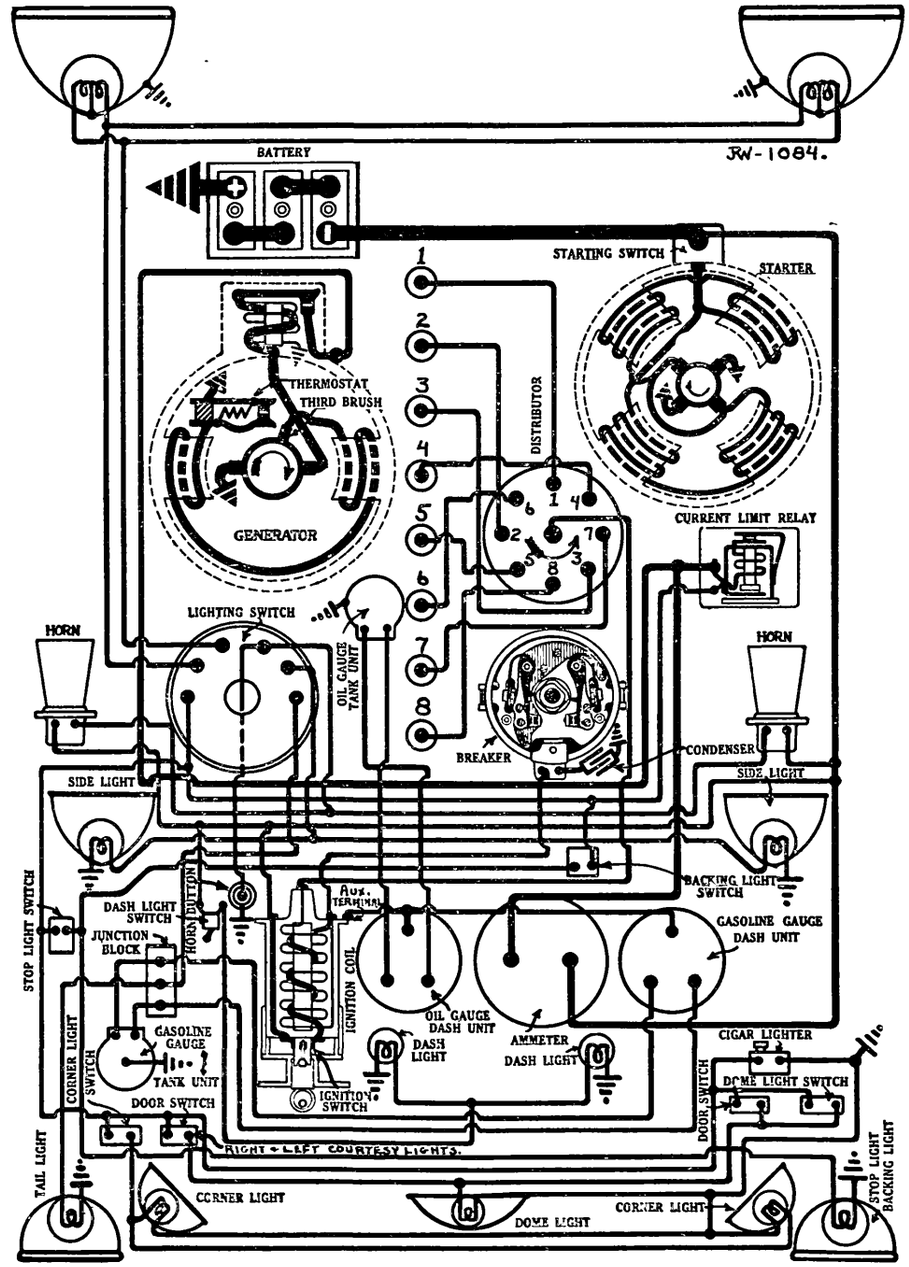
HORNS:—Sparton Vibrator type horn. Twin horns are optional.

CORD

FRONT WHEEL DRIVE, MODEL L-29 (1929-30-31-32)
PRODUCTION STARTED JULY 1, 1929—SERIAL NUMBERS 2,925,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

The Cord is a Front Wheel Drive Automobile. The engine, while essentially a stock engine, is reversed in the chassis with the flywheel and transmission at the forward end. The timing chain is likewise at the forward end between the engine block and the flywheel. The crankshaft revolves counter-clockwise. The starter drives to the flywheel and is mounted on the rear of the flywheel case which is thus the forward end of the engine. The battery is mounted near the starter on a bracket above the transmission case under the engine hood. The electrical units are similar to those used on ordinary rear wheel drive cars and no trouble should be experienced in service work.

BATTERY:—U.S.L. Type XY-15X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted on special bracket directly above transmission case under the engine hood at the forward end of the engine on the first cars. On later cars, battery is mounted in a battery box under the right fender on the outside of the right hand frame rail.



IGNITION:—Coil Model 526-V. Coil is mounted on the back of the instrument board with the ignition switch (which is built in the base of the coil) extending through to the face of the instrument panel. An extra terminal is located on the end of the coil from which the feed for the gasoline and oil gauge is taken. Ignition current is .6-3.0 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 658-W. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 17 degrees reached at 3600 R.P.M. Distributor has two sets of contacts on a four sided cam. Contacts separate alternately at intervals of 45 degrees corresponding to the firing interval of 90 degrees on the engine crankshaft. Contacts must be synchronized for correct ignition performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual control rod and primary lead and take off distributor head with cables intact. Then remove hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one half turn every month or each 1000 miles of operation. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft and place a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts: Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (top dead center entering power stroke). If the second set of contacts do not open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

CORD

FRONT WHEEL DRIVE, MODEL L-29 (1929-30-31-32)
PRODUCTION STARTED JULY 1, 1929—SERIAL NUMBERS 2,925,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke is 12.8° or 3-4 teeth on the flywheel before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the engine is hand cranked in the usual way through an opening in the differential case at the front of the engine. The hand crank engages the crankshaft through an idler shaft and spur gear so that the crank should be turned clockwise in the usual way). Fully advance spark control lever. Continue to crank engine over until a point on the flywheel 3 teeth before the top dead center mark '1-8DC' is directly opposite the indicator in the inspection hole in the flywheel case. The crankshaft rotates in the opposite direction from an ordinary engine which reverses the position of the mark on the flywheel. Then loosen advance arm clamp screw and rotate distributor until one set of contacts begin to open. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the plug in cylinder No. 1.

The proper ignition setting is determined by setting breaker contacts to open at top dead center with the manual spark control fully advanced and then rotating distributor clockwise to advance spark until a slight 'ping' or spark knock is noticed throughout the speed range of the car.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. No. 1 cylinder nearest the radiator.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches. Stem diameter, .341-.3425 inch. Stem length, 4⅞ inches. Valve lift, 11/32 inch. Tappet clearance, .006 (hot). Spring pressure, 45.5 pounds (valve closed). Inlet valves open at top dead center and close 45 degrees after lower dead center on 1929 cars, and open 5 degrees before top dead center and close 40 degrees after lower dead center on 1930 and 1931 cars.

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .341-.3425 inch. Stem length, 4⅞ inches. Valve lift, 11/32 inch. Tappet clearance, .008 inch (hot). Spring pressure, 45.5 pounds (valve closed). Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are made.

To Set Valve Timing:—Turn crankshaft and camshaft so that punch mark on crankshaft sprocket is directly opposite and midway between the two marks on the camshaft sprocket (use a straightedge across the shaft centers). Mesh chain without disturbing position of shafts.

To Check Valve Timing. Crank engine over until No. 1 piston is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Crank engine over one complete revolution and stop with piston on top dead center when flywheel mark '1-8.D.C.' is opposite the indicator on 1929 cars, or when piston is 5 degrees before top dead center with dead center mark on flywheel 1½ teeth before the indicator on 1930 and 1931 cars. The No. 1 inlet valve should begin to open at this point.

STARTER:—Model 724-N. Starter is connected to the engine through reduction gears and a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces. Starting switch is Delco-Remy Part No. 821627.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is flange mounted at right of engine on rear of flywheel case. To remove starter, disconnect engine ventilator pipe and starter cable and take out three flange mounting cap screws. Then pull starter to the rear to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the armature shaft every month or each 1000 miles of operation. Every six months remove the grease plug in the reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 941-T, 957-J. The direction of rotation is clockwise, viewed from the commutator end. Current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165° cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 19-21 amperes at 8.5 volts reached at 1450 R.P.M.

Generator Data—Model 957-J

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7-7.3	750	11-14	7.35-7.65	1900-2100
19-22	8.3-8.7	1550			

Model 941-T

19-21	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Shunt field current is 4-6.1 (941-T) or 2.8-3.5 (957-J) amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

NOTE:—Model 941-T generator was used on first 2000 cars.

Mounting:—Generator is base mounted at left of engine and is driven by accessory shaft from the chain case. To remove generator, disconnect lead and two screws in flexible drive coupling. Then take out four screws in base and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles of operation.

RELAY:—Model 265-J. Relay is mounted on the generator. Relay contacts close at 575 R.P.M. when the generator voltage reaches 6.8-7.3 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Soreng Manegold Switch Model 5650-A. Switch is mounted at the base of the steering column. Double filament headlights using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Tail light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and dome lights are 6-8 volt, 3 cp. S.C. Mazda 63. Corner lights are 6-8 volt, 6 cp. S.C. Mazda 81.

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits to protect them from overload and short-circuits. It begins to vibrate when the current reaches 25-30 amperes and continues limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

SERIAL NUMBER:—First number—1101. Stamped on Service Motor plate on right side of cowl under hood.

COMPRESSION:—**Ratio**—6.5-1 Std. aluminum head. **Pressure**—Approximately 110 lbs. at cranking speed of 130 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 6 M.P.H.

IGNITION:—**Coil Model CE-4620.** Service Winding (coil less switch and cable) CE-3224S.

Ignition Current—3 amperes idling, 4½-5½ amperes at 6.0 volts stopped.

Ignition Switch:—Mitchellock Model 16-S, Type 6679. Connected to coil by armored cable. Switch has two 'on' positions—right hand (Startix operative, regular running position), left hand (Startix not operative, ignition on).

Ignition Lock—Yale & Towne Model 9366. Mitchell No. 6622.

Distributor Model IGP-4006. Single breaker, 8 lobe cam, full automatic advance type. No sychronization required.

Breaker Gap—Set at .017".

Cam Angle or Dwell—27.5° closed, 17.5° open.

Breaker Arm Spring Tension—18-20 ozs.

Condenser—Part No. IG-2671. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2.5	600	5	1200
5	900	10	1800
7.5	1200	15	1500
10	1500	20	3000

Removal:—Distributor mounted between cylinder banks at forward end of engine. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—

	Flywheel Deg.	Piston Position
All engines	5° BTDC	.0089" BTDC

NOTE—Use left hand 'on' position of switch if ignition turned on to check timing to avoid automatic cranking.

To Set Timing—Crank engine by engaging transmission and rolling car on floor or by jacking up one front wheel and turning wheel by hand. With #4L piston (rear piston left bank) on compression, turn engine over until piston reaches firing position, stop when point of flywheel exactly 2 teeth before top dead center mark '4L' lines up with pointer in inspection hole in right side of flywheel housing. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.

Firing Order:—4L-2L-2R-1R-3R-4R-1L-3L with cylinder banks right (R) and left (L) viewed from driver's seat and #1 cylinder nearest radiator. See diagram.

Spark Plugs:—Champion Type J9B. 14 MM. Metric.

Spark Plug Gaps—.025".

CARBURETION:—**Carburetor**—Stromberg Model EE-15, 1" dual, downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not make carburetor adjustments until engine is warmed up and idling at hot or slow idling speed with choke valve wide open.

Idle Adjustment—Set throttle stopscrew so that idling speed is 6 M.P.H. Turn each idling adjusting screw, in succession, in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Not adjustable.

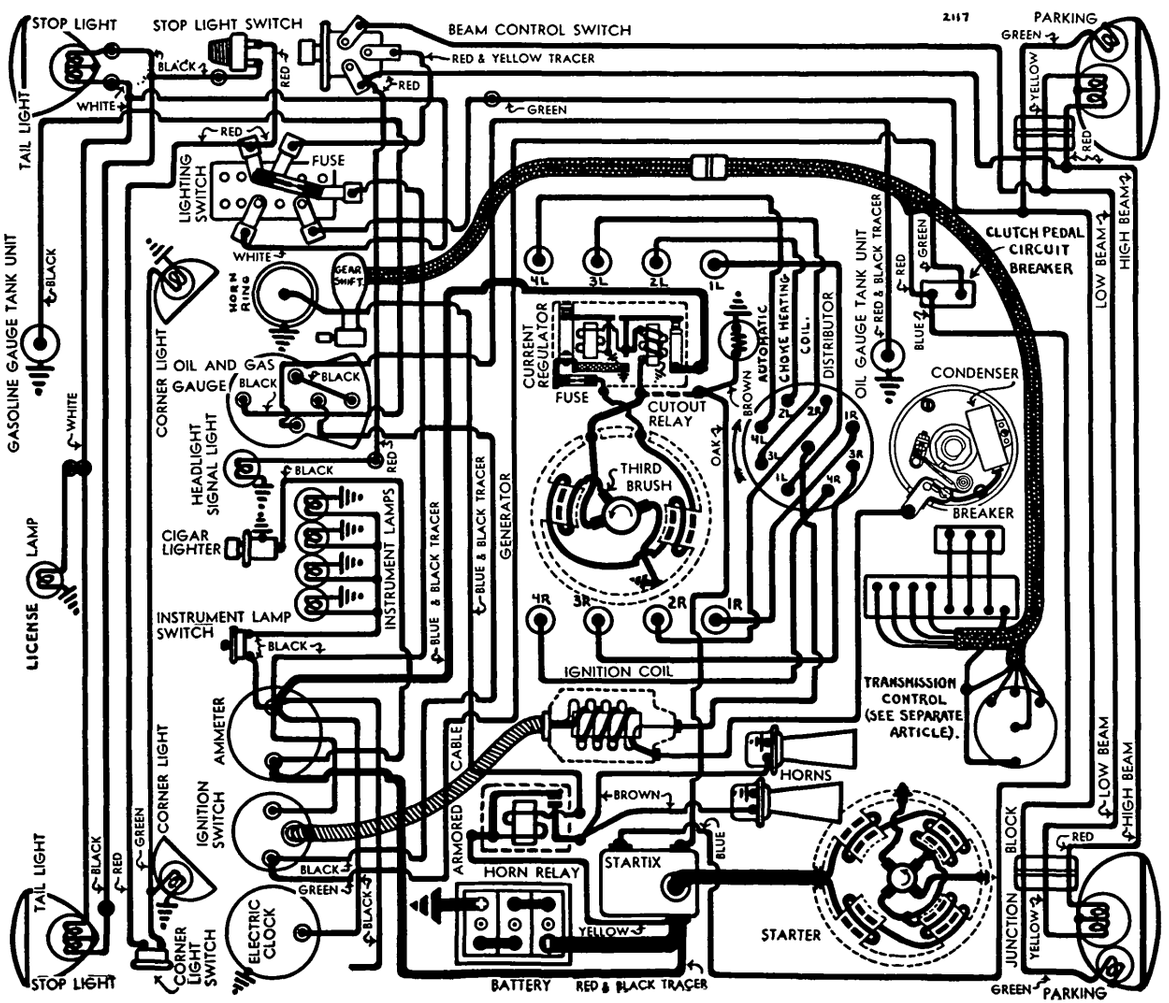
Fast Idle:—Integral with carburetor. See article in Carburetion Section on Fast Idle and Automatic Choke as used with EE-15 carburetors. Not adjustable.

Automatic Choke:—Integral with carburetor. See article in Carburetion Section (same as Fast Idle above).

Air Cleaner:—AC. #1525598 oil-wetted type std.

Fuel Pump:—AC. Special. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Stewart-Warner. Combination electric gasoline and oil gauge.



VALVE TIMING:—**To Check Timing**—Set tappet clearance #4L (rear cylinder—left bank) intake valve at .016". This valve should be about to open (with clearance not taken up) with piston 7½° or .0200" before top dead center when point on flywheel approximately 3 teeth before dead center mark '4L' lines up with pointer in inspection hole in right hand side of clutch housing. Reset tappet clearance at .008".

Tappet Clearance:—.008" all valves—engine cold.

Valve Spring Pressure:—42-47 lbs. (valve closed), 88-94 lbs. (valve open).

LUBRICATION:—**Crankcase Capacity**—8 qts.

Normal Oil Pressure—30-40 lbs. (warm oil).

TRANSMISSION REMOTE CONTROL GEAR SHIFT:—Bendix electro-pneumatic type gear shift standard. See article in Equipment Section for complete description, wiring diagram and trouble shooting on this unit.

BATTERY:—**U.S.L. Type FN-19F.** 6 volt, 19 plate, 108 ampere hour capacity (20 hour rate).

Starting Capacity—135 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under driver's seat.

STARTER:—**Model MAX-4021. Armature No. MAW-2006.**

Drive—Bendix Barrel Type No. A-1729.

Cranking Engine—130 R.P.M., 180 amperes at 5.1 v.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300 Min.	5.5	65 Max.
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Starter flange mounted on right rear face of flywheel housing. To remove, take out 3 flange mounting screws.

Starting Switch:—Startix Type D. Automatic starting controlled by ignition switch and operative only with clutch disengaged (lead taken through Master Shift switch or clutch pedal circuit breaker of Transmission Control system).

GENERATOR:—**Model GAR-4630-5 Armature GAR-2077 (first), Model GBR-4603-4 Armature GAR-2116 (later).** Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

NOTE—Model GBR-4603-4 fitted with resistance-jumper control switch on side of regulator case which should be opened (regulator operative) for summer driving and closed (regulator resistance short-circuited) for winter driving.

Charging Rate Adjustment—Use test meters to check output. Short out regulator by closing control switch (above) or by connecting jumper between fuse cup on regulator case and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction. Remove jumper wire.

Maximum Charging Rate—22 amperes (GAR-4630-5) 26 amperes (GBR-4603-4) cold, reached at 2400 R.P.M., 1500 engine R.P.M. (tachometer).

Performance Data—GAR-4630-5

Cold — Regulator Contacts Closed — Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2400			

Performance Data—GBR-4603-4

0	6.4	720	0	6.4	780
4	6.65	820	4	6.7	900
8	6.9	920	8	6.95	1060
12	7.1	1050	12	7.2	1250
16	7.4	1200	16	7.5	1440
20	7.6	1400	20	7.8	1840
26	8.0	2400	23	8.0	2800

Rotation—Counter-clockwise at commutator end.

Bush Spring Tension—24 ozs. min., 36 ozs. max.

Field Current—3.51-3.89 (GAR-4630-5), 4.18-4.62 (GBR-4603-4) amperes at 6.0 volts.

Field Fuse—5 ampere in cup on regulator.

Motoring Current—5.03-5.67 (GAR-4630-5), 5.60-6.20 (GBR-4603-4) amperes at 6.0 volts. Allow ½ ampere additional if relay and regulator in circuit.

Removal:—Generator pivot mounted between cylinder banks at rear of engine. Driven by separate belt from pulley on rear end of camshaft. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Adjusted in usual manner by loosening pivot bolts and clamp bolt and swinging generator up until belt is tight.

RELAY-REGULATOR:—**Model TC-4302-A (GAR-4630-5), TC-4306-A (GBR-4603-4).** Consists of Cutout Relay and Current Regulator (two-rate charging control) in case on generator frame. See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge at 6.3 volts.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—**Headlamps**—Corcoran-Brown, Pre-focused type. Upper and lower beams controlled by foot selector switch on toeboard. Headlamps fold into fenders and are elevated for use by turning cranks at each end of instrument panel (independent control for each headlamp).

Switches

Lighting—Soreng-Manegold Model A5640A.
Foot Selector—Delco-Remy.
Stop Light—Motometer Model 50812 hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking	1½	55
Instrument, License	3	63
Stop and Tail	21-2	1158
Corner	6	81

FUSES:—**Lighting**—20 ampere on lighting switch.
Generator Field—5 ampere in cup on regulator.

HORNS:—Swarze Vibrator type twin horns operated by horn relay. Horn current approximately 6 amperes each.

NOTES:—Special Valve Timing, Ignition Setting, and Distributor (IGH-4028 which requires synchronization) used on Schgd. 812 model. All other equipment and service data same for both models.

Engine Hood—Hinged at cowl and lifts from forward end. Free hood by pressing up on latch under top radiator louvre at center in front.

Rotation—Crankshaft rotation counter-clockwise or opposite direction from conventional (occasioned by reversal of engine).

SERIAL NUMBER:—Stamped on Service Motor Plate on right hand side of cowl under engine hood.

COMPRESSION:—Ratio—6.32-1 Std. aluminum head.

Pressure—110 lbs. at cranking speed of 130 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 6 M.P.H.

IGNITION:—Coil Model CE-4620. Service Coil (less switch and cable) CE-3224S.

Coil Draw—3 amperes idling, 4½-5½ stopped.

Ignition Switch:—Mitchellock Model 16-S No. 6679. Connected to coil by armored cable. Switch has two 'on' positions—right hand (Startix operative, regular running position), Left hand (Startix off, ignition on).

Ignition Lock—Yale & Towne No. 9366. Mitchell No. 6622.

Distributor (Std. 812) Model IGP-4006. Single breaker, 8 lobe cam, full automatic advance type. No Synchronization required for this model.

Breaker Gap—Set at .017".

Cam Angle or Dwell—27.5° closed, 17.5° open.

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part No. IG-2671. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
2½	600	5	1200
5	900	10	1800
7.5	1200	15	2400
15	1500	30	3000

Removal:—Distributor mounted between cylinder banks at forward end of engine. To remove, take out hold-down screw in advance arm.

Distributor (Schgd. 812) Model IGH-4028. Double breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to regular 90° firing intervals of the engine and must be Synchronized (See Timing).

Breaker Gap—Set at .020" (both sets equal).

Cam Angle or Dwell—34° closed, 11° open for both sets operating together when correctly synchronized.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—No. IG-1025B. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	800	6	1600
6	1300	12	2600
9	1800	18	3600

Removal:—Same as for IGP-4006 above.

IGNITION TIMING:—For all engines as given below. Distributors on Schgd. Model 812 must be synchronized (not required for Std. Model 812).

	Flywheel Degrees	Piston Position
Std. 812 (FB Eng.)	5° BTDC	.0089" BTDC
Schgd. 812 (FC Eng.)	2° BTDC	.0014" BTDC

NOTE—Use left hand 'on' position of ignition switch if switch turned on to check timing with engine not running.

To Set Timing (Neon Timing Light)—This method recommended by manufacturer. Mark second tooth (Std. 812), first tooth (Schgd. 812) on flywheel before timing mark '4L' (dead center mark) with white paint. Clip one timing light to #4L spark plug (rear cylinder, left bank), direct light on flywheel through inspection hole in right side of flywheel housing. Idle engine, loosen distributor advance arm clamp bolt, rotate distributor until marked tooth appears in line with pointer on housing, tighten clamp bolt. Then synchronize movable contacts (Schgd. 812 only).

To Set Timing (Without Timing Light)—Crank engine by engaging gears and rolling car on floor or by jacking up one wheel and turning wheel by hand. With #4L piston on compression, turn engine over until a point on the flywheel 2 teeth (Std. 812), 1 tooth (Schgd. 812) before the dead center mark '4L' lines up with the pointer in the inspection hole in the right side of the flywheel housing. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (On Schgd. 812, this should be stationary set mounted directly on breaker plate), tighten clamp bolt. Then synchronize movable contacts (Schgd. 812 only).

Synchronization (IGH-4028):—Manufacturer recommends use of synchronizing test equipment to set movable contacts. Set distributor for regular 45-45-45 (distributor) degree firing intervals. See Electrical Equipment Section for data on 'IGH' synchronization. Distributor can be synchronized on

engine by turning engine over 1 full revolution plus 90° from firing position of piston #4L (first timing point) to firing position for piston #4R with point on flywheel 1 tooth before mark '4R' at pointer in inspection hole Then loosen lockscrews on movable sub-plate carrying second set of contacts, move plate until contacts begin to open, tighten lockscrews

Firing Order:—4L-2L-2R-1R-3R-4R-1L-3L with cylinder banks right R and left L as viewed from driver's seat and #1 cylinder at forward or flywheel end of engine See diagram.

Spark Plugs:—Champion Type J9B 14 MM Metric
Spark Plug Gaps— 025" (Std 812), .028" (Schgd 812).

CARBURETION:—Carburetor—Stromberg Model EE-15 (Std. 812), AA-25 (Schgd 812) Duplex or dual downdraft type
See articles in Carburetion Section for data.
Idle Adjustment (All Models)—Engine must be warmed up so that Automatic Choke and Fast Idle are inoperative Set throttle lever stopscrew so that engine idles at 500 R P M or approximately 6 M P H Turn each idle adjusting screw, in succession, in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly Readjust throttle stopscrew for correct idle speed
Accelerator Pump Setting—Not adjustable

Fast Idle:—Integral with carburetor
See article on each type in Carburetion Equip. Sec.

Automatic Choke:—Mounted on carburetor and linked directly to choke valve shaft Operated by electric heating coil
See articles in Carburetion Equipment Section.

Air Cleaner:—AC. #1528345 oil-wetted type Std

Fuel Pump:—AC Mod D, #1523340 Diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Stewart-Warner Combination gasoline and oil gauge Electric type
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing (Std. 812)—Set tappet clearance #4L intake valve (rear cylinder, left bank) at 016" This valve should open with the piston 7½° or 0200" before top dead center when a point on the flywheel exactly 3 teeth before the dead center mark '4L' lines up with the pointer in the inspection hole in the right side of the flywheel housing Reset tappet clearance at 008" with engine cold.

To Check Timing (Schgd. 812)—Same as above except that valve opens with piston 9° or 0287" before top dead center with point on flywheel approximately 3½ teeth before '4L' mark at indicator. Reset tappet clearance at 008- 010".

Tappet Clearance:— 008" (Std 812), .008-.010" (Schgd 812) all valves with engine cold.
NOTE—Carburetor and intake manifold must be removed to get at valves (manifold serves as cover for valve chamber) Tappet adjusting screw located on upper end of rocker arms

Valve Springs:—59½ lbs at 2 3/16" (valve closed), 122 lbs at 1 27/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts
Normal Oil Pressure—30-40 lbs. with warm oil.

TRANSMISSION REMOTE CONTROL GEAR SHIFT:— Bendix electro-pneumatic type gear shift standard equipment Complete description, adjustment directions, wiring diagram and Trouble Shooting given in separate article
See article in Electrical Equipment Section.

BATTERY:—U.S.L. Type FN-19F. 6 volt, 19 plate, 108 ampere hour capacity (20 hour rate) .
Starting Capacity—135 amperes for 20 minutes
Zero Capacity—300 amperes for 3 9 minutes.
Grounded Terminal—Positive (+) terminal
Location—On left side under drivers seat

STARTER:—Model MAX-4021. Armature MAW-2006.
Drive—Barrel type Outboard Bendix No A-1729
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs (new brushes)
Cranking Engine—130 R P M , 180 amps , 5 1 volts

Performance Data

Torque	R P M	Volts	Amperes
0 ft lbs	5300 Min	5 5	65 Max
65 "	3300	5 5	100
2 75 "	1630	5 0	200
5 5 "	970	4 5	300
8 7 "	600	4 0	400
12 0 "	300	3 5	500
16 5 "	Lock	3 0	640
25 0 "	Lock	4 0	880

Removal:—Starter flange mounted on right rear face of flywheel housing (flywheel at front of engine). To remove, take out 3 flange mounting screws

Starting Switch:—Startix Type D Automatic starting controlled by ignition switch Operative only with clutch disengaged (lead taken through clutch pedal circuit breaker or 'master shift switch')
See article in Electrical Equipment Section.

GENERATOR:—Mod. GBR-4603-4. Armature GAR-2116. Third brush control in conjunction with Two-Charge Regulator (Non-vibrating Current Regulator) Ventilated by fan on drive pulley
Maximum Charging Rate—26 amperes (cold), 8 0 volts, 2400 R P M , 1500 Engine R P M (tachometer)
Summer-Winter Adjustment—Resistance - jumper control switch on side of regulator case should be opened (regulator operative) for summer operation, and closed (regulator inoperative) for winter operation
Charging Rate Adjustment—Use test meters to check generator performance Short out regulator by closing control switch (winter setting above) or by connecting jumper between fuse cup on regulator case and ground Shift third brush by hand counter-clockwise to increase, or clockwise to decrease, charging rate Brush held in position by friction Remove jumper wire

Performance Data

Cold Regulator Contacts Closed					Hot
Amps	Volts	R P M	Amps	Volts	R P M
0	6 4	720	0	6 4	780
4	6 65	820	4	6 7	900
8	6 9	920	8	6 95	1060
12	7 1	1050	12	7 2	1250
16	7.4	1200	16	7 5	1440
20	7.6	1400	20	7 8	1840
26	8.0	2400	23	8.0	2800

Rotation—Counter-clockwise at commutator end
Brush Spring Tension—24 ozs min , 36 ozs. max
Field Current—4 18-4 62 amperes at 6 0 volts
Field Fuse—5 ampere in fuse cup on regulator.
Motoring Current—5 60-6 20 amperes at 6 0 volts (½ ampere more if relay and regulator in circuit).

Removal:—Generator pivot mounted between cylinder banks at rear of engine with belt drive from pulley on camshaft To remove, take out pivot bolts and clamp bolt

Belt Adjustment:—Adjusted in usual manner by loosening pivot bolts and clamp bolt and lifting up on generator.

RELAY-REGULATOR:—Model TC-4306-A. Mounted on generator Consists of Cutout Relay and Two-Charge Regulator (Non-vibrating Current Regulator) in a single case
NOTE—Regulator fitted with resistance-jumper control switch (see Generator adjust. for setting).
See article in Electrical Equipment Section.

Cutout Relay
Cuts In—6 5-7 25 volts
Cuts Out— 5-2 5 ampere discharge current
Contact Gap— 025- 045"
Air Gap— 010- 030" with contacts closed

Two-Charge Regulator
Contacts Open—8 25-8 75 volts at 70° F
Contacts Close—1 2-1 4 volts below opening point
Contact Gap— 005" minimum
Air Gap— 045" with contacts closed

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type with special retracting mechanism operated by individual cranks on instrument panel
Headlamp Adjustment—Raise each headlamp to full height, turn on bright or upper beams Lamp beam should be centered on 8" diameter circular targets drawn on wall 25' distant with centers 31" above floor and 27½" right and left of car center line To aim beams vertically, loosen locknut and turn slotted adjusting screw on rear of headlamp housing under fender To aim beams horizontally, loosen mounting screws on sides of headlamp body, shift headlamp (screw holes are slotted)
NOTE—When headlamps lowered into fender, door must line up with fender contour To adjust, turn stopscrew on crank lever which contacts door edge (at bottom and in back with headlamp up—cover plate at bottom of lamp housing under fender may be removed to get at lamp mechanism)
Headlamp Indicator—In speedometer dial. Lighted when bright or upper headlamp beams are lighted

Switches
Lighting—Soreng-Manegold Model A5640A

Lamp Specifications

Position	Candlepower	Mazda No
Headlamps	32-32	2331
Parking, Indicator	1½	55
Instrument, License	3	63
Stop-Tail	21-3	1158
Corner	15	87

FUSES:—Lighting—20 amp on back of lighting switch.
Generator Field—5 ampere in fuse cup on regulator.

HORNS:—Auto-Lite Horn Set No. HC-5005. Vibrator type, twin horns operated by horn relay.

CUNNINGHAM

SERIES V-9 (1930-31), V-10 (1932-33).
DELCO-REMY GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

CAR SERIAL NUMBER:—On left hand frame side rail near front motor arm.

ENGINE NUMBER:—On left front motor arm.

ENGINE:—Eight cylinder, 90 degree 'V' eight, 'L' head type, 3⅞x5" bore and stroke, 471 cubic inch displacement, rated at 48 H.P., develops 140 H.P. at 2800 R.P.M. Standard compression ratio 5.00-1. Optional high compression ratio 5.63-1 available.

BATTERY:—(1932)—Willard, Type RJ-4-15, 6 volt, 15 plate, 128 ampere hour capacity (20 hour rate).

(1933)—Willard, Type RH-4-17, 6 volt, 17 plate, 136 hour capacity (20 hour rate). Starting capacity 160 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—In cradle under right front seat.
Dimensions:—Width, 7 1/16". Length, 11 11/16". Height, 9¾ or 9 5/16".

IGNITION:—Coil Type 5023660. Lock coil type mounted on back of instrument board.

Ignition Current:—4.75 amperes at 6 volts (engine stopped), 2.75 amperes with engine running at 400 R.P.M. decreasing to .8 ampere at 4000 R.P.M.

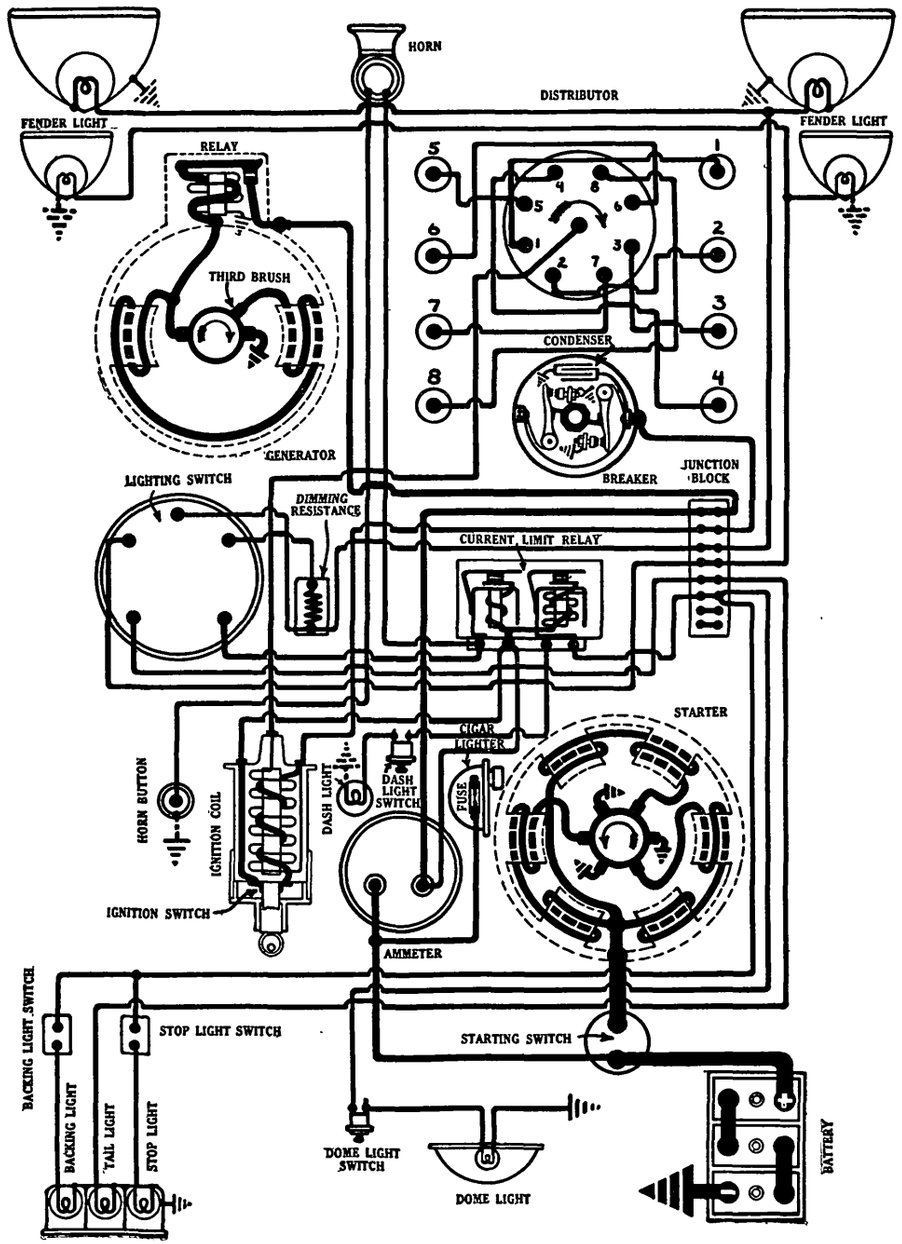
Distributor Type 10874. Two breaker arm, 8 lobe cam, semi-automatic advance type. Manual advance 40° (engine). Breaker contacts open simultaneously at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing). Breaker contact gap adjusted by loosening lock nut on stationary contact stud, turning up stud, tightening lock nut.

Contact Gap:—.018 inch. Hold within limits of .018-.020 inch. Gaps of both sets of contacts must be exactly the same.

Breaker Arm Spring Tension:—16 ounces on each breaker arm.

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		550	2		1100
13.5		1575	27		3150



Mounting:—Distributor mounted at front of engine between cylinder banks. To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out mounting screw, lift distributor out.

Oiling:—1000 Miles. Turn down grease cup on side of shaft one turn. Keep cup filled with medium cup grease. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pins, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting 1½" or 11°12' (flywheel) or .059" (piston travel) after top dead center with manual spark control retarded.

To Set Ignition Timing:—Retard manual spark control, take off cover plate over inspection hole in flywheel housing. With No. 1 piston (right hand bank) on compression, turn engine over until a point on the flywheel 1½" past the top dead center mark '#1 UP' registers with the indicator on the flywheel housing. Loosen advance arm clamp bolt, rotate distributor until both sets of contacts begin to open (contacts must be properly synchronized), tighten clamp bolt, see that rotor is opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

Synchronization of Contacts. Contacts must be synchronized whenever ignition timing is checked or contacts adjusted. Use test lamps connected across each set of contacts to determine opening point. Breaker plate is

CUNNINGHAM

SERIES V-9 (1930-31), V-10 (1932-33).
DELCO-REMY GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

constructed with .020" clearance within housing so that entire plate may be shifted after two lockscrews have been loosened. To synchronize contacts, loosen lock screws, shift plate until both sets of contacts open at same instant (lights should come on simultaneously), tighten lock screws. See Equipment Section for complete data on Synchronization.

Firing Order:—1-5-4-8-6-3-7-2 with cylinders numbered as shown on diagram, or 1R-1L-4R-4L-2L-3R-3L-2R with cylinder banks right (R) and left (L) as viewed from driver's seat and No. 1 cylinder nearest radiator.

Spark Plugs:—7/18 SAE. Short body. Champion Type C-4. Set gaps at .031".

VALVE TIMING:—Camshaft Setting. Camshaft directly above crankshaft and gear driven from crankshaft. Camshaft gear—GE. Textolite. Crankshaft gear—steel. Mesh gears so that marks on both gears are directly opposite.

To Check Valve Timing. With No. 1R piston on top dead center entering power stroke, check tappet clearance No. 1 intake and exhaust valves and set at correct figure if necessary. Turn engine over slightly more than one complete revolution and stop with flywheel mark 'EX.C.IN.0' (which is 5° after top dead center mark '#1 UP') at indicator on housing. No. 1 intake valve should open and No. 1 exhaust valve close at this point. Flywheel is marked 'EX.C.IN.0' at a point 5° after top dead center mark '#5 UP'. This intake opening and exhaust closing point for piston No. 5.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	2"	.432"	6 5/32"	45°	.375"
Exhaust	1⅞"	.432"	6 5/32"	45°	.375"

Tappet Clearance	Valve Springs
Intake .003" (cold)	Under load—95 pounds—2⅝"
Exhaust .003" (cold)	Spring constructed with 12½ coils

Timing

Intake Valves	Exhaust Valves
Open—5° after top dead center	Open—41° before lower dead center
Close—51° after lower dead center	Close—5° after top dead center

CARBURETION:—Stromberg Dual Downdraft Carburetor, Model DD-3. See Carburetor Section for complete data.

Fuel Pump:—If Autopulse electric pump is used on car, see Equipment Section for complete data.

Gasoline Gauge:—Grolan mechanical type gauge.

STARTER:—Model 350. Starter drive—Bendix. Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces on each brush. Starter switch Model 406-G mounted on toeboard.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	4.0	60
19 "	Lock	3.0	500

Mounting:—Flange mounted on right hand forward face of flywheel housing. To remove, disconnect cable, take out 3 flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—Starter bearings oilless. They require no attention.

GENERATOR:—Model 285. Third brush regulation. Rotation clockwise at commutator end. With standard car setting, maximum charging rate is 20 amperes (cold) at 8.3 volts reached at 1600 R.P.M. or 25 M.P.H.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by hand (there is a handle on the third brush plate for this purpose) clockwise to increase, or counter-clockwise to decrease charging rate. Third brush and mounting plate are held in position by friction.

Generator Data

Amperes	Volts	R.P.M.
3	....	600
9	....	800
18-20	8.3	1600

Brush Spring Tension:—24-28 ounces on each brush.

Field Current:—3 amperes at 6 volts across field terminals.

Motoring:—Approximately 6 amperes at 6 volts.

Mounting:—Cradle mounted at front of engine and accessible from left side. To remove, disconnect lead, loosen mounting clamp band by taking off lock nut and holding nut on mounting band, slide generator out.

Oiling:—500 Miles. Put 8-10 drops light engine in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close when generator voltage reaches 6.75-7.5 volts and open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-D. Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Headlights dimmed by resistance on dash, controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21	S.C.	1129
Fender or Cowl Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop and Backing Light	6-8	21	S.C.	1129
Dome and Corner Lights	6-8	3	D.C.	64

1932 cars were equipped with 32 cp. Mazda No. 1133 headlight bulbs.

NOTE:—Trouble lamp is plugged in on cigar lighter and is protected by cigar lighter fuse.

CURRENT LIMIT RELAY:—Model 5759. This unit consists of a vibrating and a lockout circuit breaker mounted on the dash. Vibrating circuit breaker begins to operate with current load of 35-40 amperes, limiting load to 5-20 amperes with direct short-circuit. Lockout circuit breaker begins to operate with a current load of 25-30 amperes, limiting current to less than 1 ampere.

Contact Gap:—.012-.030 inch. **Air Gap:**—.015-.025 inch (contacts closed).

Contact Arm Spring Tension:—5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

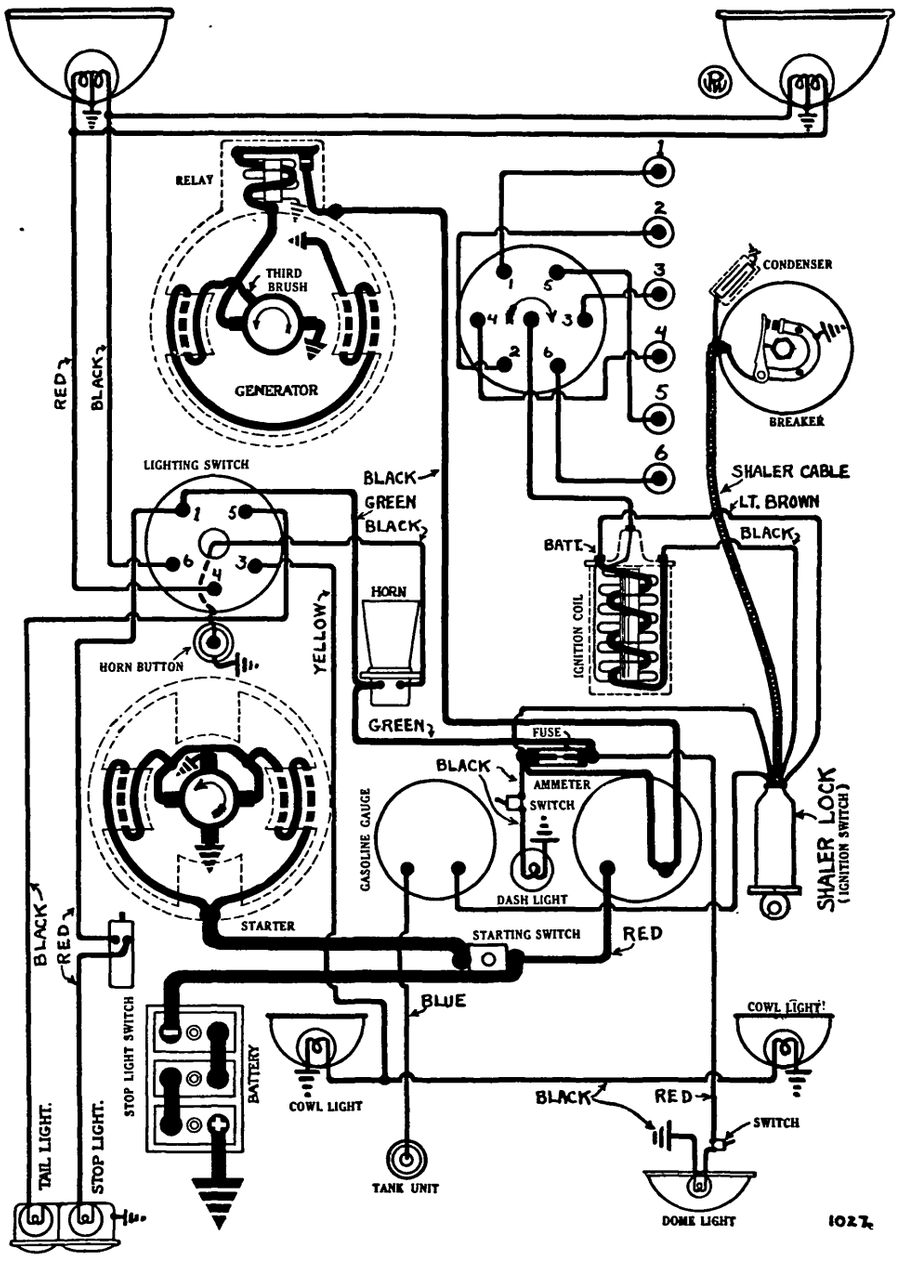
FUSES:—One 10 ampere capacity fuse mounted on cigar lighter reel.

HORNS:—Sparton vibrator type.

DE SOTO

MODEL K (1929), SERIAL NOS. KWOOOP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WR-13. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under front floor boards on left frame member.



IGNITION:—Coil Model 525-E. Distributor Model 631-C. Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Resurface contacts on a medium hard oilstone or with a fine flat contact file. To adjust contact opening, loosen lock screw and turn eccentric adjusting screw until desired breaker gap is obtained. Tighten the lock screw to hold adjustment. Distributor is semi-automatic type. Manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 20 degrees at 2600 R.P.M. Breaker arm spring tension is 17.5-20.5 ounces. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is a Shaler Lock.

Mounting:—Distributor is mounted on a diagonal shaft at the right of the engine and driven by an integrally cut gear on the camshaft. To remove distributor, disconnect manual advance rod and remove advance stop screw. Free the Shaler Lock at the dash. Then lift the distributor and Shaler Lock from place as a unit. See Equipment Section for complete data on the Shaler Lock.

Oiling:—Fill the grease cup on the side of the distributor with medium cup grease and turn down two turns every month or each 1000 miles.

Timing:—To time distributor to the engine remove the ⅛ inch pipe plug from the cylinder head (above the No. 6 piston), and screw a micrometer gauge into the tapped hole. Take a small 6 volt test lamp and connect one terminal to the distributor primary terminal and the other side to the battery terminal of the relay. If the relay is not connected to a battery, connect lamp to one terminal of a battery and ground the other terminal of the battery to the engine. When the points are closed the test lamp will burn, but when they are open the circuit is broken and the lamp will go out. Set the distributor at the full manual advance point. Turn the engine over and locate the dead center point, setting the micrometer gauge on zero at the dead center point. Next turn the engine over, coming up on the compression stroke on No. 1 cylinder and stop with the piston .035 inch before top dead center on standard head engines with a ratio of 5.2 to 1 or .008 inch before top dead center on the high compression head engines with a ratio of 6.2 to 1. While doing this press the distributor rotor back against the direction of rotation so as to remove all backlash in the drive mechanism. See that the rotor is at the No. 1 cable terminal. Loosen the screw which clamps the distributor timing lever to the distributor and rotate the distributor counter-clockwise as viewed from above until No. 1 cam begins to open the breaker points, i.e., until the lamp goes out. Tighten the clamp screw and reinstall the spark plug wires. To check timing, turn engine over two or three times then come up again on No. 1 compression stroke, tapping the crank lightly until the lamp goes out. If the dial gauge reads within the following limits ahead of dead center, the timing is satisfactory; if outside these limits, it should be reset. On the standard engines the limits should be within .030-.040 inch and on the high compression .006-.010 inch ahead of dead center.

NOTE:—If the new type timing gauge is used, which has a spark gap built in the face of the gauge, it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the distributor

DE SOTO

MODEL K (1929), SERIAL NOS. KWOOOP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be seen at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Champion Metric 18MM-1.5MM. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 15/32 inch; stem diameter, 11/32 inch; stem length, 4 11/16 inches. Tappet clearance is .004 inch (hot). Spring pressure is 88 pounds open and 47 pounds closed. Valve lift is 5/16 inch. Intake valves open at 6 degrees after top dead center and close at 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/32 inch; stem diameter, 11/32 inch; stem length is 4 11/16 inches. Tappet clearance is .006 inch (hot). Spring pressure is 88 pounds open and 47 pounds closed. Valve lift is 5/16 inch. Exhaust valves open at 42 degrees before lower dead center and close at 8 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across shaft centers.

STARTER:—**Model 714-J.** Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces. Starter switch is Model 404-Y.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4200	5.6	75
3 "	1500	5	200
6 "	800	4.5	300
9.4 "	350	4	400
12.8 "	Lock	3.5	500

Mounting:—Starter is flange mounted at left of engine on forward side of bell housing. To remove starter, disconnect starter cable and remove two flange mounting screws. Then slide starter from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The bearing on the drive end is oilless.

GENERATOR:—**Model 943-H.** The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, loosen the small screw on the generator end plate and shift the third brush mounting plate. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7.4	7.4	1000	6	7.05	1100
13	7.8	1375	10	7.45	1500
16	8.2	1700	12	7.7	1850
11.8	7.65	2750	10.4	7.5	2500

Shunt field current is 4-5.9 amperes at 6 volts. Generator brush tension is 16-18 ounces each.

Mounting:—Generator is mounted on the left to the front of the engine and is driven by a belt from the crankshaft. To remove the generator, loosen nut on adjustment clamp bolt and swing generator toward engine. Slip off drive belt. Then take out two bolts under generator forming bracket hinge and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks or each 500 miles.

RELAY:—**Model 265-B.** Relay is mounted on top of the generator. Relay closes when the generator reaches 600 R.P.M. with a terminal voltage of 7.25 volts and opens at approximately 500 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, with contacts closed.

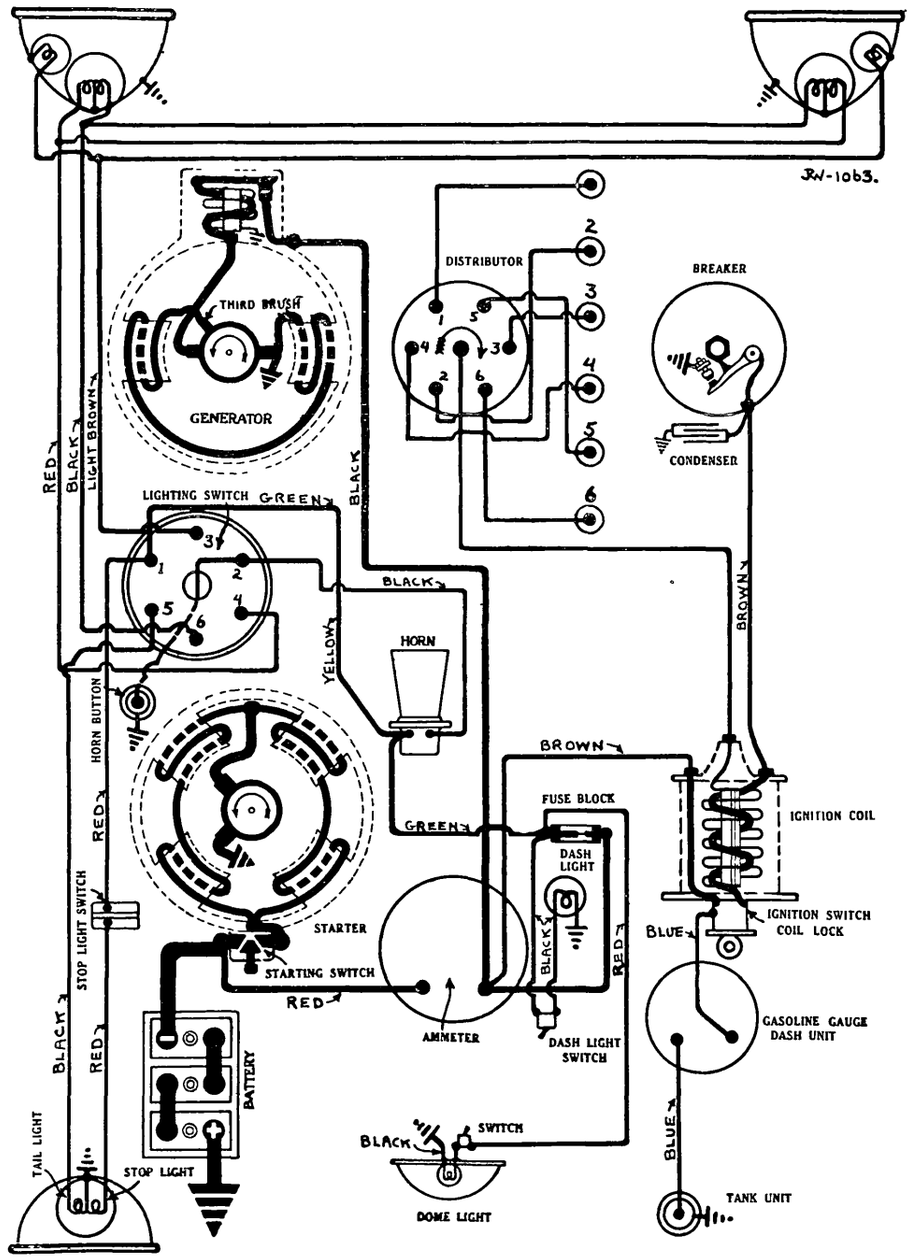
LIGHTING:—**Clum Model 10738.** The lighting switch is mounted at the base of the steering column. Head lights are 6-8 volt, 21-21 cp (double filament-double contact). Mazda No. 1110. Side lights are 6-8 volt, 3 cp. D.C. Mazda No. 64. Dash lights are 6-8 volt, 3 cp. D.C. Mazda No. 64. Tail and stop lights are 6-8 volt, 21-2 cp. D.C. Mazda No. 1158 (double filament bulb). Dome light is 6-8 volt, 15 cp. S.C. Mazda No. 87.

FUSES:—A 20 ampere fuse is mounted on the rear of the dash.

DE SOTO

MODEL K-1 (1929-30), PRODUCTION STARTED FEBRUARY 1, 1929
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

BATTERY:—Willard, Type WSB-13, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under front floor boards on left frame member.



IGNITION:—Coil Type 21998. Coil is mounted on the back of the instrument board and the ignition switch, which is built in the base of the coil, extends through to the face of the instrument panel. Ignition current is 2.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model TBU Type 10849. Breaker contacts separate .020 inch. Set contact gap by loosening lock nut on stationary contact stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20 degrees reached at 2540 R.P.M.

Mounting:—Distributor is mounted on a diagonal shaft at the right of the engine and is driven by a gear on the camshaft. To remove distributor disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out screw at rear of manual control lever and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down two turns every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the **center of the shaft with light engine oil. Every 2000 miles put a small amount of vaseline on the face of the breaker cam.**

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .035 inch before top dead center on standard 5.2-1 compression engines and .008 inch before top dead center on 6.2-1 high compression head engines with the manual spark lever in the fully advanced position. To set timing, remove the ⅛ inch pipe plug from the cylinder head above No. 6 piston and screw the special micrometer gauge which must be used in timing these engines in place in the tapped hole. Connect a small six volt test lamp between the distributor primary terminal and the battery terminal of the generator relay. If the battery is out of the car, connect one terminal of the lamp to a battery and ground the other battery terminal to the engine block. The test lamp will burn when the breaker contacts are closed but will go out when the contacts open, serving as an accurate check of the contact opening. Set distributor in full manual advance position. Turn engine over and locate top dead center position. Set micrometer gauge at zero on top dead center. Then crank engine over until piston No. 1 comes up on compression stroke and stop with piston .035 inch before top dead center on standard compression engines and .008 inch before top dead center on high compression engines. Take up all backlash in distributor gear by pressing rotor back against direction of rotation. Loosen the advance arm clamp screw and rotate the distributor counterclockwise until the contacts break when the lamp will go out. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head. Check timing by cranking engine over several times and then stop when contacts break with piston No. 1 on compression stroke. The gauge should read within limits of .030-.040 inch before top dead center for standard compression engines and .006-.010 inch before top dead center for high compression engines.

DE SOTO

MODEL K-1 (1929-30), PRODUCTION STARTED FEBRUARY 1, 1929
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

NOTE:—If the new type timing gauge is used, which has a spark gap built in the gauge dial, it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be seen at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Champion Metric 18MM. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.469 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches. Valve lift, 5/16 inch. Spring pressure, 88 pounds with valve open and 47 pounds with valve closed. Tappet clearance, .004 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1.469 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches. Valve lift, 5/16 inch. Spring pressure, 88 pounds with valve open and 47 pounds with valve closed. Tappet clearance, .006 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across shaft centers.

STARTER:—Model SBH Type 6534. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 3 pounds. Starter switch is Type 22050.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	5.6	80
1.6 "	2100	5.2	150
3.0 "	1500	5.0	200
6.0 "	800	4.5	300
9.6 "	350	4.0	400
13.0 "	Lock	3.5	500

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel bell housing. To remove starter, disconnect cable and remove two flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model LAB Type 6530. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With the standard car setting, the maximum charging rate is 12 amperes reached at 2000 R.P.M or 24.5 M.P.H. with generator hot.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	675	0	6.4	725
5	6.9	875	5	6.9	1025
10	7.4	1150	10	7.5	1500
14	7.9	1475	12	7.7	2000
16	8.1	1800	9	7.3	3000
13.4	7.8	2500			

Brush spring tension is 12-16 ounces.

Mounting:—Generator is mounted on special swinging bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and take off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment:—To adjust fan belt, loosen the adjustment clamp bolt and swing generator out from engine until correct belt tension is secured and tighten clamp bolt. Do not get too much tension on the belt or the belt will crowd the generator bearings.

Oiling:—Put a few drops of light engine oil in the oiler at each end of the generator every 2000 miles.

RELAY:—Type 20220. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 6.75 volts and open with a discharge current of 1-2 amperes. Contacts separate .020-.025 inch. Air gap is .015 inch with contacts closed.

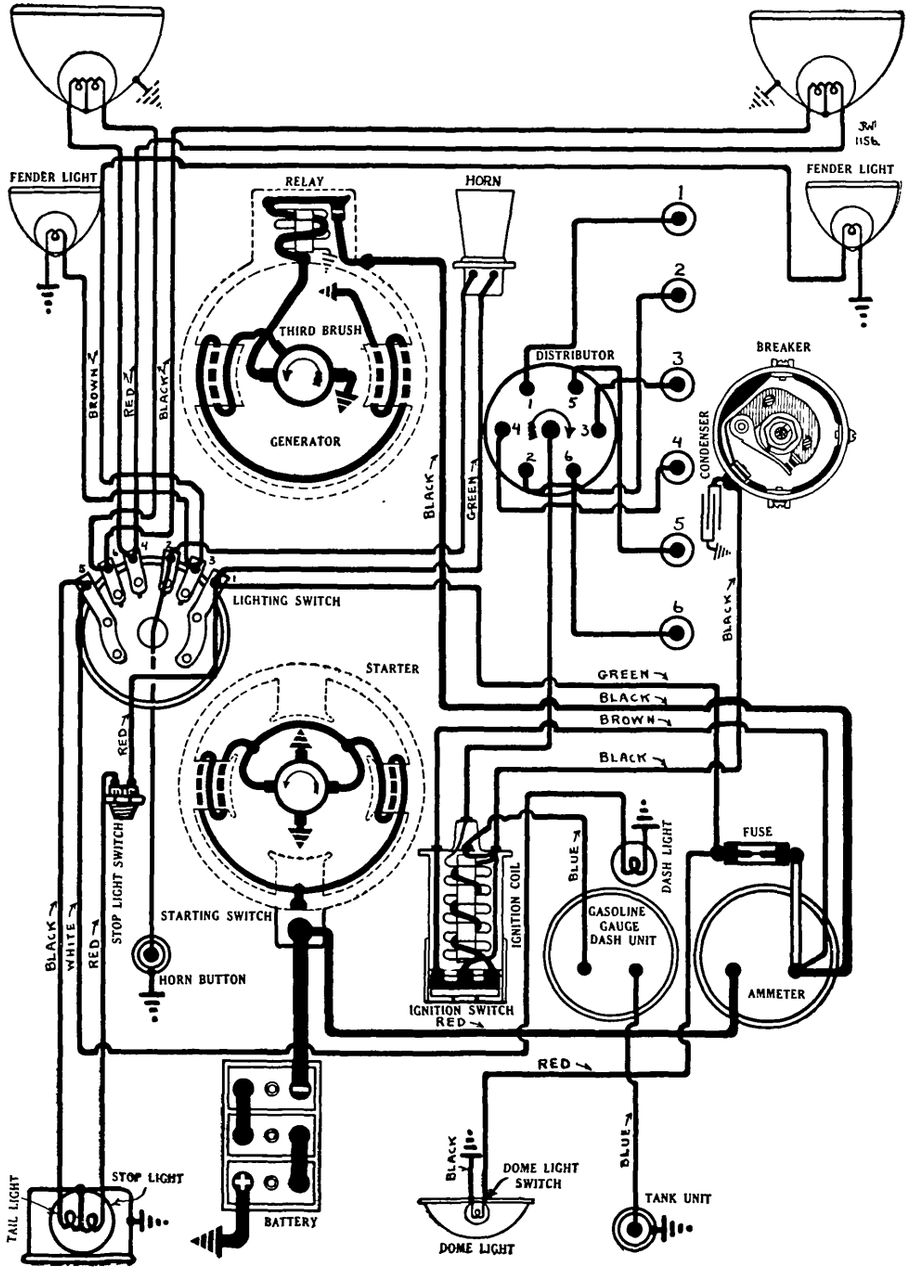
LIGHTING:—Soreng Manegold Switch Model 5500-A. Lighting switch is mounted at the lower end of the steering column. Headlights are double filament using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights on cowl are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. D.C. Mazda 64. Stop and tail light is 6-8 volt, 21-3 cp. D.C. 1158 (double filament bulb). Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Lighting fuse mounted on back of instrument panel is 20 ampere capacity.

DE SOTO

SIX MODEL CK (1930-31)
DELCO-REMY GENERATING STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-1-13, 6 volt, 86 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under the front floor boards on the left frame member.



IGNITION:—Coil Model 526-K. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model 632-D. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 2200 R.P.M. of engine. Manual advance is controlled by a button on the dash and the car is designed to operate with the button in the fully advanced position (pushed all the way in toward the dash). Pulling out the spark control button provides an auxiliary retard for starting.

Mounting:—Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one full turn every month or each 1000 miles of operation. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .028 inch (actual piston travel) before top dead center. To set timing, first set breaker contact gap at .020 inch and see that manual spark control is fully advanced. Then remove the ⅛ inch pipe plug in the cylinder head directly over No. 6 piston and screw the special micrometer timing gauge in place in the opening. Connect a small 6 volt test lamp in the primary circuit by connecting one test lamp lead to the primary terminal on the distributor and the other lead to the relay terminal on the generator. If the battery is out of the car, connect this lead to one terminal of a six volt battery and ground the other battery terminal to the car frame. The test lamp will remain lighted while the contacts are closed and will go out as the contacts open, affording a very accurate determination of the contact opening. Turn the engine over until piston No. 6 reaches top dead center and set the micrometer gauge at zero. Then turn engine over until piston No. 1 enters compression stroke and stop when the gauge indicates .028 inch before top dead center. Then loosen the advance arm clamp screw and rotate the distributor until the lamp goes out, indicating that the contacts have begun to open. Tighten the clamp screw and see that the rotor is directly opposite No. 1 segment in the distributor head (see diagram). Check the ignition setting by cranking the engine over several times and stopping with No. 1 piston on compression stroke at the exact point at which the lamp goes out. The gauge reading should be

DE SOTO

SIX MODEL CK (1930-31)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

within limits of .026-.030 inch before top dead center. If gauge reading is outside these limits the engine must be retimed.

Red Head Engines:—Timing directions as given above apply to standard 5.2-1 compression head engines. The 'Red Head' high compression (6.2-1) engines are timed in the same way except that contacts open .020 inch before top dead center and the timing limits are .018-.022 inch before top dead center.

NOTE:—The new type timing gauge has a visible spark gap built in the gauge. If this indicator is used one terminal lead on the gauge should be clipped to the high tension lead from the coil at the distributor and the other gauge terminal lead should be grounded to the engine. Turn on ignition and proceed with timing. No test lamp need be used.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—18 MM. Metric. A.C. Type G-11 (Std.), G-9 (Red Head). Gaps are .020-.025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 15/32 inches. Stem diameter, 11/32 inch. Stem length, 5¼ inches. Spring pressure, 40-44 pounds (valve closed), 75-81 pounds (valve open). Valve lift, .3125 inch. Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 15/32 inches. Stem diameter, 11/32 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 40-44 pounds (valve closed), 75-81 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 714-Q. Starter is connected to the engine through a mechanical pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	5000	5.0	65
.4 "	3250	5.5	100
3 "	1500	5.0	200
6 "	800	4.5	300
9.4 "	350	4.0	400
12 "	Lock	3.6	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out two flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 943-L, R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 16 amperes (cold) reached at 2100 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	7.0	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
16	8.0	2300	12.5	7.7	2400
12	7.7	3200	10	7.5	3200

Shunt field current is 3.5-4.5 amperes at 6 volts. Generator motoring draws 3 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special hinge bracket at the left of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then take out two hinge bolts in bracket under generator and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by shifting the generator. To adjust belt, loosen the two hinge bolts and the adjustment clamp bolt and swing generator away from the engine until belt tension is just sufficient to drive fan and generator without slipping. Tighten the bolts.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles of operation.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay closes at 750 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 9150. Lighting switch is mounted at the lower end of the steering column and is controlled by a lever on the steering wheel. Headlights are equipped with double filament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (on fenders) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

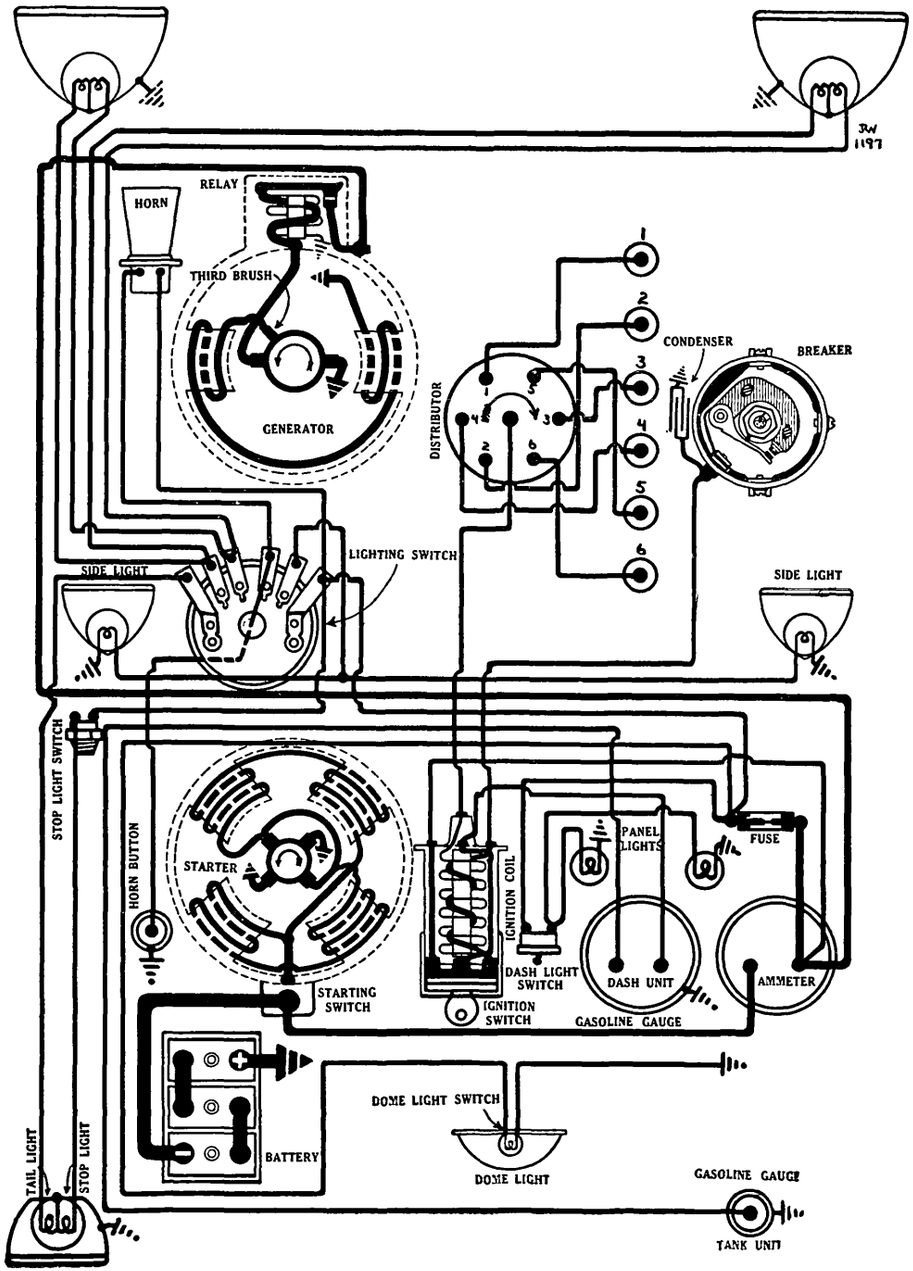
NOTE:—Soreng-Manegold Switch, Model 5500-A, was also used.

FUSES:—Lighting fuse mounted on back of ammeter is 20 ampere capacity.

DE SOTO

SERIES SA (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-1-13. 6 volt, 84 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted on the left frame member.



IGNITION:—Coil Model 526-T. The ignition switch is built in the base of the coil. Coil is mounted on the rear of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 632-K. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 18 degrees (engine) reached at 2500 R.P.M.

Mounting:—Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw at rear of advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .055 inch (Standard 5.2-1 Compression Head) or .031 inch (6.2-1 Compression Red Head Engine) before top dead center. To set timing, first set breaker contact gap at .020 inch. Then remove the ⅛ inch pipe plug from the cylinder head directly above No. 6 cylinder and screw the special timing micrometer gauge in place in the hole. Connect a small six volt lamp in the primary circuit (this can be done by connecting one lamp lead to the primary terminal of the distributor and the other lamp lead to the relay terminal of the generator. If the battery is out of the car, connect the lamp lead to a battery and ground the other battery terminal to the engine). Turn engine over and set micrometer at zero on top dead center. Crank the engine over until piston No. 1 is coming up on compression stroke (both valves will be closed) and stop when the gauge indicates that the piston is .055 inch (Standard 5.2-1 Compression Head) or .031 inch (6.2-1 Compression Red Head Engine) before top dead center. Remove distributor head and see that rotor is opposite No. 1 segment (see diagram). Loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open, when the lamp will go out. Tighten the clamp screw and connect the spark plug leads in order 1-5-3-6-2-4 clockwise around the distributor head. Check the setting by cranking the engine over several times and then stopping with piston No. 1 on compression stroke at the point where the lamp goes out, indicating that the contacts have begun to open. If the gauge reading is within limits of .050-.060 inch (Std. 5.2 Head) or .029-.033 inch (6.2 Red Head) before top dead center, the setting is satisfactory. If outside these limits the engine should be retimed.

DE SOTO

SERIES SA (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

NOTE:—If the new type gauge (with a spark gap built in the face of the gauge) is used it will not be necessary to use a test lamp. Connect one gauge lead to the high tension terminal in the center of the distributor head and ground the other gauge lead to the engine. The ignition should be turned on. A spark will be visible at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. A.C. Type G-11. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 17/32 inches. Stem diameter,, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed), 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 15/32 inches. Stem diameter, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds, (valve closed), and 78 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—**Model 725-Q.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
15 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—**Model 943-R.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
16	8.0	2300	12.5	7.7	2400
12	7.7	3200	10	7.5	3200

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by swinging the generator away from the engine. To make the adjustment, loosen the two bolts under the generator. Then loosen adjustment clamp bolt and pull generator out from the engine until the proper belt tension is secured. Tighten the clamp bolt and the mounting bolts. The belt tension should be just sufficient to drive the fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles of operation.

RELAY:—**Model 265-G.** Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**Clum Switch Model 9150.** Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

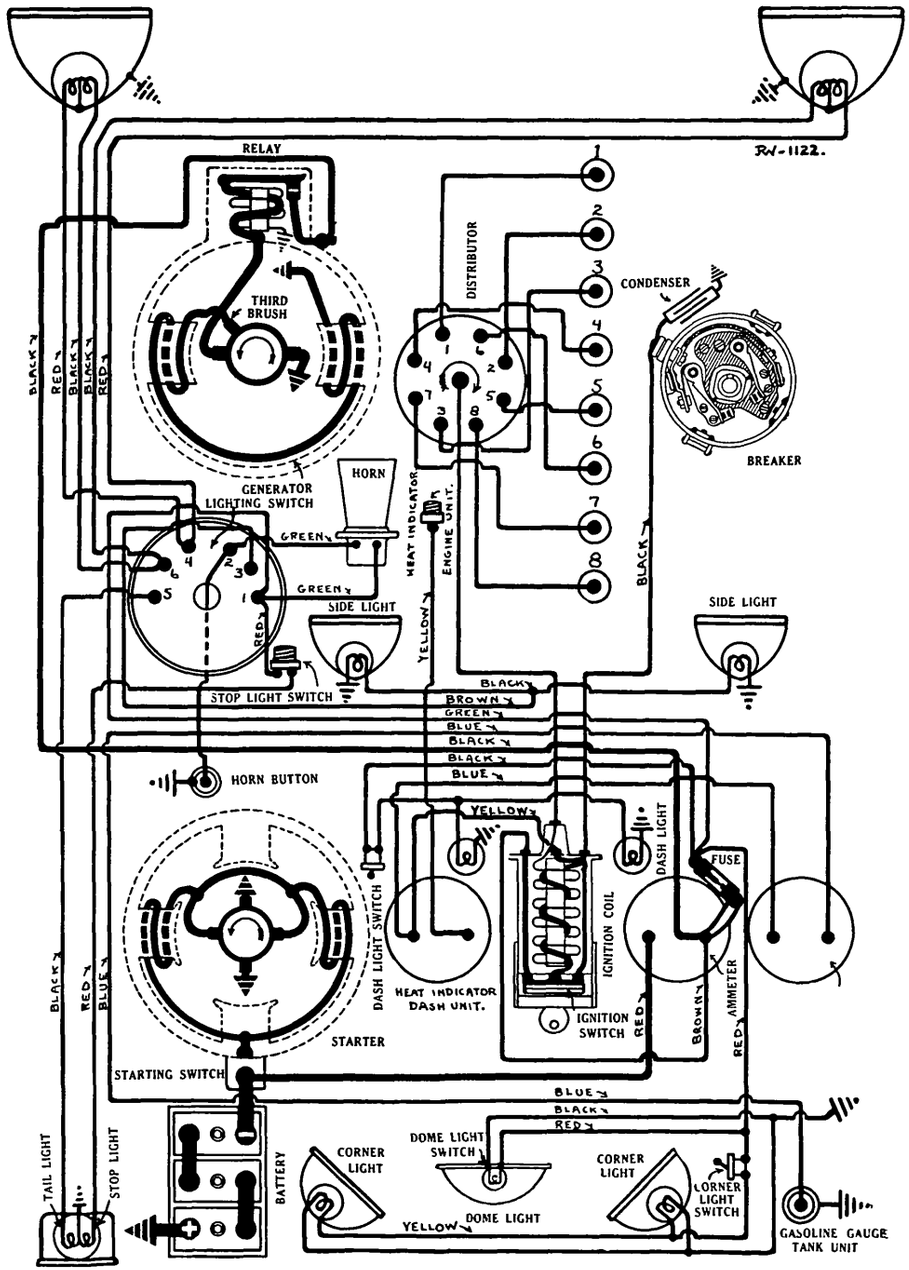
FUSES:—Lighting fuse mounted back of the ammeter is 20 ampere capacity.

DE SOTO EIGHT

MODEL CF (1930-31), SERIAL NUMBERS L001WP UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-N. The ignition switch is built in the base of the coil. Coil is mounted on the back of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5-2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 660-D. Breaker contacts separate .018-.023 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. There are two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 22 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 17 degrees reached at 2400 R.P.M. of engine. On Red Head engines the maximum automatic advance is 13.5 degrees reached at 2600 R.P.M.

Mounting:—Distributor is mounted at left of engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. To synchronize contacts, use special Delco-Remy Tool, Part No. 1838182, and follow complete directions in Equipment Section. The contacts can be synchronized without special equipment, using the regular timing gauge, if an adaptor is available so that the gauge can be mounted in the spark plug port of cylinder No. 6. Remove No. 6 spark plug, mount gauge, set gauge at zero on top dead center and turn engine over until piston No. 6 reaches firing position. Then loosen the two lock screws on the movable sub-plate (on which the second set of contacts is mounted) and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .018-.024 inch.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke is .037″ ('30), .060″ ('31) before top dead center with the spark control in the fully advanced position. To set timing, first remove the ⅛ inch pipe plug in the cylinder head directly above No. 8 piston and screw the special micrometer gauge in place in the hole. Set breaker contact gap at .020 inch. Connect a six volt test lamp in series with the primary circuit by connecting one test lamp lead to the primary terminal on the distributor and the other lead to the relay terminal on the generator (if the battery is in the car). The lamp will remain lighted while the contacts are closed and will go out as soon as the contacts open. Fully advance spark control lever. Crank engine over until piston No. 8 reaches top dead center and set micrometer gauge at zero. Turn engine

DE SOTO EIGHT

MODEL CF (1930-31), SERIAL NUMBERS L001WP UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

utor until the lamp goes out, indicating that the contacts have begun to open. Tighten the clamp screw and check rotor to see that it is directly opposite No. 1 segment in the distributor head (see diagram). Check timing over until piston No. 1 enters compression stroke (the up stroke with both valves closed) and stop when gauge reads .037" or .060" before top dead center. Then loosen advance arm clamp screw and rotate distrib- by cranking engine over several times and then stopping with piston No. 1 on compression stroke at the exact instant the lamp goes out, indicating the firing position of piston No. 1. If the gauge reading is within the limits of .032-.042 inch, the setting is satisfactory. If gauge reading is outside these limits the engine must be retimed.

Special Note for Red Head Engines. Timing directions as given above apply on all Model CF engines with standard compression 5.2-1 or 5.4-1 heads. The procedure for timing engines equipped with the high compression (6.2-1) Red Heads is similar except that contacts separate with the piston .040 inch before top dead center and the limits are .035-.045 inch.

NOTE:—If the latest type timing gauge is used (with a spark gap built in the face of the gauge), it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the center terminal on the distributor cap and ground the other gauge lead to the engine. Turn on ignition. A spark will be visible in the gauge spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.407 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches (from top of taper). Valve lift, 5/16 inch. Spring pressure, 40-44 pounds (valve closed) and 75-81 pounds (valve open). Tappet clearance .005" (hot).

EXHAUST VALVES:—Head diameter, 1.407 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches. Valve lift, 5/16 inch. Spring pressure, 40-44 pounds (valve closed) and 75-81 pounds (valve open). Tappet clearance, .007" (hot).

Valve Timing—1930

Intake	Exhaust
Open—4° before top dead center.	Open—52° before lower dead center.
Close—36° after lower dead center.	Close—2° before top dead center.

Valve Timing—1931

Open—6° after top dead center.	Open—42° before top dead center.
Close—46° after lower dead center.	Close—8° after top dead center.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with the piston .0035" (1930 cars) or .014" (1931 cars) past top dead center on intake stroke. Reset tappet clearance at .005" with engine hot.

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 714-Q. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal linkage. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
.4 "	3250	5.5	100
3 "	1500	5.0	200
6 "	800	4.5	300
9.4 "	350	4.0	400
12 "	Lock	3.6	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 943-L, R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
16	8.0	2300	12.5	7.7	2400
12	7.7	3200	10	7.5	3200

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by swinging the generator away from the engine. To make the adjustment, loosen the two bolts under the generator. Then loosen adjustment clamp bolt and pull generator out from the engine until the proper belt tension is secured. Tighten the clamp bolt and the mounting bolts. The belt tension should be just sufficient to drive the fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles of operation.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. when the generator voltage reaches 6.4-7 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch, Model 8821, or 9150. Switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—This switch interchangeable with Soreng-Manegold Model 5520-A.

FUSES:—Lighting fuse mounted back of the ammeter is 20 ampere capacity.

DE SOTO

SIX CYLINDER MODEL SC (1932)

SERIAL NUMBERS STANDARD—5,040,201 UP. CUSTOM—6,005,001 UP

DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss left side of cylinder block between No. 1 and 2 cylinders.

BATTERY:—**Willard, Type WS-1-13,** 6 volt, 13 plate, 80 ampere hour (20 hour rate). Positive (+) terminal grounded to transmission case. Battery mounted under driver's seat. Battery size, 7 1/16 inches wide, 9 1/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 534-Z.** Lock coil type with ignition switch in base. Coil mounted on back of instrument panel at extreme left. Ignition current, .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 632-L. Single breaker arm type with semi-automatic advance (manual advance set in timing and not controllable by driver). Breaker gap set at .020 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact mounting plate and turn eccentric adjusting screw. Breaker arm spring tension, 17-21 ounces (measured at tip of breaker arm with scale at right angles to contact surface). Maximum manual advance, 20 degrees (engine).

Cam Angles—Closed 36°, open 24° (distributor degrees).

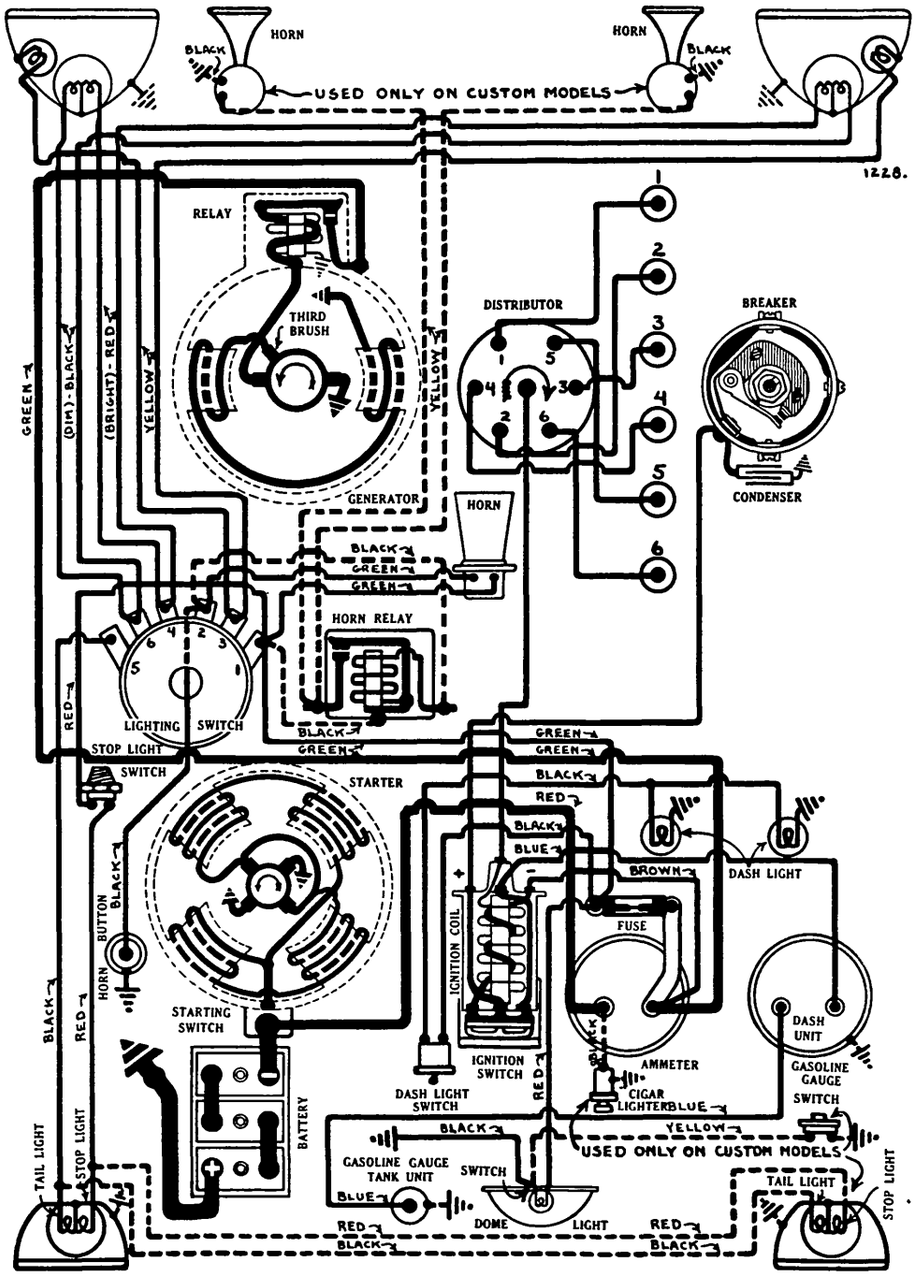
		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		400	2		800
8		1300	16		2600

Mounting:—Distributor mounted on left side of engine, driven by inclined shaft from camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium grease.

2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light oil in wick oiler in center of shaft. Apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 9° ('Silver Dome' Head), 7° (Red Head Engines) before top dead center with full manual advance. To set timing, remove inspection cover on left front face flywheel housing directly under starter. Turn engine over with No. 1 piston on compression until flywheel mark 'D/C' is opposite upper pointer on housing. Loosen advance plate clamping bolt, rotate distributor until contacts begin to open (use test lamp), tighten clamping bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).



Red Head Engines:—No special directions necessary for timing engines with 'Red Heads'. On all cars esuipped at the factory with Red Head Engines the ignition pointer is set for correct timing position. No provision is made for timing on engines where heads are changed in the field.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. A.C. Type K-12. Set gap at .028 inch. Hold within limits of .025-.030 inch. Use Type K-9 on Red Head engines.

VALVE TIMING:—Valves on right side of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Valve Lgth.	Seat Angle	Lift
Intake	1.521" (1⅜" clear)	.340-.341"	5¼"	45°	5/16"
Exhaust	1.459" (1 5/16" clear)	.340-.341"	5¼"	45	5/16"

DE SOTO

SIX CYLINDER MODEL SC (1932)
SERIAL NUMBERS STANDARD—5,040,201 UP. CUSTOM—6,005,001 UP
DELCO-REMY SYSTEM

Tappet Clearance

	Operating	Timing
Inlet	.005" (hot)	.011" (cold)
Exhaust	.007" (hot)	.012" (cold)

Spring Pressure

Closed .....40-44 pounds (2 11/16")
Open .....75-81 pounds (1¾")

SPECIAL NOTE:—Do not compress valve springs to over-all length of less than 1⅝ inches to avoid damage through springs taking on permanent set. Valve stem clearance in guide, .001-.003" (inlet), .002-.004" (exhaust).

Timing

Intake valves open 6° after top dead center. Piston .014" down on intake stroke. Close 46° after lower dead center.

Exhaust valves open 42° before lower dead center. Close 8° after top dead center. Piston .025" down on intake stroke.

To Check Valve Timing. Remove ⅛ inch pipe plug in cylinder head over No. 6 piston and install regular Chrysler timing gauge. Set gauge at '0' on top dead center. Set tappet clearance No. 1 inlet valve at .011", No. 1 exhaust valve at .012" (cold). Rotate crankshaft with No. 6 piston on compression until piston is .014" past top dead center. No. 1 inlet valve should be tight and about to open. Turn crankshaft 2° and stop with piston .025" past top dead center. No.1 exhaust valve should be closing. Reset tappet clearance at .005" (inlet), .007" (exhaust) with engine hot.

To Set Valve Timing. Remove inspection cover on left front face flywheel housing directly under starter. Rotate crankshaft until flywheel mark 'D/C' is directly opposite lower pointer on housing (top dead center position Nos. 1 and 6 pistons). Rotate camshaft until mark between teeth on camshaft sprocket is directly opposite marked tooth on crankshaft sprocket with both marks in line with straightedge across shaft centers. Mesh chain. Camshaft sprocket mounting cap screws offset so that sprocket can only be mounted in one position.

Valve Grinding. Inlet valves chrome nickel steel. Exhaust valves silchrome. Manufacturer recommends that valves be refaced on valve grinder and then lapped in in cylinder block with compound.

STARTER:—Model 725-Q. Manual pinion shift connected with starter switch lever. Starter drives through overrunning clutch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	6000	5	60
15 "	Lock	3	600

Mounting:—Flange mounted on left front face of flywheel housing. To remove, disconnect cable, take out cotter pin and clevis pin in switch linkage, take out two flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—5000 Miles. Put 8-10 drops light engine oil in commutator end oiler.

GENERATOR:—Model 943-S. Third brush control. Adjust by loosening small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase charging rate, clockwise to decrease charging rate, tighten locking screw. Manufacturer recommends that charging rate be set at 8 amperes maximum to battery (with all lights on—headlights bright) at 20 M.P.H. or 10 amperes maximum on cars equipped with radio. Rotation counter-clockwise at commutator end.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-18	7.9-8.3	2000	13-15	7.7-8.0	2400

Brush spring tension 24-28 ounces. Shunt field current 3.5-4.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove, disconnect lead, loosen adjustment clamp bolt and pivot mounting bolts, swing generator toward engine, slip off drive belt, take out mounting bolts forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt. Attach spring scale by wire looped over generator field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp. Pull generator away from engine until scale reading is 45-50 pounds. Tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Fill oiler at each end of generator with light oil.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 6.75-7.5 volts and open with 0-2.5 ampere discharge. Contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9271. Mounted at lower end of steering column. Controlled by lower lever on steering wheel. Switch position:

1. Vertical—All lights off.
2. Right—Parking bulbs and tail lights on. Headlights off.
3. No. 1 Let—Bright headlights and tail lights on. Parking bulbs off.
4. No. 2 Left—Dim (depressed beam) headlights and tail lights on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Parking Lights	6-8	3	S.C.	63
Dash Lights	6-8	3	S.C.	63
Stop and Tail Light	6-8	21-2	D.C.	1158
Dome Light	6-8	15	S.C.	87

NOTE:Stop and tail light use combination bulb. Connect tail light wire to 2 cp. filament.

FUSES:—20 ampere capacity. Mounted on bracket under ammeter.

GASOLINE GAUGE:—Motometer Electric type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer Vapor-tension type (see Equipment Section).

HORN:—Klaxon, Model K-14. Vibrator type mounted under hood. Twin horns (matched tone) optional equipment. Current draw, 7 amperes (each).

Horn Relay, Type 266-T. Used with twin horns. Pressing button completes horn relay circuit, energizing relay winding, closing relay contacts, completing horn circuit. Horn current does not pass through horn button. Relay requires .25 amperes to close contacts. Relay contact gap limits .015-.025 inch. Air gap .012-.017 inch (contacts closed).

DE SOTO

MODEL SD (1933), SERIAL NUMBERS 5,056,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Located on right hand front door hinge pillar post.

ENGINE NUMBERS:—Stamped on boss on left hand side of cylinder block between No 1 and No 2 cylinders First number of this series SD-1001.

ENGINE:—Six cylinder, 'L' head type, 3¼x4⅜" bore and stroke, 217 7 cubic inch displacement, rated at 25 35 H P, develops 79 H P at 3400 R P M (Standard Silver Dome engine), or 86 H P at 3400 R P M (high compression Red Head engine) Standard compression ratio (Silver Dome Head), 5 35-1 High compression ratio (Red Head engine), 6 2-1.

BATTERY:—Willard, Type WT-1-15, 6 volt, 15 plate, 90 ampere hour capacity (20 hour rate). Starting capacity 117 amperes for 20 minutes

Grounded Terminal:—Positive (+) terminal grounded to left front corner of transmission.

Mounting:—In cradle under driver's seat

Dimensions:—Width, 7 1/16'. Length, 9 1/16". Height, 8 13/16".

IGNITION:—Coil Model 537-R, S, Y, 538-R, 534-B (Special). Mounted on dash and connected to ignition switch by armored cable

Ignition Current:— 5-1 5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped)

Ignition Switch:—Unit with coil Switch mounted on instrument panel and connected to coil by armored cable (primary lead)

Distributor Model 622-C (first cars), 644 J, L (later cars). Single breaker, 6 lobe cam, full automatic advance type Distributor mounted on outside of distributor Breaker contacts adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.

Breaker Gap:—Set at 020' Hold within limits of 018-024".

Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm

Cam Angle or Dwell—Closed 36° Open 24° (distributor).

Automatic Advance—Model 622-C

Degrees	Distributor R P M	Degrees	Engine R P M
Start	400	2	800
8	1300	16	2600

Automatic Advance—Model 644-J

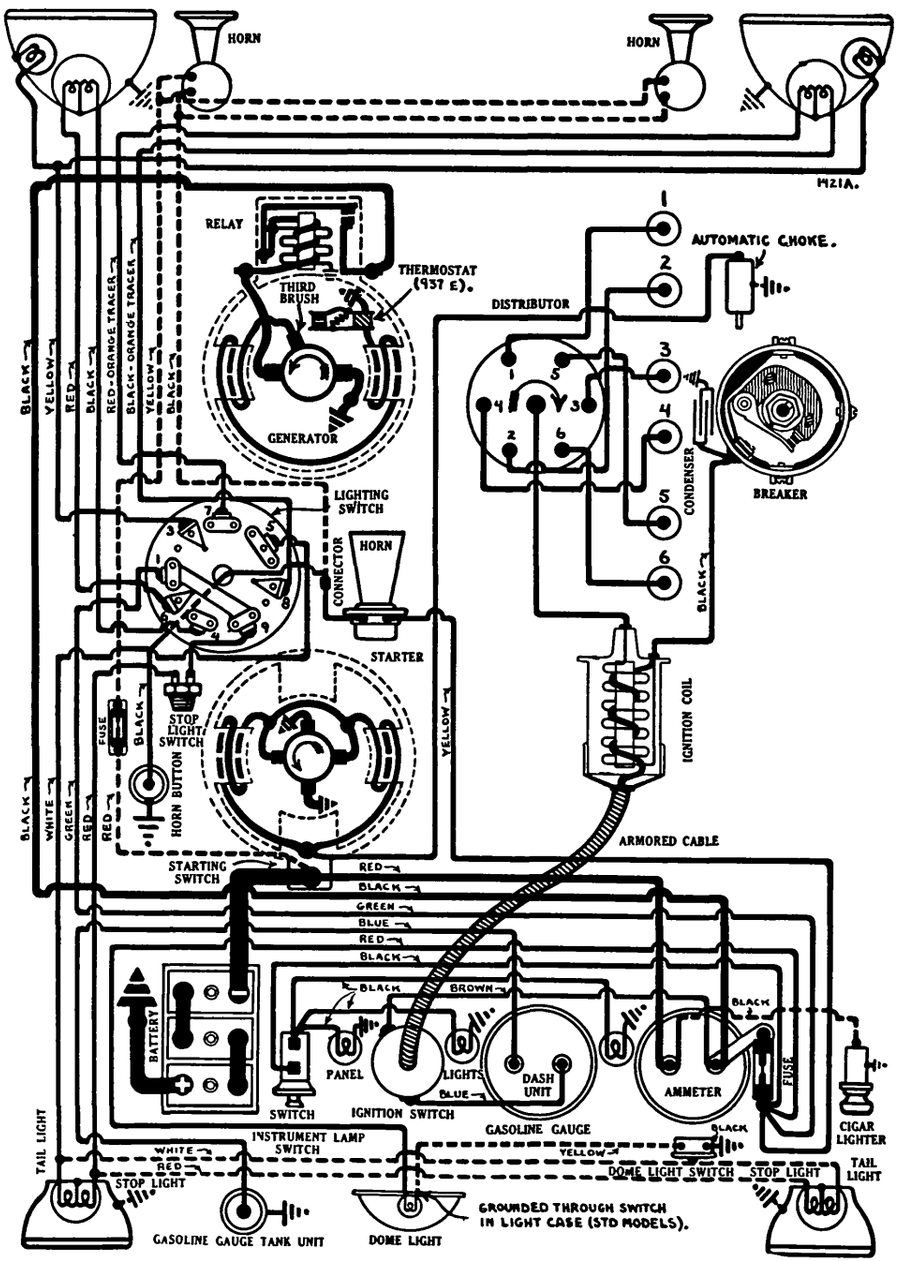
Start	250	2	500
7	400	14	800
16	1400	32	2800

Automatic Advance—Model 644-L

Start	250	2	500
7	400	14	800
13	1100	26	2200

Mounting:—Distributor mounted at left center of engine and driven by inclined shaft from the camshaft To remove, disconnect breaker lead, take off distributor cap, take out hold-down screw in advance arm, lift out

IGNITION TIMING:—Standard settings for all engines as follows



Engine Type	Distributor Type	Flywheel Degrees	Piston Travel
Silver Dome head	622-C	9° before TDC.	.033"
Silver Dome head	644-J	At top dead center	TDC.
Red Head Engine	622-C	7° before TDC	.0198"
Red Head Engine	644-J	6° after TDC.	0150"
Special 6-1 Head	644-L	7° after TDC.	.0198"

To Set Ignition Timing. First remove cover plate over inspection hole in left front face of flywheel housing directly below starter With No 1 piston on compression stroke, turn engine over by hand until flywheel mark 'D/C' registers with upper pointer in inspection hole (when ignition setting is before top dead center) or with the dead center pointer (when ignition setting is at top dead center). Then loosen clamp bolt in advance arm, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

NOTE:—Where the distributor has been changed in the field or when the ignition pointer does not correspond with the correct setting, the timing gauge should be used.

Firing Order:—1-5-3-6-2-4 No 1 cylinder nearest radiator.

Spark Plugs:—14 MM Metric. A C Type K-12 (Standard Silver Dome engines), Type K-10 (high compression Red Head engines). Set gaps at .025".

DE SOTO

MODEL SD (1933), SERIAL NUMBERS 5,056,001 UP
DELCO-REMY SYSTEM

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive. Sprockets are marked. To set timing, turn crankshaft so that pistons Nos. 1 and 6 are on top dead center with flywheel mark 'D/C' at lower pointer in inspection hole. Mesh sprockets in chain so that marks are adjacent and in line with a straightedge across the shaft centers. Camshaft sprocket mounting cap screws are offset so that sprocket can only be mounted in correct position.

To Check Valve Timing. Take out ⅛ inch pipe plug in cylinder head directly over No. 6 piston and install regular Chrysler Timing Gauge. With No. 1 piston on top dead center entering power stroke set tappet clearance of No. 1 intake valve at .011", No. 1 exhaust valve at .012". Turn engine over one complete revolution and stop with piston slightly past top dead center when gauge reads .015". No. 1 intake valve should begin to open at this point. Turn crankshaft 2° and stop when gauge reads .026". No. 1 exhaust valve should close at this point. Reset tappet clearance at .005" (intake), .007" (exhaust) with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 17/32" (1⅜" clear)	11/32"	45°	5/16"
Exhaust	1 15/32" (1 5/16" clear)	11/32"	45°	5/16"

Tappet Clearance

	Operating	Timing
Intake	.005" (hot)	.011" (cold)
Exhaust	.007" (hot)	.012" (cold)

Valve Springs

Closed—40-44 pounds—2 1/16".
Compression Limit—1¾".

Timing

Intake Valves	Exhaust Valves
Open—6° after top dead center.	Open—42° before lower dead center.
Close—46° after lower dead center.	Close—8° after top dead center.

Valve Grinding:—Valve material chrome nickel steel (intake valves), silchrome steel (exhaust valves). Special alloy exhaust valve seat inserts are used in the cylinder block. Valves should be refaced on valve grinder and then lapped in block. Ordinary reseating tool cannot be used on exhaust valve inserts and these must be ground when necessary. Install valves with .001-.003" stem clearance in guide (intake valves), .003-.005" (exhaust valves). Stem guides are removable.

CARBURETION:—Carter Downdraft Carburetor, Model E6A (see Carburetor Section for complete data). Manifold heat control is automatic. Sisson Automatic Choke is standard equipment (see Carburetor Section).

Air Cleaner:—Oil-wetted wire mesh type integral with silencer. Remove complete unit from engine at 2000 mile intervals or oftener, clean by dipping wire mesh end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. mechanical type mounted at right of engine (see Carburetion section for complete data). Remove glass sediment bowl at three month intervals, empty water and sediment, clean filter screen (located directly above sediment bowl) before reassembling.

Gasoline Gauge:—Motometer electric type (see Carburetion Section) for complete data).

STARTER:—Model 734-L, R, Model 727-B (R.H.D.). Starter drive, overrunning clutch and manual pinion shift operated by accelerator pedal through Type 1550 Selector (734-L) or by solenoid switch (734-R, 727-B on late cars). See Equipment Section for complete data on both types and Chrysler Six Model CO diagram for wiring of solenoid switch. Starter rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data—Model 734-L, R

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Starter Data—Model 727-B

0 lb. ft.	5500	5.0	65
15 "	Lock	3.0	600

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, take out flange mounting screws, pull starter forward to clear pinion housing, lift out. See article on Selector in Equipment Section for adjustment of pinion shift lever roller.

Oiling:—5000 Miles. Put 8-10 drops light engine oil in oiler on commutator end. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—Model 943-S, 937-E—Radio cars (first 4250), 937-D, 937-F (Radio cars (after 4250). Third brush regulation, thermostat control (937-E only). Thermostat contacts open at 175°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (943-S, 937-D) or 10 amperes (937-E,F) maximum charge to battery as shown on dash ammeter with all lights on and engine operating at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data—Models 943-S, 937-D

	Amperes	Volts	R.P.M.		Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000	Hot	13-15	7.7-8.0	2400

Generator Data—Models 937-E, 937-F

Cold	20-22	8.2-8.4	2100	Hot	12-14	7.7-8.0	2800-3000

Brush Spring Tension—24-28 ozs. (all brushes).

Field Current:—3.5-4.5 amperes at 6 volts across field terminals.

Field Fuse:—6 ampere capacity (943-S after Serial No. 30,000; 937-D after Serial No. 12,000).

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. Attach spring scale by wire looped over generator field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp arm. Loosen adjustment clamp bolt and mounting bolts, pull generator away from engine until scale reading is 45-50 pounds, tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Put 8-10 drops light engine oil in oiler at each end of generator (fill oilers once).

CUTOUT RELAY:—Model 265-G (943-S, 937-E), 264-D (937-D, F). Model 264-D has solenoid relay for starter solenoid control in relay case. See Equipment Section for complete data on these units. Contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current. **Contact Gap:**—.015-.025". **Air Gap:**—.012-.017" (contacts closed).

Solenoid Relay

Contacts close at 3.2 volts max. and remain closed until battery voltage drops to 2.0 volts or open when difference in voltage between generator and battery is 2.0 volts or less. Contact gap is .030-.045". Air gap is .010-.014".

LIGHTING:—Clum Switch, Model 9454. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system uses standard double filament headlight bulbs but switch has a special 'passing' position with depressed beam (upper filament) of left hand headlight and driving beam (lower filament) of right hand headlight lighted (see Wiring Diagram). Stop and tail light are equipped with double filament bulb (tail light lead must be connected to 2 cp. filament).

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C	1116
Parking Bulbs	6-8	3	S.C	63
Instrument Lights	6-8	3	S.C	63
Stop and Tail Lights	6-8	21-2	D.C	1158
Dome Light	6-8	15	S.C	87

FUSES:—20 ampere capacity fuse mounted on back of instrument board near ammeter. A 20 ampere capacity fuse is assembled in a connector in the feed wire from the starter switch to the twin horns mounted under the headlights when these units are installed.

HORNS:—Klaxon Model K-31, Type 1364 (standard), Model K-26 Matched Set (optional equipment). Vibrator type horns. Current draw 4.0-6.5 amperes at 6 volts (K-31) 5.0-6.5 amperes at 6 volts (K-26, Type 1506—high note), 6.0-8.5 amperes at 6 volts (K-26, Type 1505—low note).

SERIAL NUMBER:—First number, 5,068,501. Located on right front door hinge pillar post.

COMPRESSION:—**Ratio**—6.2-1 Std. aluminum head. **Pressure**—Std. head 125-135 lbs. at 1000 R.P.M. or approximately 106 lbs. at cranking speed.

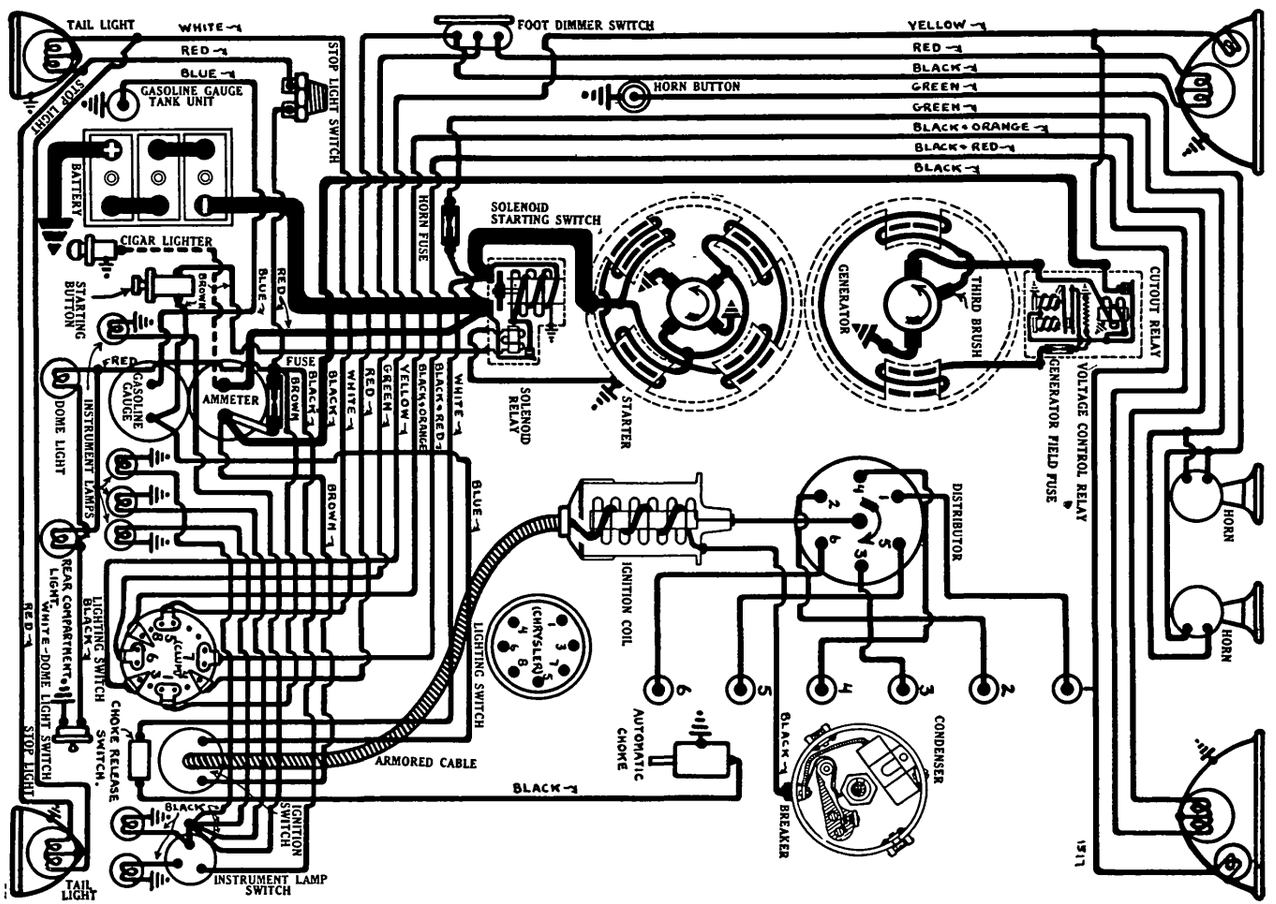
VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling.

IGNITION:—**Coil Model 540-E.** Ignition switch is part of coil assembly (connected to coil by armored cable).
Ignition Switch—Delco-Remy Model 432-E.
Distributor Model 644-W. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—19-23 ozs.
Cam Angles (Distributor Degrees) — Closed 36°. Open 24°.

Automatic Advance

Distributor Degrees	Distributor R.P.M.
Start	250
7	400
15	1600
Engine Degrees	**Engine R.P.M.**
4	500
14	800
30	3200

Mounting:—On left hand side of crankcase. Held in place by hold-down screw in advance arm.



IGNITION TIMING:—Flywheel Degs. Piston Position
Aluminum Head 3° ATDC..... .004" ATDC.
Timing (using Timing Light)—Connect timing light between distributor terminal and live terminal of generator relay. Turn engine over until #1 piston is on compression, stop with piston slightly past top dead center when 3° mark on crankshaft impulse neutralizer at front of engine is directly under pointer on chain case, loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw, loosen clamp bolt on advance arm, rotate distributor until timing light just goes out, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram). The Impulse Neutralizer is marked in 1° graduations for a total of 15° on each side of the '0' or top dead center point. The ignition mark is the third graduation to the left of the center or '0' mark (facing front of engine).
Timing (using Gauge)—All cars can be timed using a Motor Gauge installed in timing plug hole over #1 piston. Use Weidenhoff Adapter #103, Rod #12.
Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—A.C., Type SL-9 (aluminum heads only). 14 MM. Metric type.
Spark Plug Gap—.025".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, Gasoline Gauge, and Automatic Choke.
Carburetor:—Carter, Model E6B1, 1½" plain tube, downdraft type.
Automatic Choke—Sisson.
Fuel Pump:—A.C., Type P on right hand side of crankcase.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #6 intake valve at .010". This valve should open with #6 piston on top dead center when '0' mark on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.
Tappet Clearance:—.005" Int., .007" Exh., engine hot.
Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed). 104-110 lbs. at 1 11/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Presure—30-40 lbs. at 30 M.P.H.

BATTERY:—**Willard, Type WS-4-17,** 6 volt, 17 plate, 115 A.H. capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.

STARTER:—Model 727-L. Armature No. 823881.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.
Cranking Engine—175-200 amperes, 5.0 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid Switch No. 1516. Push-button Switch No. 1387. Starter pinion shift operated by solenoid on starter field frame. Controlled by relay (on solenoid switch case) operated by pushbutton switch on instrument panel. Operative only with ignition 'on'. See Equipment Section for complete data.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 935-D. Armature No. 1854856. Third brush current control with external voltage regulation (regulator combined with relay cut-out in case on generator field frame). Third brush setting should be adjusted by using test meters or by 'Commutator Bar' method.

Charging Rate Adjustment (using Meters)—Use test ammeter and voltmeter to check generator output. Connect jumper wire from 'F' generator terminal to ground (important as voltage regulator must be shorted out while adjustment is being made). With generator at room temperature, remove commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts, tighten lock screw, remove jumper wire. See Equipment Section for complete data on Voltage Regulator.

Commutator Bar Method—Remove generator from car, mount so that armature can be seen, loosen lock screw on commutator end plate, shift third brush by hand so that there are exactly 1⅞ commutator bars exposed between third brush and nearest main brush. This setting provides maximum safe output and must not be exceeded.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.6-8.0	2900

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—2.3-2.6 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs. (main brushes), 16-20 ozs. (third brush).
Field Fuse:—6 ampere capacity (in regulator case).

Mounting:—Pivot mounting at left front of engine. Driven by fan belt. To remove, take out two hinge bolts and one clamp bolt.

Belt Adjustment:—To adjust belt, loosen pivot bolts and clamp bolt, swing generator away from engine, tighten clamp bolt before slacking off on generator, tighten pivot bolts. Belt should be just tight enough to drive generator and water pump without slipping.

RELAY REGULATOR (CONTROL UNIT):—Model 5542. Consists of relay cut-out and voltage regulator in case on generator field frame. See Equipment Section for complete data on Voltage Control Relay.

Relay Cut-out

Cuts in—6.6-6.8 volts.
Cuts out—3 ampere discharge (max).
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Air Gap—.028-.040" between armature and core (armature down against stop), armature travel (between armature and stop).

LIGHTING:—Clum Switch, Model 9556. Delco Remy Foot Control Switch, Model 465-S. Foot control switch on toeboard used to provide assymmetrical 'passing' beam (upper beam right hand headlight—lower beam left hand headlight).

Bulb Specications

Lamps	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	15	87

FUSES:—Lighting—20 ampere capacity on back of ammeter.
Horn—20 ampere capacity in fuse connector in horn lead near starter.
Generator Field—6 ampere capacity under regulator cover on generator.

HORNS:—Klaxon, Model K-26-G (matched set, blended tone) Vibrator type. Current draw, 5.0-6.5 amperes at 6.0 volts (high note), 6.0-8.5 amperes at 6.0 volts (low note).

SERIAL NUMBER:—First number 6,023,501 (Detroit), 9,664,001 (Windsor, Canada). On right front door hinge pillar post.

COMPRESSION:—Ratio—6.0-1 std. cast-iron head, 6.5-1 optional aluminum head.
Pressure—(6.0-1 std. head) 120-130 lbs. at 1000 R.P.M. or approx. 103 lbs. at cranking speed. (6.5-1 optl. head) 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—Coil Model IG-4615. Mounted on dash.
Ignition Switch—Mitchellock Mod. 24-B, Type 6505. Model 24-R, Type 6520 in taxicabs.
Distributor Model IGS-4001, A. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 38°. Open 22°. (distributor).
Manual Advance—20° (engine). Adjustment only.

Automatic Advance—IGS-4001

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	710	12	1420
9	1020	18	2040
12	1350	24	2700

Automatic Advance—IGS-4001-A

Start	350	0	700
3	400	6	800
6	780	12	1560
9	1160	18	2320
12	1530	24	3060

NOTE—Distributor changed to IGS-4001-A after 20,000. IGS-4001 distributors should be changed over by using new advance weight springs, Part #IG-884 and setting distributor to advance curve given for IGS-4001-A whenever advance mechanism requires attention.
Vacuum Spark Control—Provides additional advance for intermediate speed range above idling. Spark is retarded by return spring in unit when engine is accelerated or is operated with wide-open throttle.

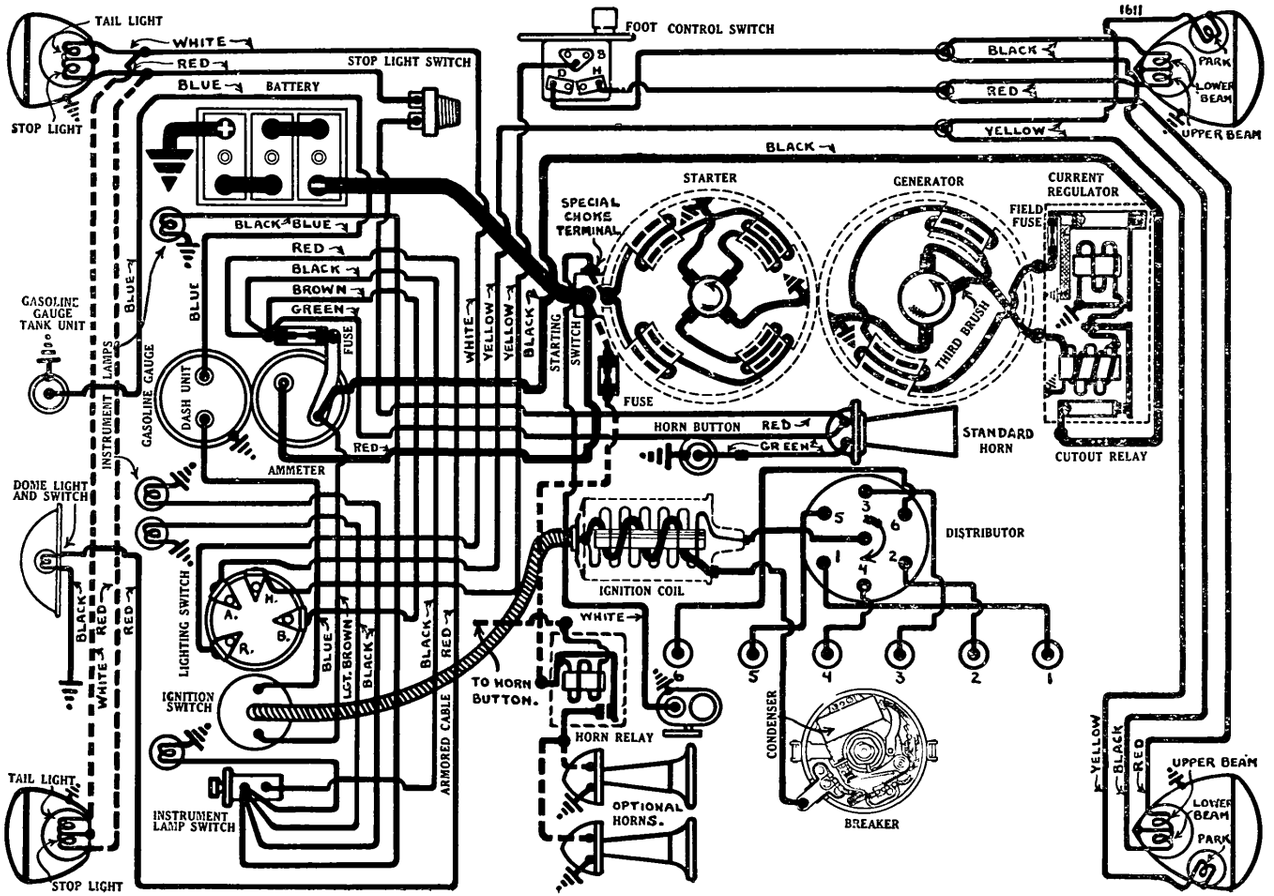
Vacuum Spark Advance

Distributor Degrees	Vacuum
½°	4-5" of HG.
9° Max.	12" of HG.

Removal:—Distributor mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
6.0-1 cast-iron head.....At TDC. ..... .0000" TDC.
6.5-1 Al. head .....5° ATDC. ..... .0108" ATDC.

Timing (using Timing Light)—Connect timing light between distributor terminal and battery terminal of generator control unit. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when '0' mark on impulse neutralizer or 5° line to left of center '0' mark at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale (opposite center '0' mark), tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing lamp goes out, tighten clamp bolt.



Timing (using Synchroscope)—Engines can be timed with a Synchroscope by directing light on impulse neutralizer at front of engine.

Timing (using Motor Gauge)—Engines can be timed with a motor gauge installed in timing hole over #6 piston (see table above). Use Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—A.C., Type K-9 (cast-iron head), KL-9 (aluminum head). 14 MM. Metric. Not interchangeable.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter Ball & Ball), Model E6F1, E6F2, 1½" downdraft type.

Automatic Choke—Sisson.
Fuel Pump:—A.C., Type P-1521788 diaphragm type.
Gasoline Gauge:—Motometer, electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open at top dead center when '0' mark on impulse neutralizer at front of engine lines up with pointer on chain case cover.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh. recommended for sustained high speed.
Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed). 104-110 lbs. at 1 22/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts.
Normal Oil Pressure—40-45 lbs. at driving speeds.

BATTERY:—Willard, Type WH-2-15, RH-2-15 (Export), 6 volt, 15 plate, 119 A.H. capacity, 20-hr. rate.
Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.

STARTER:—Model MAX-4002, MAX-4005 (Export). Armature No. MAW-2030.
Starter Drive—Positive shift outboard pinion.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).
Cranking Engine—Approx. 200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300 Min.	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

NOTE—See Equipment Section for instructions on installing Field Equalizer on these starters.
Starting Switch:—(MAX-4002), Type SW-2813. See Equipment Section for pedal adjustment and for Type SS-4101 solenoid switch (MAX-4005).
Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model GAR-4608-5. Armature No. GAR-2116-F. Air-cooled. Third brush control in conjunction with Current Regulator (two-rate charging control). See Equipment Section.
Charging Rate Adjustment (using Meters)—Use test meters to check generator output. Connect jumper wire between fuse cup on regulator case and ground on generator frame. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature (70°F.). Brush is held in position by friction. Remove jumper wire.
Commutator Bar Method—Shift third brush until there are exactly 4 commutator bars exposed between the edge of the third brush and the nearest main brush.
Maximum Charging Rate—Above settings provide maximum safe output. Do not exceed.

Performance Data

Cold—Regulator Contacts Closed—Hot					
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200

16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. (min. old brushes), 36 ozs. (maximum new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts (½ amp. more if relay and regulator in circuit).
Field Fuse—5 ampere in knurled cup on side of regulator case.
Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment:—See Model SG for adjustment.

RELAY-REGULATOR:—Model TC-4301-A. Mounted on generator field frame. Consists of Cutout Relay and Current Regulator. See Equipment Section.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Douglas Switch, Model 5374. Clum Foot Control Switch Model 9579. Foot control switch is used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Ig. Sw. Lamp	1½	55
Inst., Speedometer	3	63
Stop and Tail	21-3	1158

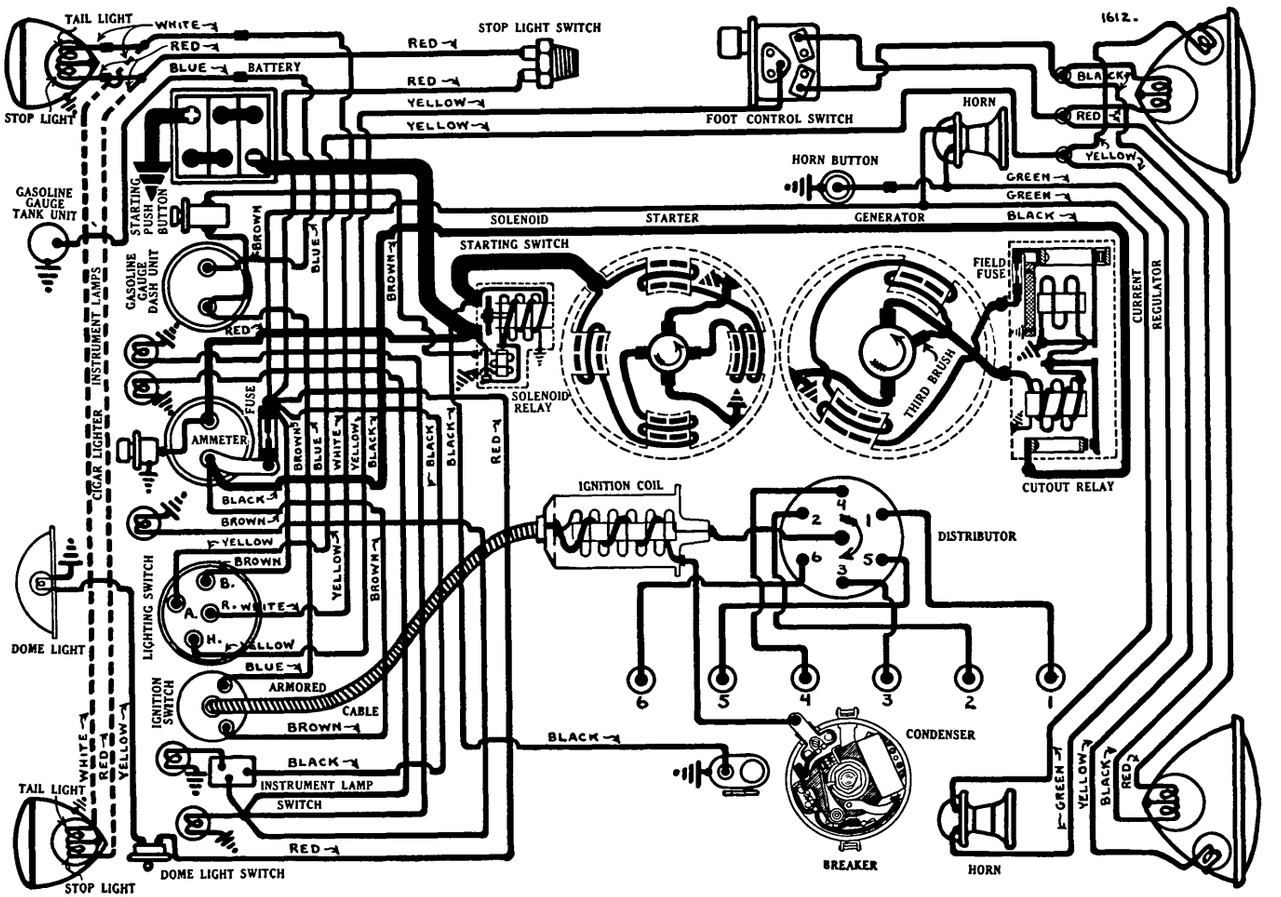
6	780	12	1560
9	1160	18	2320
12	1530	24	3060

NOTE—Distributor changed to IGS-4001A after 20,000. IGS-4001 distributors should be changed over by using new advance weight springs Part #IG-884 and setting distributor to advance curve given for IGS-4001-A whenever advance mechanism requires attention.
Vacuum Spark Control—Provides additional advance for intermediate speed range above idling. Spark is retarded by return spring in unit when engine is accelerated or is operated with wide-open throttle.



Vacuum Spark Advance

Distributor Degrees	Vacuum
½°	4-5" of HG.
9° max.	12" of HG.

Removal:—Distributor mounted on left side of crankcase. Accessible by removing left front wheel and cover plate under fender. To remove, disconnect vacuum line, take out hold-down screw

IGNITION TIMING:— Flywheel Degs. Piston Position
6.5-1 head engines .....5° ATDC. ..... .0108" ATDC.
7.0-1 head engines .....7° ATDC. ..... .0211" ATDC.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator regulator. With #1 piston on compression, turn engine over until piston is 5° or 7° past top dead center, stop when line marked '5' or '7' at left of center '0' mark on impulse neutralizer at front of engine lines up pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale (opposite '0' mark), tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.
Timing (Using Synchroscope)—Engines can be timed with a Synchroscope.
Timing (Using Motor Gauge)—Engines can be timed with a motor gauge installed in timing hole over #1 piston. See table above for setting. Use Weidenhoff Adapter #103, Rod #12.
Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—A.C. Type KL-9. 14 MM. Metric. These plugs have a longer (7/16") thread length.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter (Ball & Ball), Model E6F1, E6F2, 1½" downdraft type.
Automatic Choke—Sisson.
Fuel Pump:—A.C., Type P-1521788 diaphragm type.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open at top dead center with '0' mark on impulse neutralizer at rfont of engine opposite pointer on chain case cover. Reset tappet clearance at .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh. recommended for sustained high speed. Valves accessible by removing right front wheel and wheel housing.
Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed. 104-110 lbs. at 1 22/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—40-45 lbs. at driving speeds.

BATTERY:—Willard, Type WH-2-15, RH-2-15 (Export), 6 volt, 15 plate, 119 A.H. cap. (20 hr. rate).
Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.

STARTER:—Model MAX-4003. Armature MAW-2030.
Starter Drive—Magnetic shift outboard pinion.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).
Cranking Engine—Approx. 200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300 Min.	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300

21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension — 24 ounces minimum (old brushes), 36 ozs. maximum (new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts (½ amp. more, relay and regulator in circuit).
Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Generator pivot mounted at left front of engine with water pump belt drive (fan mounted on crankshaft). Accessible by removing left front wheel and cover plate. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment:—Loosen pivot and clamp bolts, pull generator away from engine until tension as measured on spring scale is 45-50 lbs.

RELAY REGULATOR: — Model TC-4301-A. Mounted on generator. Consists of Cutout Relay and Current Regulator. See Equipment Section.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 amperes discharge current.
Relay Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Douglas Switch, Model 5394. Clum Foot Control Switch Model 9590. Foot control switch is used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Inst., Speedometer	1½	55
Aux., Direct Inst.	3	63
Reading	15	87

NOTE—Lighting switch button and shaft are integral. See note on Chrysler Model C-6 for directions on removing switch.

FUSES:—Lighting—20 ampere on back of ammeter.
Optional Horns—30 ampere in horn relay lead. See Model SF for wiring of horns and relay.
Generator Field—5 ampere in regulator.

HORNS:—Std. Klaxon Model K-26-S, Type 1549 (low note), 1550 (high note). Matched tone, twin horns.

SERIAL NUMBER:—On right front door hinge pillar post. First number for each model as follows:

Model	Detroit	Canada
Custom S1	6,043,001	9,664,641
Deluxe S1	5,500,001	9,664,641
S2	5,089,001	9,603,551

COMPRESSION:—Ratio—6.0-1 Std. cast-iron head (S1), 6.5-1 Aluminum head (Optl. S1, Std. S2), 7.0-1 Alum. head (Optl. S2).

Pressure—(S1 Std. 6.0-1 head) 120-130 lbs. at 1000 R.P.M. or approx. 103 lbs. at cranking speed. (Optl. S1, Std. S2 6.5-1 Al. head) 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed. (S2—Optl. 7.0-1 Al. head) 130-140 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—Coil Model IG-4630, (S1), IG-4637 (S1-Conv. sedan and coupe) IG-4636 (S2), IG-4639 (S2-RHD). Service Winding (coil less switch and cable IG-3224S.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B. Type 6518 (S1), 6746 (S1-Conv. sedan and coupe), 6688 (S2). Connected to coil by armored cable.

Ignition Lock—Yale & Towne Mod. DP-108, Mitchell No. 6286.

Distributor Model IGS-4006-1, IGS-4006A-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .020". Limits .018-.020".

Cam Angle or Dwell—38° closed, 22° open.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IG-2671F. Capacity .20-.25 mfd

Automatic Advance—IGS-4006-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
6	775	12	1550
9	1150	18	2300
12	1530	24	3060

Automatic Advance—IGS-4006A-1

3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5.1"
1.4	6"
8	10-11"
16	15"

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, disconnect vacuum line. On S2 distributor accessible by removing left front wheel and cover plate under fender.

IGNITION TIMING:—Settings for all engines as follows

	Flywheel Degrees	Piston Pos.
6.0-1 Std. hd. (S1)	At TDC.	0000" TDC.
6.5-1 Optl. hd. (S1)	5° ATDC	0108" ATDC.
6.5-1 Std. hd. (S2)	5° ATDC	0108" ATDC.
7.0-1 Optl. hd. Ethyl fuel	7° ATDC	0211" ATDC.

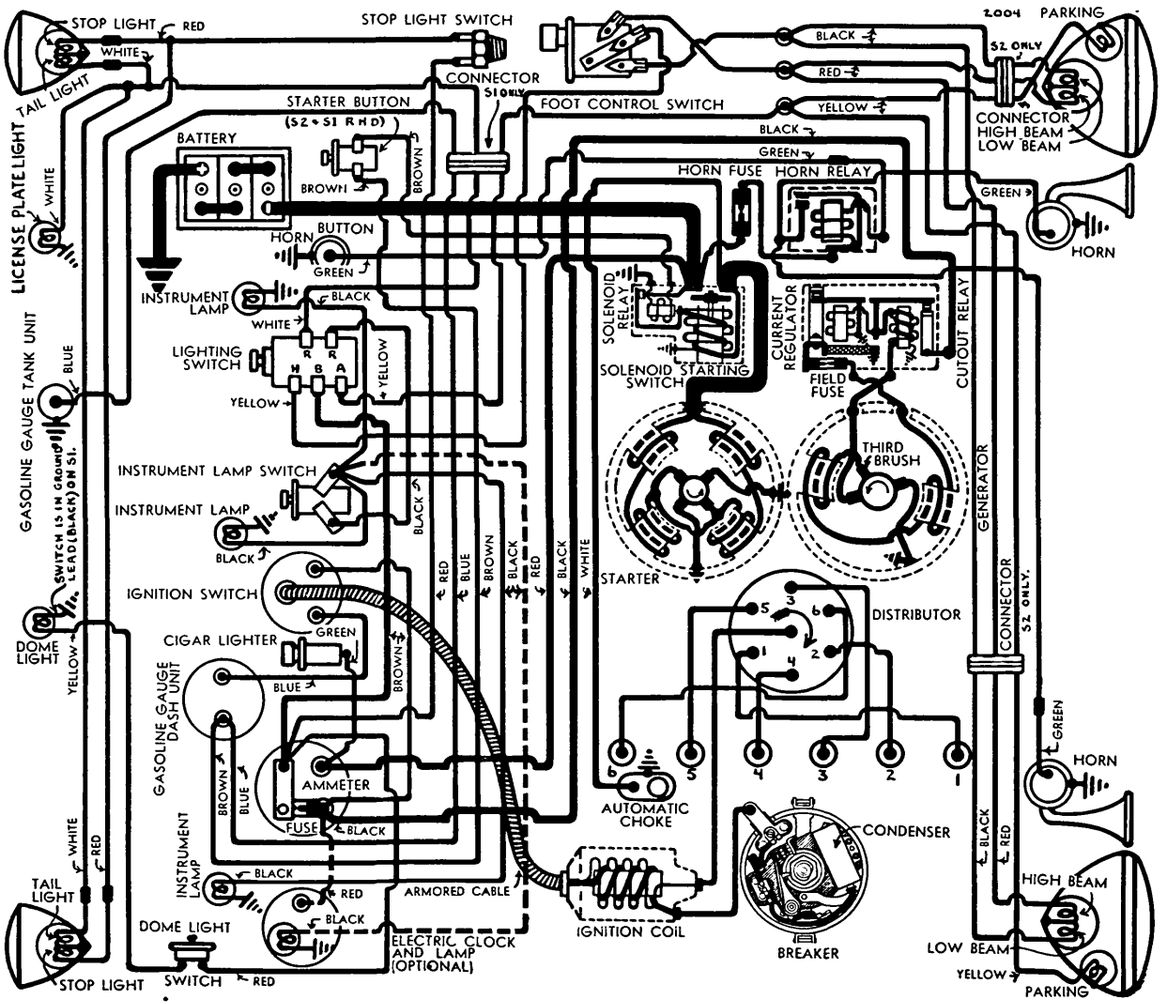
NOTE—Impulse neutralizer at front of engine marked 'O' at top dead center with 15 one degree graduations before and after this point.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table), stop when correct line on impulse neutralizer lines up with pointer on chain case cover. Loosen distributor hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt.

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint. See Equipment Section.

Timing (Motor Gauge)—Weidenhoff Adapter #103, Rod #12. Timing hole located over #1 piston (S1), #6 piston (S2).

Firing Order:—1-5-3-6-2-4. See diagram.



Spark Plugs:—(6.0-1 Cast-iron head S1) AC. Type K-9 superseded by Champion Type J-8. (All aluminum heads) AC. Type S-9 superseded by Champion Type H-10. 14MM. Metric.

NOTE—S1 only—spark plugs used in aluminum heads have longer thread. Not interchangeable with standard plugs.

Spark Plug Gap—.025".

CARBURETION:—Carburetor—Carter (B & B) Model E6G1, 1½" downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not make carburetor adjustments until

engine is well warmed up so that choke valve is wide open and fast idle inoperative.

Idle Adjustment—Adjust throttle stopscrew so that engine speed is 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Setting should be ¼-1 turn of the screw from closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:

Inner Hole (Min. stroke)—Extremely warm weather
Center Hole—Normal summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.
NOTE—5% and 10% lean main metering screws (high altitude calibration) may be used in lower altitudes for maximum fuel economy although with considerably reduced speed and power. See Carter (B & B) Jet Specifications in Carburetion Section.

Fast Idle:—Integral with carburetor. No adjustment.

Automatic Choke:—Sisson Type AC-751. See article in Carburetion Section for data and linkage adjustment.

Air Cleaner:—Burgess oil-wetted type standard, AC. #1526712 oil-bath type optional.

Fuel Pump:—AC. Type B, #1522237 (first cars), #1522995 (later cars). Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Motometer Electric. No. NG-7796-D (dash unit), No. NG-7687-T (tank unit). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston on top dead center when 'O' mark on impulse neutralizer lines up with pointer on chain case cover. Reset tappet clearance at .006" hot. **Motor Gauge**—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh., recommended for sustained high speed.

Valve Spring Pressure:—46-50 lbs. at 2 1/32" (valve closed), 104-110 lbs. at 1 11/16" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill). **Normal Oil Pressure**—30-40 lbs. at 30 M.P.H.

BATTERY:—Willard Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.

STARTER:—MAX-4015 (S1), MAX-4016 (S1 Export, S2 Std.) Armature MAW-2030.

Drive—Manual shift (S1), magnetic shift S1 Exp, S2), with outboard pinion.
Cranking Engine—Approx. 200 amperes at 5.0 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out capscrews. On S2 remove left front wheel and cover plate under fender.

Starting Switch:—S1—Type SW-2813 (MAX-4015). See Equipment Section for pedal adjustment. S-1 (Exp), S2—Solenoid Switch Type SS-4104. Controlled through relay by push-button on dash. Operative with ignition turned 'on.'

Solenoid Switch

Closes against 105 lb pull with ⅜" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts. **Contact Gap**—.025-.030". **Air Gap**—.005-.007" (closed).

GENERATOR:—Model GAR-4608A-5. Armature GAR-2116F. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Commutator Bar Method—Shift third brush until exactly 4 commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold — Regulator Contacts Closed — Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24 ozs. min. (old brushes), 36 ozs. max. (new brushes).

Field Current—3.51-3.89 amperes at 6.0 volts.

Motoring Current—5.03-5.57 amperes at 6.0 volts.

Field Fuse—5 ampere in plug on regulator case.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt. On S2 remove left front wheel and cover plate under fender.

Belt Adjustment:—Swing generator away from engine until 45-50 lb. reading on scale attached to generator frame.

RELAY-REGULATOR:—Model TC-4301A. Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran Brown, Pre-focused type. Headlamps aimed straight ahead (upper beam with lenses in place). Lower beam deflected slightly to right. Upper and lower beams controlled by foot seelctor switch.

Switches

Lighting—DeSoto Part No. 655795. Douglas Switch which is available only through DeSoto Parts Dept.
Foot Selector—Clum Model 9654 (S1), 9661 (S2).
Stop Light—R.B.M. No. 910. Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking	3	63
Stop and Tail	21-3	1158
Instrument, Ign. Sw.	1½	55
Dome	15	87

FUSES:—Lighting—20 ampere on back of ammeter.
Generator Field—5 ampere in plug on regulator.
Twin Horns—30 ampere in connector near starter.

HORNS:—Std. Motometer (S1). Klaxon Model K-33-C Type 2151 (low note), 2152 (high note) (S1 Optl.). Klaxon Model K-33-F Type 2107 (low note), 2108 (high note) (S2 Std.). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 Volts	Air Gap
2107 (low note)	11-13	.040-.044"
2108 (high note)	9-11	.032-.036"
2151 (low note)	11-13	.042-.046"
2152 (high note)	10-12	.032-.036"

Horn Relay:—Model 266-TK. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amp.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Turn radiator ornament counter-clockwise, raise hood about 1", push back safety catch at front under lower edge of hood releasing catch and raise hood. Side panels removed by freeing latches on inside lower edges of panels.

SERIAL NUMBER:—First number—5,517,301 (Detroit), 9,665,556 (Canada). On right front door hinge post.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure @ 1000 R.P.M.	@ 100 R.P.M.
6.5-1 Std. hd.	125-130 lbs.	approx. 110 lbs.
7.0-1 Optl. hd.	130-140 lbs.	approx. 117 lbs.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Models IG-4642 or CL-4602. Service winding (coil less switch and cable) IG-3224S or CL-3224S. Mounted on dash.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 7055. Connected to coil by armored cable.

Ignition Lock—Yale & Towne, Mitchell No. 7075.

Distributor Model IGS-4010-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .020".

Cam Angle or Dwell—38° (closed), 22° (open).

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part IG-3927-A. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
7	1000	14	2000
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	4.75"
1.4	6 "
8	10-11"
16	15 "

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, disconnect vacuum line.

IGNITION TIMING:—

	Flywheel Deg.	Piston Position
6.5-1 Std. head	2° ATDC	.002" ATDC.
7.0-1 Optl. Al. head	TDC	.000" TDC.

NOTE—Crankshaft pulley at front of engine marked 'O' at top dead center with 15 one degree graduations before and after this point.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston reaches firing position (see table), stop when correct line on impulse neutralizer lines up with pointer on chain case cover. Loosen distributor hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt.

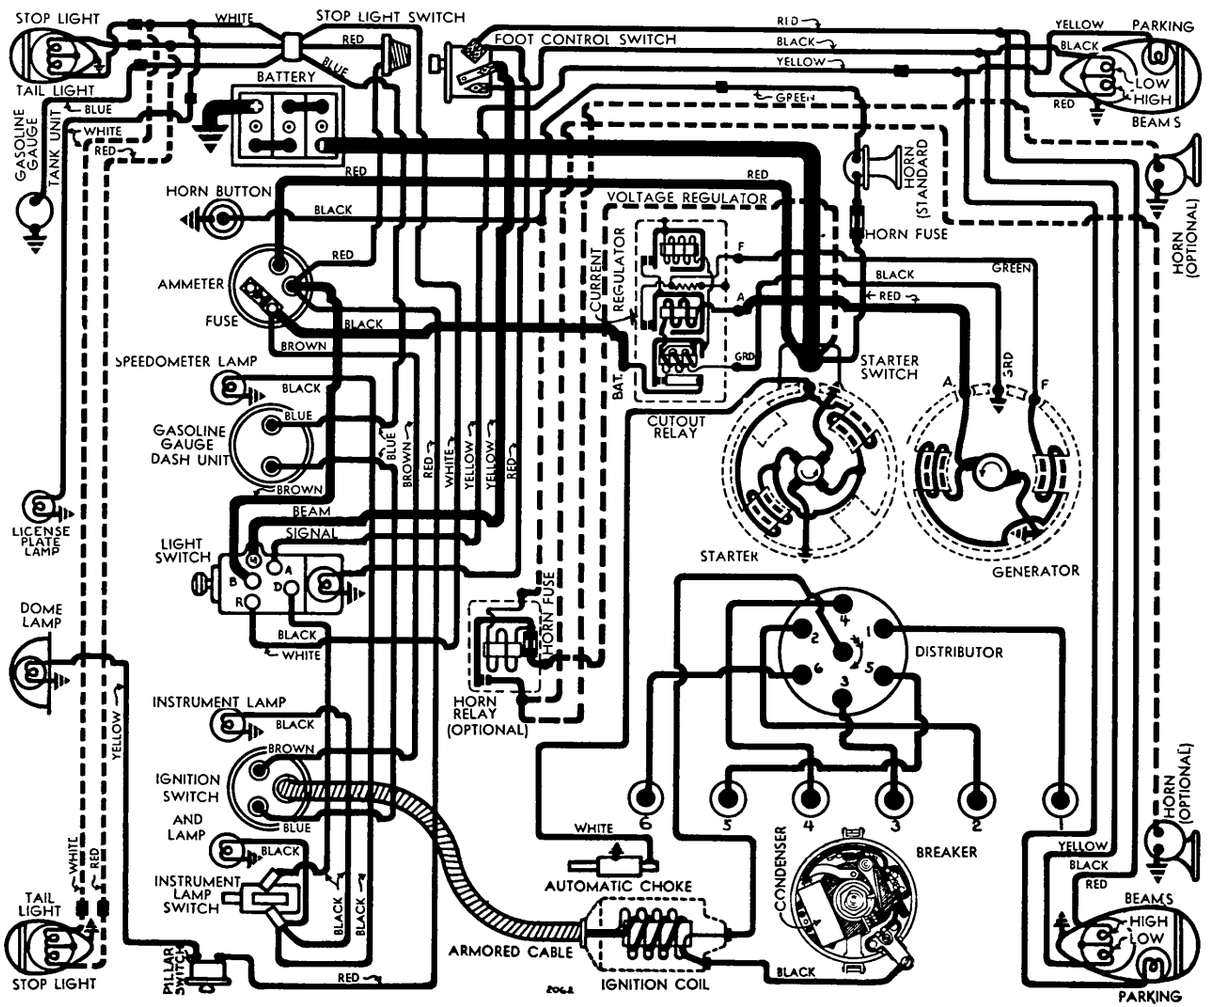
Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with chalk or white paint.

See Article in Electrical Equipment Section.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (cast-iron hd.), H-10 (aluminum head), 14 MM. Metric type.



Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Carter (Ball & Ball) Models E6I1, E6K1, E6K2, E6K3, E6K4, 1½" downdraft types.

NOTE—See article in Carburetion Section for recommended changes on first three models.

Idle Adjustment—With engine warm and choke valve wide open (fast idle inoperative), adjust throttle stopscrew so that idle speed is 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ½-1¼ turns of screw from inner closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—extremely warm weather.
Center Hole—Normal summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.
Note—5% and 10% lean main metering jets (high altitude calibration) may be used at lower altitudes for maximum fuel economy although with con-

siderably reduced speed and power. See Carter (B & B) Jet Specifications in Carburetion Section.

Fast Idle:—Integral with carburetor. No adjustment.

Automatic Choke:—Sisson Type AC-751B. See article in Carburetion Equipment Section for data and linkage adjustment.

Air Cleaner:—Burgess oil-wetted type standard. AC #1526838 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type B #1522995. Diaphragm type. AC. Type AL #1523137 comb. fuel and vacuum pump use on cars with overdrive.

See Article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .014". This valve should open with piston on top dead center when '0' mark on crankshaft pulley lines up with pointer on chain case cover. Reset tappet clearance at .010" hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.010" Int. and Exh. hot.

Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed). 101-109 lbs. at 1 13/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WHT-2-105, RHT-2-105 (Ex) 6 volt, 15 plate, 105 AH. capacity (20 hr. rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left side under drivers seat..

STARTER:—Mod. MAW-4010, MAW-4011 (Exp), Armature No. MAW-2030.

Drive—Positive shift outboard pinion.

Cranking Engine—Approx. 175 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0. ft. lbs.	4900	5.5	65
.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange screws.

Starting Switch:—(MAW-4010)—SW-2813. Mounted on starter field frame and operated by pinion shift (starting pedal). See article in Electrical Equipment Section for pedal adjustment.

(MAW-4011)—Solenoid Switch Type SS-4104. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on.'

Switch Specifications

Closes against 105 lb. pull with ⅜" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts.

Contact Gap—.025-.030". **Air Gap**—.005-.007" (closed)

GENERATOR:—Model GBW-4803-A, B (Exp.), C (Exp. Bolivia). Armature No. GBW-2006F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—22 amps., 8.0 volts, 1780 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.

Charging Rate Adjustment—No adjustment on Generator. See Regulator section below for Voltage and Current Regulator settings.

Performance Data

Cold Amps.	Volts	R.P.M.	Hot Amps.	Volts	R.P.M.
0	6.4	775	0	6.4	870
4	6.7	940	4	6.7	1065
10	7.1	1200	10	7.1	1385
16	7.6	1480	16	7.6	1780
20	7.85	1675	20	7.85	2125
22	8.0	1780	22	8.0	2400

NOTE—Current regulator limits maximum output to 22 amperes.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Curent—1.71-1.89 amps. at 6.0 volts.

Motoring Current—2.94-3.26 amps. at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolts.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs., tighten bolts.

REGULATOR:—Model VRB-4005-A, Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator and Vibrating Current Regulator in case on dash.

See Article in Electrical Equipment Section.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed. Voltage should be within 7.4-7.8 volts (low limit hot, high limit cold. If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 M.P.H., add load (use bank of headlamp bulbs or turn on car lights and discharge battery) so that generator will charge at peak rate bringing current regulator into action. Charging current should not exceed 22 amperes. If more than slight excess noted, Current Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Aim headlamps straight ahead (lenses in place, upper beams lighted and car unloaded) with center of hot spot 3" (5 pass), 2" (7 pass) below center horizontal line of headlamps at 25 feet. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in full out position.

Headlamp Beam Indicator—In light switch knob. Lighted when headlamp upper beams in use.

Switches

Lighting—De Soto Part No. 667044.
Instrument Light—De Soto Part No. 667043.
Foot Selector—De Soto Part No. 659512.
Stop Light—De Soto Part No. 661721.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Tail and Stop Light	3-21	1158
Beam Indicator, Ign. Sw	1	51
Parking, Instrument	1½	55
Dome	15	87
Rear License	3	63

FUSES:—Lighting—20 amperes on back of ammeter.

Horn—20 amp. (single) in connector near starter. 30 amp. (dual) in horn relay.

HORNS:—Auto-Lite Model HB-4002. Single, standard. Twin horns Model HC-5103 with HR-4002 horn relay optional.

DODGE

DODGE BROTHERS SIX (1929), SERIAL NUMBERS DA-1 UP
PRODUCTION STARTED DECEMBER 17, 1928
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

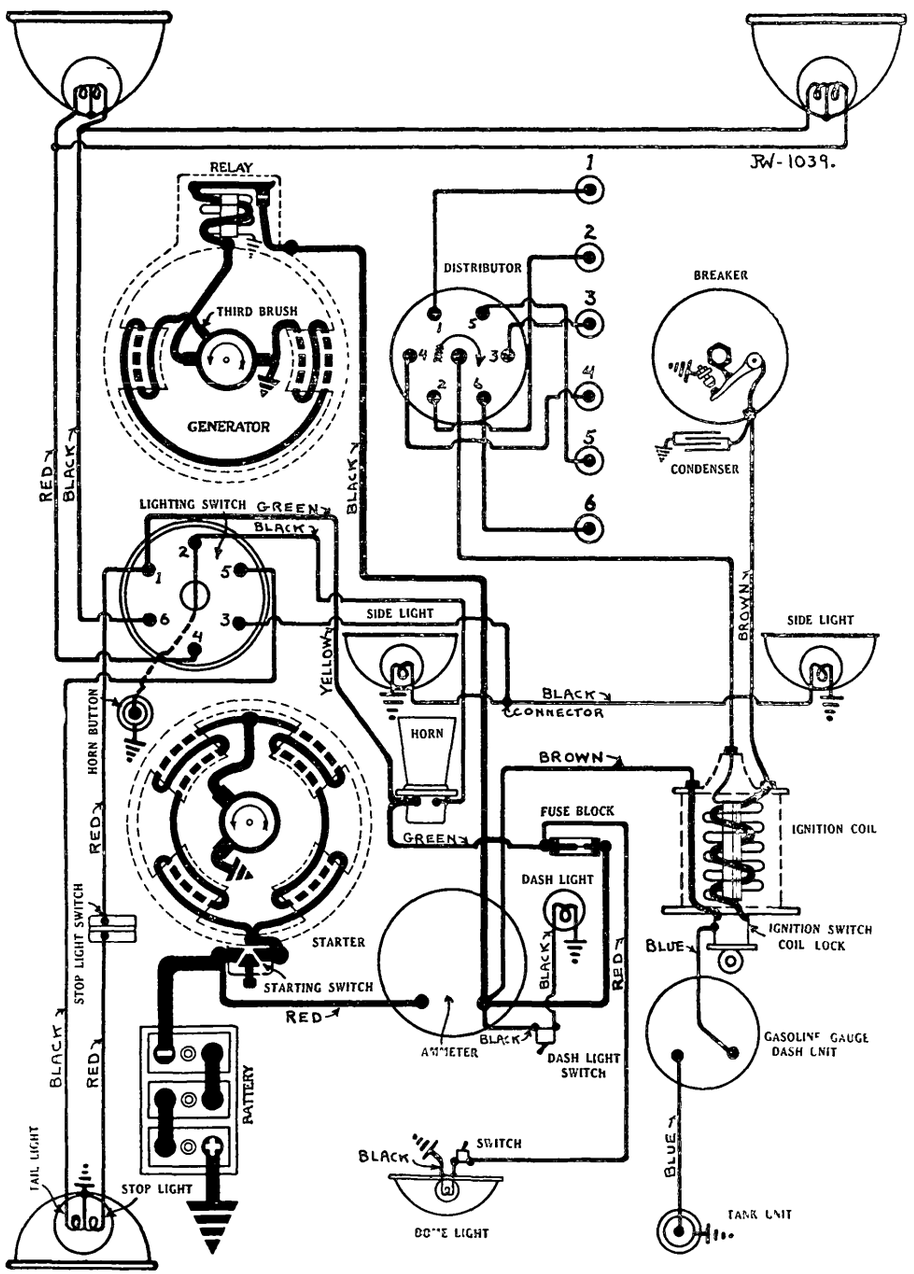
BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under the front floor board on the left side.

IGNITION:—Coil Type 21904. Coil is mounted on the back of the dash with the ignition switch (incorporated in the coil) extending through to the face of the instrument board. Ignition current is 4 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped.

Distributor Type 10845. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 15 degrees reached at 2200 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with cables intact. Then take out screw at rear of control lever and lift distributor from place.

Oiling:—Fill the grease cup with medium cup grease and turn down one turn every two weeks or each 500 miles. At the same time remove the distributor head and rotor and put a few drops of light oil in the wick oiler in the center of the shaft. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 4 degrees before top dead center with spark control lever in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever and continue to crank engine until the flywheel mark 'I', which is 4 degrees before top dead center mark 'C/1-6' is opposite the indicator in the peephole in the forward face of the flywheel housing on the left side. Loosen advance arm clamp screw and rotate distributor counter-clockwise until the contacts begin to separate. Tighten the clamp screw and connect the terminal directly opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head. With the correct setting, the back lash of the distributor gears should be sufficient to open and close the breaker contacts. Turn on the ignition switch and rock the distributor shaft back and forth. The pointer of the dash ammeter should fluctuate between '0' and 'Discharge' as the contacts open and close.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches. Stem diameter, ⅜ inch. Stem length, 5 23/64 inches. Valve lift, 5/16 inch. Spring pressure, 42 pounds (valve closed). Tappet clearance, .004-.006 inch (hot). Inlet valves open at top dead center and close 48 degrees after lower dead center. The flywheel is marked 'C/1-6' at point of inlet opening.

EXHAUST VALVES:—Head diameter, 1 17/32 inches. Stem diameter, ⅜ inch. Stem length, 5 23/64 inches. Valve lift, 5/16 inch. Spring pressure, 42

DODGE

DODGE BROTHERS SIX (1929), SERIAL NUMBERS DA-1 UP
PRODUCTION STARTED DECEMBER 17, 1928
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

pounds (valve closed). Tappet clearance, .004-.006 inch (hot). Exhaust valves open 50 degrees before lower dead center and close 6 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

To Check Valve Timing. Set tappet clearance of No. 1 inlet valve at .006 inch with piston No. 1 on top dead center entering power stroke. Crank engine over one complete revolution and stop with piston on top dead center with flywheel mark 'C/1-6' opposite indicator in peephole at left of engine. The No. 1 inlet valve should begin to open at this point.

To Set Valve Timing:—Mesh chain with sprockets turned so that '0' marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model SBH, Type 6494. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 100 R.P.M. developing 5.5 ft. lbs. and drawing 250 amperes at 5 volts. Brush spring tension is 3 pounds. Starter switch is Type 20900.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1700	5.6	120
2.4 "	1500	5.5	140
3.9 "	1200	5.25	200
5.75 "	900	4.9	260
8.0 "	600	4.5	340
11.0 "	300	4.0	425
13.5 "	Lock	3.2	550

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting switch connection and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model LAB, Type 6530. The direction of rotation is counter-clockwise, viewed from the commutator end. Current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by hand after loosening the lock screw on the end plate. Shit the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, maximum charging rate is 12 amperes (hot) at 8 volts reached at 2000 R.P.M. or 37 miles per hour.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.

15.75	2000	12	2000
12	2800	11	2400

Brush spring tension is 12-16 ounces. Shunt field current is 3 amperes at 6 volts.

Mounting:—Generator is mounted at left of engine by special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen bolt in adjustment clamp arm. Then swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on hinge bracket and lift generator from place.

Belt Adjustment:—Fan belt is adjusted by shifting generator. To tighten belt, loosen two bolts under generator and bolt in adjustment clamp arm. Swing generator away from engine until proper belt tension is secured and tighten bolts. Do not put too much tension on the belt or it will cause excessive wear of the generator bearings.

RELAY:—Type 20220. Relay is mounted on the generator. Relay contacts close at 660 R.P.M. or 11 M.P.H. when the generator voltage reaches 6.75 volts and open at 600 R.P.M. or 10 M.P.H. with a discharge current of 1-2 amperes. Contacts separate .020-.025 inch. Air gap is .015 inch with contacts closed.

LIGHTING:—Clum Swith Model 8821. Lighting switch is mounted at lower end of steering column. Double filament headlights are used instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-3 cp. D.C. Mazda 1158 (double filament bulb). Dash and corner lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

NOTE:—Soreng-Manegold Switch, Model 5500-A, was also used.

FUSES:—Lighting fuse mounted on block on dash is 20 ampere capacity.

DODGE

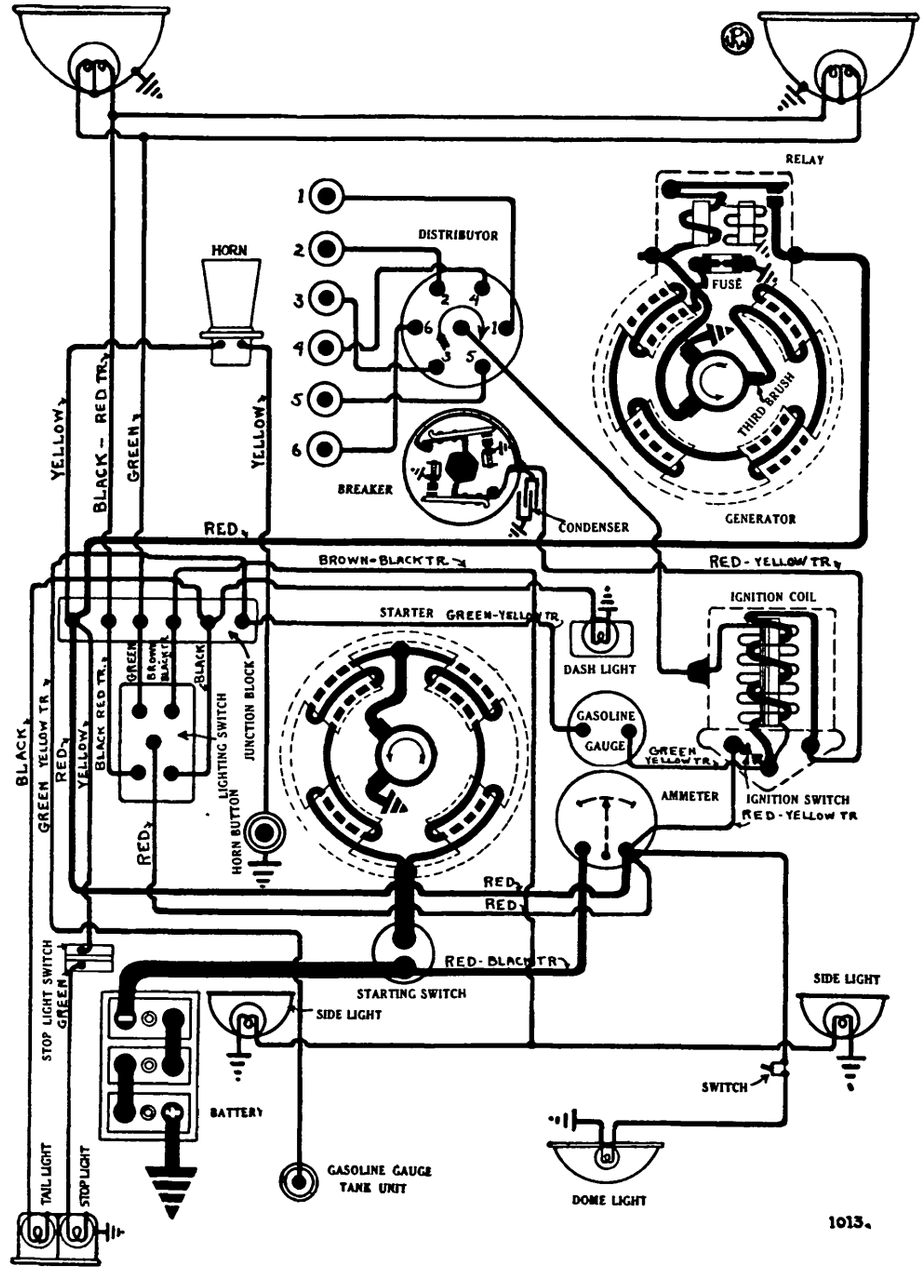
SENIOR SIX (1928-29)
SERIAL NUMBERS S-50001 UP
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

BATTERY:—Willard, Type CWR-17, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 23 hours. The battery is mounted under the front seat.

IGNITION:—Coil Type 19232. Ignition current is 2 9/10 amperes at 6 volts with engine running and 5.5 amperes at 6 volts with engine stopped. The ignition coil is mounted on the rear of the dash.

Distributor Model TBU, Type 10846-AB. Breaker contacts separate .020 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. To set contact gap, loosen the lock nut on stationary contact stud and turn up stud until proper contact is secured. Breaker arm spring tension is 16 ounces. Breaker has two sets of contacts which must be synchronized to open at the same instant. See Timing. Distributor is semi-automatic. Manual advance is 20 degrees. Automatic advance begins at 600 R.P.M. Maximum automatic advance is 15 degrees reached at 2200 R.P.M. of the engine.

Mounting:—Distributor is mounted on cylinder head between cylinders 3 and 4. To remove distributor, disconnect manual advance rod and primary lead. Remove distributor head with high tension cables intact. Remove set screw in side of distributor mounting and lift unit up and out.



Oiling:—Put a few drops of medium oil in the oiler on the side of the distributor housing. Remove rotor button and oil the felt wick in the center of the shaft. Put a small bit of vaseline on the face of the breaker cam under the fiber bumpers of the contact arms.

Timing:—Synchronization of Contacts:—To synchronize contacts, connect a six volt lamp across each of the contacts and watch lamps as contacts open. They should light at the same instant. If they do not, loosen the 2 lockscrews on the breaker plate and shift plate until contacts separate simultaneously. Tighten the screws. Check contact gaps and set at .020 inch.
Timing Distributor to Engine:—Breaker contacts separate when piston entering power stroke reaches a position 10 degrees before top dead center with the manual spark control lever in the fully advanced position. To check timing, crank engine over until piston No. 1 is coming up on the compression stroke. This is the up stroke with both valves closed. Continue to crank engine until piston reaches a position 10 degrees before top dead center (measured on the flywheel) when the ignition mark 'IGN' will be in the center of the peephole in the flywheel housing. Contacts should separate at this point. If they do not, loosen the advance arm clamp screw and rotate the distributor until contacts separate. Tighten the clamp screw. With correct setting, the backlash of the gears should be sufficient to open and close contacts. If the ignition switch is turned on the ammeter will swing from '0' to 'Discharge' as the gears are rocked.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞ inch Champion. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter is 1 21/32 inches; stem diameter is ⅜ inch; stem length is 5 11/16 inches. Tappet clearance is .004 inch (hot). Spring pressure is 110 pounds (max.). Valve lift is .320 inch. Inlet valves open at top dead center and close at 48 degrees after lower dead center.

DODGE

SENIOR SIX (1928-29)
SERIAL NUMBERS S-50001 UP
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

EXHAUST VALVES:—Head diameter is 1 19/32 inches; stem diameter is ⅜ inch; stem length is 5 11/16 inches. Tappet clearance is .006 inch (hot). Spring pressure is 110 pounds (max.). Valve lift is .320 inch. Exhaust valves open at 50 degrees before lower dead center and close at 6 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

To Check Valve Timing. Crank engine over until No. 1 piston is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .006 inch. Crank engine over one complete revolution and stop with piston on dead center with flywheel mark 'D.C.1&6' opposite indicator in peephole in flywheel housing. The No. 1 inlet valve should begin to open at this point. The No. 1 exhaust valve will close when the piston is 6 degrees past top dead center with the flywheel mark 'Ex.Cl.1&6' at the indicator.

To Set Valve Timing:—Mesh chain with sprockets turned so that '0' marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model SBH, Type 6400. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. drawing 100 amperes at 4.95 volts. Starter brush spring tension is 3 pounds. Starter switch is Model 15380.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1700	5.6	120
2.4 "	1500	5.5	140
3.9 "	1200	5.25	180
5.75 "	900	4.9	245
3.25 "	600	4.5	320
1?.9 "	300	4.0	425
16. "	Lock	3.1	550

Mounting:—Starter is flange mounted by standard S.A.E. No. 1 flange at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model LB. Type 6390-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adust charging rate, turn the slotted adjusting pinion extending through the generator end plate. The three brushes are mounted on a plate and the pinion moves all three when the adjustment is made. Turn the pinion in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With standard car setting, the charging rate is 14 amperes (hot) reached at 1400 R.P.M. or 25-30 miles per hour.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.

14.5	2000	12	2000
12	2400	10.5	2400

Brush spring tension is 12-16 ounces. In service the generator field draws 2.15 amperes at 5.1 volts. The four field coils connected in series directly across a battery draw 8 amperes at 6 volts. Generator motoring, draws 5 amperes at 6 volts.

Mounting:—Generator is flange mounted on the right of the engine at the rear of the timing chain case. To remove generator, disconnect lead and remove three flange mounting cap screws. Then pull generator straight to the rear.

Adjustment of Timing Chain:—Timing chain is adjusted by shifting the generator around the lower flange mounting screw as a pivot. To adjust chain, loosen cap screws and shift the generator away from the engine until chain operates noiselessly, and tighten the screws. The chain should be loose enough to run without noise.

RELAY:—Type 20220. Relay is mounted on top of the generator. Contacts close at 600 R.P.M. when generator voltage reaches 6.75 volts, and open when the generator voltage drops to 5.75-6.0 volts with a discharge current of 1-2 amperes. Relay contacts separate .020-.025 inch. Air gap is .015 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch, Model 40909. Lighting switch is mounted at the base of the stering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact) Mazda 1110. Side, dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Generator field fuse is 6 amperes. Mounted on end of generator.

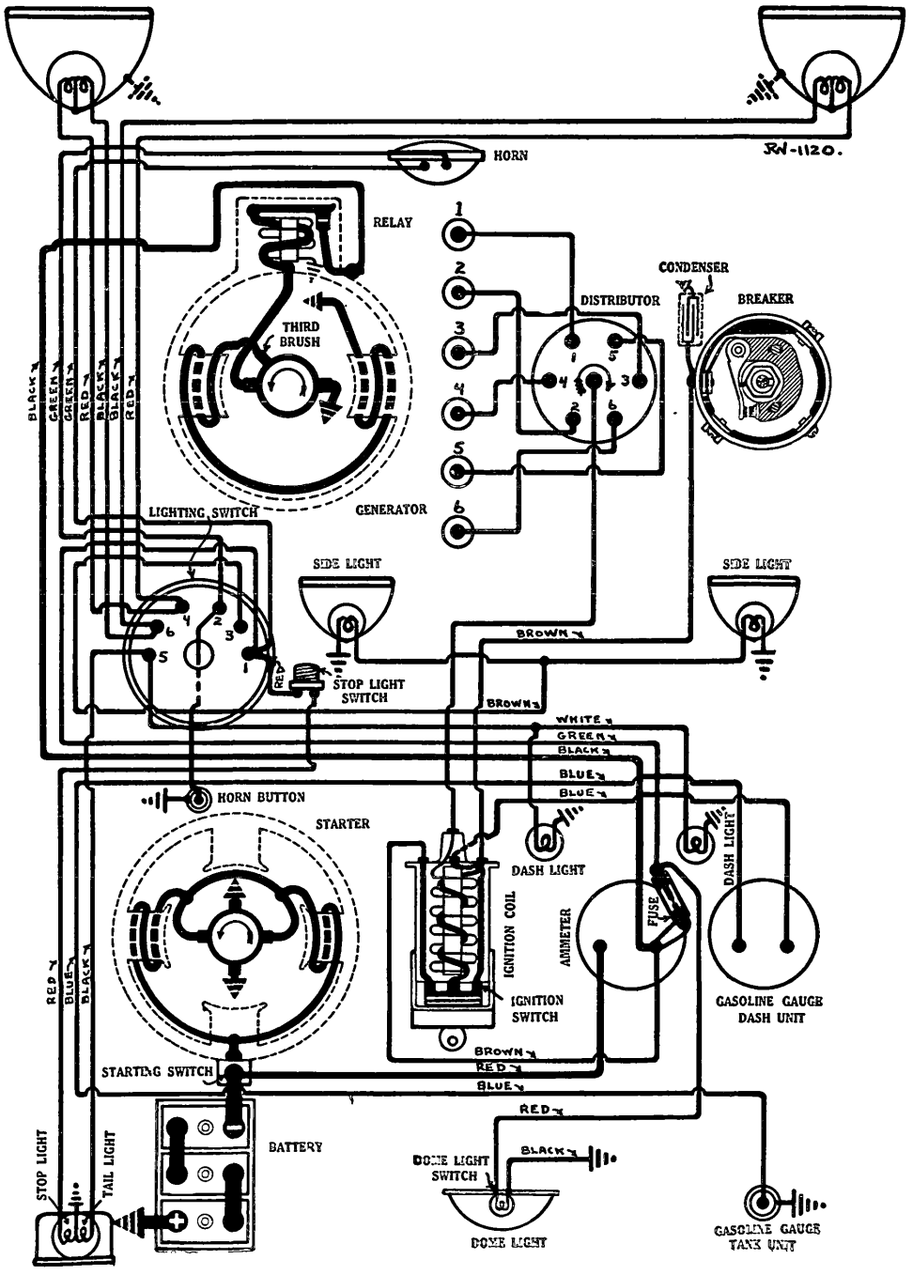
MODEL DD (1930) SERIAL NUMBERS 0001WP UP
PRODUCTION STARTED DECEMBER 13, 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-13, 6 volt, 100 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-L. The ignition switch is built in the base of the coil. Coil is mounted on the rear of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Type 10849 (North East). Breaker contacts separate .018-.023 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until gap is .020 inch with breaker arm on lobe of cam. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 2540 R.P.M. of engine.

Delco-Remy Model 632-D. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 16 degrees (engine) reached at 2200 R.P.M.

Mounting:—Distributor is mounted at the right of the engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw at rear of advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing (N. E.):—Contacts begin to open when the piston entering power stroke reaches a position .009 inch before top dead center with the spark control lever in the fully advanced position. To set timing, first set breaker contact gap at .020 inch. Fully advance spark control lever. Then remove the ⅛ inch pipe plug from the cylinder head directly above No. 6 cylinder and screw the special timing micrometer gauge in place in the hole. Connect a small six volt lamp in the primary circuit (this can be done by connecting one lamp lead to the primary terminal of the distributor and the other lamp lead to the relay terminal of the generator, If the battery is out of the car, connect the lamp lead to a battery and ground the other battery terminal to the engine). Turn engine over and set micrometer at zero on top dead center. Crank the engine over until piston No. 1 is coming up on compression stroke (both valves will be closed) and stop when the gauge indicates that the piston is .009 inch before top dead center. Remove distributor head and see that rotor is opposite No. 1 segment (see diagram). Loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open, when the lamp will go out. Tighten the clamp screw and connect the spark plug leads in order 1-5-3-6-2-4 clockwise around the distributor head. Check the setting by cranking the engine over

DODGE SIX

PRODUCTION STARTED DECEMBER 13, 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

several times and then stopping with piston No. 1 on compression stroke at the point where the lamp goes out, indicating that the contacts have begun to open. If the gauge reading is within .004-.014 inch before top dead center, the setting is satisfactory. If outside these limits the engine should be retimed.

Timing (Delco-Remy Distributor):—Breaker contacts begin to open when the piston entering power stroke reaches a position .028 inch before top dead center with manual spark control fully advanced. The allowable variation is .002 inch and piston position must be held within limits of .026-.030 inch before top dead center.

NOTE:—If the new type timing gauge is used, which has a spark gap built in the gauge dial, it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be seen at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.469 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches (from top of taper). Valve lift, 5/16 inch. Spring pressure, 40-44 pounds (valve closed) and 75-81 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.469 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches (from top of taper). Valve lift, 5/16 inch. Spring pressure, 40-44 pounds (valve closed) and 75-81 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across shaft centers.

STARTER:—Model 714-Q. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal linkage. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
.4 "	3250	5.5	100
3 "	1500	5.0	200
6 "	800	4.5	300
9.4 "	350	4.0	400
12 "	Lock	3.6	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

GENERATOR:—Model 943-L, R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
16	8.0	2300	12.5	7.7	2400
12	7.7	3200	10	7.5	3200

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

North East Model LAB, Type 6530-D or E (used on some cars). Generator current regulation is by third brush shunt field. Adjustment is similar to Delco-Remy model given above. Brush spring tension should be 12-16 ounces.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	675	0	6.4	725
5	6.9	875	5	6.9	1025
10	7.4	1150	10	7.5	1500
16	8.1	1800	12	7.7	2000
13.4	7.8	2500			

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by swinging the generator away from the engine. To make the adjustment, loosen the two bolts under the generator. Then loosen adjustment clamp bolt and pull generator out from the engine until the proper belt tension is secured. Tighten the clamp bolt and the mounting bolts. The belt tension should be just sufficient to drive the fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. when the generator voltage reaches 6.4-7 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 8821. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Soreng-Manegold Switch, Model 5500-A, was also used.

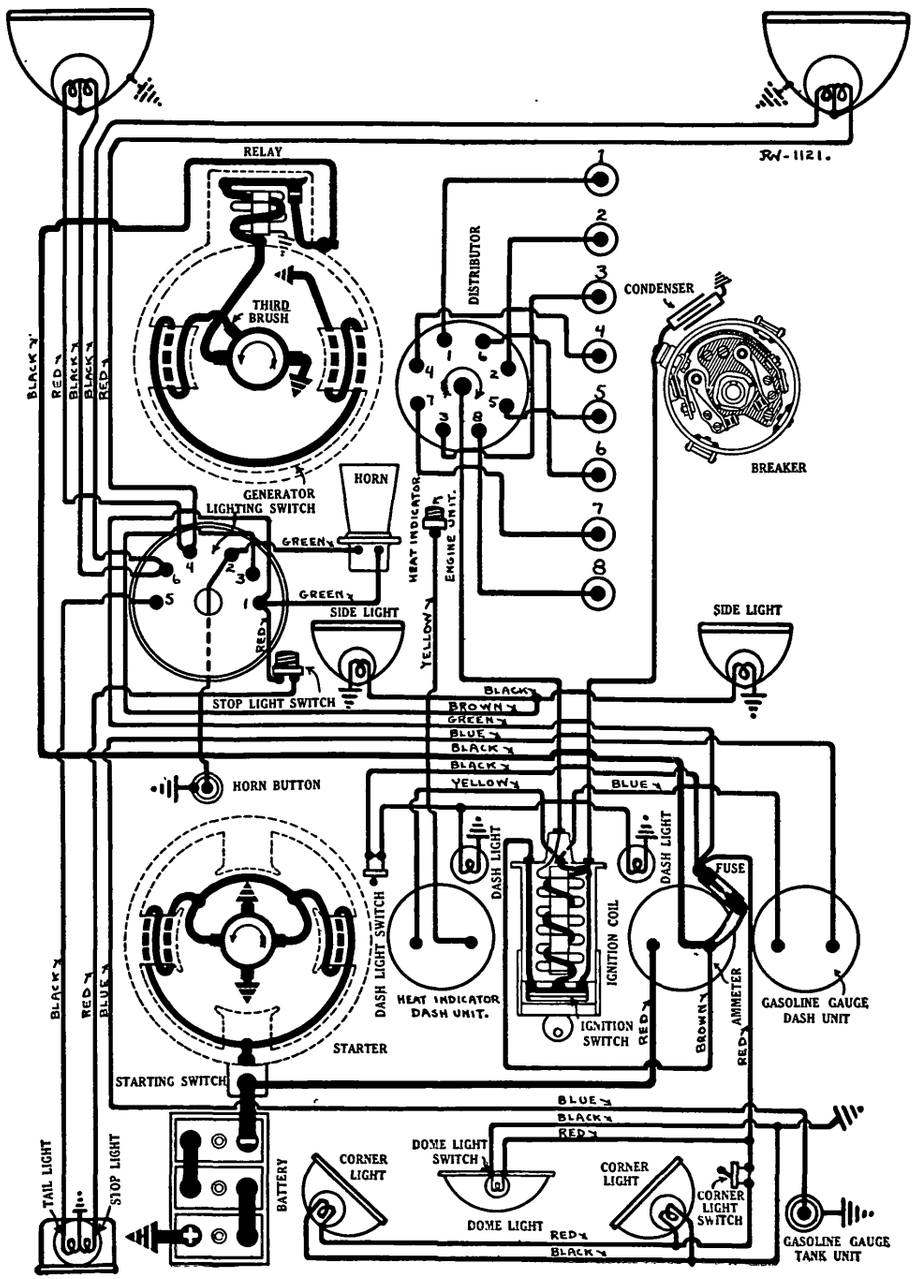
FUSES:—Lighting fuse mounted back of the ammeter is 20 ampere capacity.

DODGE EIGHT

MODEL DC (1930) SERIAL NUMBERS E001WP UP
PRODUCTION STARTED DECEMBER 13, 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 526-N. The ignition switch is built in the base of the coil. Coil is mounted on the back of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 660-B. Breaker contacts separate .018-.023 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. There are two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This interval must be accurately set by synchronizing the contacts for satisfactory performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 23 degrees (engine). Automatic advance begins at 1000 R.P.M. of engine. Maximum automatic advance is 13.5 degrees reached at 2600 R.P.M.

Mounting:—Distributor is mounted at right of engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and manual advance control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. To synchronize contacts use special Delco-Remy tool, Part No. 820738, and follow directions given in the Equipment Section. Contacts can be synchronized using the regular timing gauge after the distributor has been timed to the engine by shifting the gauge to cylinder No. 6, using a special adaptor to mount the gauge in the spark plug port. Follow the same procedure as in timing the engine except that the advance arm clamp screw is not loosened, but the lock screws on the movable sub-plate should be loosened and the eccentric adjusting screw turned until the second set of contacts (mounted on the sub-plate) begin to open.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position .040 inch before top dead center with the manual spark control fully advanced. To set timing, first take out the pipe plug in the cylinder head directly above No. 8 piston and screw the special micrometer gauge in this hole. Set breaker contact gap at .020 inch. Connect a six volt test lamp in the primary circuit to accurately determine the point at which contacts open. This can be done by connecting one test lamp lead to the primary terminal of the distributor and connecting the other lead to the relay terminal of the generator if the battery is in the car. Place spark control lever in the fully advanced position. Crank engine over until piston No. 8 is at top dead center and set microm-

PRODUCTION STARTED DECEMBER 13, 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

eter gauge at zero. Then crank engine until piston No. 1 enters compression stroke (the up stroke with both valves closed). Turn engine over until the gauge reads .040 inch indicating that piston No. 1 is .040 inch before top dead center. Then loosen the advance arm clamp screw and rotate the distributor until the lamp goes out, indicating that the contacts have opened. Tighten the clamp screw and check the rotor to see that it is directly opposite the segment connected to the spark plug in cylinder No. 1 (see diagram). Check timing by cranking the engine over several times and then stop with piston No. 1 on compression stroke at the point at which the lamp goes out, indicating that the contacts are beginning to open. If the gauge reading is within limits of .035-.045 inch the ignition setting is satisfactory. If outside these limits the engine should bee retimed. Connect the spark plug wires in order 1-6-2-5-8-3-7-4 clockwise around the distributor head.

NOTE:—If the new type gauge with a spark gap built in the face of the gauge is used it will not be necessary to use a test lamp. Connect one gauge lead to the coil high tension cable at the distributor and ground the other gauge lead to the engine block. Turn on the ignition. A spark will be visible at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18MM. A.C. Type G-10. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.407 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches (from top of taper). Valve lift, 5/16 inch. Spring pressure, 40-44 pounds (valve closed) and 75-81 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 4 degrees before top dead center and close 36 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.407 inches. Stem diameter, .3405 inch. Stem length, 5¼ inches. Valve lift, 5/16 inch. Spring pressure, 40-44 pounds (valve closed) and 75-81 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 52 degrees before lower dead center and close 2 degrees before top dead center. Valve stem guides are removable.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with the piston .0035" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across shaft centers.

STARTER:—Model 714-Q. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal linkage. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

North East Model LAB, Type 6530-D or E (used on some cars). Generator current regulation is by third brush shunt field. Adjustment is similar to Delco-Remy model given above. Brush spring tension should be 12-16 ounces.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	675	0	6.4	725
5	6.9	875	5	6.9	1025
10	7.4	1150	10	7.5	1500
16	8.1	1800	12	7.7	2000

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by swinging the generator away from the engine. To make the adjustment, loosen the two bolts under the generator. Then loosen adjustment clamp bolt and pull generator out from the engine until the proper belt tension is secured. Tighten the clamp bolt and the mounting bolts. The belt tension should be just sufficient to drive the fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. when the generator voltage reaches 6.4-7 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 8821. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Soreng-Manegold switch, Model 5500-A, was also used.

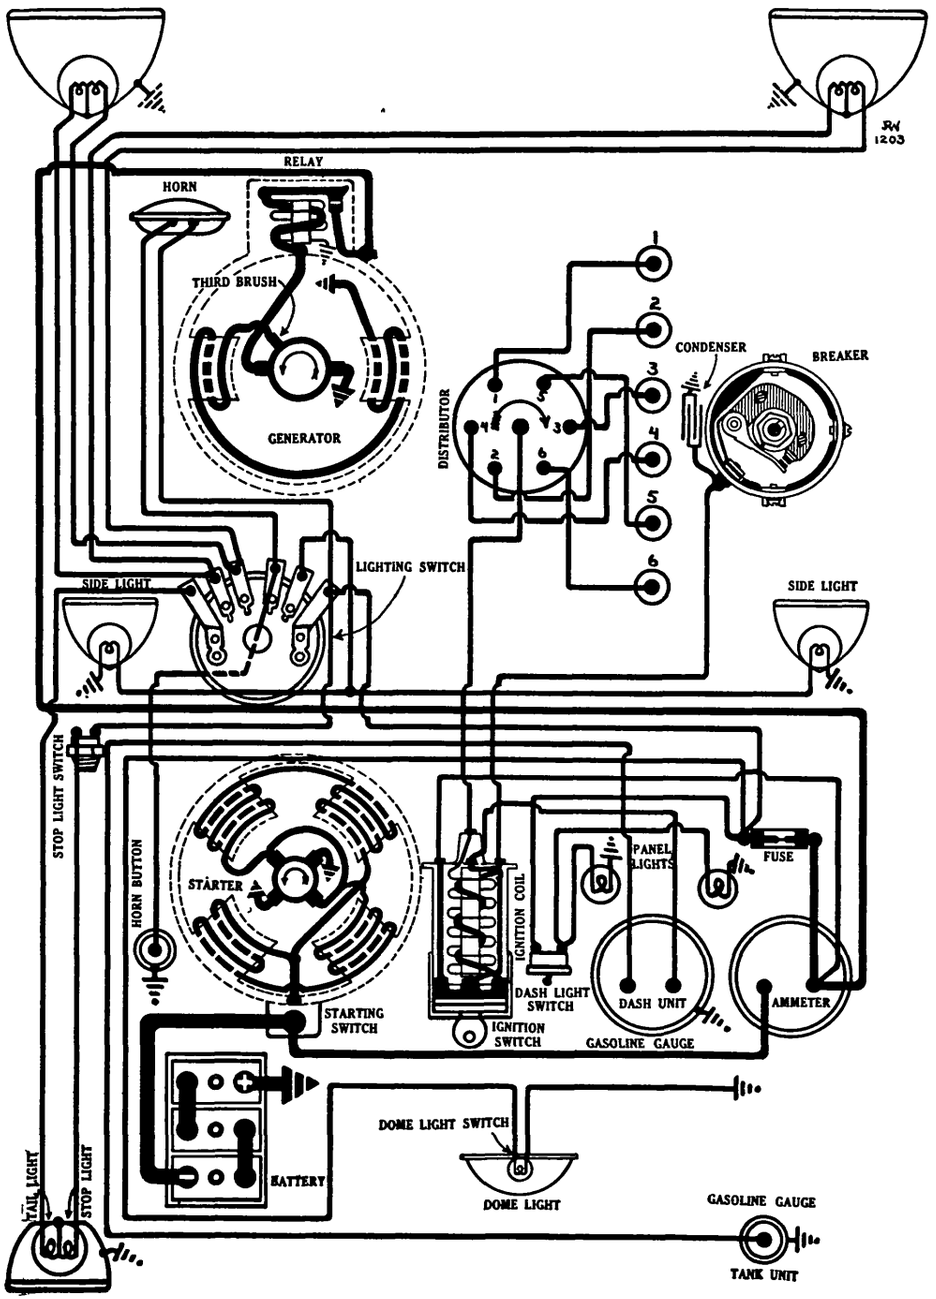
FUSES:—Lighting fuse mounted back of the ammeter is 20 ampere capacity.

DODGE SIX

SERIES DH (1931) AFTER SERIAL NUMBER 3,518,001
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-1-13. 6 volt, 84 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted on left frame member.

IGNITION:—Coil Model 533-V. The ignition switch is built in the base of the coil. Coil is mounted on the rear of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 632-K. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 18 degrees (engine) reached at 2500 R.P.M.

Mounting:—Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. To remove distributor disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw at rear of advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .032 inch before top dead center. To set timing, first set breaker contact gap at .020 inch. Then remove the ⅛ inch pipe plug from the cylinder head directly above No. 6 cylinder and screw the special timing micrometer gauge in place in the hole. Connect a small six volt lamp in the primary circuit (this can be done by connecting one lamp lead to the primary terminal of the distributor and the other lamp lead to the relay terminal of the generator. If the battery is out of the car, connect the lamp lead to a battery and ground the other battery terminal to the engine). Turn engine over and set micrometer at zero on top dead center. Crank the engine over until piston No. 1 is coming up on compression stroke (both valves will be closed) and stop when the gauge indicates the piston is .032 inch before top dead center. Remove distributor head and see that rotor is opposite No. 1 segment (see diagram). Loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open, when the lamp will go out. Tighten the clamp screw and connect the spark plug leads in order 1-5-3-6-2-4 clockwise around the distributor head. Check the setting by cranking the engine over several times and then stopping with piston No. 1 on compression stroke at the point where the lamp goes out, indicating that the contacts have begun to open. If the gauge reading is within limits of .030-.034 inch before top dead center, the setting is satisfactory. If outside these limits the engine should be retimed.

NOTE:—If the new type timing gauge (with a visible spark gap built in the face of the gauge) is used, it will not be necessary to use a test lamp. One gauge lead should be clipped to the high tension lead at the center terminal in the distributor head and the other gauge lead should be

DODGE SIX

SERIES DH (1931) AFTER SERIAL NUMBER 3,518,001
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

grounded to the engine. The ignition should be turned on. A spark will be visible at the spark gap at the instant the contacts open.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-11. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 17/32 inches. Stem diameter, .340-341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed), 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 15/32 inches. Stem diameter, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed) and 78 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across shaft centers.

STARTER:—**Model 725-Q.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	6000	5	60
15 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—**Model 943-R.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
16	8.0	2300	12.5	7.7	2400
12	7.7	3200	10	7.5	3200

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp belt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by swinging the generator away from the engine. To make the adjustment, loosen the two bolts under the generator. Then loosen adjustment clamp bolt and pull generator out from the engine until the proper belt tension is secured. Tighten the clamp bolt and the mounting bolts. The belt tension should be just sufficient to drive the fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles of operation.

RELAY:—**Model 265-G.** Relay is mounted on the generator. Relay contacts close at 750 R.P.M. when the generator voltage reaches 6.4-7 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**Clum Switch Model 9150.** Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

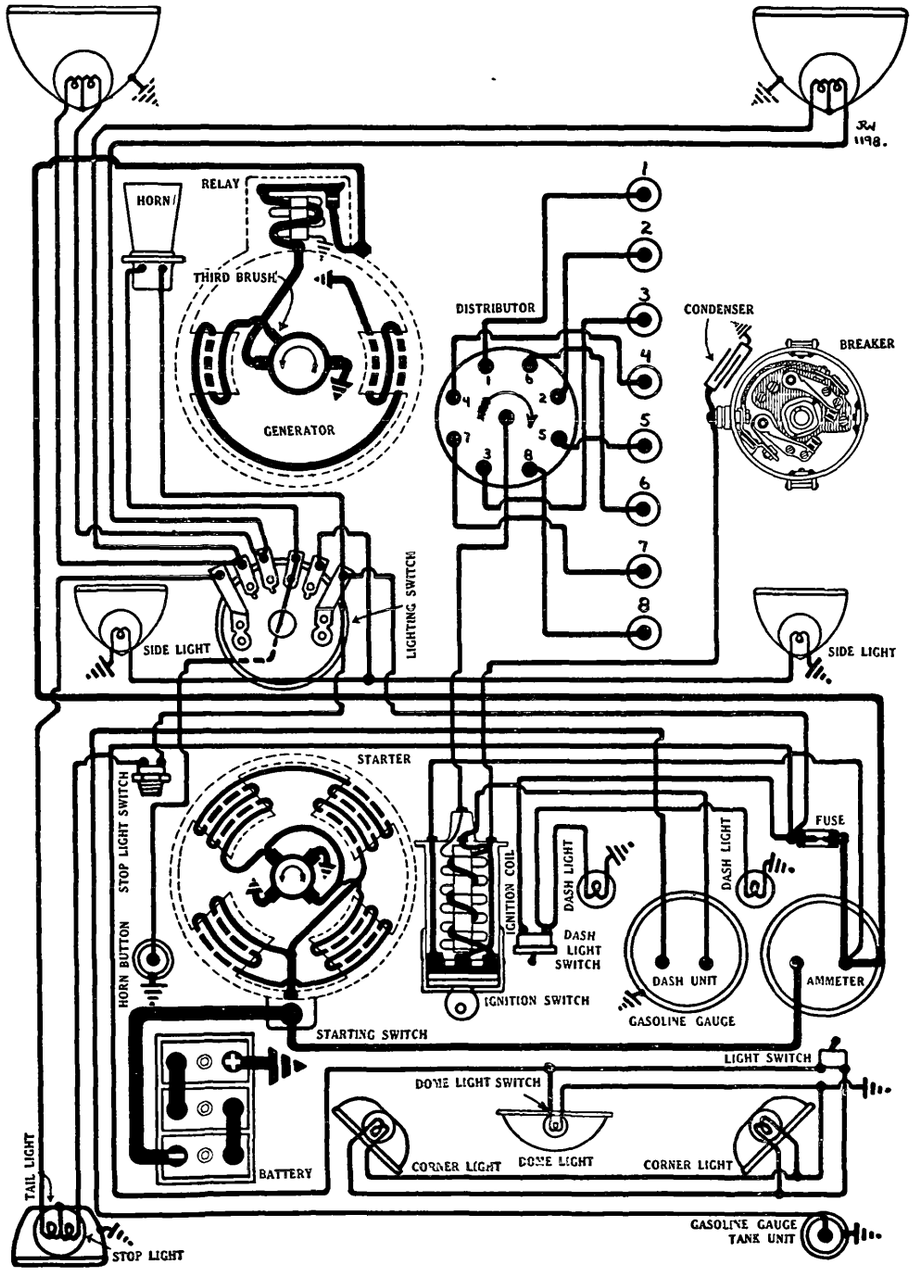
FUSES:—Lighting fuse mounted back of the ammeter is 20 ampere capacity.

DODGE EIGHT

SERIES DG (1931) AFTER SERIAL NUMBER 4,508,001
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-1-15. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the left frame member.

IGNITION:—Coil model 533-V. The ignition switch is built in the base of the coil. Coil is mounted on the back of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.



Distributor Model 660-G. Breaker contacts separate .018-.023 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. There are two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This interval must be accurately set by synchronizing the contacts for satisfactory performance. See Timing. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 3200 R.P.M.

Mounting:—Distributor is mounted at left of engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one full turn every month or each 1000 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section. The contacts can be synchronized using the regular timing gauge if a special adapter is available so that the gauge can be mounted in the spark plug of cylinder No. 6. The gauge should be set at zero on top dead center and the engine turned over to firing position exactly as for timing (see next paragraph) and the lock screws on the movable sub-plate should be loosened and the eccentric adjusting screw turned until the second set of contacts (mounted on the sub-plate) begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .018-.024 inch.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position .019 inch before top dead center. To set timing, take out the pipe plug in the cylinder head directly above No. 8 piston and screw the special micrometer gauge in this hole. Set breaker contact gap at .020 inch. Connect a six volt test lamp in the primary circuit to accurately determine the point at which contacts open. This can be done by connecting one test lamp lead to the primary terminal of the distributor and connecting the other lead to the relay terminal of the generator if the battery is in the car. Crank engine over until piston No. 8 is at top dead center and set micrometer gauge at zero. Then crank engine until piston No. 1 enters compression stroke (the up stroke with both valves closed). Turn engine over until the gauge reads .019 inch indicating that piston No. 1 is .019 inch before top dead center. Then loosen the advance arm clamp screw and rotate the distributor until the

DODGE EIGHT

SERIES DG (1931) AFTER SERIAL NUMBER 4,508,001
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

lamp goes out, indicating that the contacts have opened. Tighten the clamp screw and check the rotor to see that it is directly opposite the segment connected to the spark plug in cylinder No. 1 (see diagram). Check timing by cranking the engine over several times and then stop with piston No. 1 on compression stroke at the point at which the lamp goes out, indicating that the contacts are beginning to open. If the gauge reading is within limits of .017-.021 inch the ignition setting is satisfactory. If outside these limits the engine should be retimed. Connect the spark plugs in order 1-6-2-5-8-3-7-4 clockwise around the distributor head.

NOTE:—If the new type timing gauge (with a spark gap built in the face of the gauge) is used, it will not be necessary to use a test lamp. Clip one gauge lead to the high tension coil lead at the center of the distributor head and ground the other gauge lead to the engine. Turn on ignition. A spark will be visible at the spark gap on the gauge at the instant the contacts open.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. AC Type G-10. Gaps are .027-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 13/32 inches. Stem diameter, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed), 78 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open 6 degrees after top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 13/32 inches. Stem diameter, .340-.341 inch. Stem length, 5¼ inches. Valve lift, .3125 inch. Spring pressure, 42 pounds (valve closed), 78 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 42 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .011". This valve should open with piston .014" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent to and in line with a straightedge across shaft centers.

STARTER:—**Model 725-Q.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
15 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—**Model 943-R.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts holding generator on bracket and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by swinging the generator away from the engine. To make the adjustment, loosen the two bolts under the generator. Then loosen adjustment clamp bolt and pull generator out from the engine until the proper belt tension is secured. Tighten the clamp bolt and the mounting bolts. The belt tension should be just sufficient to drive the fan and generator without slipping. Any excessive belt tension will cause wear in the generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles of operation.

RELAY:—**Model 265-G.** Relay is mounted on the generator. Relay contacts close at 750 R.P.M. when the generator voltage reaches 6.4-7 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**Clum Switch Model 9150.** Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimemrs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome lights is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

FUSES:—Lighting fuse mounted back of ammeter is 20 ampere capacity.

DODGE

SIX CYLINDER MODEL DL (1932)
SERIAL NUMBER 3,558,101 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post. This series 3,558,101 up.

ENGINE NUMBER:—Stamped on boss left side of cylinder block between Nos. 1 and 2 cylinders.

BATTERY:—**Willard Type WS-2-15,** 6 volt, 100 ampere hour (20 hour rate). Positive (+) terminal grounded to transmission case. Battery mounted under driver's seat. Battery size 7 1/16 inches wide, 10 5/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 534-Z.** Lock coil type with ignition switch in base. Coil mounted on back of instrument panel at extreme left. Ignition current is .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 632-L. Single breaker arm type with semi-automatic advance (manual advance set in timing and not controllable by driver). Breaker gap set at .020 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact mounting plate and turn eccentric adjusting screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with scale at right angles to contact surface). Maximum manual advance 20 degrees (engine).

Cam Angles—Closed 36°, open 24° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		400	2		800
8		1300	16		2600

Mounting:—Distributor mounted left side of engine driven by inclined shaft from camshaft. To remove, disconnect lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.

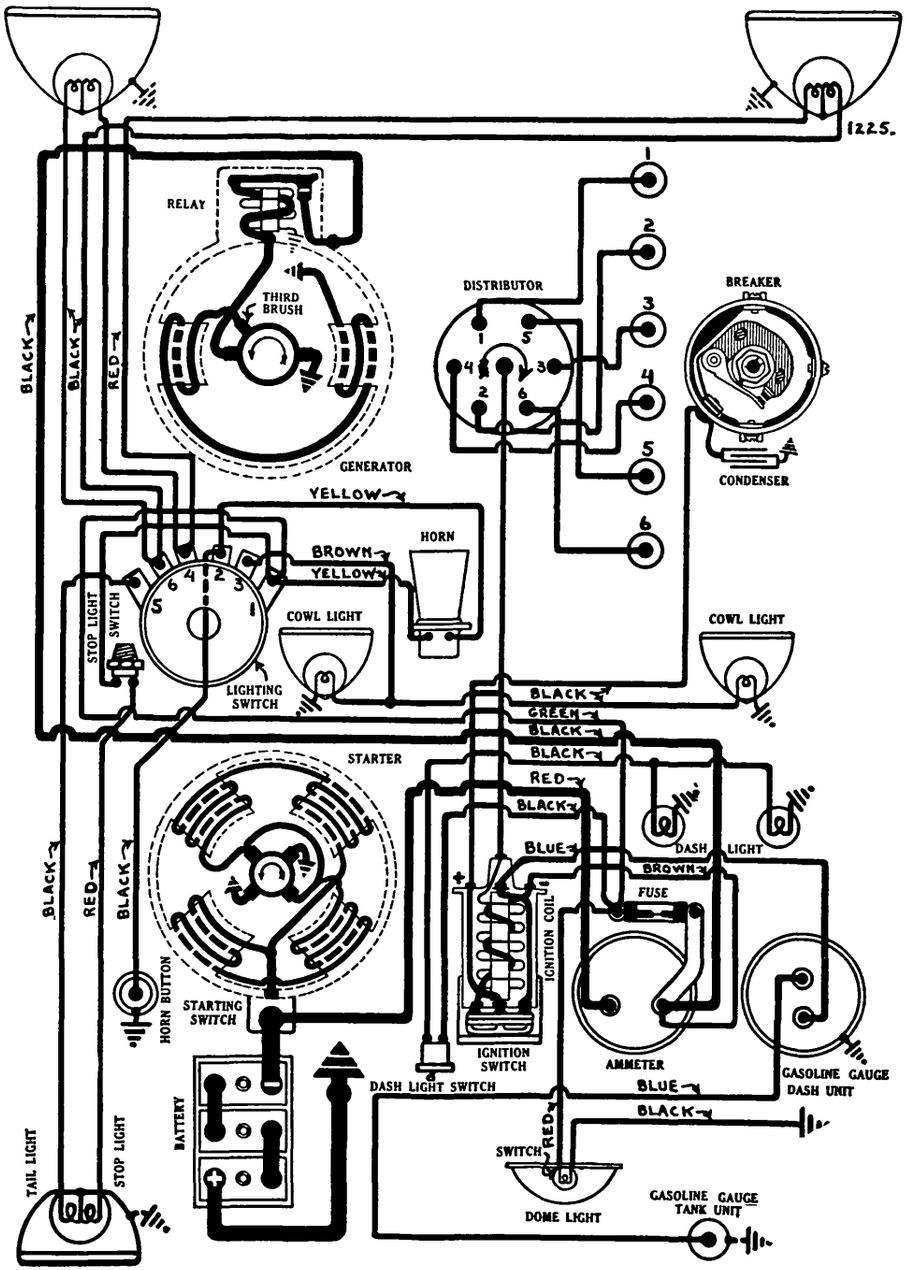
Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light oil in wick oiler in center of shaft. Apply thin film vaseline to face of breaker cam.

Timing:—Standard setting is 10° (flywheel) or .041" (piston travel) before top dead center with full manual advance. To set timing, remove inspection cover left front face flywheel housing directly under starter. Turn engine over with No. 1 piston on compression until mark 'D/C' is opposite upper pointer on housing. Loosen advance plate clamping bolt, rotate distributor cup until contacts begin to open (use test lamp), tighten clamp bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. A.C. Type K-12. Set gap at .028 inch. Hold within limits of .025-.030 inch.



VALVE TIMING:—Valves on right side of engine with camshaft driven by two-sprocket non-adjustable chain drive.

DODGE

SIX CYLINDER MODEL DL (1932)
SERIAL NUMBER 3,558,101 UP
DELCO-REMY SYSTEM

NOTE:—Do not compress springs to overall length of less than 1⅝ inches to avoid damage through springs taking on permanent set. Valve stem clearance in guide .001-.003" (intake) .002-.004" (exhaust).

Timing

Inlet valves open 6 degrees past top dead center, close 46 degrees past lower dead center.

Exhaust valves open 42 degrees before lower dead center and close 8 degress past top dead center with piston .0265 inch down on intake stroke.

To Check Valve Timing:—Remove ⅛ inch pipe plug in cylinder head over No. 6 piston and use regular Chrysler timing gauge. Set tappet clearance No. 1 inlet valve at .011 inch. No. 1 exhaust valve at .012 inch (cold). Rotate crankshaft until No. 6 piston on compression stroke is .015 inch past top dead center. No. 1 inlet valve should be tight and about to open. Turn crankshaft 2 degrees and stop with piston .0265 inch past top dead center. No. 1 exhaust valve should be closing. Reset tappet clearance at .005 inch (inlet), .007 inch (exhaust) with engine hot.

To Set Valve Timing:—Remove inspection cover on left forward face of flywheel housing directly under starter. Rotate crankshaft until flywheel mark 'D/C' is directly opposite lower pointer on housing (top dead center position for pistons Nos. 1 and 6), rotate camshaft until mark between teeth on camshaft sprocket is directly opposite crankshaft mark with both marks in line with a straightedge across the shaft centers. Mesh chain. Camshaft sprocket mounting cap screws offset so that sprocket can only be mounted in one position.

Valv Grinding. Inlet valves chrome nickel steel. Exhaust valves silchrome. Manufacturer recommends that valves be refaced in valve grinder and then lapped in in cylinder block with compound.

STARTER:—Model 725-Q. Manual engagement hooked up with starting switch lever (switch mounted on field frame). Starter drives through overrunning clutch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	6000	5	60
15 "	Lock	3	600

Mounting:—Flange mounted on left front face of flywheel housing. To remove, disconnect cables, take out cotter pin and clevis pin in switch linkake, take out two flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—5000 Miles. Put 8-10 drops light oil in oiler on commutator end.

GENERATOR:—Model 943-S. Third brush control. To adjust, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush counter-clockwise to increase output, clockwise to decrease output, tighten locking screw. Manufacturer recommends that charging rate be set at 8 amperes to battery (with all lights on—headlights bright), maximum output at 20 M.P.H. or 10 amperes on cars equipped with radio. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-18	7.9-8.3	2000	13-15	7.7-8.0	2400

Shunt field current 3.5-4.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove, disconnect lead, loosen adjustment clamp bolt and mounting bolts, swing generator toward engine, slip off drive belt, take out mounting bolts forming bracket hinge and lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt. Attach spring scale by wire looped over generator field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp. Pull generator away from engine until scale reading is 45-50 pounds. Tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Fill oiler at each end of generator with light oil.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 6.75-7.5 volts of generator and open with 0-2.5 ampere discharge. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (ontacts closed).

LIGHTING:—Clum Switch, Model 9271. Mounted at lower end of steering column controlled by lower lever on steering wheel. Switch positions:

1. Vertical—All lights off.
2. Right—Parking (cowl) and tail lights on. Headlights off.
3. No. 1 Left—Bright headlights and tail light on. Cowl lights off.
4. No. 2 Left—Dim (depressed beam) head and tail lights on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000

Stop and Tail Light	6-8	21-2	D.C.	1158
Dome Light	6-8	15	S.C.	87

NOTE:—Stop and tail light bulb is combination. Connect tail light to 2 cp. filament.

FUSES:—20 ampere capacity mounted on bracket under ammeter.

GASOLINE GAUGE:—Motometer electric type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer vapor tension type (see Equipment Section).

HORN:—Klaxon, Model K-14. Vibrator type mounted under engine hood. Current draw 7 amperes.

DODGE

EIGHT CYLINDER MODEL DK (1932)
SERIAL NUMBERS 4,520,101 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post. This series 4,520,101 up.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between Nos. 1 and 2 cylinders.

BATTERY:—**Willard, Type WS-4-17,** 6 volt, 17 plate, 115 ampere hour (20 hour rate). Positive (+) terminal grounded to transmission case. Battery mounted under driver's seat. Battery size, 7 1/16 inches wide, 11 11/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 534-Z.** Lock Coil type with ignition switch in base. Coil mounted on back of instrument panel at extreme left. Ignition current, .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped.

Distributor Model 661-D. Single breaker arm type with full automatic advance. No synchronization necessary. Set breaker gap at .020 inch. Hold within limits of .017-.022". To set gap, loosen lock screw on stationary contact mounting plate and turn eccentric adjusting screw. Breaker arm spring tension 19-23 ounces (measured behind contacts with scale at right angles to back of breaker arm).

Cam Angles—Closed 31°, open 14° (distributor degrees).

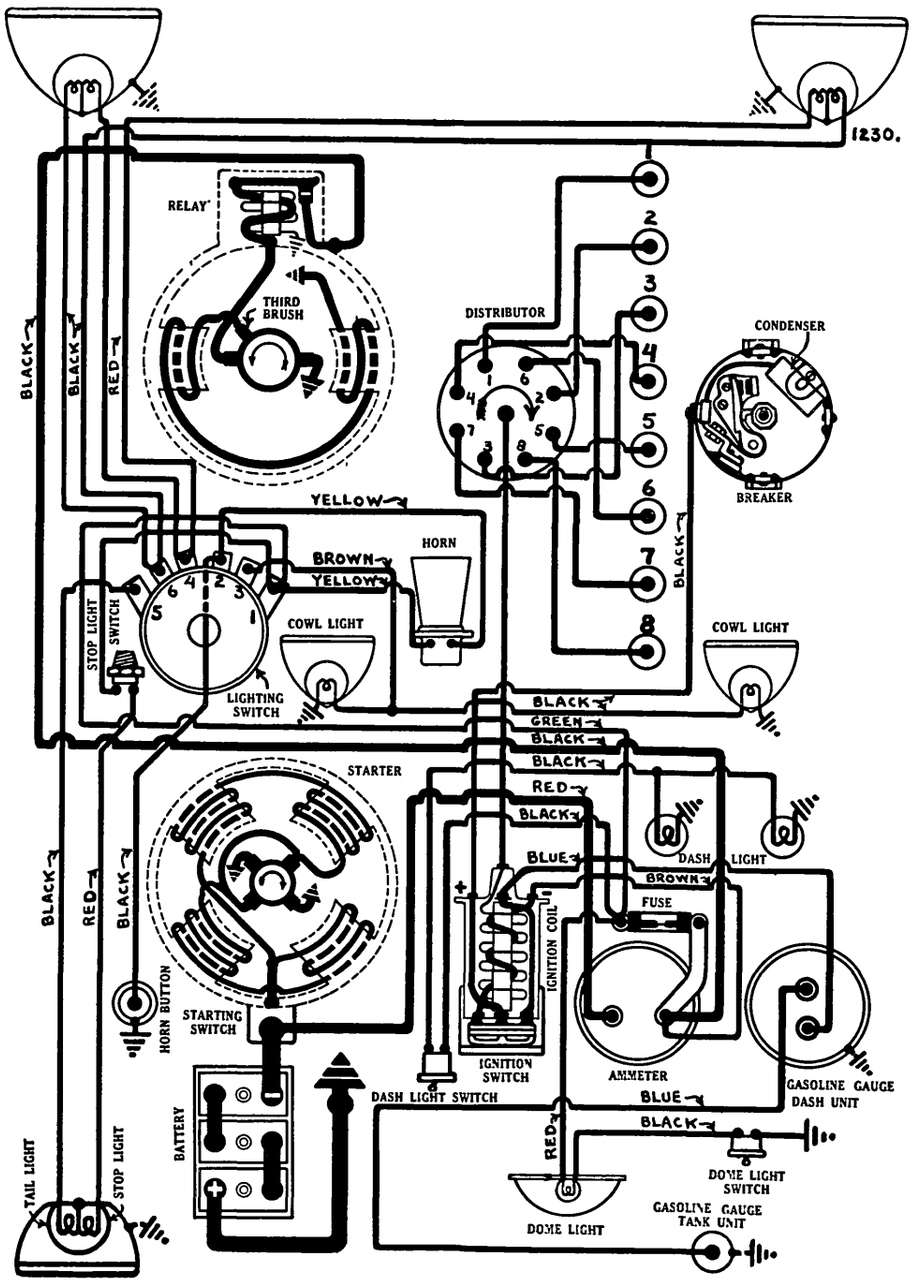
		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		400	2		800
8.5		1100	17		2200

Mounting:—Distributor mounted on left side of engine. Driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor. Put 4-5 drops light oil in wick oiler in center of shaft. Apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 10° before top dead center. To set timing, remove inspection cover on left front face of flywheel housing directly below starter. Turn engine over with No. 1 piston on compression until flywheel mark D/C' is opposite upper pointer on housing. Loosen hold-down screw in advance plate, rotate distributor cup until pointer is opposite '0' on scale (center of scale), tighten hold-down screw. Loosen advance plate clamp bolt, rotate distributor cup until contacts begin to open (use test light), tighten clamp bolt. Connect spark plugs as indicated on diagram (No. 1 terminal as designated).



Synchronization of Contacts. No synchronization necessary.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. A.C. Type K-12. Set gap at .028 inch. Hold within limits of .025-.030 inch.

VALVE TIMING:—Valves on right side of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Valve Lgth.	Seat Angle	Lift
Inlet	1 15/32" (1 5/16" clear)	.340-.341"	5¼"	45	5/16"
Exhaust	1 13/32" (1¼" clear)	.340-.341"	5¼"	45	5/16"

DODGE

EIGHT CYLINDER MODEL DK (1932)
SERIAL NUMBERS 4,520,101 UP
DELCO-REMY SYSTEM

Tappet Clearance	Operating	Timing
Inlet	.005" (hot)	.011" (cold
Exhaust	.007" (hot)	.012" (cold)

Spring Pressure

Closed .....40-44 pounds (2 1/16")
Open .....75-81 pounds (1¾")

SPECIAL NOTE:—Do not compress springs to over-all length of less than 1⅝" to avoid damage through springs taking permanent set. Valve stem clearance in guide, .001-.003" (inlet), .002-.004" (exhaust).

Timing

Inlet opens 6° after top dead center with piston .014" down on intake stroke. Inlet closes 46° after lower dead center.

Exhaust opens 42° before lower dead center. Exhaust closes 8° after top dead center with piston .026" down on intake stroke.

To Check Valve Timing:—Remove ⅛ inch pipe plug in cylinder head over No. 8 piston and install regular Chrysler timing gauge. Set gauge dial at '0' with piston on top dead center. Set tappet clearance of No. 1 inlet valve at .011" (cold) and No. 1 exhaust valve at .012" (cold). Rotate crankshaft until No. 8 piston on compression stroke is .014" past top dead center. No. 1 inlet valve should be tight and about to open. Turn crankshaft 2 degrees until piston is .026" past top dead center. No. 1 exhaust valve should be closing. Reset tappet clearance at .005" (inlet) and .007" (exhaust) with engine hot.

To Set Valve Timing:—Remove inspection cover on left front face of flywheel housing below starter. Rotate crankshaft until flywheel mark 'D/C' is directly opposite lower pointer on housing (top dead center position for pistons 1 and 8). Rotate camshaft until mark on camshaft sprocket between teeth is directly opposite marked tooth on crankshaft sprocket with both marks in line with straightedge across the shaft centers. Mesh chain. Camshaft sprocket mounting cap screws are offset so that sprocket can only be assembled in one position.

Valve Grinding:—Inlet valves chrome nickel steel. Exhaust valves silchrome. Manufacturer recommends that valves be refaced on valve grinder and then lapped in in cylinder block with compound.

STARTER:—Model 728-K. Manual pinion shift connected to starting switch lever (switch mounted on field frame). Starter drives through reduction gears and overrunning clutch. Rotation clockwise (armature shaft) at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Flange mounted on left front face of flywheel housing. To remove, disconnect cables, take out cotter pin and clevis pin in switch linkake, take out 2 flange mounting cap screws, pull starter forward to clear housing, lift from place.

Oiling:—5000 Miles. Put 8-10 drops light oil in oiler at each end of armature shaft.

10,000 Miles. Remove grease plug in reduction gear case. Repack gears with graphite grease.

GENERATOR:—Model 943-S. Third brush control. To adjust, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase charging rate, clockwise to decrease charging rate, tighten lock screw. Manufacturer recommends that charging rate be set at 8 amperes maximum to battery at 20 M.P.H. with all lights on (headlights bright) or 10 amperes on cars equipped with radio. Rotation counter-clockwise at commutator end.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-18	7.9-8.3	2000	13-15	7.7-8	2400

Brush spring tension 24-28 ounces. Shunt field current 3.5-4.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine. Driven by fan belt. To remove, disconnect lead, loosen adjustment clamp bolt and mounting bolts, swing generator toward engine, slip off drive belt, take out adjustment bolt and mounting pivot bolts, lift generator from place.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt. Attach spring scale by wire looped over generator field frame so that force of scale is tangent to top of generator and parallel to slot in adjustment arm. Pull generator away from engine until scale reading is 45-50 pounds. Tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Fill oiler at each end of generator with light oil.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close 6.75-7.5 volts of generator and open with 0-2.5 ampere discharge current. Contact gap limits .015-.025 inch. Air gap limits .014-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9271. Mounted at lower end of steering column. Controlled by lever on steering wheel. Switch positions:

1. Vertical—All lights off.
2. Right—Cowl lights and tail lights on. Headlights off.
3. No. 1 Left—Bright headlights and tail lights on. Cowl lights off.
4. No. 2 Left—Dim (depressed beam) headlights and tail lights on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Cowl Lights	6-8	3	S.C.	63
Dash Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158
Dome Light	6-8	15	S.C.	87

NOTE:—Stop and tail lights use combination bulbs. Tail light wire must be connected to 2 cp. filament.

FUSES:—20 ampere capacity mounted on bracket under ammeter.

GASOLINE GAUGE:—Motometer electric type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer vapor-tension type (see Equipment Section).

HORNS:—Klaxon Model K-18-C. Vibrator type mounted under engine hood.

DODGE SIX

MODEL DP (1933), SERIAL NUMBERS 3,579,001
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block between No. 1 and No. 2 cylinders.

ENGINE:—Six cylinder, 'L' head type, 3⅛x4⅜" bore and stroke, 201.31 cubic inch displacement, rated at 23.43 H.P., develops 75 H.P. at 3600 R.P.M. (standard compression Silver Dome head) or 81 H.P. at 3600 R.P.M. (Red Head engine). Standard compression ratio (Silver Dome engine) 5.5-1. High compression ratio (Red Head engine) 6.5-1.

BATTERY:—Willard, Type WS-1-13, 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate). Starting capacity 106 amperes for 20 minutes.

Type WT-1-15 (Late 1933 and cars with radio). 6 volt, 15 plate, 90 A.H. (5 ampere rate). Starting capacity 117 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to transmission cover plate screw.

Mounting:—Mounted in cradle under driver's seat.

IGNITION:—Coil Model 537-V, 538-Y, V, 534-B (Special). Mounted on engine side of dash and connected to ignition switch by armored cable.

Ignition Current:—.5-1.5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).

Ignition Switch:—Unit with coil. Switch mounted on instrument panel and connected to coil by means of armored cable protecting primary lead.

Distributor Model 622-H (first cars), 644-K (later cars). Single breaker, 6 lobe cam, full automatic advance type. Condenser mounted on outside of distributor. Breaker contacts adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.

Breaker Gap:—Set at .020 inch. Hold within limits of .018-.024 inch.

Breaker Arm Spring Tension:—19-23 ounces (measured at a point directly behind contacts with spring scale at right angles to back of contact arm).

Cam Angles—Closed 36°, open 24° (distributor degrees).

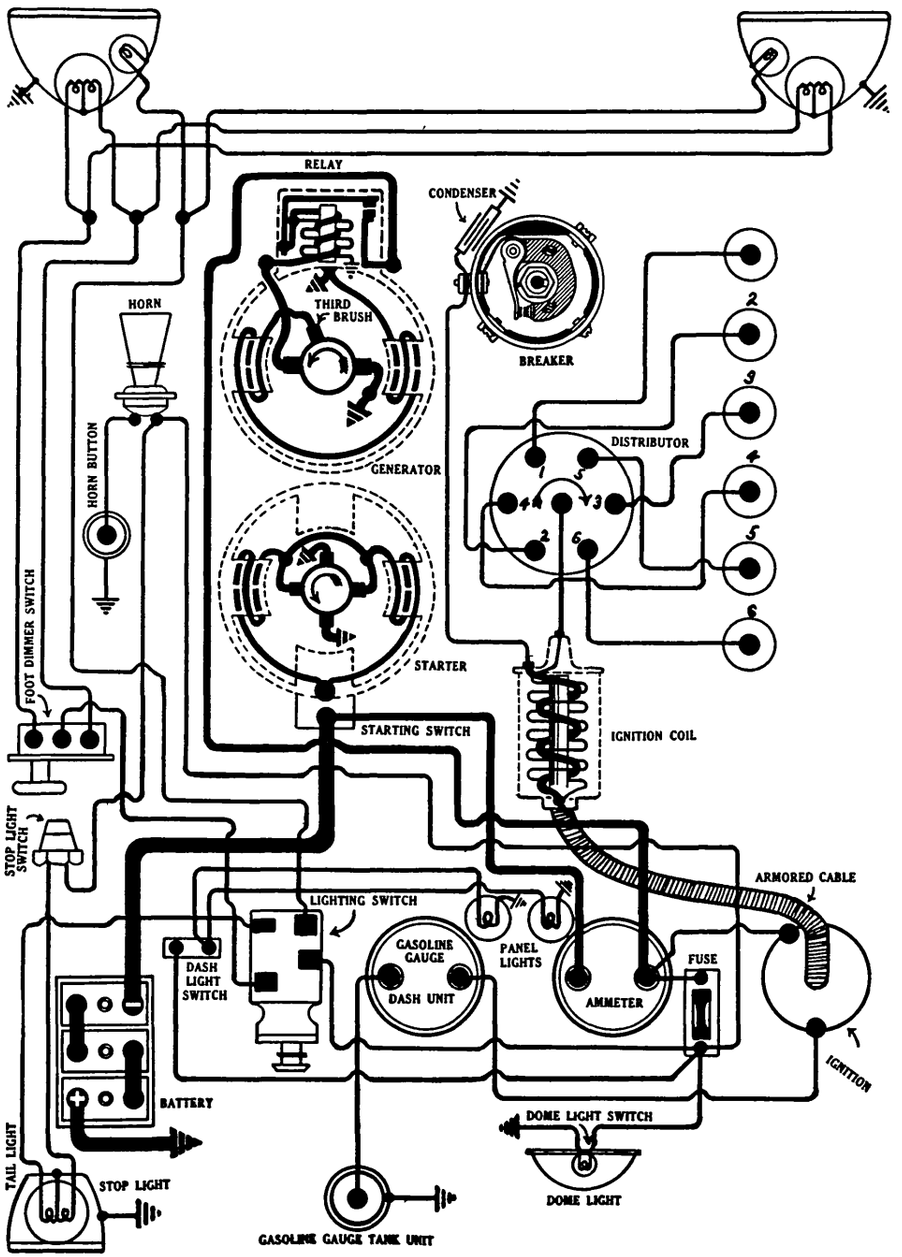
Automatic Advance—Model 622-H

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	2		800
8.75		1100	17.5		2200
9		1200	18		2400

Automatic Advance—Model 644-K

Start		250	4		500
7.5		400	15		800
16		1200	32		2400

Mounting:—Distributor mounted at center left of engine and driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift out.



Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor, put 4-5 drops light engine oil in wick oiler in center of shaft, oil breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard settings for all engines as follows:

Engine	Distributor	Flywheel Degrees	Piston Travel
Low Compression	622-H	10° before TDC	.0423"
Low compression	644-K	3° after TDC	.0038"
High compression	622-H	10° before TDC	.0423"
High compression	644-K	3° after TDC	.0038"

To Set Ignition Timing. First remove cover plate over inspection hole in left hand front face of flywheel housing directly below the starter. With No. 1 piston on compression stroke, turn engine over by hand until flywheel mark 'D/C' registers with ignition pointer (upper pointer when setting is before top dead center). Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

DODGE SIX

MODEL DP (1933), SERIAL NUMBERS 3,579,001
DELCO-REMY SYSTEM

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-12 (Standard Silver Dome engines), Type K-10 (High Compression Red Head engines). Set gaps at .025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked. To set timing, turn crankshaft so that pistons Nos. 1 and 6 are on top dead center. Mesh chain so that marks on sprockets are adjacent and in line with a straightedge laid across the shaft centers. Camshaft sprocket mounting cap screws are offset so that sprocket can only be assembled in correct position.

To Check Valve Timing. Remove ⅛ inch pipe plug in cylinder head over No. 6 piston and install Chrysler Timing Gauge. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 intake valve at .011" and No. 1 exhaust valve at .012" (cold). Turn engine over one complete revolution and stop with piston .015" past top dead center as indicated on gauge. No. 1 intake valve should open at this point. Turn engine over 2° and stop when gauge reads .027". No. 1 exhaust valve should close at this point. Reset tappet clearance at .005" (intake), .007" (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 15/32" (1 5/16" clear)	11/32"	45°	5/16"
Exhaust	1 15/32" (1 5/16" clear)	11/32"	45°	5/16"

Tappet Clearance

	Operating	Timing
Intake	.005" (hot)	.011" (cold)
Exhaust	.007" (hot)	.012" (cold)

Valve Springs

Closed—40-44 pounds—2 1/16"
Compression Limit—1¾"

Timing

Intake Valves	Exhaust Valves
Open—6° after top dead center.	Open 42° before lower dead center.
Close—46° after lower dead center.	Close 8° after top dead center.

Valve Grinding:—Valve material Chrome Nickel Steel (intake), Silchrome Steel (exhaust). Special alloy exhaust valve seat inserts are used in the cylinder block. Valves should be refaced on valve grinder and then lapped in block. Ordinary reseating tool cannot be used on exhaust valve inserts and these must be ground when necessary. Install valves with .001-.003" stem clearance in guide (intake valves), .003-.005" (exhaust valves). Valve stem guides are removable.

CARBURETION:—Stromberg Downdraft Carburetor, Model EX-22. See Carburetor Section for complete data. Manifold heat control is automatic. Choke is manually controlled by button on instrument panel.

Air Cleaner:—Oil-wetted copper mesh type integral with silencer. Remove complete unit at 2000 mile intervals or oftener, take off top plate and felt pad, wash wire mesh by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassambling.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted at right side of engine (see Carburetion Section for complete data). At three-month intervals, remove sediment bowl under pump, empty water and sediment from bowl, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer electric type (see Carburetion Section for complete data).

STARTER:—Model 734-H. Starter drive—Overrunning clutch and manual pinion shift connected to starting switch pedal. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
15 " "	Lock	3.15	570

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable and starting pedal linkage, take out flange mounting screws, pull starter forward to clear pinion housing, lift out.

Oiling:—5000 Miles. Put 8-10 drops light engine oil in commutator end ouer. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—Model 943-S, 937-H, K (Std.), 937-E (with radio). Third brush regulation, thermostat control (937-E only). Thermostat contacts open at 175°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (943-S) or 10 amperes (937-E) maximum charge to battery as shown on dash ammeter with all lights on and engine operating at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data—Models 943-S, 937-H

	Amperes	Volts	R.P.M.		Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000	Hot	13-15	7.7-8.0	2400

Generator Data—Models 937-E, K

Cold	20-22	8.2-8.4	2100	Hot	12-14	7.7-8.0	2800-3000

Brush Spring Tension—24-28 ozs. on all brushes (943-S, 937-E), 22-26 ozs. (main), 16-20 ozs. (third) on Models 937-H, K.
Field Fuse—6 ampere (on 943-S after first 30,000).

Field Current:—3.5-4.5 amperes at 6 volts across field terminals.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. To take up drive belt, loosen adjustment clamp bolt and mounting bolts, attach spring scale by wire looped over generator field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment clamp. Pull generator away from engine until spring scale reading is 45-50 pounds and tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—2000 Miles. Put 8-10 drops light engine oil in oiler at each end of generator (fill oilers once).

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.
Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Lighting switch mounted on back of instrument board is controlled by button at left of instrument panel. Lighting system 'depressed beam' with double filament headlight bulbs controlled by foot-operated dimmer switch on toeboard. Stop and tail light equipped with double filament bulb (tail light lead must be connected to 2 cp. filament). Dimmer switch is Delco-Remy, 465-Z.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C	1116
Parking Bulbs	6-8	3	S.C	63
Instrument Lights	6-8	3	S.C	63
Stop and Tail Light	6-8	21-2	D.C	1158
Dome Light	6-8	15	S.C	87

FUSES:—20 ampere capacity fuse mounted on back of instrument board near ammeter. Horn fuse (twin horns) 20 ampere in horn lead.

HORNS:—Klaxon K-31, Type 1364. Vibrator type mounted at left of engine under the hood. Current draw 4.0-6.5 amperes at 6 volts. Model K-26, Type 1505- (low note), Type 1506 (high note) matched tone twin horns are optional. Current draw 6.0-8.5 amperes at 6 volts (Type 1505), 5.0-6.5 amperes at 6 volts (Type 1506). Twin horns connected through fuse to battery terminal on starter switch.

DODGE EIGHT

MODEL DO (1933), SERIAL NUMBER 4,527,001 UP

DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block between No. 1 and No. 2 cylinders.

ENGINE:—Eight cylinder, 'L' head type, 3¼x4¼" bore and stroke, 282.1 cubic inch displacement, rated at 33.8 H.P., develops 100 H.P. at 3400 R.P.M. (standard Red Head Engine), or 92 H.P. at 3400 R.P.M. (optional Silver Dome Head engine). Standard compression ratio (Red Head engine) 6.2-1. Optional compression ratio (Silver Dome Head engine) 5.2-1.

BATTERY:—Willard, Type WS-4-17, 6 volt, 17 plate, 115 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to left hand rear transmission cover plate screw.

Mounting:—In cradle under driver's seat.

Dimensions:—Width, 7 1/16". Length, 11 11/16". Height, 8 13/16".

IGNITION:—Coil Model 537-Y, M, 538-N. Mounted on dash and connected to ignition switch by armored cable.

Ignition Current:—.5-1.5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).

Ignition Switch:—Unit with coil. Switch mounted on instrument panel and connected to coil by means of armored cable (primary lead).

Distributor Model 661-D (first cars), 661-S (later cars). Single breaker arm, 8 lobe cam, full automatic advance type. No synchronization of contacts is necessary. Breaker gap adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.

Breaker Gap:—Set at .018 inch. Hold within limits of .017-.022 inch.

Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm.

Cam Angles—Closed 31°, open 14° (distributor degrees).

Automatic Advance—Model 661-D

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	2		800
8.5		1100	17		2200

Automatic Advance—Model 661-S

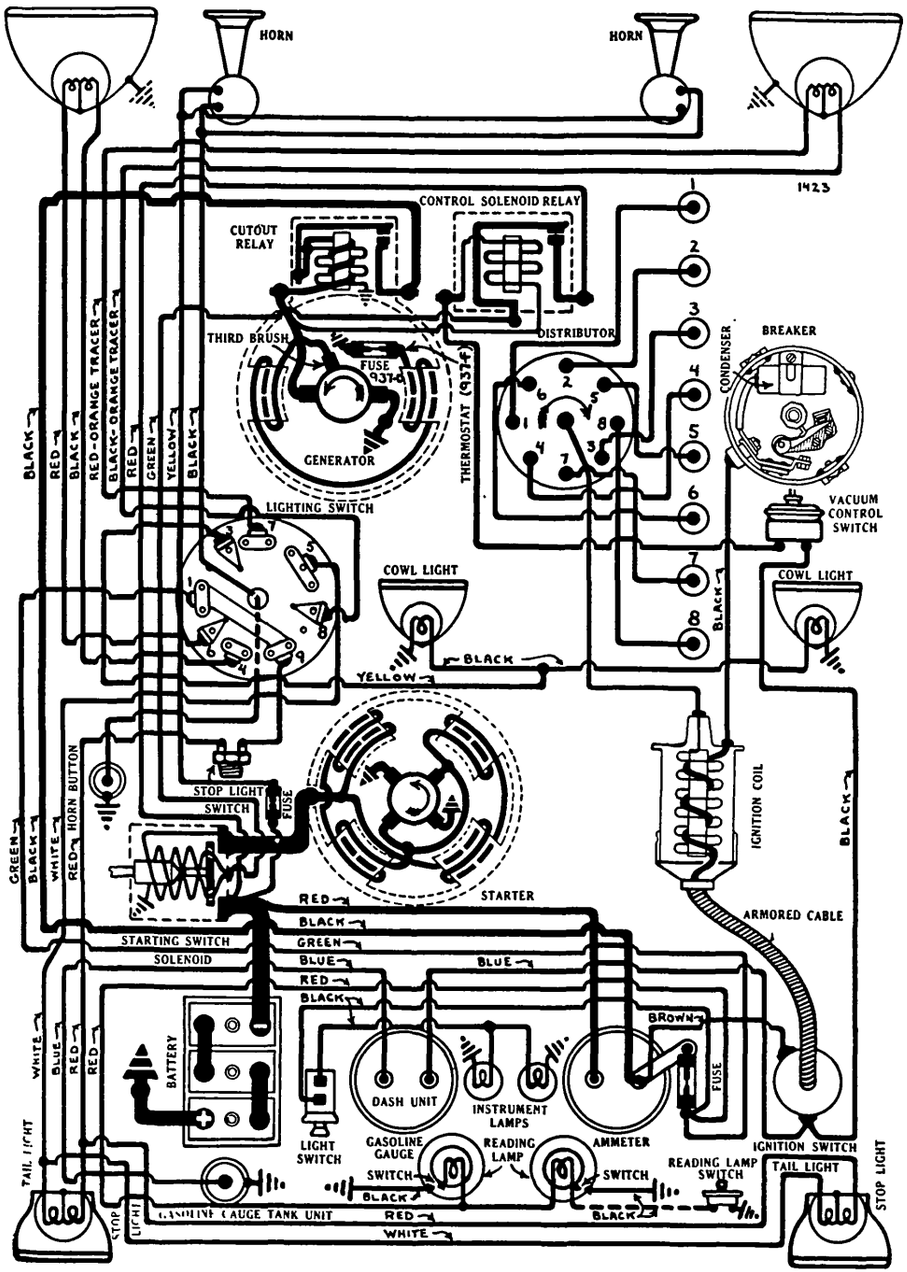
Start		250	2		500
7		400	14		800
13		1300	26		2600

Mounting:—Distributor mounted at left center of engine and driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift out.

Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor, put 4-5 drops light engine oil in wick oiler in center of shaft, oil breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard settings for all engines as follows:



Engine	Distributor	Flywheel Degrees	Piston Travel
Low compression	661D	10° before TDC	.0400"
Low compression	661-S	At TDC	TDC.
High compression	661-D	7° before TDC	.0197"
High compression	661-S	4° after TDC	.0064"

To Set Ignition Timing. First remove cover plate over inspection hole in left hand front face of flywheel housing directly below starter. With No. 1 piston on compression stroke, turn engine over by hand until flywheel mark 'D/C' registers with ignition pointer (upper pointer when setting is before top dead center). Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-10 (Standard Red Head Engine), Type K-12 (Silver Dome engines). Set spark plug gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked. To set timing, turn crankshaft so that pistons Nos. 1 and 8 are on top dead center with flywheel mark 'D/C' opposite lower pointer in

DODGE EIGHT

MODEL DO (1933), SERIAL NUMBER 4,527,001 UP
DELCO-REMY SYSTEM

inspection hole. Mesh chain on sprockets so that marks are adjacent and in line with a straightedge laid across the shaft centers. Then mount camshaft sprocket on hub (mounting cap screw holes are offset so that sprocket can only be mounted in correct position).

To Check Valve Timing. Remove ⅛ inch pipe plug in cylinder head over No. 8 piston and install regular Chrysler Timing Gauge. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 valves at .011″ (intake), .012″ (exhaust) with engine cold. Turn engine over one complete revolution and stop with piston No. 8 slightly past top dead center when gauge reads .014″. No. 1 intake valve should open at this point. Turn crankshaft 2° and stop when gauge reads .025″. No. 1 exhaust valve should close at this point. Reset tappet clearance at .005″ (intake), .007″ (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 15/32″ (1 5/16″ clear)	11/32″	45°	5/16″
Exhaust	1 13/32″ (1¼″ clear)	11/32″	45°	5/16″

Tappet Clearance

Exhaust	.007″ (hot)	.012″ (cold)

Valve Springs

Closed—40-44 pounds—2 1/16″
Compression limit—1¾″

Timing

Intake Valves	Exhaust Valves
Open—6° after top dead center	Open—42° before lower dead center
Close—46° after lower dead center	Close 8° after top dead center

Valve Grinding:—Valve material chrome nickel steel (intake valves), silchrome steel (exhaust valves). Special alloy exhaust valve seat inserts are used in the cylinder block. Valves should be refaced in valve grinder and then lapped in the block. Ordinary reseating tool cannot be used on exhaust valve inserts and these must be ground when necessary. Install valves with .001-.003″ stem clearance in guides (intake valves), .003-.005″ (exhaust valves). Valve stem guides are removable.

CARBURETION:—Carter Downdraft Carburetor, Model E8A. See Carburetor Section for complete data. Manifold heat control is automatic. Choke is manually controlled by button on instrument panel.

Air Cleaner:—Oil-wetted copper mesh type integral with silencer. Remove complete unit at 2000 mile intervals or oftener, clean by dipping wire mesh end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted at right hand forward end of engine (see Carburetion Section for complete data). At 3-month intervals, remove glass sediment bowl under pump, empty water and sediment from bowl, clean fiter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer electric type (see Carburetion Section for complete data).

STARTER:—**Model 725-Z (727-B on R.H.D. cars).** Starter drive, overrunning clutch and mechanical pinion shift operated by solenoid mounted on starter field frame. Solenoid is controlled automatically by vacuum switch Model 1585 and relay solenoid in cut-out relay case on generator (see "Starter Controls' in Equipment Section for complete data on this equipment). Starter rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces on each brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
15 " "	Lock	3.0	600

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect all wires on solenoid, take out flange mountig cap screws, pull starter forward to clear pinion housing, lift out.

Oiling:—**5000 Miles.** Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—**Models 937-D, J, L (Std.), 937-F cars with radio).** Third brush regulation, thermostat control (937-F only). Thermostat contacts open at 175°F. reducing the charging rate approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends that charging rate be set at 8 amperes (937-D) or 10 amperes (937-F) maximum charge to battery as shown on dash ammeter with all lights on and engine operating at speed equivalent to 20 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data—Models 937-D, J

	Amperes	Volts	R.P.M.		Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000	Hot	13-15	7.7-8.0	2400

Generator Data—Models 937-F, L

Cold	20-22	8.2-8.4	2100	Hot	12-14	7.7-8.0	2800-3000

Brush Spring Tension—24-28 ozs. on all brushes (937-D, F), 22-26 ozs. (main), 16-20 ozs. (third) on Models 937-J, L.

Field Fuse:—6 ampere capacity.

Field Current:—3.4-4.5 amperes at 6 volts across field terminals.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect all leads, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. Attach spring scale by wire looped over generator field frame so that force of spring will be tangent to top of generator and parallel to slot in adjustment clamp. Loosen adjustment clamp bolt and mounting bolts, pull generator away from engine until spring scale reading is 45-50 pounds, tighten adjustment clamp bolt and mounting bolts before slacking off on scale.

Oiling:—**2000 Miles.** Put 8-10 drops light engine oil in oiler at each end of generator (fill oilers once).

CUTOUT RELAY:—**Model 264-D.** On generator. Consists of cut-out relay and special relay solenoid for control of starter operating solenoid. See article on Starter Controls in Equipment Section for complete data on relay solenoid. Cut-out relay contacts close when generator voltage reaches 6.75-7.5 volts and open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contact closed).

Relay Solenoid:—Contacts close 3.2 volts max. and will remain closed until battery voltage drops to 2.0 volts or less (when starter is cranking engine). Contacts open when difference in voltage between generator and battery becomes 2.0 volts or less. Contact gap limits .030-.045 inch. Air gap limits 010-.014 inch with contacts closed.

LIGHTING:—**Clum Switch, Model 9454.** Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system uses standard double filament bulbs but switch has a special 'passing' position with depressed beam (upper filament) of left hand headlight and driving beam (lower filament) of right hand headlight lighted (see wiring diagram). Stop and tail light equipped with double filament bulb (tail light lead must be connected to 2 cp. filament).

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116
Parking Bulbs	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Light	6-8	21-2	D.C.	1158
Dome Light	6-8	15	S.C.	87

FUSES:—20 ampere capacity fuse mounted on back of instrument board. **Horn**—20 ampere capacity in horn lead near starter solenoid.

HORNS:—Klaxon Model K-18-C, Type 1263 (Standard), Model 26 Matched Set (optional equipment). Vibrator type horns are mounted under headlights. Current draw 5.5-6.5 amperes at 6 volts for each horn (Model K-18-C), 5.0-6.5 amperes at 6 volts (Model K-26, Type 1506—high note), 6.0-8.5 amperes at 6 volts (Model K-26, Type 1505—low note).

SERIAL NUMBER:—First number (DR) 3,680,001, (DS) 4,528,651. Located on right front door hinge pillar post.

COMPRESSION:—Ratio—(DR) 5.6-1 std. cast-iron hd. (DS) 6.5-1 std. aluminum head.
Pressure—(DS) 6.5-1 al. hd. 135-145 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed. (DR) approximately 95 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling.

IGNITION:—Coil Model 540-C (sedan), 540-D (coupe), 540-A (DT-Canadian). Ignition switch is part of coil assembly (connected by armored cable).
Ignition Switch—Delco-Remy Model 432-C (540-C), 432-D (540-D), 432-A (540-A).

Distributor:—Model 644-U (Cast-iron Head), 644-W (H.C. AL. Head), 644-K (DT-Canadian). Single breaker, 6-lobe cam, full automatic advance type.
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees) — Closed 36°. Open 24°.

644-U Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	1	500
7	400	14	800
15	1400	30	2800

644-W Automatic Advance

Start	250	4	500
7	400	14	800
15	1600	30	3200

644-K Automatic Advance

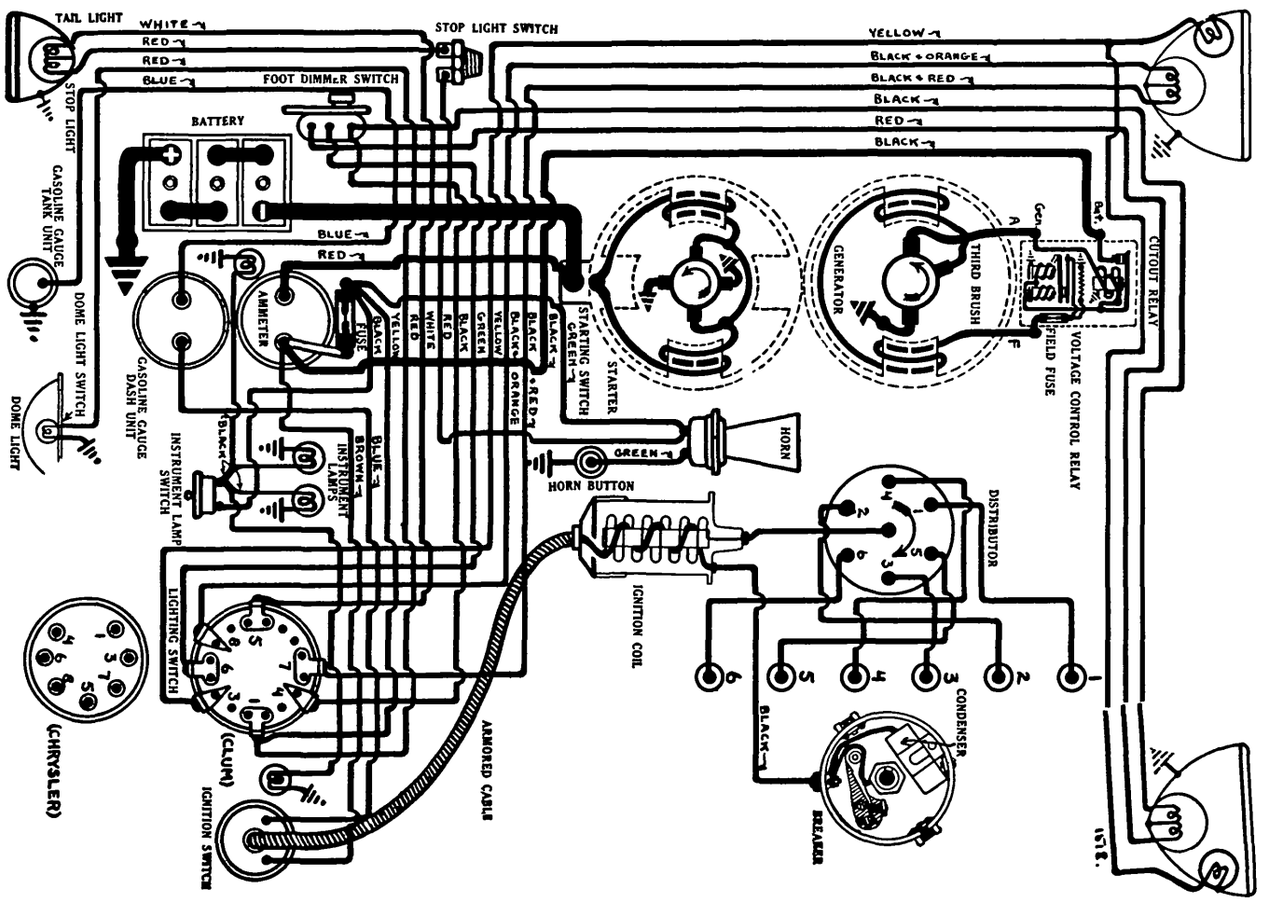
1	250	4	500
7.5	400	15	800
16	1200	32	2400

IGNITION TIMING:— Flywheel Degs. Piston Position
DR. (Cast-iron Hd.) .....2° ATDC..... .0017" ATDC.
DR., DS. (Al. Hd.) .....4° ATDC..... .0067" ATDC.

Timing (using Timing Light):—Connect timing light between distributor terminal and live terminal of generator relay. Turn engine over until #1 piston is on compression, stop with piston slightly past top dead center when 2° mark (Cast-iron Hd.), or 4° mark (Aluminum Hd.) on crankshaft impulse neutralizer at front of engine is directly under pointer on chain case, loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt, see that rotor is directly opposite #1 segment in distributor cap, check spark plug connections (see diagram). Impulse neutralizer is marked in 1° graduations for a total of 15° on each side of the '0' or top dead center point.

Timing (using Gauge):—All cars can be timed using a Motor Gauge installed in timing plug hole over #6 piston. Use Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-5-3-6-2-4 (see diagram).



Spark Plugs:—A.C., Type S-9 (Cast-iron Hd.), Type SL-9 (Aluminum Hd.). 14 MM. Metric type. Type SL-9 has a longer (7/16") thread length.
Spark Plug Gaps—.025".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, Gasoline Gauge, and Automatic Choke.

Carburetor:—Stromberg, Model EX-22, 1¼" plain tube downdraft type.
Automatic Choke—Sisson (special equipment).

Fuel Pump:—A.C., Type B on right hand side.
Gasoline Gauge:—Motometer, Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #6 intake valve at .011" (cold). This valve should open with #6 piston .015" past top dead center when 6° mark on impulse neutralizer at front of engine lines up with pointer on chain case

cover. Reset tappet clearance at .005" with engine hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12.
Tappet Clearance:— 005" Int., .007" Exh., engine hot.
Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed). 77-85 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WT-1-15, 6 volt, 15 plate, 90 A H capacity (5 ampere rate)
Starting Capacity—117 amperes for 20 minutes
Grounded Terminal—Positive (+) terminal.
Location—Under left hand front seat

STARTER:—Model 734-H. Armature No. 823881.
Rotation—Counter-clockwise at commutator end
Brush Spring Tension—24-28 ounces each
Cranking Engine—175-200 amperes, 5 0 volts.

Performance Data

Torque	R P.M	Volts	Amperes
0 ft lbs	6000	5 0	65
15 " "	Lock	3 15	570

Starting Switch:—Manual pinion shift connected to starting switch lever Interconnected with throttle cross shaft to provide ¼-1/3 throttle opening while cranking (see Equipment Section).

Mounting:—Flange mounted on left hand front face of flywheel housing.

GENERATOR:—Model 937-P. Armature No. 1838448. Third brush control type with external voltage regulation (regulator combined with relay cut-out in case on generator field frame.

Charging Rate Adjustment (using Meters):—Use test ammeter and voltmeter to check generator output Connect jumper wire from 'F" generator terminal to ground (this is important as voltage regulator must be shorted out while adjustment is being made) With generator at room temperature, remove commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate until output is 21 amperes at 8 6 volts, tighten locking screw, remove jumper wire from voltage regulator See Equipment Section for complete data on Voltage Regulator.

Commutator Bar Method:—Remove generator from car, mount so that armature can be seen, loosen lock screw on commutator end plate, shift third brush so there are exactly 2½ commutator bars exposed between third brush and nearest main brush, tighten locking screw This setting provides maximum safe output and must not be exceeded.

Performance Data

	Amperes	Volts	R P M
Cold	19-22	8 3-8 7	2400
Hot	12-15	7 6-8 0	2600

Rotation—Counter-clockwise at commutator end
Shunt Field Current—3 5-4 5 amperes at 6 0 volts
Brush Spring Tension—22-26 ozs. (main brushes), 16-20 ozs (third brush).
Field Fuse—6 ampere capacity (in regulator case)

Mounting:—Pivot mounting at left front of engine Drive by fan belt To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, use spring scale to pull generator horizontally away from engine until belt tension (scale reading) is 45-50 lbs, tighten clamp bolt and pivot bolts before slacking off scale tension

RELAY REGULATOR (CONTROL UNIT):—Model 5540. Control unit consists of relay cut-out and voltage regulator in case on generator field frame See Equipment Section for complete data on Voltage Control Relay.

Relay Cut-out

Cuts in—6 4-6 8 volts **Cuts out**—3 amps. disch , max
Relay Contact Gap— 015- 025'
Air Gap— 012- 017" (contacts closed)

Voltage Control Relay

Contacts Open—8 35-8 65 volts at 70°F
Contacts Close—7 3-7 7 volts at 70°F
Contact Gap— 008- 013".
Air Gap— 028- 040" between armature and core armature down against stop), armature travel (between armature and stop).

LIGHTING:—Clum Switch, Model 9556. Delco-Remy Foot Control Switch Model 465-Z. Foot control switch used to provide assymmetrical 'passing' beam (beam from right hand head lamp tilted).

Bulb Specifications

Lamps	Candlepower	Mazda No
Headlights	32-21	2320-C
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	15	87

FUSES:—Lighting—20 amperes on back of ammeter.
Generator Field—6 amperes in regulator case

HORNS:—Klaxon, Model K-31 or Model K-26M (Matched Set). Vibrator type

NOTE—Twin horns are connected through a 20 ampere fuse to battery terminal of starting switch.

SERIAL NUMBER:—First number, 3,756,501 (Detroit), 9,403,286 (Canada). On right front door hinge pillar post.

COMPRESSION:—**Ratio**—6.5-1 Std. cast-iron head. **Pressure**—135-145 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

IGNITION:—**Coil Model IG-4609 (Coupe), IG-4613 Sedan.**
Ignition Switch—Mitchellock Mod. 24-R, Type 6506 (Coupe), 6507 (Sedan).
Distributor Model IGS-4002. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 38°. Open 22°. (distributor).
Manual Advance—20° (engine) adjustment only.

Automatic Advance—IGS-4002

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	780	12	1560
9	1160	18	2320
12	1530	24	3060

Vacuum Spark Control—Mounted on side of distributor cup, advances spark by rotating breaker plate through link coupling (breaker plate grounded through pig-tail connection). Provides additional advance for intermediate speeds above idling. Spark is retarded by return spring in unit when engine is accelerated or is operated with wide-open throttle.

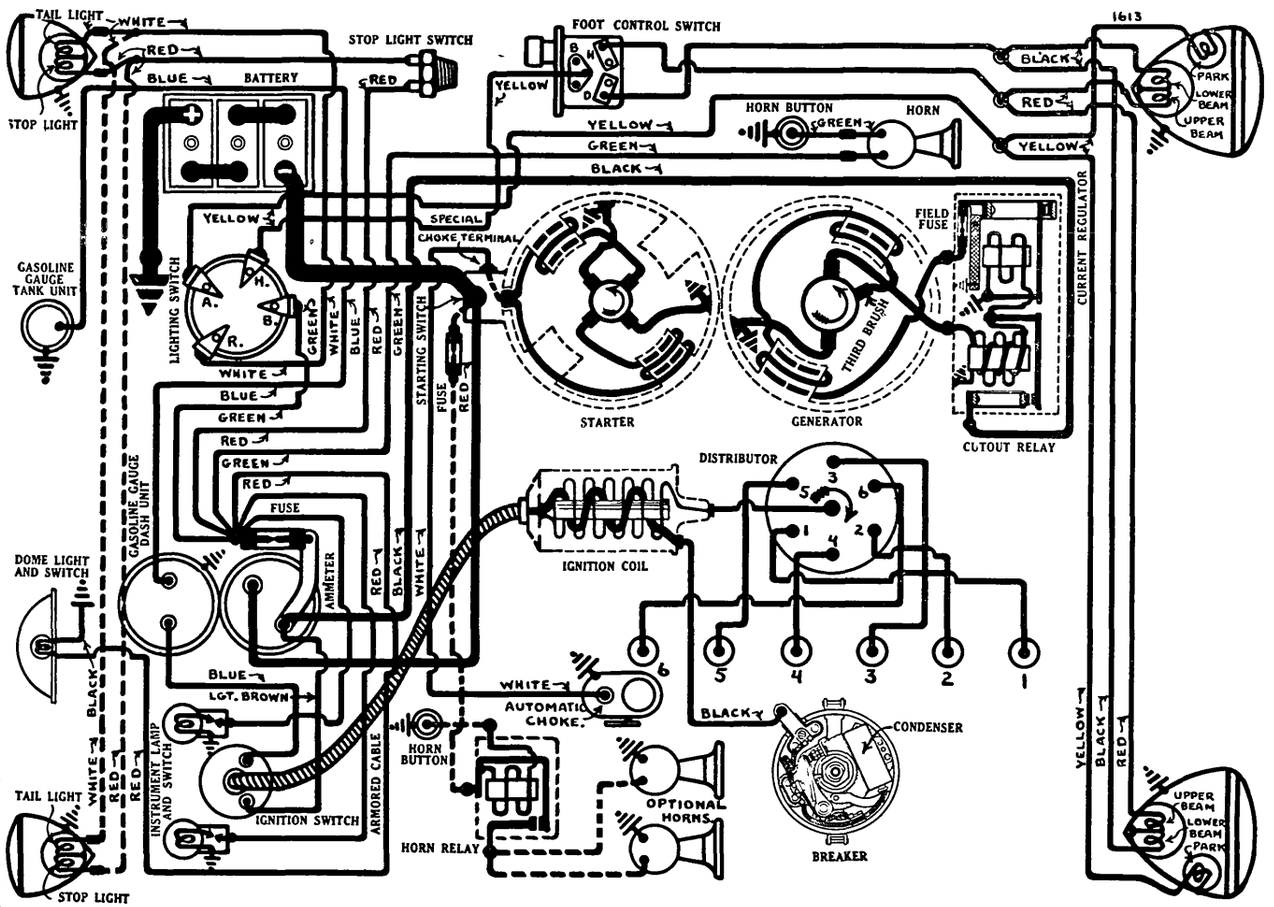
Vacuum Spark Advance—IGS-4002

Distributor Degrees	Vacuum
½°	4-5" of HG.
9° Max.	12" of HG.

Removal:—Distributor mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
DU Engines ..... 4° ATDC. ..... .007" ATDC.
Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator regulator. With #1 piston on compression, turn engine over until piston is 4° past top dead center, stop when fourth graduation at left of center 'O' mark on fan pulley at front of engine lines up with pointer on chain case cover. Loosen advance arm hold-down screw, center pointer on scale (line up with 'O' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp goes out, tighten clamp bolt.

Timing (Using Motor G uge)—Engines can be timed with a motor gauge installed in timing hole over #6 piston. See table above for setting. Use Weidenhoff Adapter #103, Rod #12.



Timing (Using Synchroscope)—Engines can be timed with a Synchroscope by directing light on fan pulley at front of engine.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-9. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Stromberg, Model EX-22, 1¼" downdraft type with Fast idle.
Automatic Choke—Sisson.
Fuel Pump:—A.C., Type B-1521789 diaphragm type.
Gasoline Gauge:—Motometer, Electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #6 intake valve at .010". This valve should open with piston .015" after top dead center (install regular timing gauge in timing plug hole over #6 cylinder). Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh. recommended for sustained high speed.
Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed). 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-60 lbs. at driving speeds.

BATTERY:—Willard, Type WT-1-15. 6 volt, 15 plate, 90 A.H. capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.

STARTER:—Model MAW-4003, MAW-4004 (Export). Armature No. MAW-2030.
Starter Drive—Postive shift outboard pinion.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900 Min.	5.5	65
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
12.0 "	Lock	3.0	505
18.0 "	Lock	4.0	670

NOTE—See Equipment Section for method of correcting burnt commutators on these starters whenever this trouble is encountered.

Starting Switch:—SW-2813 (MAW-4003), SW-2677-A (MAW-4002). Mounted on starter field frame and operated by pinion shift (starting pedal). See Equipment Section for adjustment of pedal and Type SS-4101 solenoid switch (MAW-4004).

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR: — Model GAR-4608-5. Armature No. GAR-2116-F. Air-cooled. Third brush control in conjunction with Current Regulator (two-rate charging control). See Equipment Section.

Charging Rat Adjustment (Using Meters)—Use test meters to check generator output. Connect jumper wire from fuse cup on side of regulator case to ground on generator frame. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until maximum output is 21 amperes at 8.6 volts with generator at room temperature (70°F.). Remove jumper wire.

Commutator Bar Method—Shift third brush until there are exactly 4 commutator bars exposed between the edge of the third brush and the nearest main brush.

Maximum Charging Rate—Above settings provide maximum safe output for generator and must not be exceeded.

Performance Data

Cold—Regulator Contacts Closed—Hot

Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).

Field Current—3.51-3.89 amperes at 6.0 volts.

Motoring Current—5.03-5.57 amperes at 6.0 volts (½ ampere additional if relay and regulator in circuit).

Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot and clamp bolts, pull generator away from engine until tension as measured on spring scale is 45-50 lbs.

RELAY-REGULATOR:—Model TC-4301-A. Mounted on generator. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Douglas Switch Model 5394. Clum Foot Control Switch Model 9579. Foot control switch is used to control upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Instrument	1½	55
Stop and Tail	21-3	1158
Dome	15	87

NOTE—Lighting switch button and shaft are integral. See preceding article on Chrysler C6 for instructions on removing switch.

FUSES:—Lighting—20 ampere on back of ammeter.
Twin Horns—30 ampere in horn lead near starter.
Generator Field—5 ampere in regulator.

HORNS:—Auto-Lite Model HA-4002 Std. Klaxon Model K-33-C, Type 1903 (low note), 1904 (high note) Optional. Optional horns are matched tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Relay Contact Gap—.015-.025"
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number—4,015,051 (Detroit), 9,405,681 (Canada). On right front door hinge pillar post.

COMPRESSION:—Ratio—6.5-1 Std. cast-iron head. No optl. ratios.

Pressure—135-145 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

IGNITION:—Coil Model IG-4628. Service Winding (coil less switch and cable) IG-3224S.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-R, Type 6508. Connected to coil by armored cable.

Ignition Lock—Yale & Towne Mod. DP-108, Mitchell No. 6286.

Distributor Model IGS-4002-1, IGS-4002A-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .020". Limits .018-.020".

Cam Angle or Dwell—38° closed, 22° open.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IG-2671F. Capacity .20-.25 mfd.

Automatic Advance—IGS-4002-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
6	775	12	1550
9	1150	18	2300
12	1530	24	3060

Automatic Advance—IGS-4002A-1

Start	300	0	600
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	4.9
8	8-9
16	12

Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All engines ..... 4° ATDC ..... .0068" ATDC

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. Turn engine over until #1 piston is 4° or .0068" past top dead center, stop when fourth graduation to left of center 'O' mark on fan pulley at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light at fan pulley, fill in 4° mark to left of center 'O' mark with chalk or white paint. See Equipment Section.

Timing (Motor Gauge)—Weidenhoff Adapter #103, Rod #12. Timing hole located over #6 piston.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-9 superseded by Champion Type J-8. 14 MM. Metric.

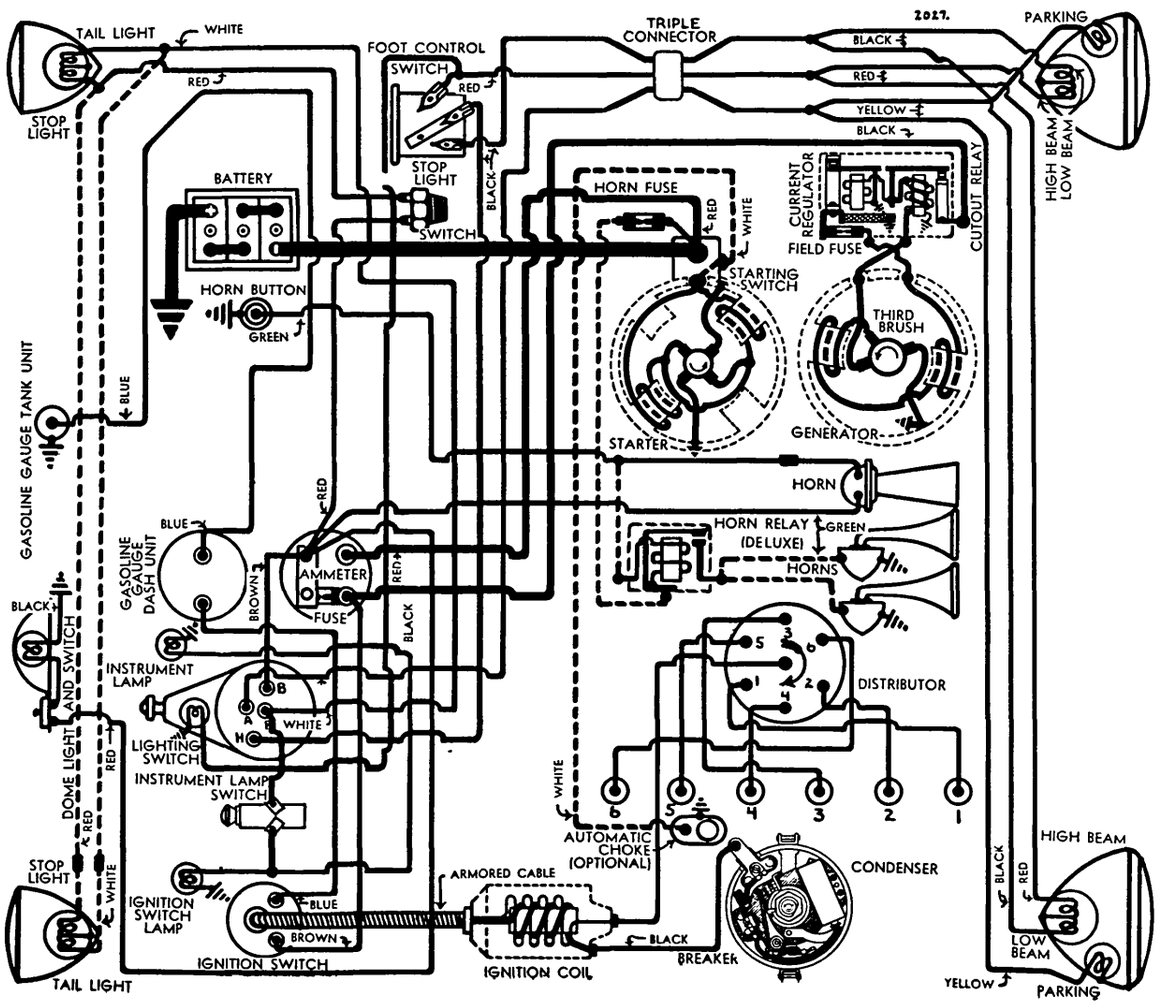
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Stromberg Model EXV-2, 1¼" downdraft type. See Carburetion Section for adjustment, overhaul, and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that engine will idle at hot or slow idling speed with choke valve wide open.

Idle Adjustment—Adjust throttle stopscrew so that idle speed is 7-8 M.P.H. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:



Inner Hole—(Min. stroke)—Extremely warm weather.

Center Hole—Normal summer temperatures.

Outer Hole—(Max. stroke)—Winter temperatures.

NOTE—5% and 10% lean main metering jets (high altitude calibration) may be used at lower altitudes for maximum fuel economy although with considerably reduced speed and power. See Stromberg Jet Specifications in Carburetion Section.

Fast Idle:—No adjustment required. Throttle stopscrew should rest on high point of cam.

Automatic Choke:—Sisson Type AC-751B. See article in Carburetion Section for data and linkage adjustment.

Air Cleaner:—AC. #1525919 oil-wetted type standard, #1526712 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type D #1522237 (early cars), #1522995 (later cars) diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Motometer Electric. No. NG-7687-T (tank unit), NG-7720-D (dash unit). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center, when sixth graduation to left of center 'O' mark on fan pulley at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12. Timing hole over #6 piston.

Tappet Clearance:—.006" Int., .008" Exh., with engine hot. 010" Exh., recommended for sustained high speed.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed), 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill). **Normal Oil Pressure**—30-40 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WT-1-15, WT-1-90 (Export). 6 volt, 15 plate, 90 ampere hour capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under driver's seat.

R-2-15 (Special Export):—6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).

Starting Capacity—127 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

STARTER:—MAW-4010, MAW-4011 (RHD). Armature MAW-2030.

Drive—Positive shift outboard pinion.

Cranking Engine—Approx. 175 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch (MAW-4010):—SW-2813. Mounted on starter field frame and operated by pinion shaft (starting pedal). See Equipment Section for pedal adjustment.

(MAW-4011)—Solenoid Switch Type SS-4104. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on'.

Solenoid Switch

Closes aaginst 105 lb. pull with ⅜" air gap drawing 65 amprees. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts. **ContactGap**—.025-.030". **AirGap**—.005-.007"(closed).

GENERATOR:—Model GAR-4608A-5. Armature GAR-2116F. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Commutator Bar Method—Shift third brush until exactly 4 commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold — Regulator Contacts Closed — Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200

16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24 ozs. min. (old brushes), 36 ozs. max. (new brushes).

Field Current—3.51-3.89 amperes at 6.0 volts.

Motoring Current—5.03-5.57 amperes at 6.0 volts.

Field Fuse—5 ampere in plug on regulator case.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Swing generator away from engine until 45-50 lb. reading on scale attached to generator frame.

RELAY-REGULATOR:—Model TC-4301A. Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.015-.045".

Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran Brown, Pro-focused type. Headlamps aimed straight ahead (upper beam with lenses in place). Lower beam deflected slightly to right. Upper and lower beams controlled by foot selector switch.

Headlamp Beam Indicator—In light switch knob. Lighted when headlamp upper beams in use.

Switches

Lighting—Dodge Part No. 652143. Douglas Switch which is available only through Dodge Parts Dept.

Foot Selector—Clum Model 9654.

Stop Lamp—R.B.M. Model 910. Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instr., Indicator	1½	55
Stop and Tail	21-3	1158
Dome	15	87

FUSES:—Lighting—20 ampere on back of ammeter.

Generator Field—5 ampere in plug on regulator case.

Twin Horns—30 ampere in connector near starter.

HORNS:—Auto-Lite Model HA-4018 Std. Klaxon Model K-33-C Type 2151 (low note), 2152 (high note) Optl. (with horn relay).

Horn Type	Current at 6 volts	Air Gap
2151 (low note)	11-13	.042-.046"
2152 (high note)	10-12	.032-.036"

Horn Relay:—Model 266-TK. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number 4,530,451 (Detroit), 9,409,056 (Canada) Located on right front door hinge pillar post

COMPRESSION:—Ratio—6 5-1 cast-iron head

Pressure—135-145 lbs at 1000 R P M or approx 110 lbs at cranking speed

IGNITION:—Coil Models IG-4641 or CL-4601. Service Winding (coil less switch and cable) IG or CL-3224S Coil mounted on dash

Ignition Current—2 5 amperes idling, 5 5 stopped

Ignition Switch:—Mitchellock Model 24-R, Type 7061 Connected to coil by armored cable

Ignition Lock—Yale & Towne, Mitchell No 6286

Distributor Model IGS-4002A-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control

Breaker Gap—Set at 020"

Cam Angle or Dwell—38° (closed), 22° (open)

Breaker Arm Spring Tension—18-20 ounces

Condenser—Part No IG-2671F Capacity 20- 25 mfds

Automatic Advance

Distributor		Engine	
Degrees	R P M	Degrees	R P M
Start	300	0	600
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor Mounted on distributor housing and linked directly to breaker plate Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	4 9
8	8-9
16	12

Distributor Removal:—Mounted on left side of crankcase To remove, disconnect vacuum line, take out hold-down screw in advance arm

IGNITION TIMING:—

	Flywheel Degrees	Piston Pos.
All engines	4° ATDC	0068" ATDC

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit With #1 piston on compression, turn engine over until piston is 4° (or 0068") past top dead center, stop when fourth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.

Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light at fan pulley, fill in 4° mark to left of center '0' mark with chalk or white paint

See Article in Electrical Equipment Section.

Motor Gauge—Weidenhoff Adapter #103, Rod #12 Timing plug hole over #6 cylinder.

Firing Order:—1-5-3-6-2-4 See diagram

Spark Plugs:—Champion Type J-8 14 MM. Metric.

Spark Plug Gap—Set at 025".

CARBURETION:—Carburetor—Stromberg Model EXV-2, 1¼" downdraft type.

See Article in Carburetion Section.

Idle Adjustment—With engine warm, choke valve wide open (fast idle inoperative), adjust throttle stopscrew so that idle speed is 7-8 MPH Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows

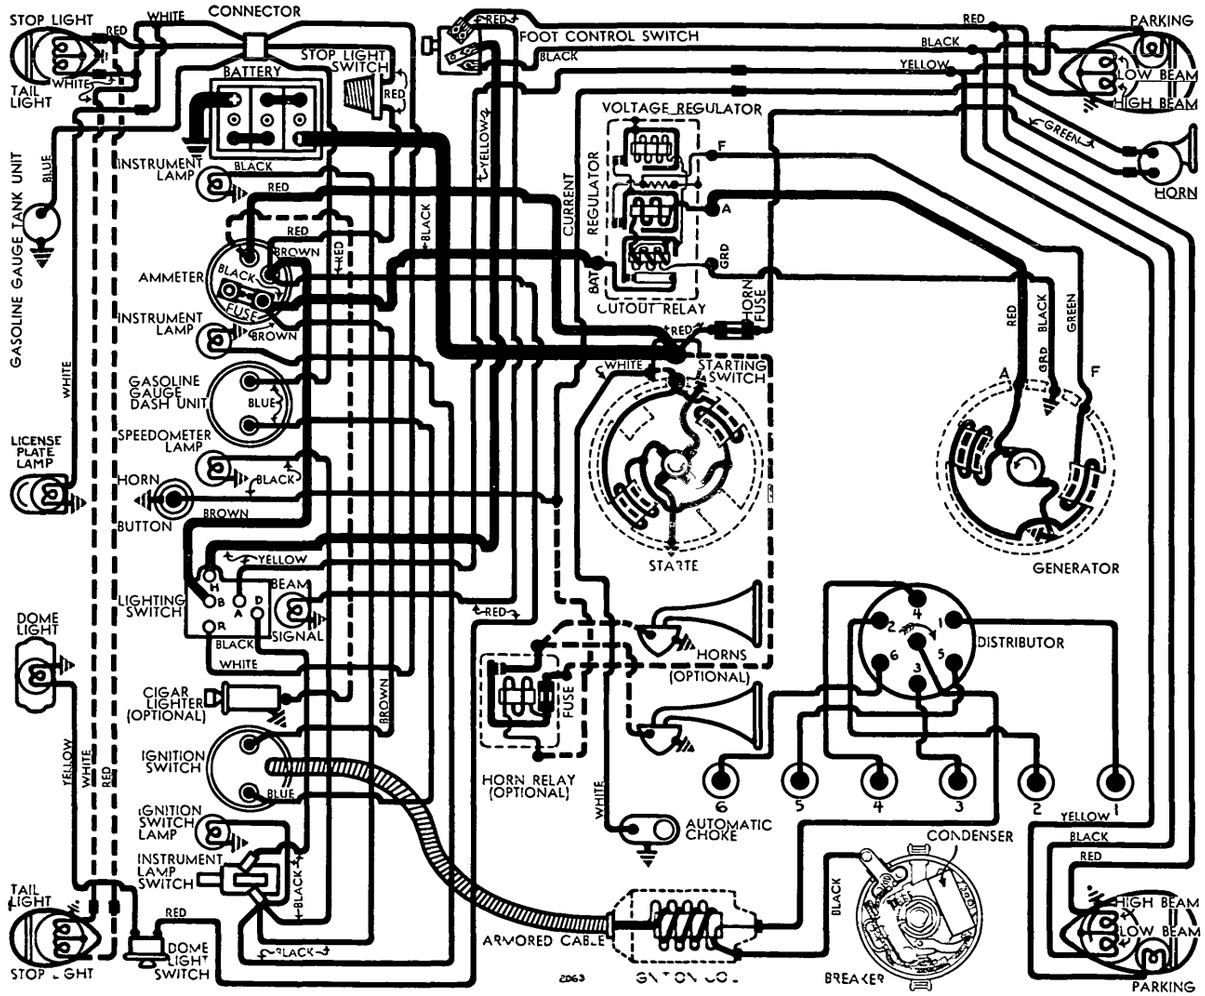
Inner Hole—(Minimum stroke)—Extremely warm weather

Center Hole—Normal summer temperatures

Outer Hole—(Max stroke)—Winter temperatures

Fast Idle:—No adjustment required Throttle stopscrew should rest on high point of cam

Automatic Choke:—Sisson Type AC-751B See article in Carburetion Equipment Section for data and linkage adjustment



Air Cleaner:—AC #1528200 oil-wetted type standard #1528197 heavy duty oil bath type optional

Fuel Pump:—AC Type B #1522995 diaphragm type Type AL #1523137 combination fuel-and-vacuum pump optional

Gasoline Gauge:—Motometer Electric No NG-8295D (dash unit), No NG-8257T (tank unit)

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at 011". This valve should open with piston 6° (0153") past top dead center,

when sixth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12. Timing hole over #6 piston.

Tappet Clearance:—.006" Int., .008" Exh.. hot.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed), 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WT-1-95. 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left side under driver seat.

(Special Export) Willard, Type RHT-2-105. 6 volt, 15 plate, 105 AH. capacity (20 hour rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes. Grounded Terminal and Location (as above).

STARTER:—MAW-4010, MAW-4011 (RHD). Armature MAW-2030.

Drive—Positive shift outboard pinion (MAW-4010), magnetic shift pinion type (MAW-4011).

Cranking Engine—Approx. 175 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch (MAW-4010):—SW-2813. Mounted on starter field frame and operated by pinion shift (starting pedal). See Electrical Equipment Section for pedal adjustment.

(MAW-4011)—Solenoid Switch Type SS-4104. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on.'

Solenoid Switch

Closes against 105 lb. pull with ⅜" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-.2.5 volts. **Contact Gap**—.025-.030". **Air Gap**—.005-.007" (closed).

GENERATOR:—Model GBW-4803-A, C (Export). Armature No. GBW-2006F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—22 amperes, 8.0 volts, 1780 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.

Charging Rate Adjustment—No adjustment on generator. See Regulator section below for Voltage and Current Regulator settings.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	775	0	6.4	870
4	6.7	940	4	6.7	1065
10	7.1	1200	10	7.1	1385
16	7.6	1480	16	7.6	1780
20	7.85	1675	20	7.85	2125
22	8.0	1780	22	8.0	2400

NOTE—Current regulator limits maximum output to 22 amperes.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.71-1.89 amperes at 6.0 volts.

Motoring Current—2.94-3.26 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs., tighten bolts.

REGULATOR:—Model VRB-4005-A, Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator and Vibrating Current Regulator in case on dash.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed. Voltage should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 M.P.H. car speed, add load (use bank of headlamp bulbs or turn on lights and discharge battery) so that generator will charge at peak rate and bring Current Regulator into action. Charging current should not exceed 22 amperes. If more than slight excess noted, Current Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Aim headlamps straight ahead (lenses in place, upper beams lighted, car unloaded) with center of hot spot of beam 3" below center horizontal line of headlamps, at 25 feet. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in full out position.

Headlamp Beam Indicator—Located in light switch knob. Lighted whenever upper beams in use.

Switches

Lighting—Dodge Part No. 667044.

Instrument Light—Dodge Part No. 667043.

Foot Selector—Dodge Part No. 659512.

Stop Light—Dodge Part No. 661721.

Bulb Specifications

Location	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking	1½	55
Stop and Tail	21-3	1158
Instruments, Indicator	1	51
Rear License	3	63
Dome	15	87

FUSES:—Lighting—20 amperes on back of ammeter.

Horn—Single horn—20 ampere in connector near starter. Dual horns—30 ampere in horn relay.

HORNS:—Auto-Lite Model HA-4020. Single horn standard. Model HC-5103 dual horns with HR-4002 horn relay optional.

DUESENBERG

MODEL J (1929-30-31-32-33)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXRV-21-2G, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 164 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30 hours. Battery is mounted on the right frame member under the dust shield.

IGNITION:—Coil Model 553-A, B (2 coil unit). The ignition switch is built in the base of the coils. Coil unit is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel.

Distributor Model 4044 (SM-1064). Two breaker arm, 4 lobe cam type with semi-automatic advance. Breaker contacts open alternately at 45 degree intervals corresponding to 90 degree firing interval of engine. Contacts must be synchronized—see Timing. Breaker gap set at .022 inch. Hold within limits of .018-.024 inch. To set gap, loosen lockscrew on stationary contact mounting plate, turn eccentric adjusting screw, tighten locking screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Maximum manual advance 20 degrees (engine).

Cam Angles—Closed 44°. Open 46° (distributor) independently.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	400	4	.....	800
10	.....	1000	20	.....	2000

Mounting:—Distributor is mounted on a bracket directly above the center of the left hand overhead camshaft on the top of the engine and is driven through spiral gears from the camshaft. The manual spark control operates through gears hidden in the base mounting flange. To remove distributor, disconnect primary leads and remove distributor head with cables intact. Then take out four mounting screws in distributor base mounting flange and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 1000 miles of operation. At the same remove the distributor head and rotor and put 4 or 5 drops of oil on top of the cam locking screw in the center of the shaft and 1 or 2 drops of oil on the breaker arm pivot pins. Put a small bit of vaseline on the face of the breaker cam.

Timing:—**Synchronization of Contacts.** The second set of contacts mounted on movable sub-plate begin to open exactly 45 degrees after the first set mounted directly on the breaker plate. Synchronize contacts on a rotary spark gap or turn engine over exactly 90 degrees from firing position of piston No. 1 after distributor has been timed to the engine when piston No. 6 will reach firing position (6 degrees after top dead center with manual spark control retarded). If the second set of contacts do not open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until contacts open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 6 degrees on the flywheel after top dead center with the manual spark control fully retarded. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark control lever and turn engine over until the ignition mark on the flywheel, which is 6 degrees after the top dead center mark '⅛' is directly opposite the reference line

DUESENBERG

MODEL J (1929-30-31-32-33)

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

on the flywheel housing. Then loosen lock screw in center of breaker cam and carefully locate cam so that the first set of contacts are beginnig to open. Tighten the screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Spark plug cables not connected in this order (see diagram).

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Overhead valve type. Two intake and two exhaust valves per cylinder mounted in cylinder head and operated directly by overhead camshafts. Intake valves are mounted on left side directly under intake valve camshaft. Exhaust valves are mounted at right directly under exhaust valve camshaft. Both camshafts are chain driven from a transfer sprocket on the front of the cylinder block. Transfer sprocket is chain driven from the engine crankshaft.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1½"	11/32"	5⅛"	30°	.350"
Exhaust	1 7/16"	11/32"	5⅛"	30°	.360"

	Tappet Clearance Operating	Timing
Intake	.015" (cold)	.025" (cold)
Exhaust	.015" (cold)	.025" (cold)

Spring Pressure

Closed	65 pounds
Open	105 pounds

Timing

Intake valves open 6° before top dead center. Intake valves close 40 degrees after lower dead center.

Exhaust valves open 40° before lower dead center. Exhaust valves close 14° after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

STARTER:—Model 429. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 36-40 ounces. The starting switch is mounted on the starter field frame.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	70
19 "	Lock	3	500

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect starting switch control wire and cables and take out three flange mounting bolts. Then pull starter forward to clear drive and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 428. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the commutator cover band and shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in any position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.3-8.7	1200	11-13	7.5-7.8	1450

Shunt field current is 3.2-4.1 amperes at 6 volts. Brush spring tension is 20-24 ounces. Generator motoring draws 4.5 amperes at 6 volts.

Mounting:—Generator is cradle mounted at left of engine and is driven by the accessory drive shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-D. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	21-21	DC	1110
Side (cowl) lights	6-8	3	SC	63
Dash and tail lights	6-8	3	SC	63
Stop and backing lights	6-8	21	SC	1129

CURRENT LIMIT RELAY:—Model 5759. This device consists of a vibrating and lock-out circuit breaker mounted on the left side of the dash. The vibrating circuit breaker is connected in the lighting circuits to protect them from overload and short-circuits. It begins to vibrate when the current reaches 35-40 amperes and continues limiting the current to 5-22 amperes. The lock-out circuit breaker connected in the horn and stop light circuits begins to operate when the current reaches 25-30 amperes and continues limiting the current to less than 1 ampere. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed. Spring tension at plunger is 5 ounces (minimum).

GASOLINE GAUGE:—KS Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—Stewart-Warner electric type fuel pump (see Carburetion Section).

HORNS:—Klaxon Model K-22-B twin horns (matched tone) Type 1153 (low note) Type 1151 (high note). Current draw 6.0-8.0 amperes at 6. volts.

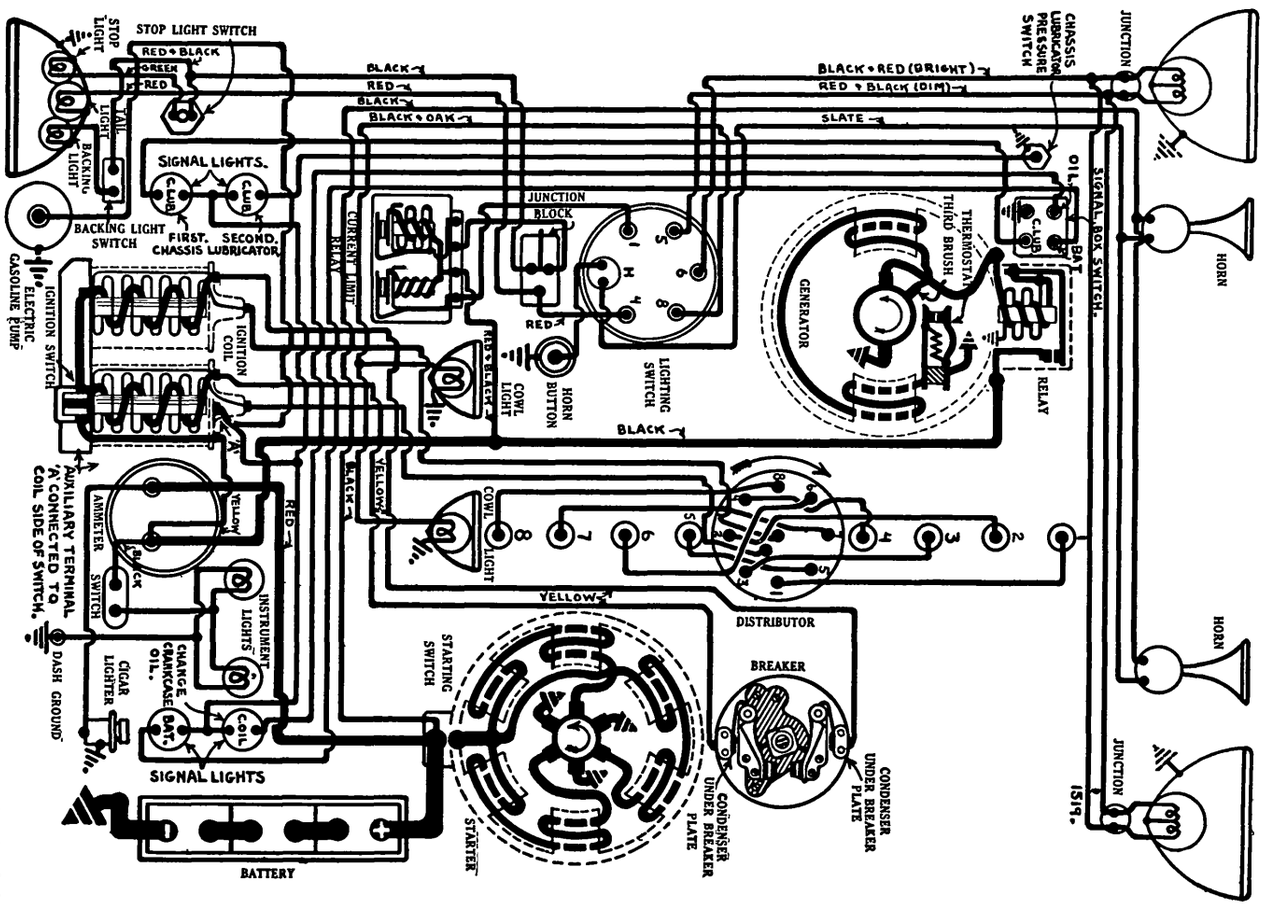
SERIAL NUMBER:—On plate on left side of dash.

COMPRESSION:—**Ratio**—5.2-1 std. cast-iron head.
Pressure—110 lbs. at 80 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 553-A (2 coil unit).** Consists of two coils on bracket with ignition switch.

Distributor Model 4094. Double breaker, 4 lobe cam, semi-automatic advance type. Contacts open alternately at regular 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 49°. Open 41° (distributor). Each set operates independently.
Manual Advance—20° (engine—maximum).



Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	380	2	760
2½	500	5	1000
5	660	10	1320
10	1020	20	2040
15	1320	30	2640
20	1550	40	3100

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines.....1½" or 12° BTDC. ..... .0645" BTDC.
With manual control fully advanced.
Timing (Stationary Contacts):—Synchronize contacts before setting timing if synchronizing tool is used. With #8 piston on compression, turn engine over by prying on flywheel ring gear with prybar, stop when flywheel mark 'Spark Adv./' which is 1½" before top dead center mark '1 &8/CL') lines up with reference line on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are beginning to open, tighten lock screw, see that rotor is in position to fire #8 spark plug.
Synchronization—Using Gauge:—Use special synchronizing tool (dummy cam), Duesenberg #6965. Loosen taper lock screw, remove regular firing cam, install synchronizing tool on distributor shaft, turn tool until stationary contact breaker arm rubbing block drops into slot in tool and rests against shoulder, loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until second breaker arm rubbing block is against shoulder of second slot, tighten locking screws, remove tool, replace regular firing cam, check timing.
Synchronization—On Engine:—Turn engine over 90° from firing position of piston #8 to firing position for piston #3 (1½" on flywheel before top dead center position). Loosen lock screws on movable sub-plate, turn eccentric adjusting screw until second set of contacts (mounted on plate) open, tighten lockscrews, check contact gap.
Motor Gauge—Weidenhoff Adapter #104, Rod #8.
Firing Order:—1-6-2-5-8-3-7-4 (see diagram). Spark plug cables not connected in this order.
Spark Plugs:—Champion, Type C-7 or 6M. 18 MM. Metric.
Spark Plug Gaps—Set at .025". Limits, .022-.028".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Stromberg, Model EE-3 Dual downdraft type (Model J), UU-3 dual updraft type Model SJ Supercharged).
Fuel Pump:—Mechanical bellows type pump (on left side of crankcase) and Stewart-Warner, Type 644-C electric type booster pump (Model J), or Autopulse Triplex Unit (SJ Supercharged).
Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—**To Check Timing**—Check tappet clearance #1 intake and exhaust valves (set at .025" cold). #1 intake valve should open with #8 piston .0161" before top dead center entering power stroke when flywheel mark '/INT. OPENS' lines up with reference line on housing. This mark is exactly

5/8" before top dead center mark '1&8/CL'. #1 exhaust valve should close with #8 piston .0068" past top dead center when flywheel mark '/EXH. CLOSES' lines up with reference line. This mark is 1¼" past top dead center mark '1&8/CL.'
Motor Gauge—Weidenhoff Adapter #104, Rod #8.

Tappet Clearance:—.025" (cold) all valves.
NOTE—To change or set tappet clearance, use feeler gauge and check actual tappet clearance of each valve (clearance between heel of cam and tappet). Remove camshafts, tappets, tappet adjusting nuts. Use shims of various thicknesses to change length of adjusting nut so that clearance when assembled will be .025" (measure length of adjusting nut with 1" micrometer, add or remove shims as necessary, recheck adjusting nut with micrometer.) Reassemble camshafts, check Valve Timing, and Ignition Timing.

Valve Spring Pressure:—

Inner Springs	Pressure	Length
Valve closed	26 lbs.	1 15/16"
Valve Open	36-40 lbs.	1 19/32"
Outer Springs	Pressure	Length
Valve closed	35-40 lbs.	2¼"
Valve open	65-70 lbs.	1 29/32"

LUBRICATION:—Crankcase Capacity—12 quarts.
Normal Oil Pressure—2-10 lbs. (low idling speeds) increasing approximately 1 lb. per M.P.H. Maximum pressure, 80-100 lbs. (high speed operation).

BATTERY:—Exide, Type XR-21-ER, 6 volt, 21 plate, 164 A.H. capacity (20 hr. rate).
Starting Capacity—123 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On right hand side under dust shield.

STARTER:—Model 429. Armature No. 37895.
Starter Drive—Bendix Type R11X-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
19 "	Lock	3.0	500

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out flange mounting bolts.

GENERATOR:—Model 428. Armature No. 827753.
Third brush regulation, thermostat control. Thermostat contacts open at 165°F. reducing generator output approximately 40%.
Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on commutator end plate, shift third brush counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.
Maximum Charging Rate:—12 amperes (hot), 7.6 volts, 1450 R.P.M.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-21	8.3-8.7	1200
Hot	11-13	7.5-7.8	1450

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—3.2-4.1 amperes at 6.0 volts.
Brush Spring Tension—20-28 ounces each.
Mounting:—Cradle mounted on left hand side of engine. To remove, disconnect drive coupling, loosen mounting clamp band.

CUT-OUT RELAY:—Model 265-B. On generator.
Cuts in—7.0-7.5 volts, 500 R.P.M. (generator).
Cuts out—0-2.5 amperes discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Switch Model 486-D. Mounted at lower end of steering column.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights (Std.)	21-21	1110
Stop and Backing	21	1129
Tail, Cowl, Instr., Step	3	63
Dome and Corner	3	64
Signal Lights	1.5	2B-G6-10

CURRENT LIMIT RELAY:—Model 5759. Consists of vibrating and lock-out circuit breaker.

Vibrating Unit

Starts to operate with current load of 35-40 amperes, limiting load to 5-20 amperes.
Contact Gap—.012-.030".
Air Gap—.015-.030" (contacts closed).
Spring Tension—5 ozs. minimum at brass button.

Lock-out Unit

Contacts open with current load of 25-30 amperes, limiting current to less than 1 ampere.

DURANT

MODEL 4-07 (1930) 6-10 (1931)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-CVX-6X-6A. 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 115 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted on right frame member under the floor boards of the front compartment.

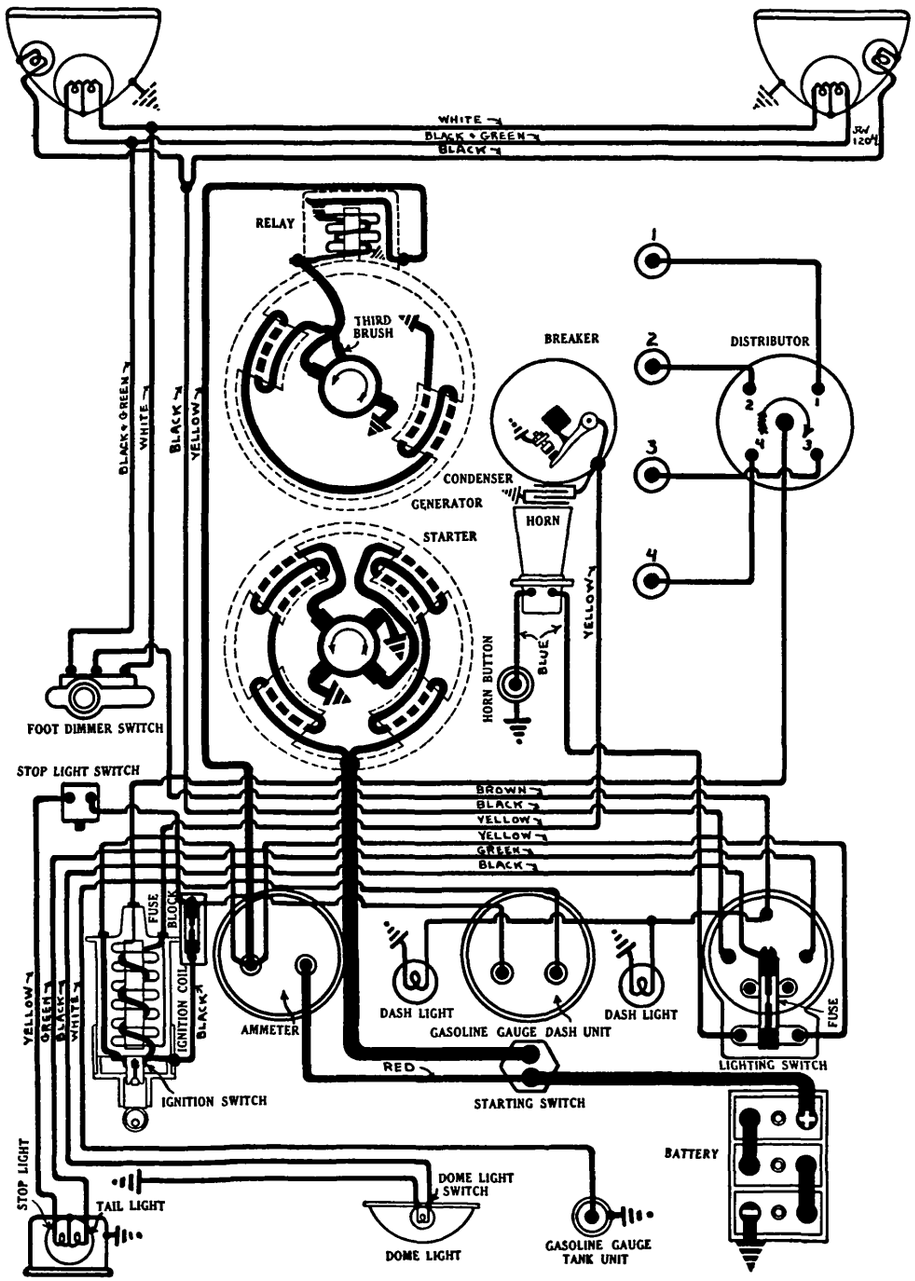
IGNITION:—Coil Model IG-4082. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. The gasoline gauge and stop light are connected to an auxiliary terminal on the side of the coil.

Distributor Model IGB-4043. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 24 degrees (engine) reached at 2400 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual spark control and primary lead and remove distributor head with cables intact. Then take off nut on hold-down stud in advance arm and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor head every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and put one drop of oil on the breaker arm pivot pin and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 8 degrees or 2½ teeth on the flywheel before top dead center with the spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control and see that distributor is rotated counter-clockwise as far as possible Turn engine over until a point on the flywheel 2½ teeth before the top dead center mark is directly opposite the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and see that the segment directly opposite the rotor in the distributor head is connected to the spark plug in cylinder No. 1. Spark plug connections are shown on the diagram.



Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Std. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 53/64 inches. Stem diameter, ⅜ inch. Stem length, 5 1/16 inch. Valve lift, ¼ inch. Tappet clearance, .008 inch (hot). Inlet valves open at top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 11/16 inch. Stem diameter, ⅜ inch. Stem length, 5 1/16 inches. Valve lift, ¼ inch. Tappet clearance, .008 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 6 degrees after top dead center.

To Check Valve Timing. Crank engine over until No. 1 piston is on top dead center entering power stroke. Set tappet clearance of No. 1 exhaust

AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

valve at .012 inch. Turn engine over one complete revolution and stop with piston on dead center when the dead center mark on the flywheel is opposite the indicator on the flywheel housing. The exhaust valve should just close at this point.

STARTER:—Model MAJ-4007. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. Starter switch is Model SW-4003.

Starter Data

Torque	R.P.M.	Volts	Amperes
.3 lb. ft.	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
19.0 "	Lock	4.0	805

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and take out two flange mounting screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler on the drive end of the starter every month or each 1000 miles of operation.

GENERATOR:—Model GAL-4330. The direction of rotation is counter-clockwise viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate is held in position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 16-17 amperes at 8 volts reached at 1900 R.P.M. or 24 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	600
8	7.1	900
17	8.0	1900
12	7.7	3200

Shunt field current is 4.08-4.52 amperes at 6 volts. Generator motoring draws 4.27-4.73 amperes at 6 volts. Brush spring tension is 8-13 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by the fan belt. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect lead and water pump drive coupling and slip off drive belt. Then loosen mounting clamp band and slip generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every week or each 500 miles of operation.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 650 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Lighting Switch Model 5192. Dimmer Switch Model 8871. Lighting switch is mounted on the instrument board. Headlights are double-filament using a second 21 cp. filament controlled by a switch mounted on the toeboard instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking bulbs (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament.

NOTE:—Dimmer Switch 8871 was superseded by Model 9126.

FUSES:—Lighting fuse mounted on switch is 20 ampere capacity. A separate fuse is mounted on the dash and connected in the auxiliary lead from the coil.

Shunt field current is 4.08-4.52 amperes at 6 volts. Generator motoring draws 4.27-4.73 amperes at 6 volts. Brush spring tension is 8-13 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by the fan belt. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect lead and water pump drive coupling and slip off drive belt. Then loosen mounting clamp band and slip generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every week or each 500 miles of operation. Every 5000 miles remove the grease cup under the bearing retainer on the commutator end and clean out all old grease. Dip wick in engine oil and fill cup with medium grease before replacing.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Lighting Switch Model 5192. Dimmer Switch Model 9126. Lighting switch mounted on back of instrument board and controlled by push-pull button on instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated dimmer switch mounted on toeboard. Parking bulbs (in headlights) are standard equipment on Models 6-19 and 6-21. Fender lights are standard equipment on Model 6-22 and optional on Model 6-19.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	21-21	DC	1110
Parking, fender lights	6-8	3	SC	63
Dash lights	6-8	3	SC	63
Stop and tail lights	6-8	21- 2	DC	1158
Dome lights	6-8	3	SC	63

Note:—Stop and tail light is a special double filament bulb. Tail light lead must be connected to the 2 cp. filament.

FUSES:—Lighting fuse mounted on switch is 20 ampere capacity. Two 20 ampere fuses are mounted on the dash connected in the auxiliary lead from the coil and in the stop light circuit.

GASOLINE GAUGE:—Motometer electric type (see Carburetion Section).

TEMPERATURE GAUGE:—Motometer Vapor tension type (see Equipment Section).

FUEL PUMP—AC mechanical fuel pump (see Carburetion Section.

ERSKINE

MODEL 52 (1929)—AFTER AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

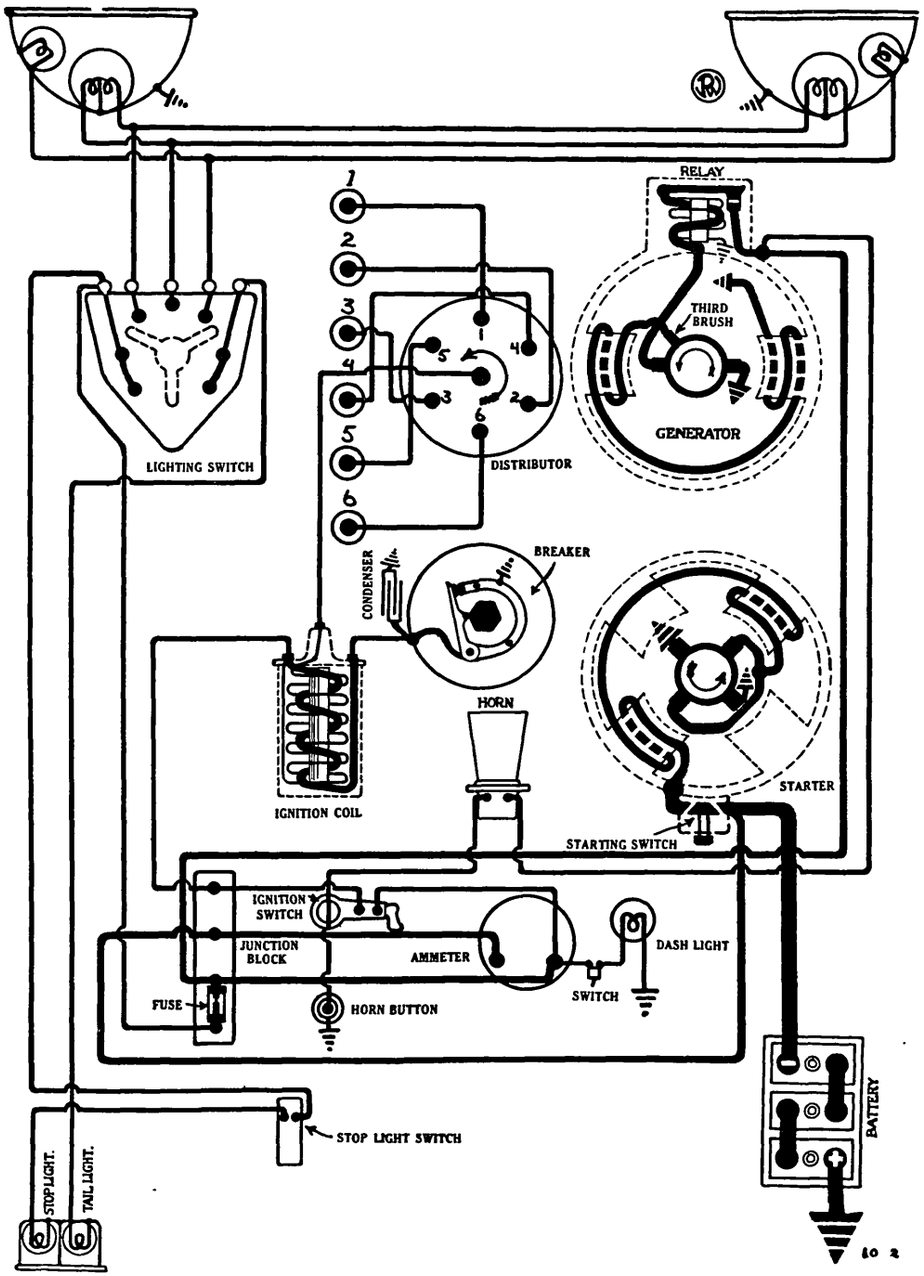
BATTERY:—Willard, Type WR-13, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 525-A (28), 528-A (29). Coil mounted on generator. Ignition current is ½-2 amperes at 6 volts with engine running and 4½ amperes at 6 volts with engine stopped. The ignition switch is a Hershey coincidental ignition switch and steering post lock.

Distributor Model 639-R. Breaker contacts separate .018-.024 inch. Adjust contact opening by loosening locknut directly back of stationary contact and turning eccentric adjusting screw to secure proper setting. The stationary contact is mounted on a movable plate and moves so that contact surfaces are always parallel. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance starts at 800 R.P.M. of engine. Maximum automatic advance is 24 degrees reached at 3100 R.P.M.

Mounting:—Distributor is mounted on the rear of the generator at the right of the engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with high tension cables intact. Then loosen the clamp screw in the distributor shaft housing and lift the distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down two turns every 2500 miles or every six weeks. At the same time remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler in the center of the distributor shaft.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7½ degrees after top dead center measured on the flywheel with manual spark lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Continue to crank engine until piston reaches top dead center. Determine flywheel mark "T-DC-1-6" through timing hole in left rear engine support. Advance spark lever exactly one half. Breaker contacts should begin to separate at this point. If they do not, loosen clamp screw in advance arm and rotate distributor until contacts separate. Tighten the clamp screw. Connect the segment directly opposite rotor to spark plug in cylinder No. 1 and connect remaining plugs in order 5-3-6-2-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard Champion No. 4. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 27/64 inches; stem diameter 5/16 inch; stem length, 4⅞ inches. Tappet clearance, .005 inch (cold). Spring pressure, 67 to 73 pounds (valve open). Valve lift is 5/16 inch. Intake opens 5 degrees past top dead center and closes 45 degrees past lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/64 inches; stem diameter 5/16 inch; stem length, 4⅞ inches. Tappet clearance, .008 inch (cold). Spring pressure is 67 to 73 pounds (valve open). Valve lift, 5/16 inch. Exhaust opens 40 degrees before lower dead center and closes 12 degrees past top dead

ERSKINE

MODEL 52 (1929)—AFTER AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

center. Exhaust closing of cylinder No. 1 is marked on the flywheel by mark "EX-CL-1-6". Valve stem guides are removable. Oversize valve stems are not made.

To Check Valve Timing. Crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 exhaust valve at .008 inch. Crank engine over one complete revolution and stop with piston slightly past top dead center when the flywheel mark 'EX.CL. 1-6' is opposite the indicator in the peephole at the left of the flywheel housing. The exhaust valve should just close at this point.

To Set Valve Timing. Turn crankshaft until piston No. 1 is 12 degrees past top dead center with the flywheel mark 'EX.CL.1-6' at the indicator. Turn camshaft in direction of rotation until No. 1 exhaust valve has just closed. Assemble timing chain. Timing chain is adjusted by shifting the generator. See Generator Mounting.

STARTER:—Model 712-H. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks engine at 110 R.P.M. drawing 225 amperes at 4.8 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
4 "	1100	4.8	225
11 "	Lock	3.6	450

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove one bolt and two flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the commutator end of the starter once a month. The drive end is oilless.

GENERATOR:—Models 940-J, G. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen small round headed screw on generator end plate and remove commutator cover band. Then shift third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 12 amperes at 7.6 volts reached at 1700 R.P.M.

Generator Data
Hot Test

Amperes	Volts	R.P.M.
0	6.4	690
7	7.1	1080
10	7.4	1340
12	7.6	1700
10	7.4	2600

Motoring, generator draws 3 amperes at 6 volts. Shunt field current is 4.3 amperes at 6 volts. Brush spring tension is 12-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect all ignition wiring or remove distributor and coil. Then back off chain adjustment screw and remove inspection cover on front face of chain case by taking out four screws. Remove the nut and washer on the end of the generator shaft. Then take out two flange mounting screws and pull generator to the rear, leaving the sprocket meshed in the chain. A ridge cast in the chain case will prevent the sprocket falling down, but the engine should not be turned over with the generator out.

Adjustment of Timing Chain Tension:—Timing chain tension is adjusted by shifting generator around lower flange mounting cap screw as a pivot. To adjust chain, loosen both flange mounting cap screws and turn up on adjusting screw until there is ⅛ inch movement of the generator shaft. This can be checked by removing the inspection cover. Tighten flange cap screws. Be careful not to get the chain too tight. With proper tension the chain will run without noise.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the commutator end of the generator every 2500 miles or once a month. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 12 M.P.H. when the generator voltage reaches 6.8 volts at 800 R.P.M. and opens at 9 M.P.H. with a discharge current of 1 ampere. Contacts separate at .014 inch. Air gap is .014 inch with contacts closed. Charging current at closing of contacts is approximately 2 amperes.

LIGHTING:—Delco-Remy Switch, Model 484-E, 486-F. Switch mounted on lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base). Mazda No. 1110. Side, dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87.
Stop light switch is Delco-Remy, Model 466-A.

FUSES:—Lighting fuse on front of dash is 20 amperes capacity.

ERSKINE

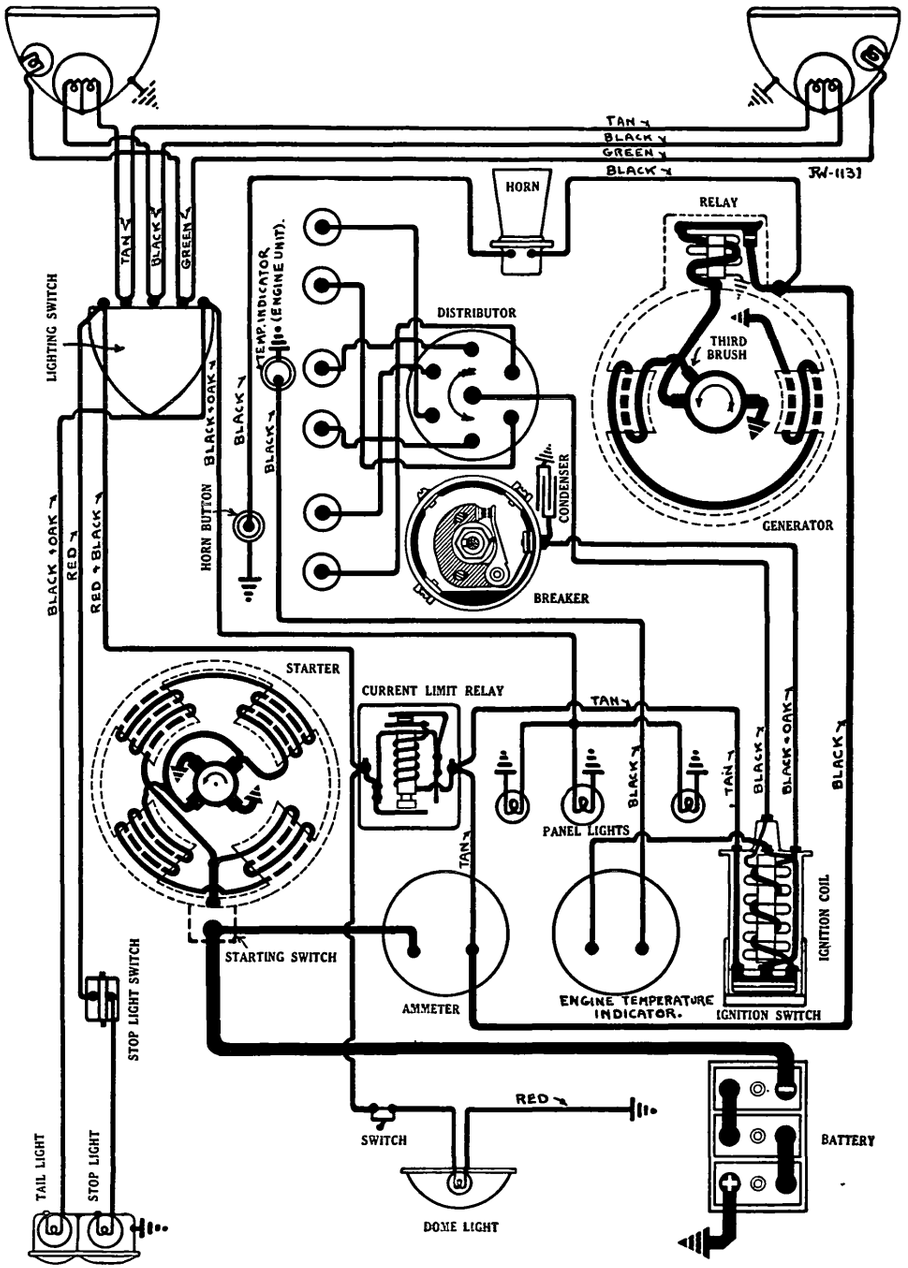
DYNAMIC MODEL 53 (1930)
PRODUCTION STARTED JANUARY 1, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WJ-1-11, 6 volt, 90 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 526-Q. The ignition switch is built in the base of the coil. Coil is mounted on the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is .5-2.5 ampere at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 639-J. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 30 degrees reached at 2400 R.P.M. of engine.

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out stop screw on advance arm and lift distributor from place.



Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and put 4 or 5 drops of light engine oil in the wick oiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 7½ degrees or ¾ inch (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control lever and see that distributor is rotated clockwise to the full extent of the advance arm slot. Remove cover over inspection hole in the flywheel housing and turn engine over until the punch marks on the flywheel (which are ¾ inch or 7½ degrees before the top dead center mark 'U-D-C-1-6') are directly in line with the indicator on the flywheel housing. Then loosen advance arm clamp screw and rotate distributor until the contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 4-2-6-3-5 counter-clockwise around the distributor head.

The engine can be timed on top dead center with the flywheel mark 'U-D-C-1-6' opposite the indicator if the spark control lever is advanced exactly one half. Place the spark lever midway between the fully retarded and fully advanced positions and crank engine over until the dead center mark is opposite the indicator. Piston No. 1 will be on top dead center entering power stroke and the breaker contacts should open at this point.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Champion No. 4. Gaps are .020 inch.

ERSKINE

DYNAMIC MODEL 53 (1930)
PRODUCTION STARTED JANUARY 1, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches. Valve lift, 5/16 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .004 inch. Inlet valves open 5 degrees after top dead center and close 53 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1½ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches. Valve lift, 5/16 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .006 inch. Exhaust valves open 38 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing. Crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 exhaust valve at .010 inch. Crank engine over one complete revolution and stop when piston is slightly past top dead center with the flywheel mark 'EX. CL.1-6' opposite the indicator in the inspection hole in the flywheel housing at the right of the engine. The exhaust valve should just close at this point.

To Set Valve Timing. Turn crankshaft over until No. 1 piston is 10 degrees past top dead center with the flywheel mark 'EX.CL1-6' opposite the indicator on the flywheel housing. Turn camshaft in direction of rotation until No. 1 exhaust valve has just closed. In this position the marks on the two sprockets should be together and in line with a straightedge across the two shaft centers. Assemble the timing chain.

To Adjust Timing Chain. Timing chain is adjusted by shifting the accessory shaft sprocket and mounting flange. To take up timing chain, loosen the three mounting screws on the accessory shaft flange and back off the adjustment screw lock nut. Then turn up the adjustment screw until there is approximately ⅛ inch free play on the circumference of the fan pulley. Tighten the mounting screws and adjustment lock nut.

STARTER:—Model 718-L. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 1050 R.P.M. (armature speed) drawing 275 amperes. Brush spring tension is 24-28 ounces. The starting switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.2	575

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting switch control and take out the flange mounting bolts and cap screw. Then pull starter forward to clear drive and lift from place.

Oiling:—Pue 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every six weeks or each 2500 miles. The drive end bearing is oilless.

GENERATOR:—Model 955-U. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 10-12 amperes (hot) reached at 1650 R.P.M. or 20.7 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Voles	R.P.M.	Amperes	Voles	R.P.M.
15-17	8.0	1400	11-14	7.55-7.85	1700-1800

Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine at rear of accessory bracket. To remove generator, disconnect lead and take out three flange mounting cap screws. Then pull generator to rear to disengage drive coupling and life from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every six weeks or each 2500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. or 7.5 miles per hour when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-E. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy, Model 466-L or H (R.H.D.).

CURRENT LIMIT RELAY:—Model 410-F. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits to protect them against overload and short-circuits. The circuit breaker begins to vibrate when the current reaches 25-30 amperes and continues to vibrate limiting the current to 2-15 amperes. Contact gap is 012-.030 inch. Air gap is .015-.025 inch with contacts closed.

ESSEX

CHALLENGER MODEL (1929) SERIAL NUMBERS 928658 UP
PRODUCTION STARTED JANUARY 1, 1929
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

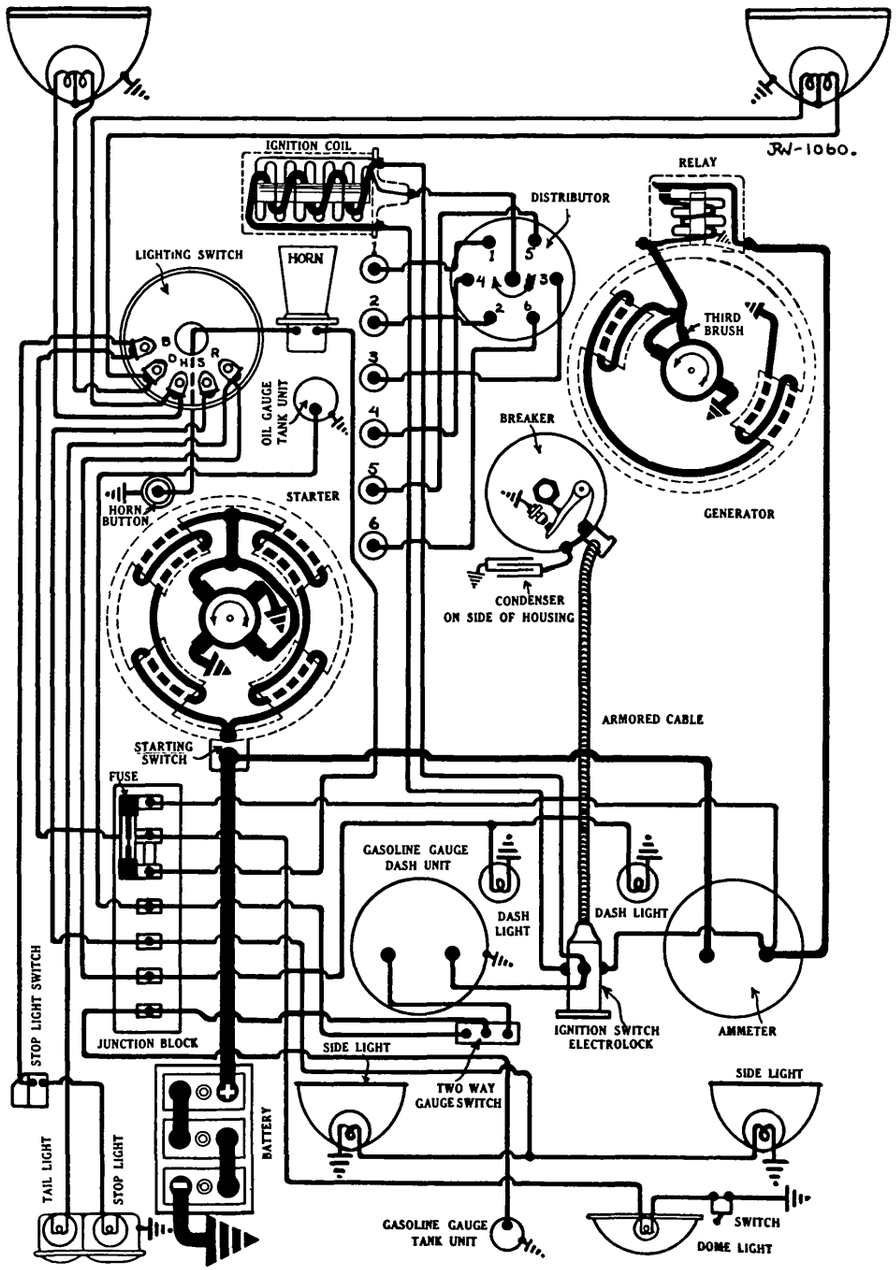
BATTERY:—Exide, Type 3-XI-13-IG, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model IG-4065. Coil is mounted on the cylinder head at the front of the engine. Ignition current is 1.5-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGB-4022. Breaker contacts separate .020-.024 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees (engine) reached at 4000 R.P.M. An Electrolock Type 9-B ignition switch is standard equipment.

Mounting:—Distributor is mounted on the accessory shaft housing at the right of the engine. To remove distributor, disconnect Electrolock at the dash and remove the distributor head with cables intact. Then take off the nut on the taper pin in support housing and lift distributor and Electrolock assembly from place. The Electrolock can then be removed by taking off the nut on the terminal stud inside the distributor housing and withdrawing the Electrolock cable, ferrule and stud from the distributor housing.

Oiling:—Put 6 or 8 drops of light engine oil in the oiler on the side of the distributor each 500 miles of operation. Every 250 miles put one drop of oil on the breaker arm pivot pin. Every 5000 miles remove the distributor head and rotor and put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches top dead center with the breaker assembly fully retarded. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Carefully turn engine over until the vertical mark on the flywheel which immediately precedes the top dead center mark 'DC1-6' coincides with the lower edge of the square inspection hole in the flywheel housing at the rear of the engine on the right side. Then loosen nut on clamp bolt on side of distributor shaft housing and rotate distributor until contacts begin to open. Tighten the clamp bolt and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .025 inch.

VALVE TIMING:—Head diameter, 1⅜ inches. Stem diameter, 5/16 inch. Stem length, 5 1/32 inches. Valve lift, 5/16 inch (inlet), 21/64 inch (exhaust). Spring pressure, 50 pounds. Tappet clearance, .003-.005 inch (inlet) and .005-.007 inch (exhaust). Valve stem guides are removable. Valves with oversize stems are not made.

Timing:—Inlet valves open 7 degrees after top dead center with the piston 1/64 inch down on inlet stroke. Tappet clearance must be .006 inch.

ESSEX

CHALLENGER MODEL (1929) SERIAL NUMBERS 928658 UP
PRODUCTION STARTED JANUARY 1, 1929
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

To Check Valve Timing. Crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .005 inch. Turn engine over one complete revolution until piston is slightly past top dead center with a point on the flywheel 2 teeth past the top dead center mark 'D.C.1-6' even with the lower edge of the inspection hole in the housing. The inlet valve should begin to open at this point.

To Set Valve Timing. Turn crankshaft until piston No. 1 is slightly past top dead center. Turn camshaft in direction of rotation until No. 1 inlet valve is about to open. Then assemble chain so that the first marked chain pin is meshed between the two marked teeth on the camshaft sprocket and the second marked chain pin is between the two marked crankshaft teeth. The eccentric chain adjustment should be turned to the position of minimum adjustment when assembling chain.

Chain Adjustment. Timing chain is adjusted by rotating eccentric accessory sprocket mounting. To take up chain, loosen the three mounting bolts in the accessory bracket (the inner top and bottom bolts may have to be taken out to avoid striking the flange notches). Then use a special wrench to rotate the flange directly in front of the accessory bracket in a clockwise direction (facing toward front of car) until there is approximately ⅛ inch play on the circumference of the generator drive coupling. Tighten the mounting bolts. It may be necessary to back off the adjustment slightly to line up the bolt holes if the bolts have been taken out.

NOTE:—If the accessory bracket has been taken off the car, the pipe plug to the right and above the generator drive shaft should be taken out and 1½ pints of engine oil poured into the housing before the engine is started.

STARTER:—Model MZ-4014. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 2½ pounds. Starter switch is Model 2208-S. Switch is mounted on the starter field frame and is controlled by a button on the dash.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
1.5 "	1800	5.2	150
2.5 "	1325	5.0	200
5.0 "	740	4.5	300
7.6 "	220	4.0	400
12.2 "	Lock	4.0	550

Mounting:—Starter is mounted by special flange at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and lead to junction block. Then remove three flange mounting cap screws, pull starter forward to clear Bendix and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAM-4101. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 15 amperes at 8 volts reached at 1350 R.P.M. or 25 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	620
2	6.9	710
5	7.1	830
10	7.8	1090
14	7.9	1490
15	8.0	1900

Motoring, generator draws 4.46-4.94 amperes at 6 volts. Shunt field current is 4.08-4.52 amperes at 6 volts. Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush).

Mounting:—Generator is cradle mounted at right of engine. To remove generator, disconnect generator lead and drive coupling and loosen mounting clamp band. Lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles of operation.

RELAY:—Model CB-4016. Relay is mounted on the generator end plate. Relay closes at 550 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Switch, Model 8830. Lighting switch is mounted at base of steering column. Double filament headlights using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Soreng-Manegold switch Model 2560-A also used.

FUSES:—Lighting fuse on junction block on dash is 20 ampere capacity.

ESSEX

SUPER SIX (1930) SERIAL NUMBERS 1,165,674 UP
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Exide, Type 3-XI-13-1G, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on the left frame member under the driver's seat.

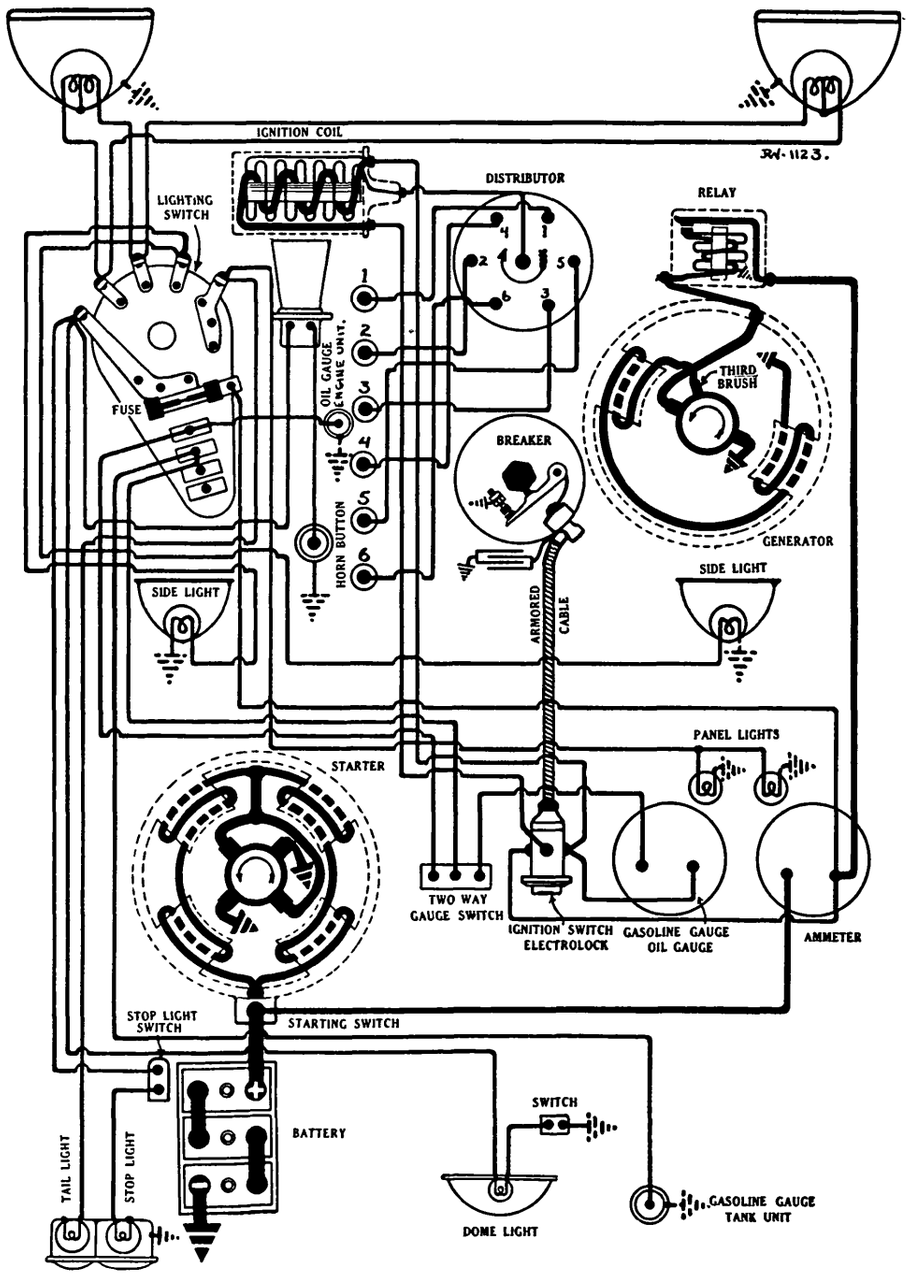
IGNITION:—Coil Model IG-4081. Coil is mounted on the front of the engine block. Igntion current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is a Type 9-B Electrolock. The Electrolock must be removed with the distributor as a unit.

Distributor Model IGB-4030, IGB-4033. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with the breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees (engine) reached at 4000 R.P.M. of engine.

Mounting:—Distributor is mounted on accessory drive bracket at right of engine. To remove distributor, disconnect Electrolock at dash and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place. The Electrolock can be removed from the distributor by following complete directions given under 'Electrolock' in Equipment Section.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every 2000 miles. At the same time remove the distributor head and rotor and put a few drops of oil on the breaker arm pivot pin and coat the face of the breaker cam with a light film of vaseline or grease.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Loosen clamp screw in advance arm slot and rotate distributor clockwise as far as possible. Continue to crank engine over until the flywheel mark 'UDC 1&6' is directly opposite the pointer in the inspection hole in the flywheel case at the right of the engine. Then loosen advance arm clamp bolt and rotate distributor counter-clockwise until the contacts begin to open. Check to see that the segment directly opposite the rotor is connected to the spark plug in cylinder No. 1 and connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.



Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .020-.022 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅜ inches. Stem diameter, .3085 inch. Stem length, 5 1/32 inches. Valve lift, 5/16 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .003-.005 inch (hot).

EXHAUST VALVES:—Head diameter, 1⅜ inches. Stem diameter, .3085 inch. Stem length, 5 1/32 inches. Valve lift, 21/64 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .005-.007 inch (hot). Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40' before top dead center with piston .0494" from top of stroke. No flywheel mark is provided but timing

ESSEX

SUPER SIX (1930) SERIAL NUMBERS 1,165,674 UP
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

can be checked with a timing gauge. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Two pins on the timing chain exactly 20 links apart are marked. Two adjacent teeth on both camshaft and crankshaft sprocket are also marked. Mesh chain so that marked pins on chain are meshed between the marked teeth on each sprocket with arrow on chain pointing in direction of rotation. In this position piston No. 1 will be on top dead center with flywheel mark 'D.C.1&6' at indicator and No. 1 exhaust valve just closing and No. 1 intake valve opening. Chain adjustment must be in position of minimum adjustment.

Timing Chain Adjustment. Timing chain is adjusted by shifting the eccentric accessory drive shaft sprocket. To take up timing chain, loosen the upper outside mounting bolt in the accessory bracket and remove the upper inside bolt and the bottom bolt. Then use a special wrench to rotate the flange in front of the accessory bracket in a clockwise direction (facing forward) until there is approximately ⅛ inch play on the circumference of the generator drive coupling. Then tighten the mounting bolts. If it is necessary to line up the bolt holes in the flange to permit the mounting bolts to be inserted, the adjustment should be backed off slightly.

NOTE:—If the accessory bracket has been taken off the engine the pipe plug at the lower end of the distributor shaft should be taken out and ½ pint of engine oil should be poured into the housing before the engine is started.

STARTER:—Model MZ-4017. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 125 R.P.M. drawing 125 amperes at 5.5 volts. Brush spring tension is 44-56 ounces. Starting switch is mounted on the starter field frame and is operated through a flexible control from the dash. Starter switch is Model MU-2208-S.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4902	5.5	47
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
12.25 "	Lock	4.0	545

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and lead to ammeter. Remove starting switch control wire. Then take out three flange mounting cap screws. Pull starter forward to clear drive and lift from place.

GENERATOR:—Model GAM-4102. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush by tapping on the brush mounting plate with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate are held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 14-16 amperes (cold) at 8 volts reached at 1900 R.P.M. or 23 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	620
2	6.9	710
5	7.1	830
10	7.8	1090
14	7.9	1490
15	8.0	1900

Shunt field current is 4.08-4.52 amperes at 6 volts. Generator motoring draws 4.46-4.94 amperes at 6 volts. Brush spring tension is 22-25 ounces (main brush), 31-34 ounces (third brush).

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from the accessory drive shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every 1000 miles.

RELAY:—Model CB-4016. Relay is mounted on the generator end plate. Relay closes at 900 R.P.M. or 11 M.P.H. when the generator voltage reaches 7 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 8000-A. Switch is mounted at lower end of steering column. The junction block is combined with the lighting switch. Headlights are fitted with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights or side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Lighting fuse mounted on junction block is 20 ampere capacity.

ESSEX

NEW SUPER SIX (1931)

AUTO-LITE GENERATING, STARTING SYSTEM

AUTO-LITE IGNITION

BATTERY:—Exide, Type 3-XI-13-1G. 6 volt, 105 ampere hour. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on the left frame member under the driver's seat.

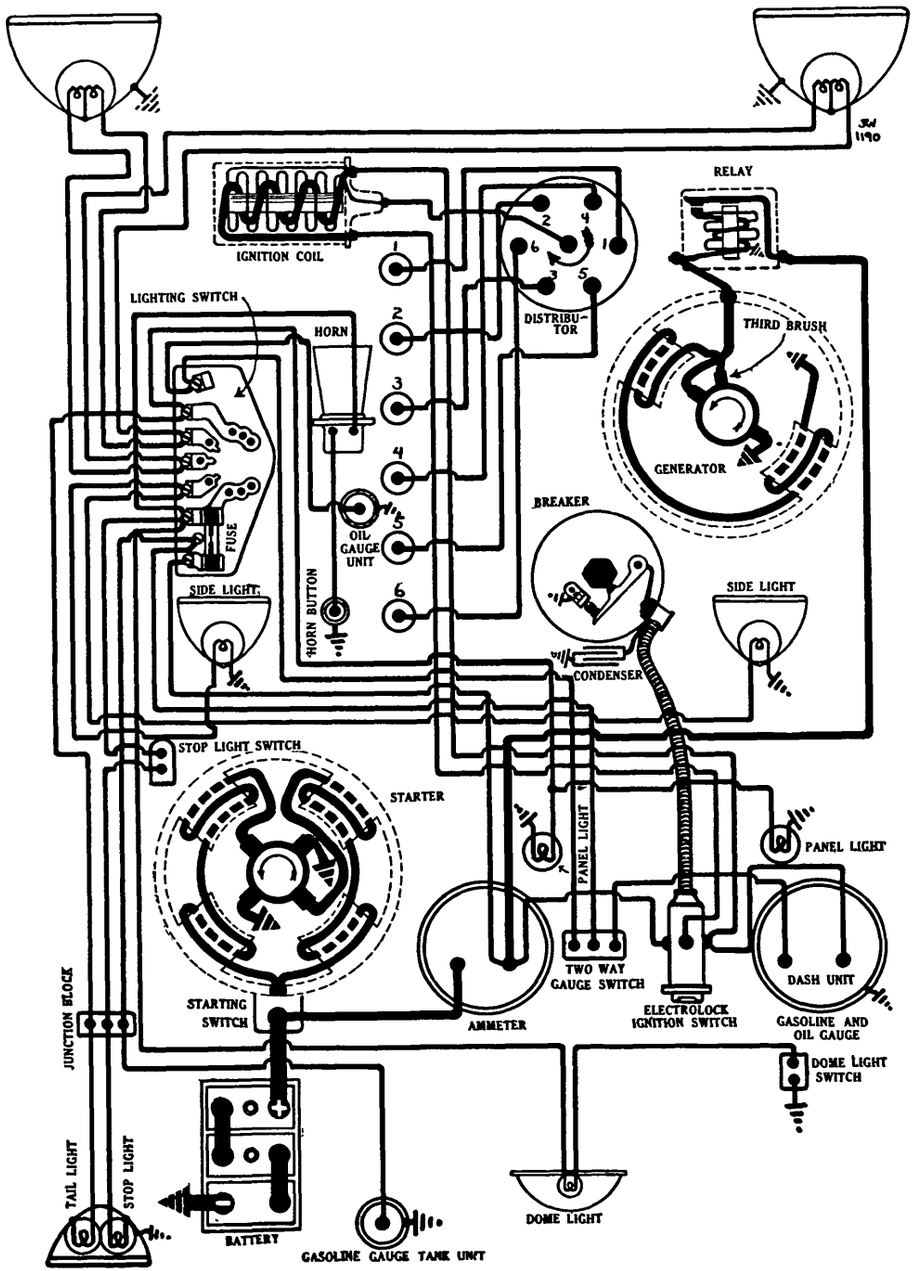
IGNITION:—Coil Model IG-4087, 4088. Coil is mounted on cylinder head. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is a Type 9-B Electrolock. The Electrolock must be removed with the distributor as a unit.

Distributor Model IGB-4033, 4052. Contact gap .018-.020 inch. Set contact gap by losening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with the breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees (engine) reached at 4000 R.P.M.

Mounting:—Distributor is mounted on accessory drive bracket at right of engine. To remove distributor, disconnect Electrolock at dash and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place. The Electrolock can be removed from the distributor by following complete directions given under 'Electrolock' in Equipment Section.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every 2000 miles. At the same time remove the distributor head and rotor and put a few drops of oil on the breaker arm pivot pin and coat the face of the breaker cam with a light film of vaseline or grease.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assmbly in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Loosen clamp screw in advance arm slot and rotate distributor clockwise as far as possible. Continue to crank engine over until the flywheel mark 'DC 1&6' is directly opposite the pointer in the inspection hole in the flywheel case at the right of the engine. Then loosen advance arm clamp bolt and rotate distributor counter-clockwise until the contacts begin to open. Check to see that the segment directly opposite the rotor is connected to the spark plug in cylinder No. 1 and connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.



Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .022 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1½ inches. Stem diameter, .3085 inch. Stem length, 5 1/32 inches. Valve lift, 5/16 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .003-.005 inch (hot).

EXHAUST VALVES. Head diameter, 1⅜ inches. Stem diameter, .3085 inch. Stem length, 5 1/32 inches. Valve lift, 21/64 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .005-.007 inch (hot). Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40' before top dead center with piston .0494" from top of stroke. No flywheel mark is provided but timing

ESSEX

NEW SUPER SIX (1931)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

can be checked with a timing gauge. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Two pins on the timing chain exactly 20 links apart are marked. Two adjacent teeth on both camshaft and crankshaft sprocket are also marked. Mesh chain so that marked pins on chain are meshed between the marked teeth on each sprocket with arrow on chain pointing in direction of rotation. In this position piston No. 1 will be on top dead center with flywheel mark 'D.C.1&6' at indicator and No. 1 exhaust valve just closing and No. 1 intake valve opening. Chain adjustment must be in position of minimum adjustment.

Timing Chain Adjustment. Timing chain is adjusted by shifting the eccentric accessory drive shaft sprocket. To take up timing chain, loosen the upper outside mounting bolt in the accessory bracket and remove the upper inside bolt and the bottom bolt. Then use a special wrench to rotate the flange in front of the accessory bracket in a clockwise direction (facing forward) until there is approximately ⅛ inch play on the circumference of the generator drive coupling. Then tighten the mounting bolts. If it is necessary to line up the bolt holes in the flange to permit the mounting bolts to be inserted, the adjustment should be backed off slightly.

NOTE:—If the accessory bracket has been taken off the engine the pipe plug at the lower end of the distributor shaft should be taken out and ½ pint of engine oil should be poured into the housing before the engine is started.

STARTER:—Model MAJ-4009. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 125 R.P.M. drawing 125 amperes at 5.5 volts. **Brush spring tension is 44-56 ounces.** The starter switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash.

Starter Data

Torque		R.P.M.	Volts	Amperes
.3	"	2500	5.5	100
2.25	"	1450	5.0	200
4.6	"	960	4.5	300
7.3	"	575	4.0	400
10.3	"	225	3.5	500
19.0	"	Lock	4.0	805

Mounting:—Starter is flange mounted at left of engine on forward face of flywheel housing. To remove starter, disconnect cable and lead to ammeter. Remove starter switch control wire. Then take out three flange mounting cap screws. Pull starter forward to clear drive and lift from place.

Oiling:—Put 3 or 4 drops of light engine oil in the oiler at each end of the starter armature shaft every 1000 miles of operation.

GENERATOR:—Model GAM-4302 (4303 after #1279722). Rotation is counter-clockwise viewed from commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush by tapping on the brush mounting plate with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate are held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 14-16 amperes (cold) at 8 volts reached at 1900 R.P.M. or 23 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	620
2	6.9	710
5	7.1	830
10	7.8	1090
14	7.9	1490
15	8.0	1900

Shunt field current is 4.08-4.52 amperes at 6 volts. **Generator motoring draws 4.46-4.94 amperes at 6 volts. Brush spring tension is 8-13 ounces.**

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from the accessory drive shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

Oiling:—Put 3 or 4 drops of light engine oil in the oiler at each end of the generator every 1000 miles.

RELAY:—Model CB-4016 (GAM-4302), CB-4008 (GAM-4303). On generator end plate. Relay closes at 900 R.P.M. or 11 M.P.H. with generator voltage of 7 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contact closed.

LIGHTING:—Soreng-Manegold Model 8050-A. Lighting switch is mounted at lower end of steering column. The lighting fuse is mounted on the switch and two extra terminals are provided which serve as junctions for the oil and gasoline gauge lines. Headlights are fitted with double filament bulbs using a second 21 cp. filament instead of dimmer. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights or side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Lighting fuse mounted on lighting switch is 20 ampere capacity.

ESSEX

PACEMAKER MODEL SUPER SIX (1932), SERIAL NUMBERS 1,281,685 UP
STANDARD MODEL SUPER SIX (1932)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on dash under hood. This series 1,281,685 up.

ENGINE NUMBER:—Stamped on left side cylinder block opposite No. 3 cylinder.

BATTERY:—**Exide, Type 3-VXA-15-1,** 6 volt, 15 plate, 100 ampere hour (20 hour rate). Negative (—) terminal grounded. Battery mounted on left frame member under driver's seat. Battery size, 7¼ inches wide, 10¼ inches long, 9¼ inches high.

IGNITION:—**Coil Model IG-4088.** Coil mounted on left side cylinder head. Ignition current 1-3 amperes at 6 volts (engine running) 3-4.5 amperes at 6 volts (engine stopped). Ignition switch Type 15-S Electrolock. See Equipment Section for complete description of Electrolock ignition switch. Switch positions left—ignition on—timing position, right—ignition on—Startix operative—running position.

Dstributor Model IGB-4052-A. Single breaker arm, 6 lobe cam type with full automatic advance. Breaker contact .020 inch. Hold within limits of .018-.020 inch. To set gap, loosen locknut on stationary contact mounting stud, turn up stud, tighten locknut. Resurface contacts when necessary wth fine flat contact file. Breaker arm spring tension 16-22 ounces measured at tip of breaker arm with spring scale in line with center of contacts and at right angles to arm).

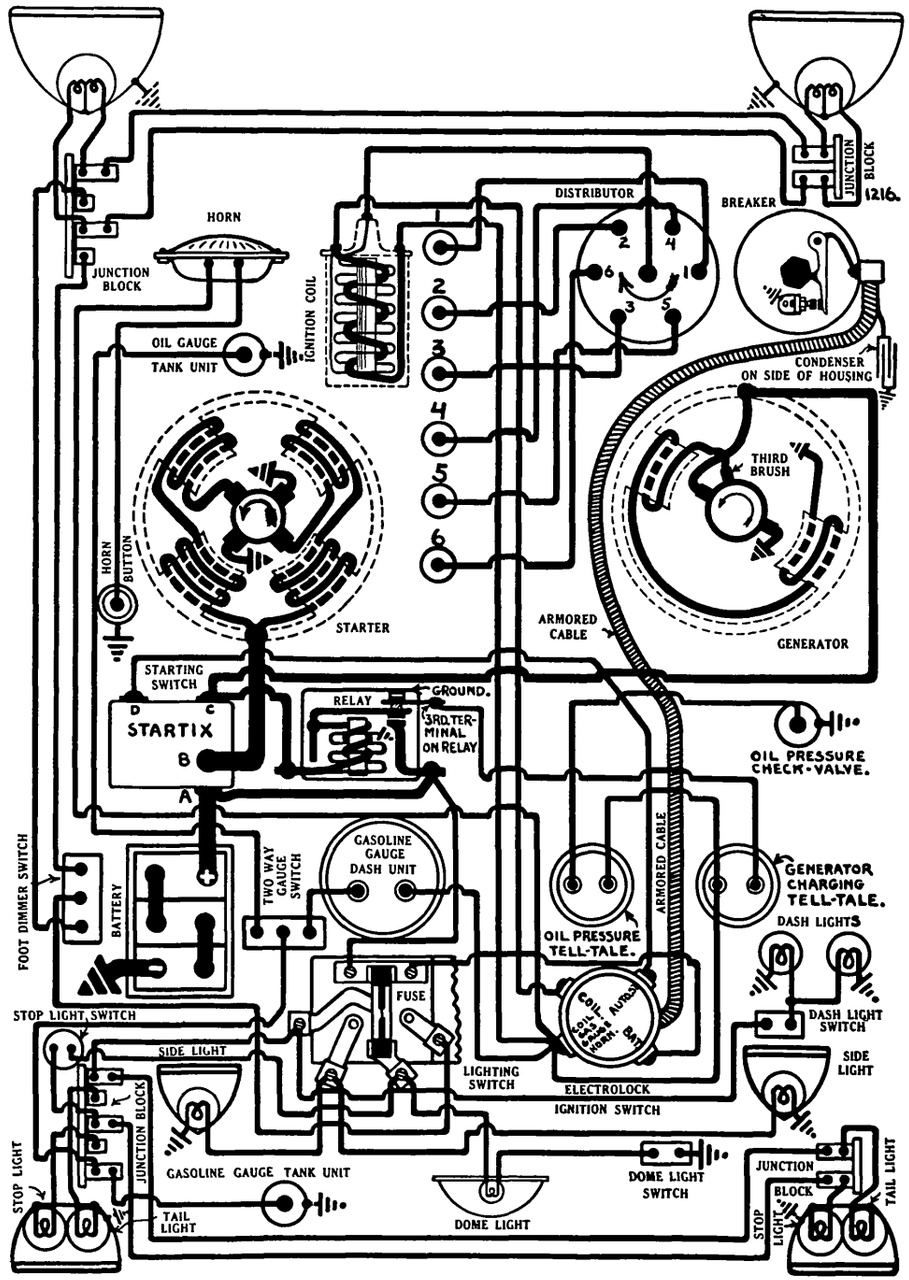
Cam Angles—Closed 40°. Open 20° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		400	0		800
4		820	8		1640
8		1240	16		2480
12		1675	24		3350
15		2000	30		4000

Mounting:—Distributor mounted on accessory bracket right front of engine. Electrolock must be removed as a unit with distributor when distributor is taken off car. See Equipment Section for details of Electrolock. To remove, disconnect ignition wires and free Electrolock at dash, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**2000 Miles.** Fill distributor base to level of oiler under distributor head with line engine oil. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.

Timing:—Engines regularly supplied with two types of cylinder heads 'Power Dome Head' and 'Super Power Dome Head'. Standard ignition settings as follows:



Power Dome Head—using standard gasoline, Set at top dead center.
Power Dome Head—using Ethyl fuel, Set ¾ inch before top dead center.
Super Power Dome Head—use Ethyl fuel, Set at top dead center.

To set timing, first loosen hold-down screw in advance arm, rotate distributor until hold-down screw is in center of scale on advance arm, tighten screw. With No. 1 piston on compression stroke, turn engine over until flywheel mark 'DC.1-6' (top dead center mark for cylinder No. 1 and 6) is directly opposite pointer on edge of inspection hole in right front face of flywheel housing (engines with Power Dome Head using standard gasoline and Super Power Dome Head using Ethyl fuel) or stop with the mark ¾ inch ahead of indicator (engines with Power Dome Head using Ethyl fuel). Loosen advance arm clamp screw, rotate distributor until contacts begin to open (use test lamp), tighten clamp screw, connect spark plugs as indicated in diagram.

Firing Order:—**1-5-3-6-2-4.** No. 1 cylinder nearest radiator.

Spark Plugs:—**Power Dome Head.** 18 MM. AC. Type G-8. Set gap at .022 inch.
Super Power Dome Head. 14MM. AC. Type K-12. Set gap at .022 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by chain in tandem with accessory shaft sprocket. Chain adjusted manually—see below.

ESSEX

PACEMAKER MODEL SUPER SIX (1932), SERIAL NUMBERS 1,281,685 UP
STANDARD MODEL SUPER SIX (1932)
AUTO-LITE SYSTEM

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅜"	5/16"	5 3/32"	45°	11/32"
Exhaust	1⅜"	5/16"	5 3/32"	45°	11/32"

	Tappet Clearance		Spring Pressure
Intake	.003-.005" (hot).		
Exhaust	.005-.007" (hot).	Closed	53 pounds (length—2").

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40' before top dead center with piston .0525" from top of stroke. No flywheel mark is provided but timing can be checked with a timing gauge. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Two pins on the chain exactly 20 links apart are marked. Two adjacent teeth on both camshaft and crankshaft sprocket are also marked. Mesh chain so that marked pins on chain are meshed between the marked teeth on the sprockets with arrow on chain pointing in direction of rotation. In this position piston No. 1 will be on top dead center with flywheel mark 'D.C.1&6' at indicator and No. 1 exhaust valve just closing and No. 1 intake valve just opening. Chain adjustment must be in position of minimum adjustment.

To Adjust Timing Chain. Adjust chain at end of first 1500 miles and every 5000 miles throughout life of car or whenever play on circumference of generator drive coupling exceeds ⅛" (excluding slack of coupling bolts). To adjust chain, loosen three bolts in accessory bracket (the inside top bolt and bottom bolt pass through notches in eccentric and must be removed), insert special wrench on notched nut in front of bracket (between bracket and chain case), turn wrench clockwise until play on coupling is ⅛", tighten mounting bolts (slack off adjustment slightly if neecssary to insert mounting bolts). If bracket has been taken off engine, take out plug directly above shaft, fill with ½ pint engine oil before engine is run.

STARTER:—Model MAJ-4025. Starter drives engine through inboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M	Volts	Amperes
.3 lb. ft	2500	5.5	100
2.25 " "	1450	5.0	200
4.6 " "	960	4.5	300
7.3 " "	575	4.0	400
10.3 " "	225	3.5	500
12.6 " "	Lock	3.0	575
19.0 " "	Lock	4.0	805

Startix:—Pacemaker Model equipped with Startix automatic starting switch mounted on left side engine block directly above starter. See Equipment Section for complete article on Startix. Not necessary to disconnect Startix to time engine. Startix not used on Standard Model.

Mounting:—Starter flange mounted left side of engine on front face flywheel housing. To remove, disconnect cable, take out 3 flange mounting capscrews, pull starter straight forward to clear Bendix, lift out.

GENERATOR:—Model GAL-4344. Third brush regulation. To adjust charging rate, take off commutator cover band, shift third brush (by prying on brush mounting stud) counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction. Rotation counter-clockwise at commutator end. Maximum charging rate 14-16 amperes (cold) at 8.0 volts reached at 1900 R.P.M. or 23 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700
4	6.7	740	4	6.9	900
8	7.1	900	8	7.4	1150
12	7.4	1120	10	7.7	1340
17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush spring tension 17-22 ounces. Shunt field current 4.08-4.52 amperes at 6.0 volts, Generator motoring draws 4.27-4.73 amperes at 6.0 volts.

Note:—Special charging tell-tale used instead of ammeter in charging circuit. Tell-tale light goes out when generator begins to charge battery. See paragraph on 'Signal Lights'. An ammeter must be connected in generator line at relay whenever charging rate is checked or adjusted.

Mounting:—Generator cradle mounted at right of engine and driven by shaft from accessory bracket. To remove, disconnect lead, disconnect generator drive coupling, loosen mounting clamp band, lift generator out.

Oiling:—1000 Miles. Put 3-4 drops light engine oil (fill cups once) in oiler at each end of generator.

RELAY:—Model CBA-4001. Relay mounted on left side engine block (beside Startix). Relay equipped with extra terminal and contact for Charge Tell-tale (see diagram). Contacts close at 675 R.P.M. or 10 M.P.H. when generator voltage reaches 7.0-8.0 volts with charging current of not more than 5 amperes and open with discharge current of 0-2.5 amperes. Relay contact gap limits .025-.035 inch (with upper contacts closed). Air gap limits .010-.030 inch (contacts closed).

LIGHTING:—Soreng Manegold Switch, Model B-5670-A. Dimmer Switch Soreng Manegold, Model A-2100-A. Lighting switch mounted on back of instrument board controlled by push-pull button on lower left center instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toeboard. Cowl lights used only on Pacemaker Model. Lighting switch positions:

1. Button pushed in—All lights off.
2. Button one half out—Side lights on, tail light on.
3. Button pulled out—Headlights on, tail light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	32-32	DC	1000
Side lights	6-8	3	SC	63
Dash & tail lights	6-8	3	SC	63
Stop light	6-8	15	SC	87
Dome light	6-8	15	SC	87
Signal lights	6-8	3	DC	64

FUSES:—30 ampere capacity mounted on back of lighting switch.

SIGNAL LIGHTS:—Consist of battery charge tell-tale and oil pressure tell-tale lights mounted on instrument panel instead of ammeter and oil pressure gauge. Light bulbs used are standard 6-8 volt, 3 cp.DC. Mazda 64 and can be removed by turning light counter-clockwise slightly to release bayonet socket pin.

Charging Tell-tale.—Under ruby reflector on right center of instrument panel. Tell-tale should light with ignition turned 'on' with car stopped and continue to burn until generator begins to charge (relay contacts close). Closing of main relay contacts opens auxiliary contacts in tell-tale circuit causing tell-tale light to go out. If tell-tale light does not burn when ignition is turned on and at idling speeds below 10 M.P.H. check bulb by grounding left hand relay terminal to generator field frame (never short the two terminals). If tell-tale does not light replace bulb. If lamp lights when terminal is grounded, check auxiliary contact spring and contacts and ground strap, see that contacts are closed when main contacts are open.

Oil Pressure Tell-tale. Under ruby reflector on left center of instrument panel. Tell-tale should light with ignition turned on and engine stopped and should flash at idling speeds of engine. Tell-tale should not light at engine speeds above idling. If tell-tale does not light when ignition is turned on, short terminal on check valve (right side of crankcase) to engine. If tell-tale does not light replace bulb. If tell-tale does not flash at idling speeds, dissassemble check value and clean out by-pass hole behind plunger. See that terminal pin is straight and clean and that plunger is free to move in housing.

GASOLINE GAUGE:—Combination gasoline and oil gauge electrical type with selector switch under instrument board. Gasoline gauge in circuit and registers whenever ignition switch on. Oil reading obtained by pressing selector switch button. Motometer design (see Carburetion Section).

HORNS:—EA disc type vibrator horn mounted under engine hood.

ESSEX TERRAPLANE

SIX CYLINDER MODEL K (1932-33), SERIAL NUMBERS 350,000 UP
SPECIAL SIX MODEL KU (1933), SERIAL NUMBERS 5001 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on dash under engine hood. First serial number 350,000 (1932), 364,125 (1933).

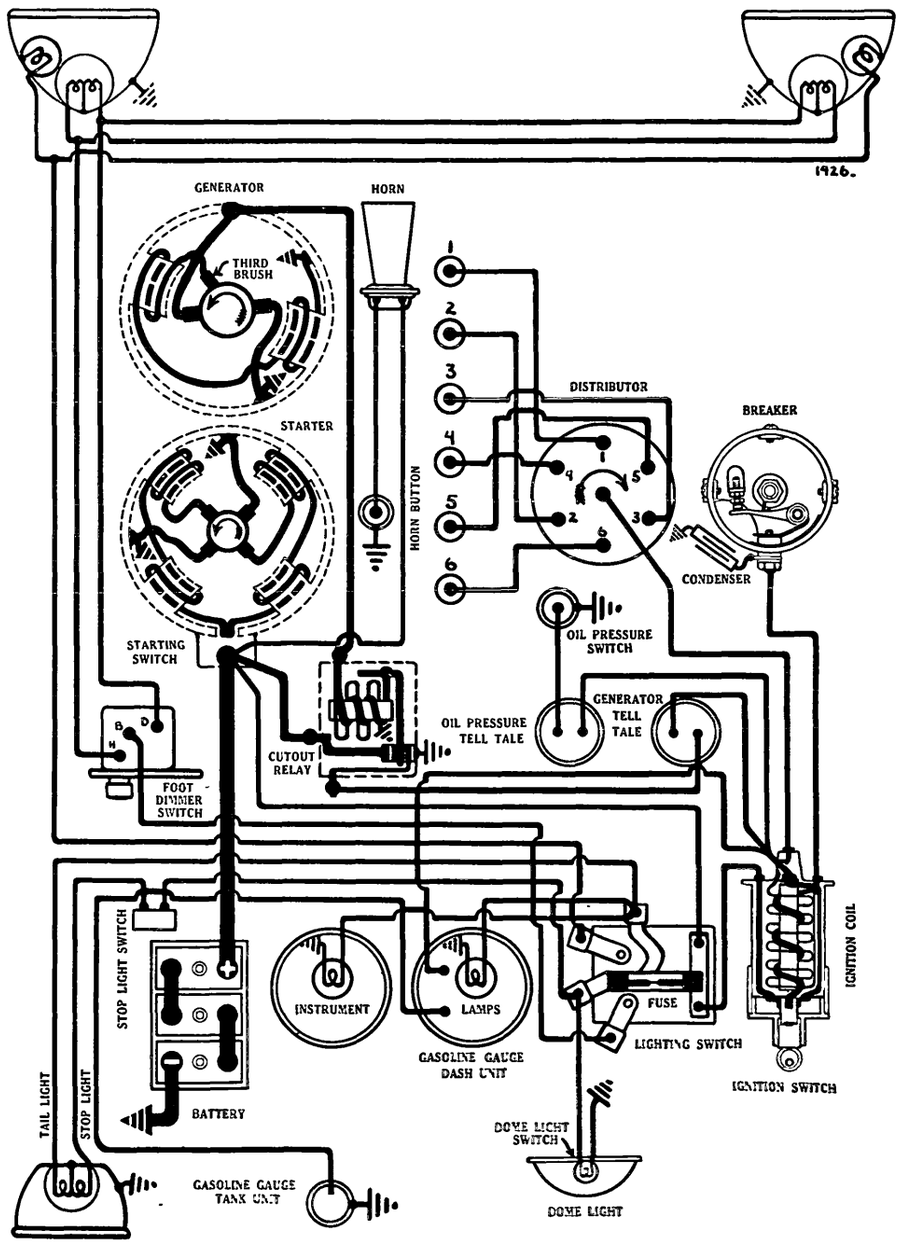
ENGINE NUMBER:—Stamped on left hand side center of engine block. First serial number 5000 (1932), 20,501 (1933).

ENGINE:—Six cylinder, 'L' head type, 2 15/16x4¾" bore and stroke, 193 cubic inch displacement, rated at 20.7 H.P., develops 70 H.P. at 3200 R.P.M. (standard compression head engine) or 80 H.P. at 3200 R.P.M. (optional high compression head engine). Standard compression ratio 5.8-1. Optional high compression ratio 7.1-1. Compression ratio of each engine is cast in upper surface of cylinder head casting.

BATTERY:—National, Type H3-13X, 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate). Starting capacity 102 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—Battery is mounted under left rear seat.
Dimensions:—Width, 7⅛". Length, 9⅛". Height, 8 13/16".

IGNITION:—Coil Model IG-4308. Lock coil type with ignition switch in base.
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped).
Ignition Switch:—Switch in base of coil extends through instrument board at lower center of instrument panel. Gasoline gauge and tell-tale signal lights connected to terminal on coil are controlled by ignition switch.
Distributor Model IGB-4074A. Single breaker arm, 6-lobe cam, full automatic advance type. To adjust contact gap, loosen lock nut on stationary contact stud, turn up stud, tighten lock nut.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.020".
Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm with spring scale centered on arm and at right angles to back of arm.
Cam Angles—Closed 40°. Open 20° (distributor degrees).

Automatic Advance



Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	400	0	800
4	820	8	1640
8	1240	16	2480
12	1675	24	3350
15	2000	30	4000

Mounting:—Distributor mounted at right center of the crankcase and is driven from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift out.
Oiling:—2000 Miles. Fill distributor base with light engine oil to level of oiler under distributor cup. Take off distributor cap and rotor, put one drop of oil on breaker arm pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Three distinct ignition settings are used, depending upon type of engine (compression ratio) and fuel characteristics:
1. Standard head—standard fuel:—Top dead center.
2. Standard head—Ethyl fuel:—¾" (flywheel) or .0262" (piston travel) before top dead center.
3. High compression head—Ethyl fuel:—Top dead center.

To Set Ignition Timing. Loosen hold-down screw in advance plate, rotate distributor clockwise to limit of advance plate slot, tighten hold-down screw. Turn engine over by means of a wrench on the hexagonal end of the starting motor shaft until piston No. 1 reaches top dead center on compression stroke with flywheel mark 'U.D.C.1-6/' at indicator in inspection hole in left hand front face of flywheel housing (mark should be ¾ inch before pointer on standard compression engines using Ethyl fuel exclusively). Then loosen hold-down screw, rotate distributor cup until contacts begin to open, tighten hold-down screw, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

ESSEX TERRAPLANE

SIX CYLINDER MODEL K (1932-33), SERIAL NUMBERS 350,000 UP
SPECIAL SIX MODEL KU (1933), SERIAL NUMBERS 5001 UP
AUTO-LITE SYSTEM

Spark Plugs:—14 MM. Metric. Champion Type J-7. Set gaps at .020-.025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is gear driven from the crankshaft. Gears are marked. Mesh gears so that marks are adjacent and in line with straightedge laid across shaft centers.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40' before top dead center with piston .0528" from top of stroke. No flywheel mark is provided at this point. Reset tappet clearance at .006" (hot).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅜"	5/16"	5 3/32"	45°	11/32"
Exhaust	1⅜"	5/16"	5 3/32"	45°	11/32"

Tappet Clearance

Intake .....006" (hot).
Exhaust .....008" (hot).

Valve Springs

Closed .....53 pounds.

CARBURETION:—Carter Downdraft Carburetor, Model 243-S (first cars), 267-S (later cars). See Carburetor Section for complete data. Manifold heat control is adjusted manually.

Fuel Pump:—A.C. Mechanical fuel pump mounted on right side of crankcase and driven by eccentric on camshaft (see Carburetion Section for com-complete data).

Gasoline Gauge:—Motometer electric type (see Carburetion Section for complete data).

STARTER:—Model MAJ-4028, 4031. Drive—Inboard Bendix. Starter switch is mounted on starter field frame and is operated through flexible cable control by button at the left of the instrument panel. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
.3 lb. ft.	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.0 "	Lock	3.0	550
17.0 "	Lock	4.0	750

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect starter switch control, disconnect cable, take out flange mounting bolts, pull straight forward to clear Bendix, lift out.

GENERATOR:—Model GAM-4402, 4403, 4503. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amperes (cold) at 8 volts reached at 2400 R.P.M. Signal light (generator tell-tale) used instead of dash ammeter.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction. For all charging rate adjustments an ammeter must be connected in the generator line at the relay.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	700	0	6.4	760
4	6.9	880	4	6.9	1040
7	7.0	1000	8	7.3	1400
10	7.2	1180	10	7.5	1600
14	7.8	1520	12.8	7.9	2550
17	8.0	2400	12.2	7.8	3200
15.2	7.9	3200			

Brush Spring Tension:—18-22 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.

Motoring:—4.94-5.46 amperes at 6.0 volts.

GENERATOR:—Model GBK-4602 (Model KU deluxe). Third brush regulation in conjunction with Auto-Lite Type XA-414-S Owen-Dyneto Battery Charge Regulator (first cars), or Auto-Lite Model TC-4102-A Current Regulator (after #11685). See Equipment Section for complete data on these regulators.

Charging Rate Adjustment—Same as for Model GAM-4503. Maximum charging rate 22 amperes (cold), 8.0 volts, 2200 R.P.M.

Generator Data

Cold Regulator Contacts Closed			Hot	
Amperes	Volts	R.P.M.	Volts	R.P.M.
0	6.4	800	6.4	840
4	6.7	980	6.8	1025
8	7.0	1085	7.15	1200
12	7.3	1300	7.5	1450
16	7.55	1500	7.85	1760
22	8.0	2200	8.0	2400
		Amperes		
		0	6.4	840
		4	6.8	1025
		8	7.15	1200
		12	7.5	1450
		16	7.85	1760
		18	8.0	2400

Brush Spring Tension—18-22 ounces (new brushes).
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Current—3.75-4.15 amperes at 6.0 volts.
Field Fuse—7½ ampere capacity in knurled cup under regulator case.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts under generator forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, swing generator out or away from engine, tighten adjustment bolt before slacking off on generator, tighten mounting bolts. Belt tension should be just enough to drive fan and generator without slipping.

RELAY:—Model CBA-4002. Special type with auxiliary contacts and terminal for operation of generator charge tell-tale. Tell-tale contacts are closed with main contacts open, and open when main contacts close (as generator begins to charge battery). Relay contacts close when generator voltage reaches 7.0-8.0 volts with charging current of not more than 5 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". **Air Gap:**—.010-.030" (contacts closed).

SIGNAL LIGHTS:—These consist of battery charge tell-tale and oil pressure tell-tale lights mounted on instrument panel instead of conventional ammeter and oil pressure gauge. Light bulbs are standard 6-8 volt, 3 cp. D.C. Mazda Number 64 and can be removed by turning light counter-clockwise slightly to release bayonet socket pin. See Equipment Section for complete data.

LIGHTING:—Soreng-Manegold Switch, Model B-5670-A. Dimmer Switch Model C-2100-A. Lighting switch mounted on back of instrument board and controlled by push-pull button at lower left center of instrument panel. Headlights equipped with double filament bulbs for 'depressed beam' dimming controlled by foot-operated switch on toeboard. Parking bulbs (in headlights) or fender lights are standard equipment. Stop and tail light fitted with double filament bulb.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking or Fender Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Tell-tale Lights	6-8	3	D.C.	64
Stop and Tail Lights	6-8	21-2	D.C.	1158
Dome Lights	6-8	15	S.C.	87

FUSES:—20 ampere capacity fuse mounted on back of lighting switch.

ESSEX TERRAPLANE

EIGHT CYLINDER MODEL K-T (1933), SERIAL NUMBERS 65,001 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on dash under engine hood. First serial number 65,001.

ENGINE NUMBER:—Stamped on left hand side at center of engine block. First serial number 15,001.

ENGINE:—Eight cylinder, 'L' head type, 2 15/16x4½" bore and stroke, 244 cubic inch displacement, rated at 27.6 H.P., develops 94 H.P. at 3600 R.P.M. Standard compression ratio 5.8-1. No optional high compression ratio is offered. Special ignition setting is used for standard engine when operated with Ethyl fuel exclusively (see Ignition Timing).

BATTERY:—Exide, Type 3-VXA-15, 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate). Starting capacity 114 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—Battery mounted under left rear seat.
Dimensions:—Width, 7". Length, 10 9/32". Height, 9 7/32".

IGNITION:—Coil Model CE-4303. Lock coil type with ignition switch in base. Mounted on back of instrument board.
Ignition Current:—2 amperes at 6 volts (engine running), 5 amperes at 6 volts (engine stopped).
Ignition Switch:—Switch in base of coil extends through instrument board to lower center of instrument panel. Gasoline gauge and tell-tale signal lights connected to accessory terminal of coil are controlled by switch.

Distributor Model IGH-4024A. Two-breaker arm, 4-lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing). To adjust contact gap, loosen two lock screws and turn eccentric adjusting screw on stationary contact mounting plate (first or 'fixed' set of contacts), loosen lock nut on stationary contact mounting stud and turn up stud (second or 'movable' set of contacts).
Breaker Gap:—Set contact gap at .020". Hold within limits of .020-.022".
Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm
Cam Angles—Closed 34.5°, open 10.5° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		400	0		800
5		850	10		1700
10		1310	20		2620
15		1760	30		3520
17.5		2000	35		4000

Mounting:—Distributor mounted at right center of engine crankcase and is driven from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift out.

Oiling:—2000 Miles. Fill distributor base to level of oiler under distributor cup with light engine oil. Take off distributor cap and rotor, put one drop of oil on breaker arm pivot pins, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Two distinct ignition settings are used, depending upon type of fuel used in engine:
1. Standard fuel—Top dead center.
2. Ethyl fuel—1¼" (flywheel), or .0625" (piston travel) before top dead center.

To Set Ignition Timing:—Loosen hold-down screw in advance plate, rotate distributor clockwise to full extent of advance plate slot, tighten hold-down screw. With No. 1 piston on compression, turn engine over by means of a wrench on the hexagonal end of the starting motor shaft until piston reaches top dead center (or 1¼ inch before for Ethyl fuel) with the flywheel mark 'U.D.C.1-8/' opposite the pointer (or 1¼" ahead) in the inspection hole in the left hand front face of the flywheel housing. Then loosen hold-down screw in advance plate, rotate distributor counter-clockwise until first set (fixed contacts) begin to open, tighten hold-down screw, see that

ESSEX TERRAPLANE

EIGHT CYLINDER MODEL K-T (1933), SERIAL NUMBERS 65,001 UP
AUTO-LITE SYSTEM

rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated. Contacts must then be synchronized to time second (movable) set of contacts.

Synchronization of Contacts—first method. After first or fixed contacts have been timed to engine (above), turn engine over 90° or ¼ revolution to firing position of piston No. 6 with flywheel mark 'U.D.C.3-6/' at indicator in inspection hole in flywheel housing (or 1¼ inch before indicator for Ethyl fuel). Then loosen lock screws on breaker sub-plate carrying second set of contacts, shift plate until contacts begin to open, tighten lock screws.

Synchronization of Contacts—second method. Use special Auto-Lite tool and follow complete directions in Equipment Section.

Final Performance Test. After setting ignition, car should be road tested for performance. With correct setting, a slight spark knock should be heard when car is accelerated in high gear from 10 to 25 M.P.H. on a level road with wide open throttle. If knock is too pronounced, loosen hold-down screw in advance plate and retard setting one-half division at a time on the scale (rotate distributor clockwise). If knock is not heard, advance setting by rotating distributor counter-clockwise one scale division. Repeat test and change setting until correct performance is secured.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. Champion Type J-7. Set gaps at .020-.025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is gear driven from the crankshaft. Gears are marked. Mesh gears so that marks are adjacent and in line with straightedge across shaft centers.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40' before top dead center with piston .0494" from top of stroke. No flywheel mark is provided at this point. Reset tappet clearance at .006" (hot).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1½"	5/16"	5 3/32"	45°	11/32"
Exhaust	1⅜"	5/16"	5 3/32"	45°	11/32"

Tappet Clearance		Valve Springs	
Intake	.006" (hot).	Closed	53 pounds
Exhaust	.008" (hot).		

CARBURETION:—Carter Downdraft Carburetor, Model 261-S (see Carburetor Section for complete data). Manifold heat control is adjustable manually.

Fuel Pump:—A.C. Mechanical fuel pump mounted on left side of crankcase

Gasoline Gauge:—Motometer electric type (see Carburetion Section).

STARTER:—Model MAB-4051, 4052. Drive—Inboard Bendix. Starter switch is mounted on starter field frame and operated through flexible cable control by a button at extreme left of instrument panel. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect starter switch control, disconnect cable, take out flange mounting bolts, pull straight forward to clear Bendix, lift out.

GENERATOR:—Model GAM-4503. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amperes (cold) at 8 volts reached at 2400 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction. For all charging rate adjustments an ammeter must be connected in the generator line at the relay.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	700	0	6.4	760
4	6.9	880	4	6.9	1040
7	7.0	1000	8	7.3	1400

17	8.0	2400	12.2	7.8	3200
15.2	7.9	3200			

Brush Spring Tension:—18-22 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.

Motoring:—4.94-5.46 amperes at 6.0 volts.

GENERATOR:—Model GBK-4602 (Deluxe models). Third brush regulation in conjunction with Auto-Lite Type XA-414-S Owen-Dyneto Battery Charge Regulator (first cars), or Auto-Lite Model TC-4102-A Current Regulator (after #73463). See Equipment Section for complete data on these regulators.

Charging Rate Adjustment—Same as for Model GAM-4503. Maximum charging rate 22 amperes (cold—regulator contacts closed), 10 amperes (regulator contacts open), 8.0 volts, 2200 R.P.M.

Performance Data

Cold		Regulator Contacts Closed		Hot	
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	840
4	6.7	980	4	6.8	1025
8	7.0	1085	8	7.15	1200
12	7.3	1300	12	7.5	1450
16	7.55	1500	16	7.85	1760
22	8.0	2200	18	8.0	2400

Brush Spring Tension—18-22 ounces (new brushes).

Motoring Current—4.46-4.95 amperes at 6.0 volts.

Field Current—3.75-4.15 amperes at 6.0 volts.

Field Fuse—7½ ampere capacity in knurled cup under regulator case.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts under generator forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, swing generator out or away from engine, tighten adjustment bolt before slacking off on generator, tighten mounting bolts.

RELAY:—Model CBA-4002. Special type with auxiliary contacts and terminal for operation of generator charge tell-tale. Tell-tale contacts are closed with main contacts open, and open when main contacts close (as generator begins to charge battery). Relay contacts close when generator voltage reaches 7.0-8.0 volts with charging current of not more than 5 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". **Air Gap:**—.010-.030" (contacts closed).

SIGNAL LIGHTS:—For complete data see 'Signal Lights' in Equipment Section.

LIGHTING:—Soreng-Manegold Switch, Model B-5670-A. Dimmer Switch Model C-2100-A. Lighting switch mounted on back of instrument board.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking or Fender Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Tell-tale Lights	6-8	3	D.C.	64
Stop and Tail Lights	6-8	21-2	D.C.	1158
Dome Lights	6-8	15	S.C.	87

FUSES:—20 ampere capacity fuse mounted on back of lighting switch.

FORD

NEW MODEL A (1929-30-31)
FORD SYSTEM

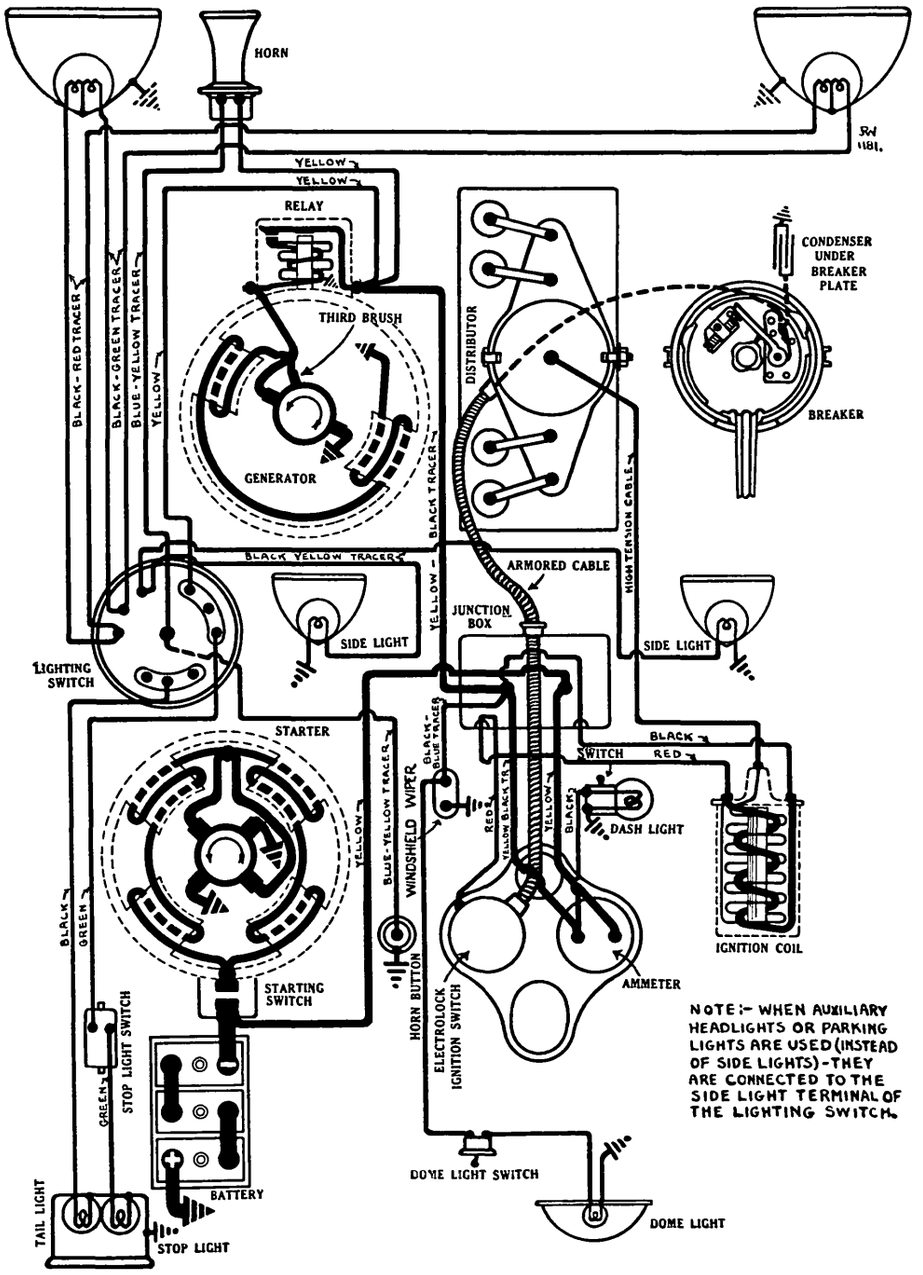
BATTERY:—Ford, 13 plates, 6 volt, 80 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16 hours. Battery is mounted under the front floor boards on the left frame member.

IGNITION:—Ignition coil is mounted on the dash directly above junction box. Ignition current is 1¾ amperes at 7 volts with engine running and 4½ amperes at 6 volts with engine stopped.

Breaker contacts separate .018-.022 inch. Adjust contact opening by loosening lock screw on stationary contact mounting bracket and turning up stud until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 14-20 ounces. Distributor is full manual type. Maximum manual advance is 28 degrees (engine).

Mounting:—Distributor is mounted on the cylinder head between cylinders two and three. To remove breaker plate, disconnect cable in center of cap and four spring connectors to spark plugs, loosen clips and take off cap and terminal assembly. Then loosen lock screw in center of breaker cam and remove cam. Disconnect manual advance rod and turn breaker plate until projections on plate line up with grooves in housing. Then lift breaker plate straight up. The distributor housing can be removed if necessary by loosening the lock nut and backing out the mounting stud on the right side of the engine block directly opposite the distributor mounting. The ignition switch is an Electrolock Type 12-A which is permanently connected to the distributor housing by an armored cable. See Equipment Section for data.

Oiling:—Put a few drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, fully retard spark control lever and take out timing pin which is screwed in front of gear case directly over the camshaft gear. Reverse the pin in the hole and turn engine over slowly, pressing on the pin meanwhile, until the pin drops into the recess in the face of the camshaft gear. This is the top dead center position for piston No. 1. Then remove distributor cap and rotor and loosen the lock screw in the center of the cam. Replace rotor and turn cam until rotor button is directly opposite No. 1 segment (right hand segment on front of distributor housing facing radiator). Remove rotor and shift cam slightly until contacts are just beginning to open. Tighten the lock screw. **Be careful to withdraw timing pin and screw it firmly in place in original position before the engine is run.**

Firing Order:—The firing order is 1-2-4-3. Number one cylinder nearest the radiator.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .035 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.532-1.547 inches. Stem diameter, .3105-.3115 inch. Stem length, 5.651 inches. Valve lift, .287 inch. Spring pressure, 34-38 pounds (spring length, 2½ inches). Tappet clearance, .010-.013 inch (cold). Inlet valves open 7½ degrees before top dead center and close 48½ degrees after lower dead center.

EXHAUST VALVES. Head diameter, stem diameter, stem length, lift, spring pressure, and tappet clearance same as inlet valves. Exhaust valves open 51½ degrees before lower dead center and close 4½ degrees after top

FORD

NEW MODEL A (1929-30-31)
FORD SYSTEM

dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Gears are marked. Mesh gears so that marked tooth is meshed with marked space on the other gear.

STARTER:—Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is two pounds. Starter switch is mounted on the field frame. The new type switch has a flat spring and if it is installed on an old starter the starter terminal must be dressed down flat to a height of 11/32-3/8 inch. The starter cable terminal has been redesigned and now extends straight out from the cable. The old cable assembly can be used with the new switch by bending the terminal from its right angle position.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	2700	6	50
14 "	Lock	3.75	560

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and pedal rod or remove starter switch (this is the quickest method). Then remove flange mounting cap screws and pull starter forward. Lift starter from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—The generator has been modified and a new type two pole three brush generator is now being used. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by hand. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by the spring tension of the third brush holder. For normal driving the charging rate should be set at 6 amperes during the summer months and 10 amperes in winter. The maximum charging rate is reached at 1500 R.P.M. or 25 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
10-14	7.0	1500

Shunt field current is 4.5 amperes at 6 volts. Generator, motoring, draws 4.75 amperes at 6 volts. Brush spring tension is 24 ounces.

Mounting:—Generator is mounted at left of engine by special bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt and bracket mounting bolt. Swing generator toward engine and slip off drive belt. Then take out mounting bolt in bracket under generator and lift generator from place.

Oiling:—Put 2 or 3 drops of light engine oil in the oiler at the drive end of the generator every 1000 miles of operation. Fill the oiler on the commutator end of the generator every 2000 miles of operation. The commutator end bearing is oiled from this oil well by a wick which bears against the porous bushing of the bearing. If the generator is disassembled care must be taken to replace this wick. The wick does not extend through the bushing and the bushing should not be drilled to open this oiler as the porosity of the bushing is sufficient to provide ample lubrication.

RELAY:—Ford Model. Relay is mounted on the generator field frame. Relay contacts close when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .010 inch with contacts closed.

LIGHTING:—Ford Lighting Switch Part No. A-11654-B. Switch is mounted on the lower end of the steering column. Headlights are now 'Twolite' using 21 cp. double filament bulbs. Two types are used, Ford Part No. A-13005-C (with dimmer bulbs) and Part No. A-13005-D (for use with fender lights or cowl lights). Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110 or 6-8 volt, 32-21 cp. D.C. Mazda 'Ford' type (for use in states where laws permit). Stop light is 6-8 volt, 21 cp. S.C. Mazda 1129. Auxiliary headlights and cowl lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 2 cp. S.C.

FORD

MODEL V-8-106 (1932)
FORD GENERATING, STARTING SYSTEM
FORD-MALLORY IGNITION

CAR SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on top of clutch housing on engine and on left hand frame side member in front of left hand dash bracket.

ENGINE:—Eight cylinder 90 degree 'V' type, 'L' head engine, 3 1/16x3¾" bore and stroke, 220 cubic inch displacement, rated at 30 H.P., develops 70 H.P. at 3600 R.P.M. Standard compression ratio 5.50-1. Compression pressure with open throttle is 104 pounds at 500 R.P.M. and 114 pounds at 1800 R.P.M.

BATTERY:—**Ford Type.** 6 volt, 13 plate, 80 ampere hour. Starting capacity 98 amperes (to end voltage of 1.5 volts per cell). Lighting capacity 5 amperes for 18 hours (to end voltage of 1.75 volts per cell). Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery mounted crosswise, accesible after removing special cover plate.

IGNITION:—**Mallory Large Type.** Special coil (two section secondary). Coil mounted on top of ignition unit at front of engine. Ignition current 0.7 amperes at 6.2 volts (engine running at 1500 R.P.M.), 3 amperes at 6.2 volts (engine stopped). Ignition switch co-incidental with steering post lock (mounted on steering column at instrument board).

Distributor Ford-Mallory Type. Two breaker arm, 8 lobe cam type. Right hand contacts (viewed from front of engine) used for timing, left hand contacts used to load coil (contacts close first and open first but spark does not occur until right hand contacts open). See article on Mallory distributors in Equipment Section. Distributor is full automatic advance type with a vacuum brake or advance control. See Equipment Section for complete description and adjustment instructions on the Vacuum Brake.

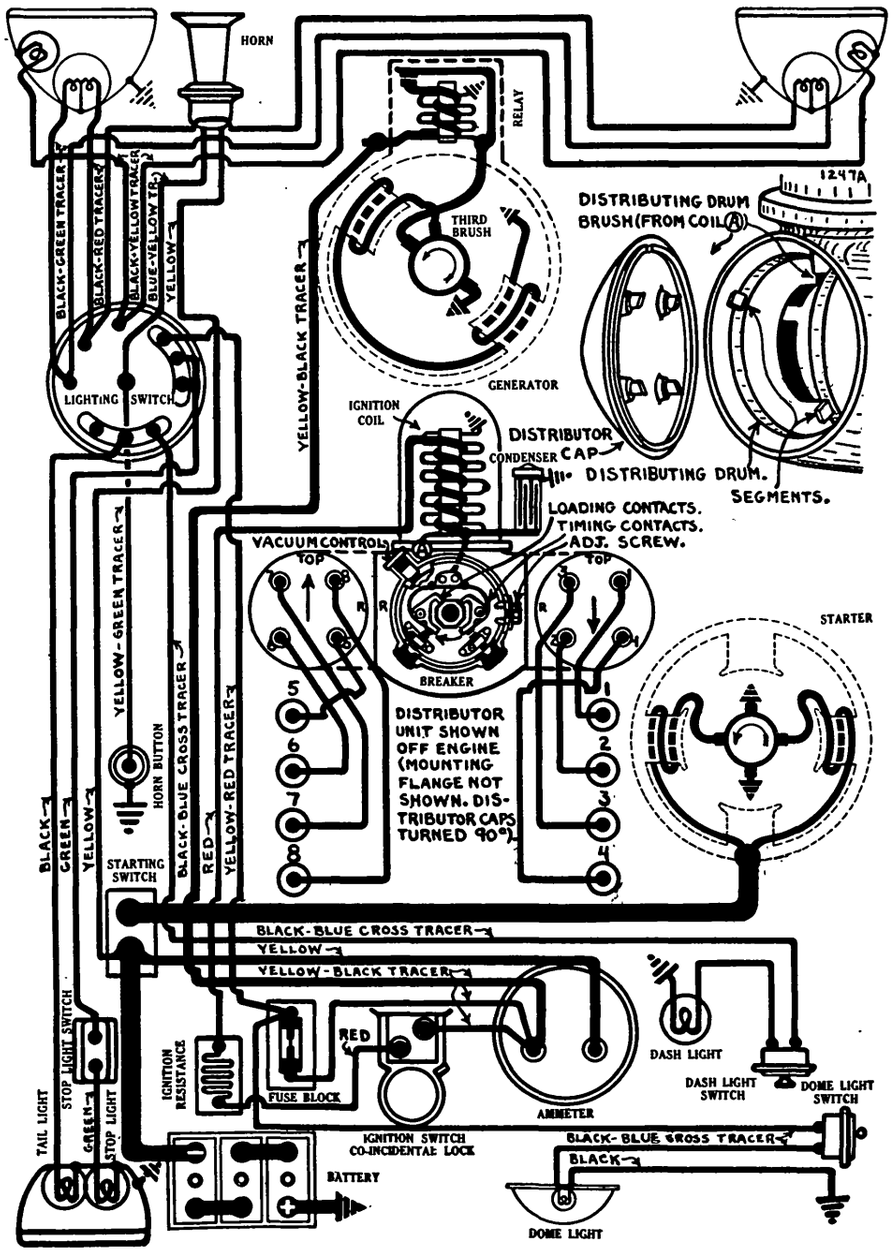
Breaker Gap:—.012-.014". Breaker gap can be adjusted by inserting a screwdriver through holes in side of distributor housing (holes closed normally by rubber plugs) and turning stationary contact screw after lock screw has been loosened.

Breaker Arm Spring Tension:—19-22 ounces. A special spring scale has been developed to check this spring tension.

Cam Angles—Closed 35-37½°. Open 7½-10° (distributor) both sets with correct 'lead.'

Automatic Advance—Normal Operating Conditions

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		325	0		650
1		435	2		870
2		500	4		1000
5		700	10		1400
8		890	16		1780



Automatic Advance—High Vacuum (Brake Inoperative)

Start		150	0		300
2		225	4		450
3		300	6		600
5		525	10		1050
8		850	16		1700

Automatic Advance—Low Vacuum (Brake Operative)

Start		475	0		950
2		550	4		1100
3		600	6		1200
5		800	10		1600
8		1075	16		2150

Mounting:—Complete ignition unit mounted on front of engine on gear case cover. Driven directly through offset tongue-and-slot coupling from forward end of camshaft. Coil mounted on top of distributor unit with condenser on left and primary ballast coil on right side (viewed from front of car). Distributor consists of distributing drum with jump spark seg-

FORD

MODEL V-8-106 (1932)
FORD GENERATING, STARTING SYSTEM
FORD-MALLORY IGNITION

ments rotating between two distributor caps containing four terminals each. Spark plugs in right hand bank connected to terminals on right hand distributor cap and spark plugs in left hand bank connected to terminals on left hand distributor cap (see illustration). To remove ignition unit, disconnect primary lead, take off two distributor caps (without disturbing the cable connections, disconnect vacuum line, take out 3 mounting cap screws, lift unit out.

Timing:—Standard setting 4° (flywheel) before top dead center. Ignition unit built to provide this setting when properly mounted on engine (drive through tongue-and-slot coupling) and ignition setting should not be required. An adjustment is provided (breaker plate locked to housing by means of lockscrew passing through slotted hole in housing—see illustration) which allows breaker plate to be rotated 5° both ways to take care of variations in dimension limits and contact gap. To check timing, turn crankshaft to firing position (piston on top dead center), check contact gap, place timing adjusting screw in retarded position (lower end of slot), move screw upward slowly until contacts begin to open, note position of screw with reference to graduations on edge of slot, then move screw up one additional graduation, tighten the screw. This gives the correct setting of 4° before top dead center.

Firing Order:—1-5-4-8-6-3-7-2 with cylinders numbered as indicated on diagram. This is 1R-1L-4R-4L-2L-3R-3L-2R with cylinder banks right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder nearest the radiator.

Spark Plugs:—7/8-18 S.A.E. Champion Type C-4-X. Set gaps at .025 inch. Hold within limits of .022-.027 inch.

VALVE TIMING:—Engine 'L' head type. Valves on inner side of cylinder block in 'valve alley' acssessible after removing intake manifold. No tappet adjustment provided. Camshaft gear driven from crankshaft.

To Set Valve Timing:—Camshaft gear and crankshaft gears are marked. Mesh gears so that the '0' mark on the crankshaft gear is directly opposite the 'I' mark on the camshaft gear.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1½"	5/16"	4¾" (O.A.L.)	45°	300"
Exhaust	1½"	5/16"	4¾" (O.A.L.)	45°	300"

Tappet Clearance
No adjustment provided or required.

Valve Springs
40-42 pounds.

Valve Timing

Intake Valves	Exhaust Valves
Open—9½° before top dead center.	Open—57½° before lower dead center.
Close—54½° after lower dead center.	Close—6½° after top dead center.

Special Note:—Valve stem guides are split. They must be removed in order to take valves out of engine (because of lifter on end of valve stem). Guides can be removed after taking out spring retainer and releasing valve springs. Valve stems have a mushroom end which rests on the valve lifter bearing on the face of the cam. Valve tapppet clearance should be held within limits of .0125-.0135 inch and valves should be replaced when clearance becomes excessive.

CARBURETION:—Detroit Lubricator Downdraft Carburetor (see Carburetion Section for complete data).

Fuel Pump:—Ford type mechanical fuel pump mounted on manifold at rear of engine. See Carburetion Section for complete data on this unit.

Gasoline Gauge:—K-S Telegauge, hydrostatic type (see Carburetion Section for complete data).

STARTER:—Ford V-8 Type. Starter drives through inboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 2 pounds. Starter cranks engine at 1070 R.P.M. drawing 200 amperes at 6 volts (starting).

Starter Data

Torque	R.P.M.	R.P.M.	Amperes
4 lb. ft.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Mounting:—Starter mounted on front of flywheel housing at right of engine. Bendix drive under cover at rear of housing. To remove starter, take out two bolts on starter end plate, pull starter out.

GENERATOR:—Ford-Auto-Lite Type. Generator current regulation by third brush system. To adjust generator output, take off commutator cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Third brush mounting plate held in position by friction. Rotation counter-clockwise at commutator end. Maximum charging rate should not exceed 10-12 amperes. Standard setting 10 amperes at 7 volts reached at 2000 R.P.M. or 30 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
5.2	6.4	800
10.7	6.9	1600
4.8	6.75	4000

Brush spring tension 20 ounces. Shunt field draws 6.3 amperes at 7 volts. Motoring generator draws 5.75 amperes at 7 volts.

Mounting:—Generator mounted on bracket on top of cylinder block at front of engine and belt driven from crankshaft in tandem with two water pumps. Fan mounted on end of generator shaft. To remove generator, disconnect lead, take off nut on mounting stud in generator mounting bracket, lower generator and slip off drive belt, lift unit out.

Belt Adjustment. Belt is adjusted by raising generator. To adjust belt tension, loosen mounting stud clamp bolt, lift generator until correct belt tension is secured, tighten clamp bolt. Generator stud is threaded and is adjusted for height by turning the adjusting nut on the generator mounting collar.

RELAY:—Ford Type. Mounted on generator field frame. Relay contacts close at 8.5 M.P.H. or 650 R.P.M. of generator when voltage reaches 7.5 volts and open at 7 M.P.H. or 550 R.P.M. of generator with discharge current of 2.5 amperes. Relay contact gap limits .015-.020 inch. Air gap limits .010-.015 inch (contacts closed).

LIGHTING:—Essex Wire Co. Switch, Ford V-8 Type. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazad No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs (in headlights)	6-8	3	S.C.	63
Cowl Lights (when used)	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	21	S.C.	1129
Dome Light (passenger cars)	6-8	3	S.C.	63
Dome Light (commercial cars)	6-8	15	S.C.	87

FUSES:—Lighting fuse on block on back of instrument board is 20 ampere capacity. This fuse was not used on the first cars.

FORD

FOUR CYLINDER MODEL B AND COMMERCIAL CARS (1932-33)
FORD-AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Same as Engine Number.

ENGINE NUMBER:—Stamped on top of flywheel housing on left hand side above starter.

ENGINE:—Four cylinder, 'L' head type, 3⅞x4¼" bore and stroke, 200.5 cubic inch displacement, rated at 24.03 H.P., develops 50 H.P. at 2800 R.P.M. Standard compression ratio 4.6-1. Optional compression ratios are not offered.

BATTERY:—**Ford Type,** 6 volt, 15 plate, 80 ampere hour capacity (5 amperes for 18 hours to end voltage of 1.75 volts per cell). Starting capacity 98 amperes (to end voltage of 1.5 volts per cell).

Grounded Terminal:—Positive (+) terminal grounded to frame.

Mounting:—On left hand side of frame under front floor boards.

IGNITION:—**Ford Auto-Lite Coil.** Ignition coil is mounted on the dash.
Ignition Current:—.62 amperes at 6.2 volts (engine running) at 1500 R.P.M.). 4 amperes at 6.2 volts (engine stopped).

Ignition Switch:—Co-incidental type ignition switch and steering post lock mounted on steering post at instrument board.

Distributor Ford Auto-Lite Type. Single breaker, 4-lobe cam, full automatic advance type. Contact gap is adjusted by loosening lock nut on stationary contact mounting stud and turning up stud.

Breaker Gap:—Set contact gap at .020". Hold within limits of .016-.024" in service, or .022-.028" with new breaker arm fiber rubbing block.

Breaker Arm Spring Tension:—14-20 ounces.

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		350	0		700
1½		550	3		1100
3½		800	7		1600
5½		1050	11		2100
7		1225	14		2450

Mounting:—Distributor mounted on right side of cylinder head at center of engine. To remove distributor, disconnect spark plug connectors, take off distributor cap and high tension cable, loosen lock nut and back off set screw in side of cylinder head opposite distributor, lift distributor out. The breaker plate may be taken out of the distributor housing by taking out the timing adjustment screw on the spark control arm and rotating the breaker plate until the projections on the plate line up with the notches in the housing.

Oiling:—**500 Miles.** Put a few drops of light engine oil in oiler on side of distributor housing.

2000 Miles. Apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 15° (standard gasolines) or 23° (Ethyl gasolines) before top dead center. To set timing, first center spark control arm by loosening adjustment screw and moving arm so that center line on control arm scale is directly under center of adjustment screw, tighten screw. Then take out timing pin screwed in front face of timing gear case (over camshaft gear), reverse pin in hole. With No. 1 piston on compression stroke turn engine over slowly and press on pin until pin engages hole in front face of camshaft gear (this hole is 9½ degrees on the camshaft corresponding to 19 degrees on the crankshaft before the top dead center position).

FORD

FOUR CYLINDER MODEL B AND COMMERCIAL CARS (1932-33)
FORD-AUTO-LITE SYSTEM

Loosen lock screw in center of breaker cam, carefully locate cam so that contacts are beginning to open, tighten locking screw. Then loosen adjustment screw on spark control arm, move arm 4 degrees to right (15 degree setting for cars using standard gasoline) or 4 degrees to left (23 degree setting for cars using Ethyl gasoline), tighten adjustment screw. **Remove timing pin and replace in running position before attempting to operate car.**

Firing Order:—1-2-4-3. No. 1 cylinder nearest the radiator. See diagram for spark plug connections.

Spark Plugs:—⅞-18 SAE. Champion Type 3X. Use Type C-4 for replacement. Set gaps at .030 inch. Hold within limits of .030-.035 inch.

VALVE TIMING:—Camshaft Setting. Camshaft is gear driven. Gears are marked. Mesh gears so that marks line up with both marks on a line between the shaft centers.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Exhaust	1½"	5/16"	5.649-5.651" (O.A.L.)	45°	.287"
Intake	1½"	5/16"	5.649-5.651" (O.A.L.)	45°	.314"

Tappet Clearance		Spring Pressure	
Intake	.010-.013" (see note)	38 pounds	2 15/16"
Exhaust	.020-.022" (see note)		

Timing

Intake valves open 8° before top dead center. Intake valves close 56° after lower dead center.

Exhaust valves open 56° before lower dead center. Exhaust valves close 8° after top dead center.

Note on Tappet Clearance. No tappet clearance adjustment is provided. Tappet clearance as given above represents limits in service. Valves should be replaced when tappet clearance becomes excessive. Valve stem guides are of the split type and are held in place by the valve spring. Guides can be removed after the spring retainer is taken out and the valve spring released.

CARBURETION:—Special Zenith Updraft Carburetor (see Carburetor Section for complete data). Choke and needle valve are controlled manually by button at lower edge of instrument board on right side.

Fuel Pump:—Ford mechanical type fuel pump mounted on right hand side of crankcase and driven by eccentric on camshaft (see Carburetor Section for complete data).

Gasoline Gauge:—K-S Telegauge, hydrostatic type (see Carburetion Section for complete data).

STARTER:—Ford Auto-Lite Type. Starter drives engine through Bendix drive. Rotation is counter-clockwise at commutator end. Brush spring tension 2 pounds. Starter cranks engine at 1150 R.P.M. drawing 200 amperes at 6 volts (starting).

Starter Data

Torque	R.P.M.	Volts	Amperes
4 lb. ft.	1000	4.85	225
8 "	540	4.15	360
12 "	220	3.60	475

Starter Switch:—Auto-Lite design. Switch is mounted at left of engine and is operated by button between pedals (passenger cars) or at left of steering column (trucks).

Mounting:—Starter flange mounted on forward face of flywheel housing at left of engine. To remove, disconnect cable, take out 3 flange mounting bolts, pull starter forward to clear Bendix, lift out.

Oiling:—Starter bearings oilless. They require no attention.

GENERATOR:—Ford Auto-Lite Type. Generator current regulation by third brush system. To adjust generator output, take off commutator cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Third brush mounting plate held in position by friction. Rotation counter-clockwise at commutator end. Maximum output should be set at 10-12 amperes. With standard setting, maximum charging rate is 10 amperes at 7 volts reached at 2000 R.P.M. or 22 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
5.2	6.4	800
10.7	6.9	1600
4.8	6.75	4000

Brush spring tension is 20 ounces. Field current draw is 6.3 amperes at 7 volts. Generator motoring draws 5.75 amperes at 7 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine and driven by the fan belt. To remove generator, disconnect leads, loosen mounting bolt, swing generator toward engine, slip off drive belt, take out mounting bolt forming bracket hinge, lift generator out.

Belt Adjustment. To take up fan belt, loosen generator mounting bolt, swing generator away from engine until belt tension is just sufficient to drive generator and fan without slipping, tighten mounting bolt.

Oiling:—1000 Miles. Put few drops light engine oil in oiler at each end of the generator.

RELAY:—Ford Type. Mounted on generator field frame. Relay contacts close at 650 R.P.M. of generator or 7.5 M.P.H. with generator voltage of 7.5 volts and charging current of approximately 2 amperes and open at 6.5 M.P.H. or 550 R.P.M. of generator with discharge current of 2.5 amperes. Relay contact gap limits .015-.020 inch. Air gap limits .010-.015 inch (contacts closed).

LIGHTING:—Essex Wire Co. Switch. Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	21	S.C.	1129
Dome Light (Commercial Cars)	6-8	15	S.C.	87

FUSES:—20 ampere capacity lighting fuse mounted on fuse block in back of instrument board under cowl (see diagram). This fuse was not used on the first cars and lighting switch feed wire was connected to the generator relay terminal and dome light lead to the ammeter.

FORD

MODEL V-8-112 (1933)
FORD GENERATING, STARTING SYSTEM
FORD-MALLORY IGNITION

CAR SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on top of clutch housing on engine and on left hand frame side member in front of left hand dash bracket.

ENGINE:—Eight cylinder 90 degree 'V' type, 'L' head engine, 3 1/16x3¾" bore and stroke, 220 cubic inch displacement, rated at 30 H.P., develops 81 H.P. at 3800 R.P.M. Standard compression ratio 6.33-1. Engine equipped with aluminum cylinder head. Compression pressure with open throttle is 125 pounds at 500 R.P.M. and 138 pounds at 1800 R.P.M.

BATTERY:—Ford Type, 6 volt, 15 plate, 80 ampere hour capacity.
Grounded Terminal:—Positive (+) terminal grounded.
Mounting:—In cradle under front floor boards on left hand side.

IGNITION:—Mallory Ignition Coil, Ford Type No. 18-12024. Coil is mounted on top of ignition unit at front of engine. A resistance unit mounted on the back of the instrument board is connected in series with the ignition coil.
Ignition Switch:—Co-incidental ignition switch and steering post lock mounted on steering column at instrument panel.
Distributor:—Mallory Ford Type. Two-breaker, 8-lobe cam, full automatic advance type with Vacuum Brake control. Right hand set of contacts (viewed from front of engine) are used for timing, left hand set of contacts are used to load coil (this set closes first and opens first but spark does not occur until right hand set of contacts open). See Equipment Section for complete data on Mallory distributors.
Breaker Gap:—Contact gap set at .012-.014" (both sets). To set gap with ignition unit off engine or distributor caps removed, loosen lock screw on stationary contact mounting bracket, take out rubber plug in side of housing and turn up stationary contact stud.
Breaker Arm Spring Tension:—19-22 ounces. Breaker arm spring tension should be measured at contacts using special compression spring scale which can be inserted through contact adjustment opening. Press breaker arm toward cam and note scale reading at instant contacts open.
Vacuum Brake:—See article on Mallory distributors in Equipment Section for complete information. If engine 'pings' under load and quality of gasoline is satisfactory, vacuum brake spring tension should be increased slightly by loosening lock nut and turning up adjusting screw.
Cam Angles—Closed 35-37½°. Open 7½-10°. Both sets with correct coil loading lead.

Automatic Advance—Normal Operating Conditions

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		350	0		700
1		450	2		900
2		520	4		1040
5		850	10		1700
8		1200	16		2400
11		1570	22		3140

Start		200	0		400
2		275	4		550
3		350	6		700
5		625	10		1250
8		1075	16		2150
11		1500	22		3000

Automatic Advance—No Vacuum (brake operative)

Start		475	0		850
2		540	4		1060
4		775	8		1550
6		1065	12		2130
8		1370	16		2740
11		1800	22		3600

NOTE:—The new distributor unit with the exception of the automatic advance weights and the distributor shaft assembly (40-12178) are inter-

FORD

MODEL V-8-112 (1933)
FORD GENERATING, STARTING SYSTEM
FORD-MALLORY IGNITION

changeable with the distributor used on the former V-8 model and will be supplied for service. The new distributor shaft is stamped '40' on the end of shaft beside the coupling tongue for identification. The advance weights are stamped '40' on the outside rim and can be checked by disassembling the vacuum brake and sighting through the piston cylinder.

Mounting:—Complete ignition unit mounted on front of engine on gear case cover. Driven directly through offset tongue-and-slot coupling from forward end of camshaft. To remove, disconnect primary lead, take off distributor caps (without disturbing cable connections), disconnect vacuum line, take out 3 cap screws, lift unit out.

Oiling:—1000 Miles. Light engine oil in oiler on front of distributor unit.

IGNITION TIMING:—Standard setting 4° before top dead center.

To Set Timing:—With No. 1 piston (front cylinder of right hand block) on top dead center of compression stroke, loosen the timing adjusting screw on the left hand side of the ignition unit, place the screw in the retarded position at the lower end of the slot and then move screw upward until contacts begin to open, note the position of the timing screw with reference to the graduations on the edge of the slot, move the screw up one additional graduation, tighten the adjusting screw. This will give the correct setting of 4° before top dead center. No flywheel marks are provided and the ignition should be set with the piston on dead center as directed above. This dead center position can be determined by a gauge rod placed in No. 1 cylinder or, with the head off, the distance below the top of the cylinder of No. 2 and No. 3 pistons can be measured. These distances will be exactly the same at dead center.

The timing screw slot is graduated in 4° intervals (crankshaft(and permits a maximum advance or retard of 10° on the crankshaft. The setting of individual engines can be varied in accordance with operating conditions and fuel characteristics.

Firing Order:—1-5-4-8-6-3-7-2 with cylinders numbered as indicated on diagram. This is 1R-1L-4R-4L-2L-3R-3L-2R with cylinder banks right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder nearest the radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set plug gaps at .025".

VALVE TIMING:—Engine 'L' head type. Valves on inner side of cylinder block in 'valve alley' accessible after removing intake manifold. No tappet adjustment provided. Camshaft gear driven from crankshaft.

To Set Valve Timing. Camshaft gear and crankshaft gears are marked. Mesh gears so that the '0' mark on the crankshaft gear is directly opposite the 'I' mark on the camshaft gear.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1½"	5/16"	4¾"(O.A.L.)	45°	.300"
Exhaust	1½	5/16"	4¾"(O.A.L.)	45°	.300"

Tappet Clearance

No adjustment provided or required

Valve Springs

40-42 pounds.

Valve Timing

Intake Valves	Exhaust Valves
Open—9½° before top dead center.	Open—57½° before lower dead center.
Close—54½° after lower dead center.	Close—6½° after top dead center.

Special Note:—Valve stem guides are split. They must be removed in order to take valves out of engine (because of lifter on end of valve stem). Guides can be removed after taking out spring retainer and releasing valve springs. Valve stems have a mushroom end which rests on the valve lifter bearing on the face of the cam. Valve tappet clearance should be held within limits of .0125-.0135 inch and valves should be replaced when clearance becomes excessive.

CARBURETION:—Detroit Lubricator Downdraft Carburetor (see Carburetor Section for complete data).

Fuel Pump:—Ford type mechanical fuel pump mounted on manifold at rear of engine. See Carburetor Section for complete data on this unit.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section for complete data).

STARTER:—**Ford V8. Type.** Starter drives through inboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 2 pounds. Starter cranks engine at 1070 R.P.M. drawing 200 amperes at 6 volts (starting).

Starter Data

Torque	R.P.M.	Volts	Amperes
4 lb. ft.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Mounting:—Starter mounted on front of flywheel housing at right of engine. Bendix drive under cover at rear of housing. To remove starter, take out two bolts on starter end plate, pull starter out.

Oiling:—Starter bearings fitted with oilless bushings requiring no attention.

GENERATOR:—**Auto-Lite Ford Type.** Third brush regulation. Rotation is counter-clockwise at commutator end. With standard setting maximum charging rate is 10 amperes at 7 volts reached at 2000 R.P.M. or approximately 30 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Amperes	Volts	R.P.M.
5.2	6.4	800
10.7	6.9	1600
4.8	6.75	4000

Brush Spring Tension:—20 ounces.

Field Current:—6.3 amperes at 7 volts.

Motoring:—5.75 amperes at 7 volts.

Mounting:—Generator mounted on bracket on top of cylinder block at front of engine and belt driven from crankshaft in tandem with two water pumps. Fan mounted on end of generator shaft. To remove generator, disconnect lead, take off nut on mounting stud in generator mounting bracket, lower generator and slip off drive belt, lift unit out.

Belt Adjustment:—To take up fan belt, loosen nut on mounting stud under generator, lift generator up until sideplay on belt at a point midway between water pump and crankshaft pulley is 1", tighten mounting nut.

Oiling:—1000 Miles. Light oil in oiler at each end of generator. Commutator bearing oiled from wick oiler in oil well under bearing cap.

RELAY:—**Ford Type.** Mounted on generator field frame. Relay contacts close at 8.5 M.P.H. or 650 R.P.M. of generator when voltage reaches 7.5 volts and open at 7 M.P.H. or 550 R.P.M. of generator with discharge current of 2.5 amperes. Relay contact gap limits .015-.020 inch. Air gap limits .010-.015 inch (contacts closed).

LIGHTING:—**Essex Wire Co. Switch, Ford V-8 Type.** Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs (in headlights)	6-8	3	S.C.	63
Cowl Lights (when used)	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	21	S.C.	1129
Dome Light (passenger cars)	6-8	3	S.C.	63

FUSES:—20 ampere capacity lighting fuse mounted on fuse block on back of instrument panel (under cowl).

SERIAL NUMBER:—Same as engine number. Stamped on top of clutch housing and on left frame side member in front of dash bracket

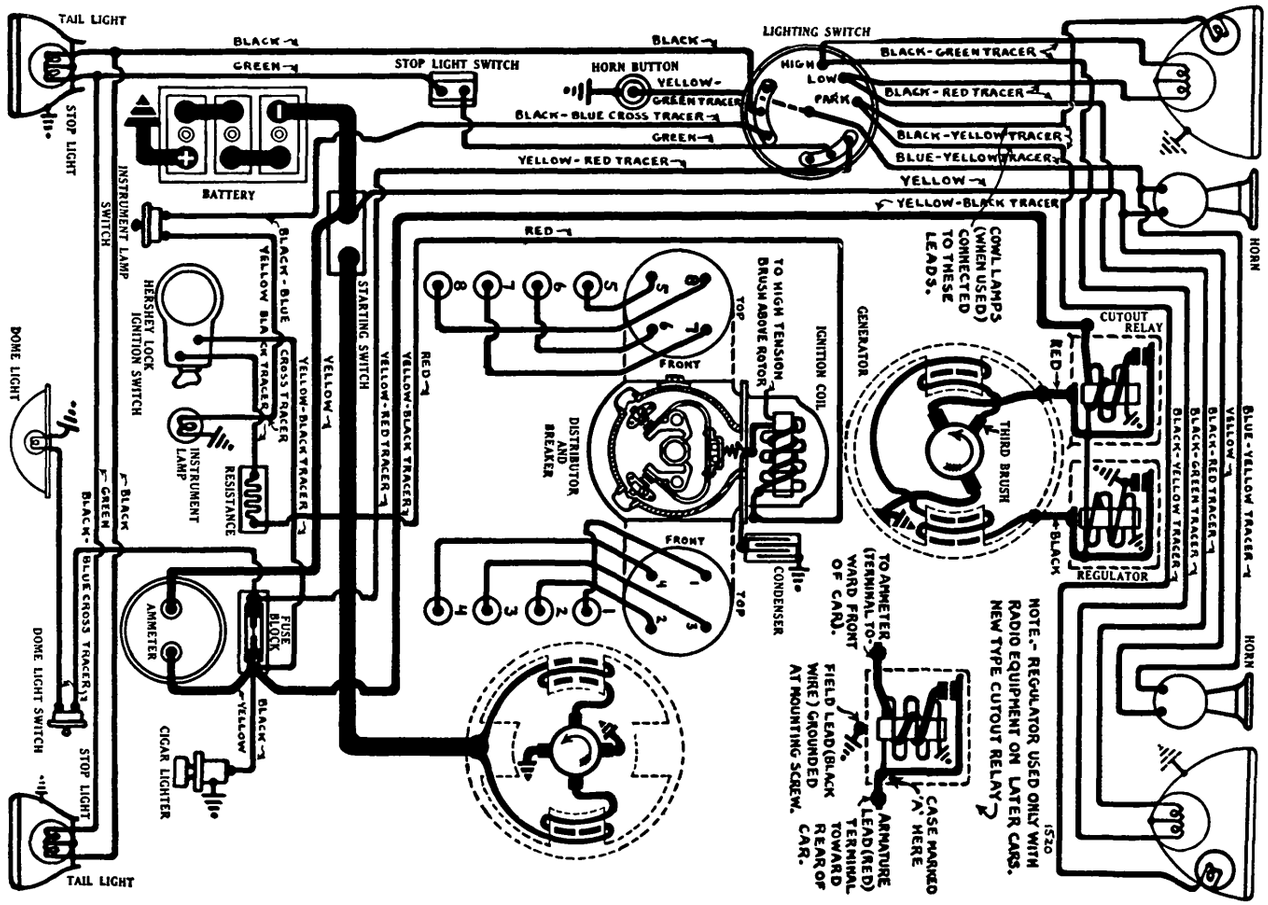
COMPRESSION:—Ratio—6 3-1 std head.
Pressure—138 lbs. at 1000 R.P.M. or 105 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Mallory Special Coil. Part of ignition unit at front of engine A resistor unit mounted on back of instrument board is connected in the coil primary circuit
Ignition Current—2 8 amperes (idling), 4 amperes (stopped)
Ignition Switch — Co-incidental ignition switch and steering post lock
Distributor Ford Type 40-12127-B. Double breaker, 8 lobe cam, full automatic advance type with vacuum brake control One set of contacts (right hand) are used for timing Second set of contacts (left hand) used to load coil (these contacts close first and open first but spark does not occur until timing contacts open). See Equipment Section for complete data on Mallory distributors
Breaker Gap— 012- 014" (both sets) Stationary contact studs accessible by taking out rubber plugs on side of housing Studs held by locking screws in stationary contact bracket
Breaker Arm Spring Tension—22-27 ozs
Cam Angles—Closed 35-37½°. Open 7½-10° (distrib deg). Both sets with correct lead for coil loading contacts.

Automatic Advance—High Vacuum Brake Inoperative

Distributor		Engine	
Degrees	R P M	Degrees	R P M
Start	200	0	400
2	325	4	650
3	425	6	850
5	850	10	1700
8	1475	16	2950



NOTE—Distributor shaft and Governor Weight assemblies with above advance characteristics used only on engines with dual carburetor They may identified by figure '34' or '40-B' stamped on rear end of shaft (beside coupling tongue) and on outside rim of advance weight (remove vacuum brake piston, sight down brake cylinder).

Mounting:—Complete ignition unit mounted on front of engine To remove, disconnect vacuum connection, take out 3 flange mounting cap screws

IGNITION TIMING:— Flywheel Degs Piston Position
All engines 4° BTDC. .0058" BTDC

NOTE —Ignition coil must not be removed from ignition unit when setting contact gap or timing distributor. The Ford Motor Company recommend that this practice be discontinued.
Timing:—No flywheel marks Ignition designed to be set with piston on top dead center With piston #1 (front cylinder, right hand block) on top dead center of compression stroke, loosen timing adjusting screw on left hand side of ignition unit, place screw in retard position at lower end of slot, then move screw upward slowly until contacts begin to open, note position of screw with reference to timing graduations on edge of slot, move screw up one additional graduation, tighten screw. This will give correct setting of 4° before top dead center Determine top dead center position of piston by inserting gauge rod in cylinder #1 or measure distance from top of block to top of pistons #2 and 3 (with head off). This distance should be the same.

Vacuum Brake Setting:—Vacuum brake can be set for individual fuel characteristics or operating conditions by loosening lock nut and backing off vacuum brake adjusting screw until engine 'pings' under load and then turning screw in just enough to remove 'ping'. Tighten lock nut after making adjustment.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.
Firing Order:—1-5-4-8-6-3-7-2. Cylinders numbered as shown on diagram.
Spark Plugs:—Champion, Type C-7. 18 MM. Metric.
Spark Plug Gaps—.025".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EE-1, 1" dual, plain tube, downdraft type.
Fuel Pump:—A.C., Type R.
Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—No flywheel marks provided. If dead center point for #1 piston is established on flywheel, #1 intake opening point will be approximately 2.96 teeth before this point. Using timing gauge valve should open with piston .0327" before top dead center.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.
Tappet Clearance:—.0125-.0135" (all valves). Not adjustable. Special two-step feeler available as 'go' and 'no go' gauge. First step (.0125") should pass between valve stem and lifter with lifter on heel of cam. Second step (.0135") should be 'no go'. Replace valves if clearance is excessive, or grind off end of valve stem if clearance is insufficient.
Valve Spring Pressure:—39-44 lbs. at 2.68" (valve closed). 62-65 lbs. at 2.38" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—30 lbs. at 55 M.P.H.

BATTERY:—Ford, Type 40-17, Part No. 40-10655-B, 6 volt, 17 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Battery Size—Width, 7¼". Length, 10 9/16". Height, 7⅛".
Location—Under front floor board, left hand side.

STARTER:—No. 18-11002. Armature No. 18-11005.
Starter Drive—Inboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 pounds each.
Cranking Performance—225 amperes at 3 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Mounting:—On front of flywheel housing, right hand side. To remove, take out two bolts on starter end plate.

GENERATOR:—Part No. 40-10000-B. Armature No. 18-10005 or 40-10005. Air cooled type. Third brush control with voltage regulator or two-stage charging rate (some cars). See Equipment Section.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction. Be sure regulator contacts are closed when checking output.

Maximum Charging Rate—Maximum rated capacity of generator is 18 amperes (cold) at 1500 R.P.M. or 20 M.P.H. when voltage regulator is used, or 12 amperes without voltage regulator.

Generator Performance (Hot)

Amperes	Volts	R.P.M.	M.P.H.
0	6.1	660	8.8
4	6.25	795	10.6
8	6.5	960	12.8
12	6.7	1150	15.2
16	6.95	1500	20.0
18	7.1	1875	25.0

Rotation—Counter-clockwise at commutator end.
Field Current—5 amperes maximum.
Brush Spring Tension—26-28 ounces.
Mounting:—On bracket between cylinder banks at front of engine. Fan mounted on end of generator shaft. Driven in tandem with two water pumps by Vee belt. To remove, take off nut on bracket flange mounting stud.
Belt Adjustment:—Loosen nut on bracket flange mounting bolt, move generator up until total sideplay on belt at point midway between water pump and crankshaft pulley is ¾-1", tighten nut.

RELAY REGULATOR:—Part No. 40-10505, A. (Std. on first cars with 40-10000-B generators, used only when radio installed on later cars). Consists of cutout relay and Voltage Regulator or Two-Rate Relay. See Equipment Section for complete data.

Cut-out Relay
Cuts in—7 volts or 10 M.P.H.
Cuts out—3 ampere discharge current.
Relay Contact Gap—.015-.020".
Air Gap—.010-.015" (contacts closed).

CUTOUT RELAY:—Part No. B-10505. (Used on late cars with 40-10000-B generator when radio not installed). This cutout relay is similar to previous units except that location of terminals has been changed (see illustration).

LIGHTING:—Essex Switch, Ford Part No. 49-3616-B. Lighting switch mounted at lower end of steering column, controlled by lever on steering wheel.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32	1000
Parking, Cowl, Instrument, Dome	3	63
Stop and Tail	21-2	1158

FUSES:—Lighting—20 ampere capacity on fuse block. 25 ampere capacity (cars with radio).

SERIAL NUMBER:—Same as engine number. Stamped on top of clutch housing and on left frame side member in front of dash bracket.

COMPRESSION:—Ratio—6.3-1 Std. aluminum head. **Pressure**—105 lbs. at cranking speed or 138 lbs. at 1600 R.P.M. (passenger cars), 109 lbs. at 2500 R.P.M. (131" & 157" WB. trucks with 5.32-1 cast-iron head).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

IGNITION:—Coil Part No. 40-12000-B. Mounted on top of ignition unit at front of engine. Resistor unit mounted in back of instrument panel.

Ignition Current—2.8 amperes idling, 4 stopped.

Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Part No. 40-12127-B. Double breaker, 8 lobe cam, full automatic advance type with vacuum brake control. One set of contacts (right hand) are used for timing. Second set of contacts (left hand) are used to load coil (these contacts close first and open first but spark does not occur until timing contacts open). Contacts are rigidly mounted on breaker plate and no synchronization is required. See Equipment Section for complete data on Mallory Distributors.

Breaker Gap—.012-.014" (both sets). Stationary contact studs are accessible through hole in side of housing after taking out rubber plugs.

Breaker Arm Spring Tension—22-27 ounces.

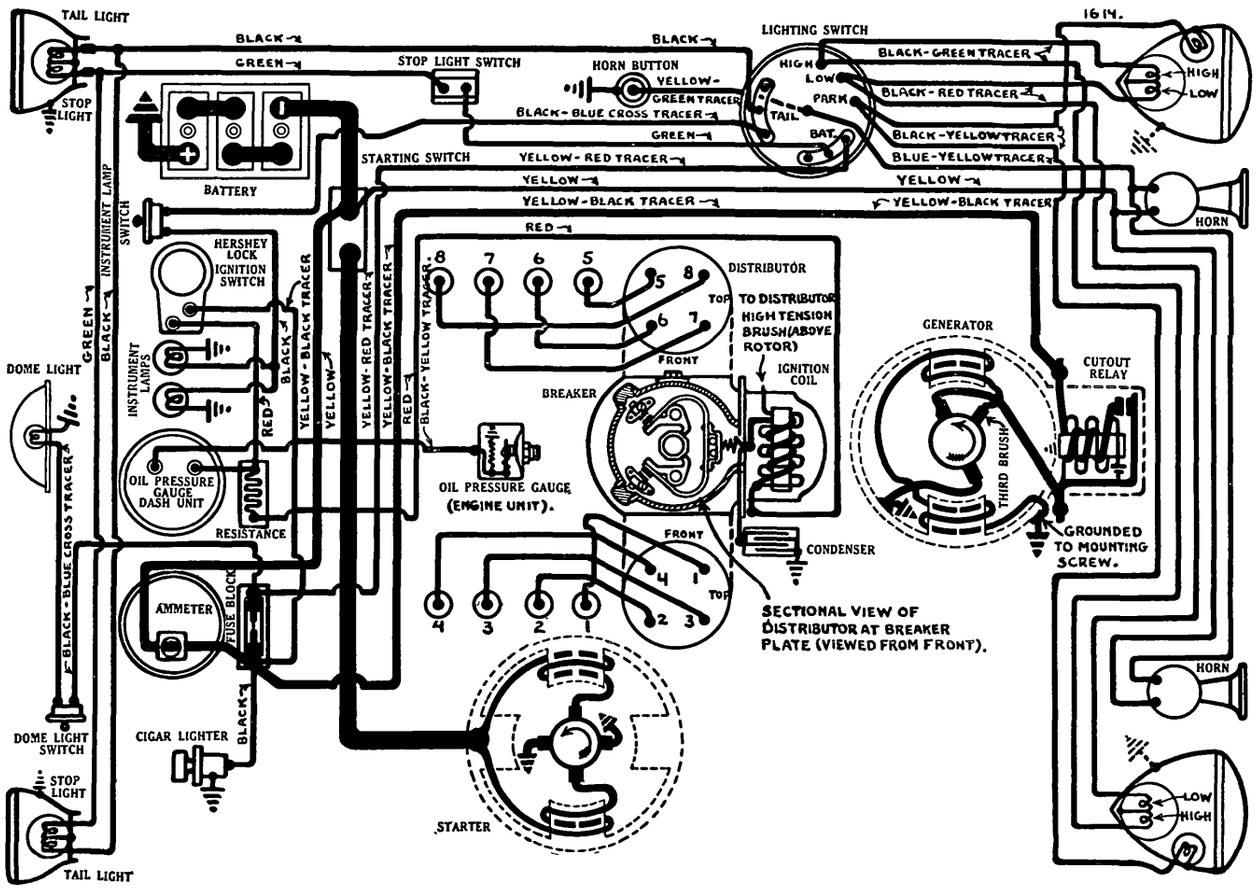
Cam Angles—Closed 35-37½° Open 7½-10° (distributor). Both sets with correct lead for loading contacts.

Automatic Advance—Vacuum Brake Inoperative

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	850	10	1700
8	1475	16	2950

Vacuum Brake—Consists of an adjustable spring-loaded plunger in vacuum cylinder on side of distributor housing. Braking action of plunger on edge of advance weight plate governed by manifold vacuum. See Ignition Timing for setting.

NOTE—Distributor shaft and governor weight assemblies with above advance characteristics identified by mark '34' or '40-B' stamped on rear end of shaft beside coupling tongue and on outside rim of advance weight (this mark may be seen by removing vacuum brake piston).



Removal:—Complete ignition unit mounted on timing gear case cover at front of engine. To remove, disconnect vacuum line, take out three flange capscrews.

NOTE—On first cars in 1935, the single bolt hole on the right hand end of the mounting flange was drilled smaller than formerly. The smaller hole would not fit the locating pin of the regular timing fixture and has since been returned to its former size. The small hole on these distributors can be drilled out to .323" to take the timing fixture locating plug and new type mounting bolts, Part No. 48-12148 used. All distributors now fitted with these new type bolts with a .312-.316" locating shoulder under the head.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....4° BTDC. ..... .0058" BTDC.

Timing—No flywheel marks. Ignition designed to be set with piston #1 on top dead center. With #1 piston (front cylinder—right hand bank) on top dead center of compression stroke, loosen timing adjusting screw on left hand side of ignition unit, place screw in retard position at lower end of slot, then move screw upward in slot until contacts begin to open. Note position of screw with reference to timing graduations on edge of slot at this point, then move upward one additional graduation, tighten screw. This will give correct setting of 4° before top dead center.

NOTE—Top dead center position of piston #1 can be determined by inserting gauge rod in cylinder, or by measuring distance to top of pistons

in cylinders #2 and #3 should be equal.

Vacuum Brake Setting—Vacuum brake can be adjusted for fuel characteristics or operating conditions by loosening locknut and backing off adjusting screw until engine pings under load and then turning screw in just enough to eliminate this ping. Tighten locknut.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-4-8-6-3-7-2 with cylinders numbered from front to rear as follows: Right hand bank—1, 2, 3, 4. Left bank—5, 6, 7, 8 (see diagram).

Spark Plugs:—Champion, Type 7. 18 MM. Metric.

Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.

Carburetor:—Stromberg, Model EE-1, 1" dual, downdraft type.

Fuel Pump:—A.C., Type R-1521764 diaphragm type.

Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—No flywheel marks or other means of checking timing provided. If dead center point for piston #1 is established on flywheel, #1 intake opening will be approximately 2.96 teeth before this point, with piston .0327" before top dead center.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.0125-.0135" all valves. No adjustment. Use special two-step feeler as Go-No-Go gauge. First step (.0125") should pass between valve stem and lifter with lifter on heel of cam. Second step (.0135") should be 'no-go'. Replace valves if clearance is excessive or grind off end of valve stem if clearance is insufficient.

Valv Spring Pressure:—39-44 lbs. at 2.68" (valve closed). 62-65 lbs. at 2.38" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.

Normal Oil Pressure—30 lbs. at 55 M.P.H.

BATTERY:—Ford, Part No. 40-10655-C. 6 volt, 17 plate, 96 A.H. capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under front floor board.

STARTER:—Part No. 18-11002. Armature No. 18-11005.

Starter Drive—Inboard Bendix, Type L11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Performance—100 R.P.M., 225 amperes, 4.75 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R.B.M., Type A-11450-C. Ford Part No. 18-11450. Operated by pedal on toeboard.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take out two bolts on endplate.

GENERATOR:—Part No. 40-10000-B. Armature No. 40-10005. Air-cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—15 amperes, 25 M.P.H. (4" generator pulley) or 30 M.P.H. (new 4 5/16" pulley).

Performance Data

Amperes	Volts	R.P.M.	M.P.H.
0	6.1	660	8.8
4	6.25	795	10.6
8	6.5	960	12.8
12	6.7	1150	15.2
16	6.95	1500	20.0
18	7.1	1800	25.0

Rotation—Counter-clockwise at commutator end.

Field Current—4.5 amperes at 6.0 volts.

Brush Spring Tension—26-28 ounces.

Removal:—On bracket between cylinder banks at front of engine with fan mounted on end of generator shaft. Driven in tandem with two water pumps by Vee belt. To remove, take off nut on bracket mounting stud.

Belt Adjustment:—Loosen nut on bracket flange mounting bolt, move generator up until total sideplay on belt at point midway between water pump and crankshaft pulleys is ¾-1", tighten nut.

SPECIAL GENERATORS:—See Equipment Section for data on Regulator (Two-Rate Relay) when used.

CUTOUT RELAY:—Part No. B-10505. Mounted on generator. Generator field lead is grounded to cutout mounting screws.

Cuts In—7 volts, 10 M.P.H.

Cuts Out—3 ampere discharge current.

Relay Contact Gap—.015-.020".

Air Gap—.010-.015" with contacts closed.

LIGHTING:—R.B.M. Switch, Type B-11657 (body and contact assembly), B-11673 (plate), B-11655-B (cover). Ford Part No. B-11654B. Lighting switch mounted at lower end of steering column and operated by handle on steering wheel.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330-C
Stop and Tail	21-2	1158
All others	3	63

FUSES:—20 ampere capacity on fuse block. 25 amperes (cars with radio).

HORNS:—Vibrator type. Horn current 6-8 amperes.

SERIAL NUMBER:—Same as engine number. Stamped on top of clutch housing and on left frame side member in front of dash bracket. First number 60-2,207,111 (Sept. 4, 1935).

COMPRESSION:—Ratio—6.3-1 Aluminum Head (68, 67), 5.32-1 Cast-iron Head (51 Trucks).

Pressure—105 lbs. (68, 67), 90 lbs. (51) at cranking speed of 100 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

IGNITION:—Complete ignition unit Part No. 48-12127-B or 68-12127 (part production). Mounted on front of gear case. Driven through tongue-and-slot coupling from camshaft.

NOTE—These ignition units interchangeable as a unit although specifications are not identical (see data below). Parts are not interchangeable. May be identifed by round top coil (48-12127-B), flat type coil (68-12127) and by part No. 68-12116 stamped on inner face of terminal plate on 68-12127 units.

Ignition Coil Part No. 18-12024-A3. Mounted on top of ignition unit.

Ignition Current—2.8 amperes idling, 4 stopped.

Ignition Resistance—Part No. 40-12250 mounted on fuse block and connected in coil primary circuit.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model 48-12127-B. Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Setting for adjustment). Same design as used previously on Ford V-8 with one set of contacts used to load coil (this set closes first and opens first) and one set for ignition timing.

Breaker Gap—.012-.014" (both sets). Adjusted by loosening lockscrew on stationary contact bracket and turning contact stud (accessible through hole in housing after removing rubber plug).

NOTE—Use .012-.014" two-step feeler labeled 'Breaker V-8' in BV-45 Ford Feeler Gauge Sets as 'Go' and 'No-go' gauges in setting gap.

Cam Angles—Closed 35-37½°. Open 7½-10°—for both sets operating together with correct coil-loading lead.

Breaker Arm Spring Tension—22-27 ounces.

Condenser—Part No. 18-12300-B. Capacity .33-.36 mfd.

Automatic Advance

(High Vacuum—Vacuum Brake Inoperative)

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	825	10	1650
8	1475	16	2950

Distributor Model 68-12127. Same design as 48-12127-B except for breaker plate design (new type breaker arm and contact mounting). See diagram.

Breaker Gap—.014-.016" (both sets). Adjust by loosening lockscrew and turning eccentric adjusting screw on stationary contact mounting plate accessible through terminal plate opening after plates removed).

NOTE—New two-step feeler blade marked '.014-.016"' can be added to BV-45 feeler gauge set for use in setting these contact gaps.

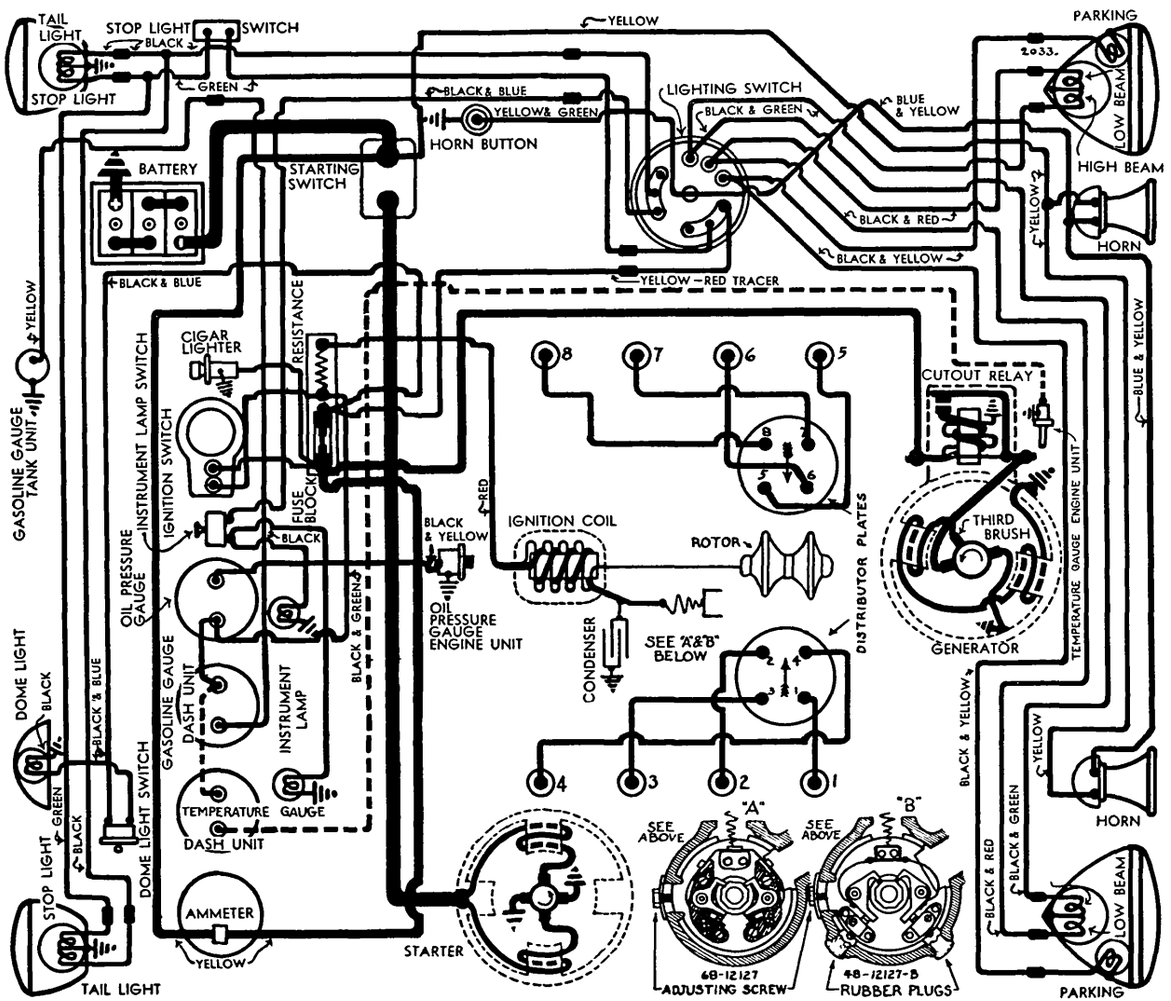
Cam Angles—Closed 35-37½°. Open 7½-10°. Same as previous type distributor due to new breaker arm design.

Breaker Arm Spring Tension—20-24 ounces.

Condenser—Part No. 18-12300-B. Capacity .33-.36 mfd.

Automatic Advance

(High Vacuum—Vacuum Brake Inoperative)



Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
2	300	4	600
3	375	6	750
5	600	10	1200
8	950	16	1900

Distributor Removal:—At front of engine. To remove, disconnect vacuum line and take out 3 capscrews in mounting flange.

IGNITION TIMING:— Flywheel Degrees Piston Pos'n
All Engines ..... 4° BTDC ..... .0058" BTDC
NOTE—See Vacuum Brake Setting section below.

To Set Timing—No flywheel marks provided. Timing designed to be set with piston on top dead center. With #1 piston on top dead center entering power stroke, loosen timing adjusting screw on left side of ignition unit, place screw in retard position at lower end of slot, move screw upward in slot until contacts begin to open. Note graduation of scale on plate under screw head in line with reference mark on housing, move screw up one additional graduation, tighten screw. This will give correct 4° BTDC. setting.

NOTE—Top dead center position of Piston #1 can be determined by inserting gauge rod in cylinder or by measuring distance to tops of pistons #2 and 3 which should be equal.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Vacuum Brake Setting:—Vacuum Brake should be adjusted for best performance with particular fuel or operating conditions. To adjust, loosen locknut, back off adjusting screw until engine 'pings' under load, turn up adjusting screw just enough to eliminate ping, tighten locknut.

Firing Order:—1-5-4-8-6-3-7-2 with cylinders numbered as indicated on diagram.

Spark Plugs:—Champion No. 7. 18 MM. Metric.

Spark Plug Gaps:—.025".

CARBURETION:—Carburetor—Stromberg Model EE-1, 1" dual, downdraft type. Various type used as follows:

Ford Part No.	Service
48-9510-D	Std. on Models 68, 67.
67-9510-A	Part production Models 68, 67, 51.
SE-67-9510	Service option on all models.
67-9510-B	Altitudes of 5000-10000 ft.
67-9510-C	Altitudes of 10000-15000 ft.
67-9510-D	Altitudes above 15000 ft.

See Carburetion Section for complete adjustment, overhaul and Jet Specifications. Adjustment on all models is similar.

NOTE—Do not adjust carburetor until engine is warmed up and idling at hot or slow idling speed with choke valve wide open.

Idle Adjustment—Manufacturer recommends use of vacuum gauge and adjustment of idling screws for highest vacuum reading. If vacuum gauge not used, adjust throttle stopscrew for 5-7 M.P.H. idling speed, turn each idle adjusting screw in until engine begins to miss, out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for idling speed.

NOTE—The 67-9510A carburetor used in part production is equipped with a .97" venturi and slightly smaller main metering jet which gives better fuel economy. This model may be identified by figure '97' cast on body under connector link. Type SE-67-9510 has 13/16" venturi and smaller main metering jet (see Stromberg Jet Specifications in Carburetion Section). Both types have accelerating pump adjustment.

Accelerating Pump Setting (67-9510A, SE-67-9510 only)—Two studs provided on throttle lever for pump link connection and marked as follows:
S—3/16" shorter pump stroke for summer operat'n.
W—Normal stroke for winter or improved performance.

Fast Idle:—Integral with carburetor. Operative with choke valve closed. No adjustment required.

Air Cleaner:—AC. #1525501 oil-wetted type std., Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type R #1521764 Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—King-Seeley Electric. Ford Part No. 68-9280-A (dash unit—68 Std., 67), 68-9280-B (dash unit—68 Deluxe), 68-9275 (tank unit—all).
Model 51—K-S Telegauge hydrostatic type. Ford Part No. 51-9280-B (dash unit), 51-9275 (tank unit). See articles on each type in Carburetion Section.

VALVE TIMING:—To Check Timing—No flywheel marks or other means provided to check timing. If top dead center position for piston #1 established on flywheel, intake opening point for this cylinder will be approximately 2.96 teeth on flywheel before dead center point with piston .0327" before top dead center.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.0125-.0135". No adjustment.

Valve Spring Pressure—32-36 lbs. at 2.13" (valve closed), 62-66 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts.

Normal Oil Pressure—30 lbs. at 55 M.P.H.

BATTERY:—Ford No. 40-10655-C. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under front floor.

STARTER:—Ford No. 18-11002. Armature No. 18-11005.

Drive—Inboard Bendix Type L11FX-10.

Cranking Engine—100 R.P.M., 225 amperes at 4.75 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lb.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—Ford No. 48-11450. Operated by pedal on toeboard.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, take out two through-bolts on commutator endplate.

GENERATOR:—Model 40-10000-B (68, 67), 67-10000-A1, A2 (67, 51 Std.), 51-10000-A1, A2 (51). Armature No. 40-10005. Air-cooled. Third brush control type.

NOTE—These generators are the same except for pulley diameter and type as follows:

Generator	Pulley Diameter	Pulley Type
40-10000-B	4.30"	Single Sheave
67-10000-A1, A2	5.18"	Single Sheave
51-10000-A1, A2	4.08"	Double Sheave

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate Setting—16 amperes (hot), at 1810 R.P.M. or 30 M.P.H. (68 with 4.3" pulley).

Performance Data
Generator Hot

Amperes	Volts	R.P.M.
0	6.2	650
4	6.4	815
8	6.5	1020
12	6.6	1300
16	6.7	1810
18	6.8	3000

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—26-28 ounces.

Field Current—4.6 amperes at 6.1 volts maximum at 850-1200 R.P.M. of generator.

Removal:—Mounted on bracket at front of engine between cylinder banks with fan mounted on forward end. Driven in tandem with two water pumps by Vee belt. To remove, take off nut on bracket mounting stud.

Belt Adjustment:—Loosen nut on bracket flange mounting stud, move generator up until total side-play on belt at point midway between water pump and crankshaft pulleys is ¾-1", tighten nut.

CUTOUT RELAY:—Ford No. B-10505. Mounted on generator. Generator field lead grounded to relay mounting screw.

Cuts In—7 volts, 10 M.P.H.

Cuts Out—3 ampere maximum discharge.

Contact Gap—.015-.020".

Air Gap—.010-.015" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown 'Two-Lite,' Pre-focused type. Headlamps aimed straight ahead Upper and lower beams controlled by lighting switch handle on steering wheel.

Switches

Lighting—R.B.M. Model B-11654-B. Ford Part No. B-11657 (body and contact assembly), B-11673 (plate), B-11655-B (cover)—not furn'd assembled.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330-C
Stop and Tail	21-2	1158
All others	3	63

FUSES:—Fuse Block Ford Part No. 40-12250. Ignition resistance unit mounted on fuse block.

Lighting—20 ampere capacity on fuse block.

HORNS:—Sparton. Vibrator type. Current 6-8 amp. ea.

REPL. MANUAL 1937

NOTE:—Special Carburetors and Generators used on all models for special service as required. Service data given below for all units on each model.

Engine Hood and Side Panels—Hood now hinged at cowl and lifts from front with radiator ornament serving as hood latch (turn ornament to free latch). Side panels may be removed by taking out screw in top flange at rear and bolt at front. Washers used under screw at rear to adjust panel height.

SERIAL NUMBER:—Same as engine number. Stamped on top of clutch housing and on left frame member in front of dash bracket.

COMPRESSION:—Ratio—6.6-1 (73, 74, 75), 6.12-1 (77, 78, 79).

Pressure—(73, 74, 75) 150 lbs. at 2800 R.P.M. or approx. 105 lbs. at cranking speed. (77, 78, 79) 135 lbs. at 2500 R.P.M. or 100 lbs. at cranking speed.

VACUUM READING:—18-20" steady reading with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model 78-12024. Mounted on top of distributor housing as part of ignition unit assembly.

Ignition Current—5 amperes (stopped).

Resistor Unit—Part of No. 40-12250 assembly (includes fuse block) mounted on dash and connected in coil primary circuit.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model 78-12127. (Less coil, and distributor caps and plates). Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Setting for adjustment). Same design as used previously on Ford V8 engines (one set of contacts used to load coil, one set for ignition timing—no adjustment required).

Breaker Gap—.014-.016" (both sets). Use special two step feeler to set gap, first .014" step 'go', second .015" step 'no go'. Contact adjustment same as for second type 1936 ignition unit (eccentric adjusting screw).

Cam Angle—36° closed. 9° open. For both sets operating together with correct coil-loading lead.

Breaker Arm Spring Tension—20-24 ounces.

Condenser—No. 78-12300. Capacity .33-.36 mfd.

Automatic Advance
(High Vacuum or Vacuum Brake Inoperative)

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	825	10	1650
8	1500	16	3000

Removal:—Ignition unit mounted on front of engine. To remove, disconnect vacuum line, take off caps, take out screws in mounting flange.

IGNITION TIMING:—

	Flywheel Deg.	Piston Position
Model 73, 74, 75	4° BTDC	.0048" BTDC.
Model 77, 78, 79	4° BTDC	.0058" BTDC.

NOTE—See Vacuum Brake Setting below for adjustment dependent on type of service and fuel used.

To Set Timing—No flywheel marks provided and timing should be set with piston on top dead center. With #1 piston on top dead center entering power stroke, loosen timing adjusting screw on left hand side of ignition unit housing, place screw in retard position at lower end of slot, move screw slowly up until timing contacts begin to open, note graduation on plate under screw head which is in line with reference mark on housing, move screw up exactly one additional graduation, tighten screw. This provides correct 4° BTDC. ignition timing.

NOTE—Dead center position can be determined by inserting gauge rod in cylinder or by measuring distance to tops of #2 and #3 pistons (should be equal).

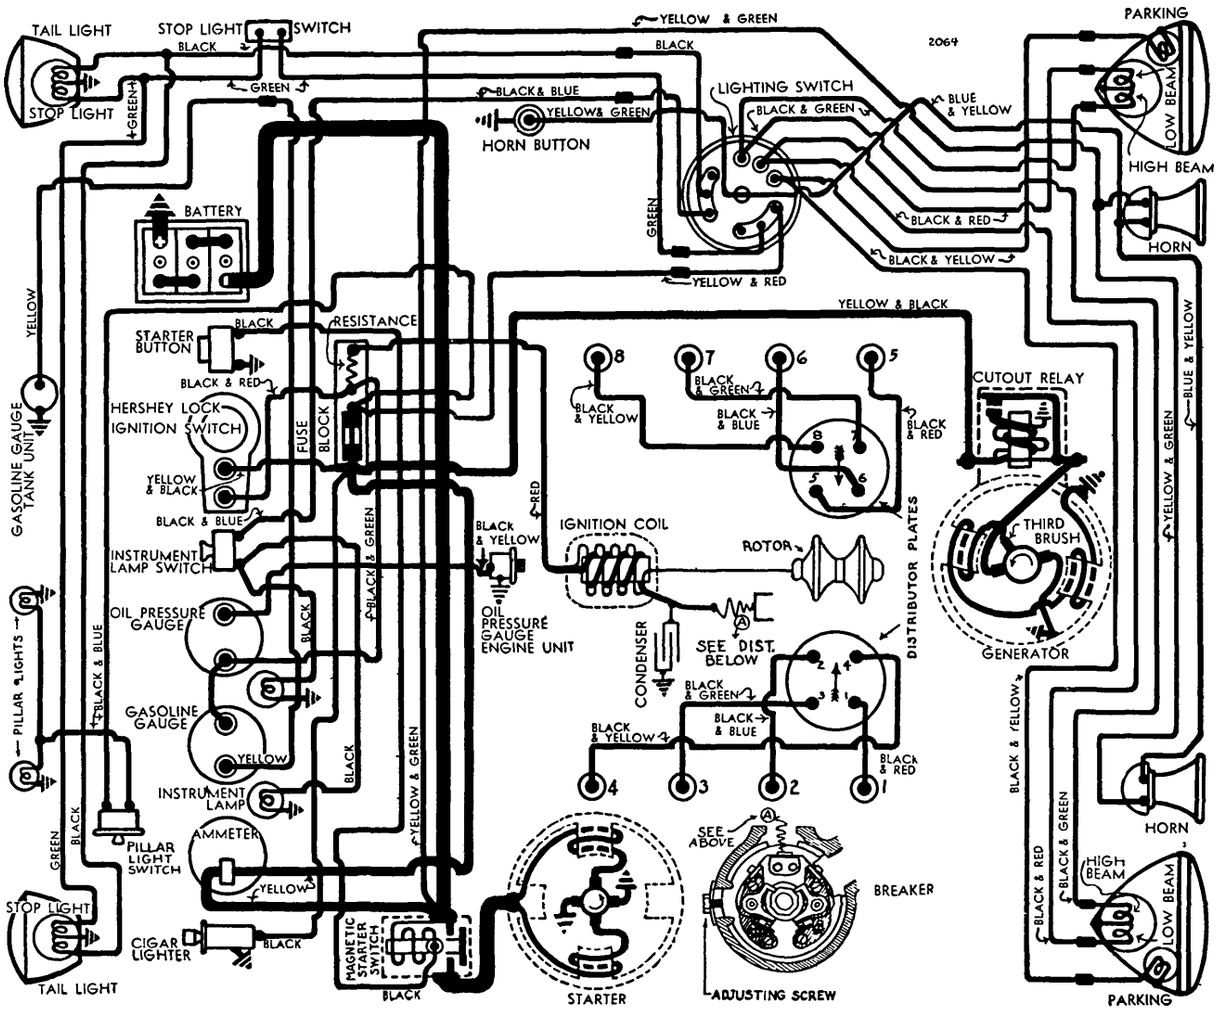
Motor Gauge—Weidenhoff Adapter #114, (73, 74, 75), #104 (77, 78, 79). Rod #40 (all models).

Vacuum Brake Setting:—To adjust, loosen locknut, back off adjusting screw until engine 'pings' under load, turn screw in just enough to eliminate ping, tighten locknut.

Firing Order:—1-5-4-8-6-3-7-2 with cylinders numbered as shown on diagram.

Spark Plugs:—(Models 73, 74, 75) Champion H-10, 14 MM. Metric. (Models 77, 78, 79) Champion No. 7, 18 MM. Metric.

Spark Plug Gaps—.025" (all models).



CARBURETION:—Carburetor—Stromberg Model EE-⅞ (73, 74, 75), EE-1 (77, 78, 79). Ford Part Nos. for carburetor models and service for which used as follows:

Service	Models 73, 74, 75	77,78,79
Standard Equipment	52-9510-B	67-9510-A
Special Service	52-9510	52-9510-B
Alt. 5000-10000 ft.	52-9510-C	67-9510-B
Alt. 10000-15000 ft.	52-9510-D	67-9510-C
Alt. Over 15000 ft.	52-9510-E	67-9510-D

NOTE—All carburetors with same prefix (52 or 67) are alike except for main metering jet size.

See article in Carburetion Section for complete data and Jet Calibrations for each model.

Idle Adjustment—Engine must be warm so that fast idle inoperative. Vacuum gauge recommended for

carburetor adjustment (adjust idle screws for highest vacuum, set throttle lever stopscrew for 5-7 M.P.H. idling speed). If vacuum gauge not used, set throttle lever stopscrew so that idling speed is 5-7 M.P.H. Turn each idle adjusting screw, in succession, in until engine begins to miss, then out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Final setting should be ⅝-¾ turn open from inner seated position. Readjust stopscrew for correct idling speed.

Accelerating Pump Adjustment—Two ball studs provided on throttle lever for pump link connection as follows:
'S'—Minimum stroke—summer operation.
'W'—Maximum stroke—winter operation.

Fast Idle—Integral with carburetor. Operative with choke valve closed. No adjustment required.

Air Cleaner—AC. #1528238 (73, 74, 75), #1528237 (77, 78, 79) oil-wetted type standard. United or Donaldson Oil-bath type optional.

Fuel Pump:—AC. Type R, #1523257 (73, 74, 75), #1523138 (77, 78, 79). Diaphragm type. See article in Carburetion Equipment Section for complete data.

Gasoline Gauge:—King-Seeley Electric. Ford Part No. 78-9280 (dash unit—all models), 78-9275 (tank unit—73, 74, 77, 78), 79-9275A (tank unit—75, 79 first 2500), 79-9275B (tank unit—75, 79 after first 2500), H-9275 (tank unit—D.S.R. Bus).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—No flywheel marks or other means provided to check timing. If dead center position for piston #1 is established on flywheel, intake opening for this cylinder (distance on flywheel before this point, and piston position) for each model is as follows:

Model	Flywheel Teeth	Piston Position
73, 74, 75	3.22	.0270" BTDC.
77, 78, 79	2.96	.0327" BTDC.

Motor Gauge—See Ignition Timing above for Weidenhoff Rod and Adapter data for each model.

Tappet Clearance:—.0125-.0135". No adjustment.

Valve Spring Pressure—	Closed	Open
73, 74, 75	26-30 lbs., 2.05"	48-52 lbs., 1.80"
77, 78, 79	35-38 lbs., 2.13"	65-72 lbs., 1.84"

LUBRICATION:—Crankcase Capacity—4 qts. (73, 74, 75), 5 qts. (77, 78, 79).

Normal Oil Pressure—30 lbs. at 3200 R.P.M. (73, 74, 75), 30 lbs. at 2600 R.P.M. (77, 78, 79).

BATTERY:—Ford No. 78-10655-A. 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Grounded Terminal—Positive (+) terminal.

NOTE—Battery grounded to metal dash by ground strap. Dash is grounded to rear corner of right cylinder head by additional ground strap.

Location—Mounted in recess in cowl on right side of engine compartment.

STARTER:—Ford No. 52-11002 (73, 74, 75), 18-11002 (77, 78, 79).

Armature—52-11005 (52-11002), 18-11005 (18-11002).

Drive—Barrel Type Bendix No. A-1806, Ford No. 52-11350 (52-11002), Inboard Bendix No. L11FX-10, Ford No. B-11350 (18-11002).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Engine—100 RPM., 225 amperes, 4.75volts.

Performance Data.

Torque.	R.P.M.	Volts.	Amperes.
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R.B.M. Model 2220, Ford No. 78-11450 (except Bus), 70-11450 (Bus). Magnetic type mounted on right side of engine dash above starter. Controlled by pushbutton switch on instrument panel, (R.B.M. Model 3200, Ford No. 78-11500).

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, take out two through bolts on commutator end plate.

GENERATOR:—Various types used for special service on each model. These generators alike except for pulley diameter which determines at what car speed maximum output is secured.

Model	Generator	Pulley Diameter	Service
73,74,75	BB-10000-D	3.70"	Std. Equipment
77,78	40-10000-B	4.30"	Std. Equipment
77,78	78-10000-HA	4.20"	Low Speed
77,78	78-10000-HB	3.40"	High Speed
79	79-10000-B		Std. Equipment
75,79	79-10000-H	4.00"	Spec. Equipment

Armature—Ford No. 18-10005-A (BB-10000-D, 40-10000-B), 78-10005-H (78-10000-HA & HB), 79-100005 (79-10000-B & H).

Type—Third brush control type. Air-cooled. Two-Rate Charge Regulator optional where higher capacity required.

Maximum Charging Rate—15 amperes (hot) at 28-30 M.P.H. depending on diameter of pulley installed on car.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Performance Data.

Amperes	Volts	R.P.M.
0	6.2	650
4	6.4	820
8	6.5	1025
12	6.6	1300
16	6.7	1800
18	6.8	3000

Performance Data—78-10000-HA, HB.

0	6.2	660
5	6.4	790
10	6.55	900
15	6.7	1030
20	6.95	1180
25	7.3	1400
30	7.6	1800
31.6	7.7	2000

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—26-28 ounces.

Field Current—4.6 amperes at 6.1 volts maximum at 800-1200 R.P.M. of generator.

Removal:—Generator mounted on bracket at front of engine between cylinder banks with fan mounted on forward end. Driven in tandem with two water pumps by Vee Belt. To remove, take off nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket flange mounting stud, move generator up until total side movement on belt midway between generator and water pump pulleys is 1", tighten nut.

CUTOUT RELAY:—Ford No. B-10505 (Std. on all models). Mounted on generator field frame. Generator field lead grounded to mounting screw.

Cuts In—7 volts.

Cuts Out—3 ampere maximum discharge.

Contact Gap—.015-.020".

Air Gap—.010-.015" with contacts closed.

RELAY-REGULATOR:—Ford No. 68-10505 (Spec. Equipment on all models). Consist of Cutout Relay and Voltage Regulator (Two-Rate Relay). Mounted on generator field frame. See article in Electrical Equipment Section for complete data (all data same as for No. 40-10505).

LIGHTING:—Headlamps—Corcoran-Brown 'Two-Lite', Pre-focused type. Headlamp beams aimed straight ahead with top of beam 30½" above floor at 25' (upper beams lighted). Upper and lower beams controlled by lighting switch handle on steering wheel.

Switches.

Lighting—R.B.M. Model B-11654-B, Ford No. B-11657 (Switch Body), B-11655-B (lower cover). Complete switch furnished only as assembly with wiring harness as follows: 78-11653 (74, 78), 77-11653-A (73, 77 Std.), 77-11653-B (73, 77 Deluxe). 79-11653-A (75, 79 Std.), 79-11653B (75, 79 Del.).

Instrument Lamp—Ford No. 50-13740 (73, 75, 77, 79), 78-13740 (74, 78).

Dome Lamp—B-13752-A (all models).

Stop Lamp—48-13480 (73, 74, 77, 78), BB-13480-A (75, 79).

Bulb Specifications.

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking (except 79)	1½	55
Parking (79)	3	63
Instrmt., Tail, Pillar	3	63
Stop and Tail	21-3	1158

FUSES:—Fuse Block—R.B.M. Model 40-12250. Ignition resistor unit mounted on assembly.

Fuse Capacity—20 ampere.

HORNS:—Sparton, Vibrator Type. One horn Standard, Twin horns standard on Deluxe models, optional on others. Horns mounted below radiator within grille.

Car Model.	Horn (Ford No.).

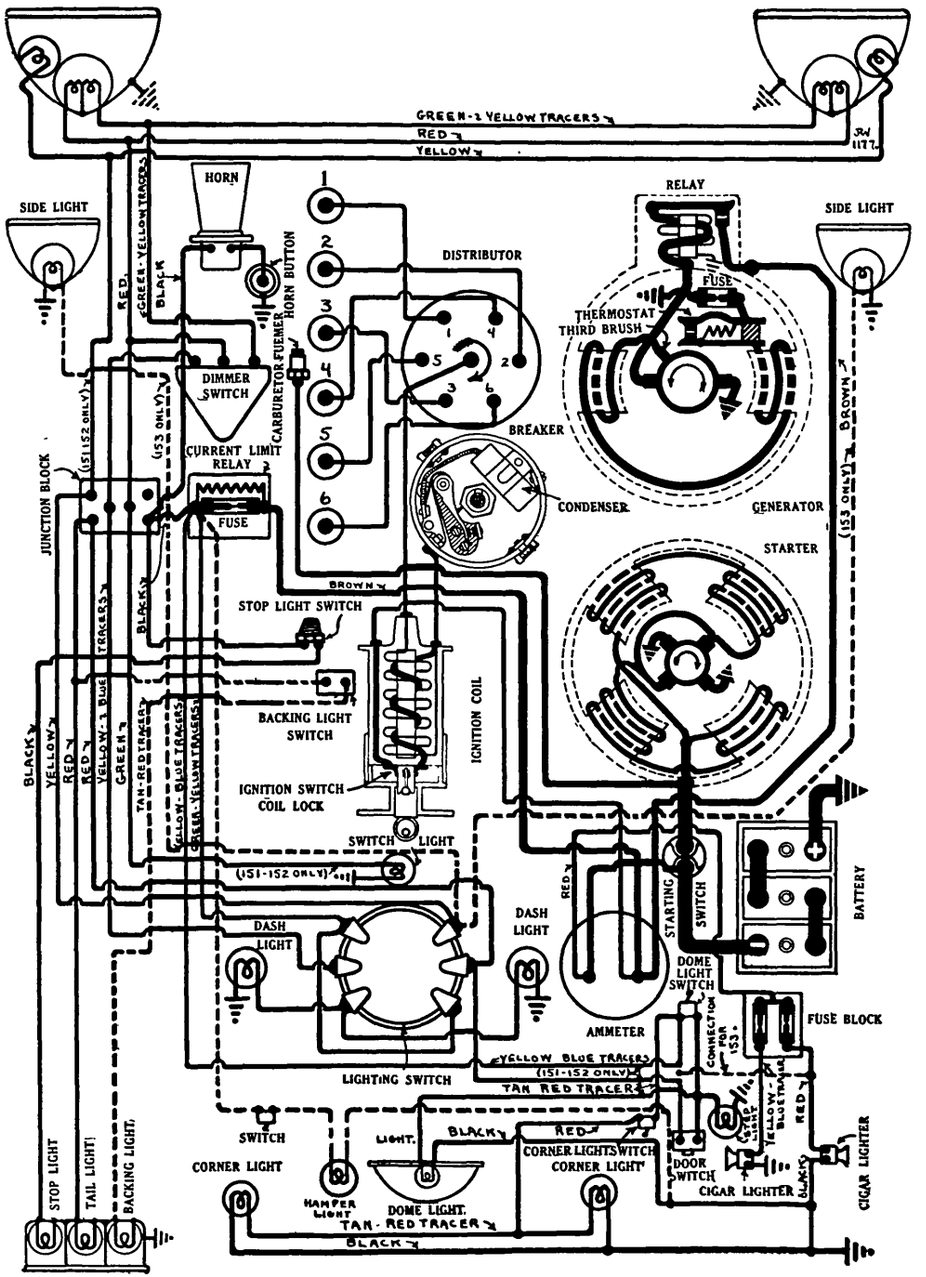
FRANKLIN

SERIES 14 (1930), 15 (1931).
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—**National, Type 619-SM, 6 volt, 165 ampere hour.** The positive (+) terminal is grounded. The battery is mounted under the right front seat and is grounded to the right frame member.

IGNITION:—**Coil Model 532-C and Z.** The ignition switch is built in the base of the coil (532-Z) used on Transcontinental models. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. The 532-C coil, used on De Luxe models, is mounted on the back of the dash but is not of the coil lock type. A separate lock ignition switch is used. Ignition current is 1.7-2 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 642-P. Breaker contact gap should be .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate (directly behind breaker arm) and turning eccentric adjusting screw. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 31 degrees reached at 2200 R.P.M. The distributor manual advance is controlled by a spark button on the instrument panel. The normal position is with distributor advanced (button pushed in toward the dash). Pulling out the button provides retard for starting and full load operation at low speeds.



Mounting:—Distributor is mounted on the crankcase at the right of the engine. To remove distributor, disconnect the primary lead and remove the distributor cap with cables intact. Then loosen advance arm clamp bolt and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one half turn every month or each 1000 miles of operation. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put a drop of oil on the breaker arm pivot pin and place a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position one inch before top dead center (measured on the fan wheel) with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control (push the spark button all the way in toward the dash) and see that the distributor is rotated counter-clockwise as far as possible. Remove the inspection cover over the fan wheel at the front of the engine on the right side. Turn the engine over until the fan wheel mark '0', which is the top dead center mark for cylinder No. 1, is one inch before or to the right of the indicator line on the fan wheel housing. Then loosen the advance arm clamp bolt and rotate the distributor until the contacts begin to open. Tighten the clamp bolt and see that the distributor head segment which is opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are 18 MM. Metric. Champion No. 7. Gaps are .025 inch.

FRANKLIN

SERIES 14 (1930), 15 (1931).
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

VALVE TIMING:—INLET VALVES. Head diameter, 1 27/32 inches. Stem diameter, .3725-.3715 inch. Stem length, 6.214-6.144 inches over all. Valve lift, 5/16 inch. Spring pressure, 50 pounds (valve closed), 100 pounds (valve open). Tappet clearance, .003 inch (hot). Inlet valves open 28 degrees after top dead center and close 36 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 21/32 inches. Stem diameter, .3725-.3715 inch. Stem length, 5.256-5.276 inches over all. Valve lift, 5/16 inch. Spring pressure, 50 pounds (valve closed), 100 pounds (valve open). Tappet clearance, .006 inch (hot). Exhaust valves open 52 degrees before lower dead center and close 8 degrees before top dead center. Valve stem guides are removable. Valves with oversize stems are not made. The tappet clearance must be adjusted with the engine hot and running at idling speed.

To check the valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .036 inch and insert a .005 inch feeler gauge to be used to determine when valve opens. Turn engine over almost one complete revolution and stop when the tension on the .005 inch feeler indicates that the valve is about to open. The '0' mark on the fan wheel should be between 3 3/16 and 4 3/16 past the indicator line on the fan wheel housing. To set valve timing, assemble the camshaft sprocket on the camshaft so that the '0' mark on the sprocket lines up with the '0' on the camshaft flange. Turn the camshaft and crankshaft so that the '2' marks on the sprockets line up and assemble the timing chain.

STARTER:—Model 723-C. Starter is connected to the engine through a set of reduction gears and a Bendix drive. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Starter cranks the engine at 175 R.P.M. drawing 135 amperes at 5 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 408-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5	70
2 "	2550	5	135
22 "	Lock	3.0	600

Mounting:—Starter is flange mounted at the right of the engine on the forward face of the clutch housing. To remove the starter, disconnect the cable and fuemer lead and take out three flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the three starter bearing oilers every month or each 1000 miles of operation. Once each year remove the grease plug in the reduction gear case and pack gear compartment with graphite grease.

GENERATOR:—Model 957-E. Generator current regulation is by third brush shunt field and thermostat. The direction of rotation is counter-clockwise, viewed from the commutator end. The thermostat contacts open at 190°F. cutting the resistance connected across the contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the locking screw on the outside of the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 18 amperes at 8.6 volts reached at 1700 R.P.M. or 27 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.4-8.6	1800	11-14	7.5-7.8	1900-2100

A five ampere field fuse mounted under a plug on the end plate is connected in the field circuit. Shunt field current is 4 amperes at 6 volts. Generator motoring, draws 5.5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the timing chain case. To remove generator, disconnect the lead and take out the two upper flange mounting cap screws. Remove the nut on the lower flange mounting stud but do not disturb the nut on the forward end of the stud. Pull generator to the rear to disengage drive coupling and lift from place. The drive sprocket is mounted on a journal between the generator flange and the chain case which permits removal of the generator without disturbing the chain or the valve timing.

Adjustment of Timing Chain. The tension of the timing chain is adjusted by shifting the generator. To take up the timing chain, loosen the two upper flange mounting screws and the nut on the forward end of the lower mounting stud. Then turn up on the adjustment set screw until there is ⅜-½ inch up and down play on the chain between the generator sprocket and the camshaft sprocket. This can be checked by removing the timing chain inspection plug in the top of the chain case. Then tighten the mounting screws and stud nut. With the proper adjustment the chain should run noiselessly. If the chain hums with the engine running, the adjustment is too tight and the generator must be backed off slightly.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles of operation. The drive end bearing is oiled from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 680 R.P.M. or 8-9 M.P.H. when the voltage of the generator reaches 6.25 volts and open with a discharge current of 1.5 amperes. Relay contact gap is .015-.025 inch. Air gap should be .014-.020 inch with contacts closed.

LIGHTING:—Hersey Lighting Switch, Delco-Remy Dimmer Switch Model 486-J. Lighting switch is mounted on the instrument panel. Headlights are equipped with double filament bulbs controlled by a dimmer switch mounted at the lower end of the steering column. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Auxiliary headlights or side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light and backing light (when used) are each 6-8 volt, 15 cp. S.C. Mazda 87. Stop light on Models 151 and 152 is 6-8 volt, 21 cp. S.C. Mazda 1129. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Corner lights on closed cars are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—This consists of a fixed resistance connected across a 20 ampere fuse. The current limit relay is connected in the lighting circuits to protect them from overload. When the current reaches 20 amperes the fuse burns out. The resistance then limits the current flow to 30 amperes.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on the Current Limit Relay is 20 ampere capacity. Lighting fuses for closed car body circuits mounted on fuse block on the dash are 30 ampere capacity.

SUPERCHARGED AIRMAN, SERIES 16 (1932), 16-B (1933), 19-A, B (1934)
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on dash under hood.

ENGINE:—Six cylinder, 'I' or overhead valve type with individual air-cooled cylinders bolted to the crankcase. Bore and stroke 3½x4¾ inches, 274 cubic inch displacement, rated at 29.4 H.P., develops 100 H.P. at 3100 R.P.M. Standard compression ratio 5.12-1. Optional compression ratios are not offered.

BATTERY:—**Willard, Type WSB-21D,** 6 volt, 21 plate, 143 ampere hour capacity (20 hour rate). Starting capacity 175 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—In crade on outside of right hand frame member under dust shield.
Dimensions:—Width, 5 7/16". Length, 20 5/16". Height, 8⅝".

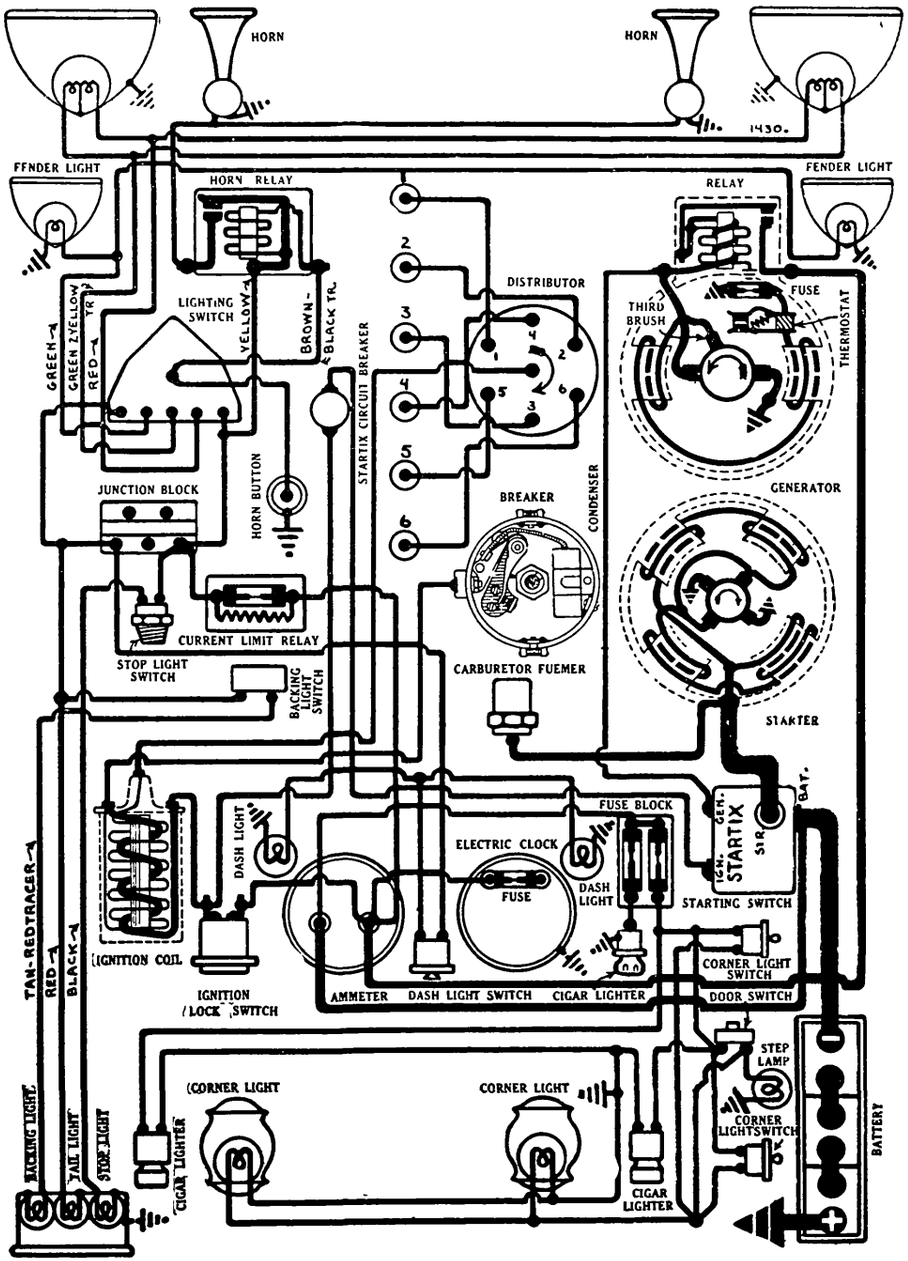
IGNITION:—**Coil Model 532-C (32-33), 533-R (34).** Coil mounted on back of instrument board on left side.
Ignition Current:—1.7-2 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).
Ignition Switch:—Clum Model 9193 lock switch mounted on instrument panel. It will be necessary to disconnect and tape wire on 'IGN' terminal of Startix case when ignition is turned on to check timing or whenever automatic cranking is not desired.

Distributor Model 643-N ('32), 644-E ('33). Single breaker, 6 lobe cam semi-automatic advance type. Manual spark advance is controlled by button on instrument panel. Push button in (toward panel) to advance spark.
Manual Advance:—25° engine (maximum).
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Cam Angles—Closed 36°, open 24° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		200	2		400
15.5		1100	31		2200

Mounting:—Distributor mounted on right side of crankcase. To remove, disconnect primary lead, take off distributor cap and cable conduit, loosen advance arm clamp bolt, lift distributor out.



Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one half turn. Keep cup filled with heat resistant grease such as Socony B-R-X2.
1000 Miles. Take off distributor cap and rotor. Fill wick oiler in center of shaft with light engine oil, put one drop on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting 6° or 1" on fanwheel before top dead center with manual spark control advanced. To set timing, advance manual spark control button (push button in toward dash), see that distributor is rotated counter-clockwise to end of advance arm slot, take off inspection hole cover in fan wheel housing at right of engine. With No. 1 piston on compression turn engine over until '0' mark on fanwheel (which is top dead center mark) is exactly 1" before or to the right of the indicator line on the housing, loosen advance arm clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, connect spark plugs as indicated on diagram.

Firing Order:—1-4-2-6-3-5. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Valves in cylinder head operated by rocker arm and push-rods at right of engine. Valve tappet adjustment at upper end of pushrods on rocker arm. Camshaft at right of engine. Driven by chain from crankshaft in tandem with generator drive sprocket. Chain adjusted manually by shifting generator (see Generator Mounting).

FRANKLIN

SUPERCHARGED AIRMAN, SERIES 16 (1932), 16-B (1933), 19-A, B (1934)

DELCO-REMY SYSTEM

To Check Valve Timing. Set tappet clearance No. 1 intake valve at .036" with No. 1 piston on top dead center entering power stroke. Place .005" feeler between rocker arm and valve stem to determine opening point, crank engine over one complete revolution and stop when tension on feeler indicates that valve is about to open (feeler will be gripped between rocker arm and valve stem). The '0' mark on the fanwheel should be between 3 3/16" and 4 3/16" past the reference line on the fanwheel housing in the inspection hole at the right of the engine.

To Set Valve Timing. Assemble camshaft sprocket on camshaft flange so that '0' marks on flange and sprocket line up. Turn camshaft and crankshaft so that '2' marks on sprockets line up and assemble chain.

Valve Specifications—1932

	Head Diameter	Stem Diameter	Valve Length	Seat Angle	Lift
Intake	1 27/32"	.3725/.3715"	6.214/6.144"	30°	5/16"
Exhaust	1 21/32"	.3725/.3715"	5.256/5.276"	30°	5/16"

Valve Specifications—1933-34

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 27/32"	.373"	5 9/32"	30°	5/16"
Exhaust	1 21/32"	.373"	5 9/32"	30°	5/16"

Tappet Clearance	Spring Pressure
Intake .007" (hot—engine idling)	48-52 pounds (total both springs
Exhaust .007" (hot—engine idling)	with valve closed)

Timing—1932

Intake Valves	Exhaust Valves
Open—28° after top dead center.	Open—52° before lower dead center.
Close—36° after lower dead center.	Close— 8° before top dead center.

Timing—1933-34

Intake Valves	Exhaust Valves
Open—28° after top dead center.	Open—48° before lower dead center.
Close—50° after lower dead center.	Close—4° before top dead center.

CARBURETION:—Stromberg Updraft Carburetor, Model U-3 (33), URO-2 (33-34) (See Carburetor Section for complete data). Heat control is automatic. Carburetor is supercharged by the air intake being connected to the cooling air housing. Supercharging action is controlled manually by button on instrument panel (pulling out button cuts out supercharging action).

Air Cleaner:—Incorporated in supercharging mechanism.

Fuel Pump:—A.C. mechanical fuel pump mounted on left hand side of crankcase (see Carburetion Section).

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—**Model 723-C.** Starter drives engine through reduction gears and an inboard Bendix drive. Starter gear reduction ratio 14 to 22. Rotation (armature shaft) clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 175 R.P.M. drawing 135 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5.0	70
2 "	2550	5.0	135
22 "	Lock	3.0	600

Starting Switch:—This model is equipped with Startix automatic starting switch. See Equipment Section for complete data on Startix and Startix Circuit Breaker. It will be necessary to disconnect wire on 'IGN' terminal of Startix case when ignition is turned on to check timing or whenever automatic cranking is not desired.

Mounting:—Starter flange mounted on right front face of flywheel housing. To remove, disconnect cable and fuemer lead, take out 3 flange mounting screws, pull starter forward to clear Bendix drive, lift out.

GENERATOR:—**Model 957-E.** Third brush regulation, thermostat control. Thermostat contacts open at 190°F. reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end. With standard setting, maximum charging rate is 18 amperes (cold) at 8.0 volts reached at 1800 R.P.M. or 27 M.P.H.

Charging Rate Adjustment. Loosen small round headed lock screw on end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.4-8.6	1800	11-14	7.5-7.6	1900-2100

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—2.8-3.5 amperes at 6 volts across field terminals.

Field Fuse:—5 ampere capacity mounted in plug on commutator end plate.

Motoring:—Approximately 4-5 amperes at 6 volts.

Mounting:—Generator flange mounted on rear face timing chain case at right of engine. To remove, disconnect lead, take out two upper flange mounting screws, take off nut on rear end lower flange mounting bolt, pull generator to rear to disengage drive coupling, lift out. Generator sprocket mounted on journal between generator and chain case. Timing chain and camshaft setting will not be disturbed by removal of generator if nut on forward end of lower bolt is not loosened.

Chain Adjustment. To take up timing chain, loosen two upper flange mounting screws, loosen nut on forward end of lower flange mounting stud, turn adjustment set screw until play in chain between generator sprocket and camshaft sprocket is ⅜-½ inch (check by removing inspection plug in top of chain case and hooking wire under chain). Tighten mounting screws and stud nut. Chain should run noiselessly with proper adjustment. If chain hums, adjustment should be backed off slightly.

RELAY:—**Model 265-B.** Relay mounted on generator. Relay contacts close at 680 R.P.M. of generator or 8-9 M.P.H. with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—**Delco-Remy Switch, Model 486-V.** Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop and Backing Lights	6-8	15	S.C.	87
Corner and Step Lights	6-8	3	S.C.	63

CURRENT LIMIT RELAY:—Mounted on dash. Consists of 20 ampere fuse connected across a fixed resistance. Fuse blows when current in line reaches 20 amperes, fixed resistance then limits current to 30 amperes.

FUSES:—Lighting fuse on Current Limit Relay 20 ampere capacity. Lighting fuses on fuse block on dash (body circuits) 30 ampere capacity. Generator field fuse 5 ampere capacity. Fuse on back of clock 5 ampere capacity.

HORNS:—Klaxon horns, Model K-18-C or K-14. Horns operated by horn relay.

Horn Relay, Model 266-T. Pressing of horn button completes horn relay circuit, energizes horn relay winding which closes horn relay contacts. Closing of horn relay contacts completes horn circuit. Horn current does not pass through horn button. Relay requires .25 amperes to close contacts. Horn relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch.

FRANKLIN

TWELVE CYLINDER, SERIES 17 (1932), 17-B (1933-34)

DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on left hand side of dash under engine hood.

ENGINE NUMBER:—Stamped on left hand side of crankcase between Nos. 3 and 4 cylinders.

ENGINE:—Twelve cylinder 60-degree 'V', 'I' or overhead valve type, 3¼x4" bore and stroke, 398 cubic inch displacement, rated at 50.7 H.P., develops 150 H.P. at 3100 R.P.M. Standard compression ratio 5.1-1. Optional compression ratios are not offered.

BATTERY:—Willard, Type RH-5-19, 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate). Starting capacity 180 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to frame.

Mounting:—In cradle on right frame member under front floor boards.

Dimensions:—Width, 7 1/16". Length, 13". Height, 9¾".

IGNITION:—Coil Model 532-C (2 used). Coils are mounted on the dash.

Ignition Current:—6 amperes at 6 volts (engine running), 10 amperes at 6 volts (engine stopped) total for both coils.

Ignition Switch:—Delco-Remy Model 427-Z.

Distributor Model 667-A. Two-breaker, 6-lobe cam, semi-automatic advance type. Breaker contacts open alternately at 30° intervals corresponding to 60° firing interval of engine. Contacts must be synchronized (see Timing). Manual advance is controlled by button on instrument board.

Manual Advance:—15 degrees (engine) maximum.

Breaker Gap:—Set contact gap at .022". Hold within limits of .018-.024".

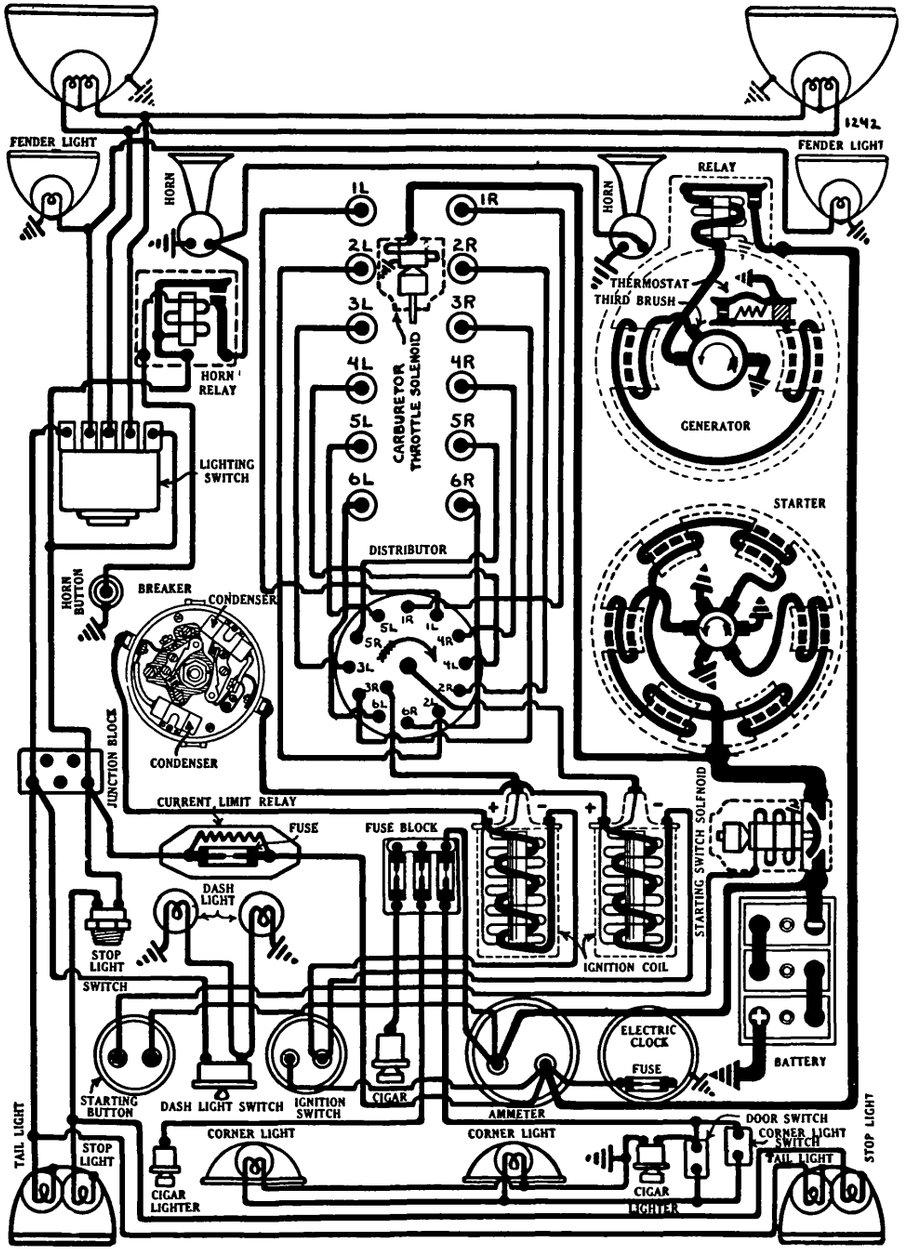
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Cam Angles—Closed 36°, open 24° (distributor), each set independently.

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	200	2	400
7	800	14	1600

Mounting:—Distributor mounted at rear of engine between cylinder banks. To remove, disconnect primary leads, disconnect manual spark control, take off distributor cap with cables intact, take out hold-down screw in advance arm, lift distributor out.



Oiling:—500 Miles. Turn down grease cup on side of shaft housing one half turn. Keep filled with heat resistant grease such as Socony B-R-X2.

1000 Miles. Take off distributor cap and rotor, fill wick oiler in center of shaft with light engine oil, put one drop oil on breaker arm pivot pins, apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting ¾" (fanwheel) before top dead center with manual spark control advanced. To set timing, advance manual spark control, take off cover on inspection hole in fanwheel housing at front of engine. With No. 6 piston (left hand bank) on compression, turn engine over until second '0' mark on fanwheel is ¾ inch before the center line mark on the fanwheel housing. Loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open, tighthen clamp bolt. Set timing for right hand bank of cylinders by synchronizing contacts.

Synchronization of Contacts—first method. After setting ignition for left hand cylinder bank (above) turn engine over two revolutions until No. 1 piston of the right bank enters compression stroke and stop with the first '0' mark on the fanwheel ¾ inch before the center line mark on the fanwheel housing. Then loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws. Contacts will then be correctly synchronized.

Synchronization of Contacts—second method. Contacts can be synchronized on a rotary spark gap by adjusting movable plate until contacts open at 30 degree intervals. After synchronizing contacts, check contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

FRANKLIN

TWELVE CYLINDER, SERIES 17 (1932), 17-B (1933-34)
DELCO-REMY SYSTEM

Firing Order:—1R-6L-4R-3L-2R-5L-6R-1L-3R-4L-5R-2L with cylinder banks right (R) and left (L) as viewed from the driver's seat and No. 1 cylinder nearest the radiator. Spark plug cables not connected in this order.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Valves in each cylinder block are operated by rocker arms on the cylinder head and pushrods on the outside of the block from an individual camshaft in the crankcase. Camshaft for left hand block is driven by chain from the crankshaft with an automatic idler take-up sprocket. Right hand block camshaft is chain driven from the crankshaft in tandem with the generator. Chain is adjusted manually (see Generator Mounting). To set timing with chain and sprockets removed from engine, mount sprockets so that '0' marks on camshaft flanges line up with '0' marks on sprockets and mesh chain so that '1' and '2' marks on crankshaft sprocket line up with the '1' or '2' marks on each sprocket.

To Check Valve Timing. Intake valves open with '0' mark on fanwheel 2½" past the indicator on the housing with .031" tappet clearance. To check timing, set tappet clearance intake valves No. 1 cylinder (right hand bank), No. 6 cylinder (left hand bank) at .031 inch, using a feeler gauge. Turn engine over one complete revolution past the firing position of No. 1R cylinder and stop with the first '0' mark on the fanwheel exactly 2½ inches past the center line mark on the fanwheel housing. No. 1R intake valve should open at this point. Turn engine over 60 degrees and stop with sec- '0' mark on fanwheel exactly 2½ inches past center mark on fanwheel housing. No. 6L intake valve should begin to open at this point. Set tappet clearance of all valves at .007 inch with engine hot and idling.

Valve Specifications

	Head Diameter	Stem Diameter	Stem Length	Valve Lift
Intake	1⅝"	.372"	6.555"	.120"
Exhaust	1 51/64"	.372"	6.555"	.120"

	Tappet Clearance		Spring Pressure
	Operating	Timing	
Intake	.007" (hot)	.031" (cold)	48-52 pounds
Exhaust	.007" (hot)	.031" (cold)	

CARBURETION:—Stromberg Downdraft Dual Carburetor, Model EE-2 (see Carburetor Section for complete data). Manifold heat control and choke operated manually by buttons on instrument panel. Carburetor is super-charged by feeding air from the cylinder cooling duct. Super-charging action is controlled by button on instrument panel.

Carburetor Control:—Delco-Remy Solenoid No. 1370. This solenoid is set to open the carburetor throttle to one third of the full open position for starting. It is connected to the starter terminal and operates for as long as the starter is cranking the engine.

Fuel Pump:—A.C. mechanical type fuel pump mounted on left hand side of crankcase and operated by eccentric on left hand camshaft (see Carburetion Section for complete data).

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—**Model 545.** Starter connected to engine through Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5.0	70
19 "	Lock	3.0	500

Starter Switch:—Delco-Remy Operating Solenoid No. 120. Starting switch is of the electro-magnetic type and consists of an operating solenoid controlled by a push button switch on the instrument panel.

Mounting:—Starter mounted on forward face of flywheel housing at right of engine. To remove, disconnect cables, take out flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 931-G. Third brush regulation, thermostat control. Thermostat contacts open at 190°F. reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 22-24 amperes at 8.6 volts (cold) reached at 1400 R.P.M. or 23-25 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on endplate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.6-9.0	1300	13.5-16.5	7.7-8.1	1700

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—3.5-4.0 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted on rear face of timing chain case at right of engine. To remove generator, disconnect lead, take out flange mounting screws at top and take off nut on rear end of lower mounting stud (do not disturb nut on forward end of stud). Pull generator to rear to disengage drive coupling, lift out.

Chain Adjustment. Check chain adjustment by taking out inspection plug in top of chain case at right of engine. Hook stiff wire under chain and measure sideplay at inspection hole. Adjust chain when sideplay exceeds ½". To take up chain, loosen two upper generator mounting screws and nut on forward end of lower mounting stud. Back off adjustment screw lock nut and turn up on adjustment screw until sideplay on chain is ⅜-½". Tighten mounting screws, nut on mounting stud and adjusting screw lock nut.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler on commutator end. Drive end bearing oiled from chain case.

RELAY:—Model 265-B. Relay mounted on generator. Relay contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-V. Lighting switch is mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Corner Lights	6-8	3	S.C.	63

CURRENT LIMIT RELAY:—Mounted on dash. Consists of a fixed resistance connected across a 20 ampere fuse. Fuse blows when current in line reaches 20 amperes and fixed resistance then limits current to 30 amperes.

FUSES:—Lighting fuse on Current Limit Relay 20 ampere capacity. Lighting fuses on fuse block on dash (body circuits) 30 ampere capacity.

HORNS:—Klaxon Horn, Model K-18-C and K-14. Horns controlled by horn relay. Current draw approximately 6 amperes each.

Horn Relay:—Model 266-T. Horn relay circuit is controlled by horn button on steering wheel. Pressing horn button completes horn relay circuit, energizes relay solenoid, closes horn relay contacts. This completes horn circuit. Horn current does not pass through horn button. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch.

FRANKLIN

OLYMPIC SERIES 18 (1933), 18-B, C (1934)

DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on left hand side of dash under engine hood. First number this series, 11001.

ENGINE NUMBER:—Stamped on left hand side of crankcase below No. 2 cylinder in back of the fuel pump. First number of this series, 5601.

ENGINE:—Six cylinder, 'I' or overhead valve type, with individual air-cooled cylinders bolted to crankcase, 3½x4¾ bore and stroke, 274 cubic inch displacement, rated at 29.4 H.P., develops 100 H.P. at 3100 R.P.M. Standard compression ratio, 5.12-1. No optional ratios are furnished.

BATTERY:—Willard, Type WH-1-13, 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate). Starting capacity 120 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to frame.

Mounting:—In cradle under right hand front compartment floor boards.

Dimensions:—Width, 7 1/16". Length, 9 1/16". Height, 9 5/16".

IGNITION:—Coil Model 533-R. Coil mounted on dash above center of toeboard.

Ignition Current:—1.7 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).

Ignition Switch:—Electrolock, Type 17-S (no armored cable). Switch has two on positions, both located to right of vertical 'off' position. With switch in first 'on' position, ignition is turned on but Startix is not operative. This position should be used in checking ignition when automatic cranking is not desired. The second 'on' position with key turned to extreme right is the regular running position of the switch with ignition and Startix operative.

Distributor Model 644-E. Single breaker arm, 6 lobe cam, semi-automatic advance type. Manual spark advance controlled by knob on instrument panel. Pulling out knob retards distributor for heavy pulling or hand cranking. Pushing in knob advances distributor 25 degrees (engine).

Breaker Gap:—Set gap at .020". Hold within limits of .018-.024".

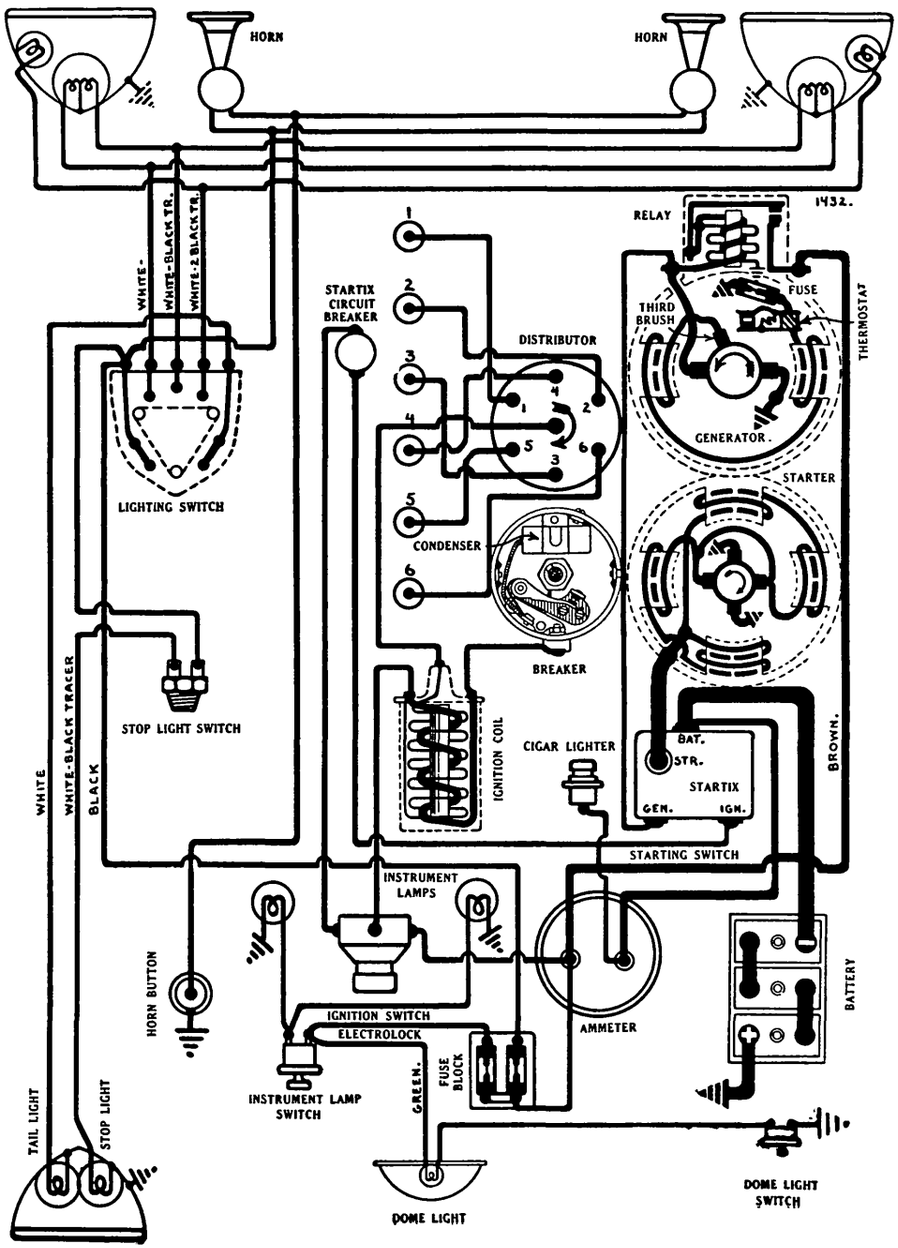
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Cam Angles—Closed 36°, open 24° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		200	2		400
15.5		1100	31		2200

Mounting:—Distributor mounted at top right center of engine. To remove, take off distributor cap, disconnect primary lead, loosen advance arm clamp bolt, lift distributor out.



Oiling:—500 Miles. Turn down grease cup on side of shaft housing. Keep cup filled with special heat resistant grease such as Socony B-R-2X.

1000 Miles. Take off distributor cap and rotor, put 5-6 drops light engine oil in wick oiler in center of shaft, put one drop oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting 6° or 1" on fanwheel before top dead center with manual spark control advanced.

To Set Ignition Timing. First advance manual spark control (push knob in toward dash) and see that distributor is rotated counter-clockwise to extent of advance arm slot (lever must be forward against stop). Take off cover plate on right hand side of fanwheel housing, take off No. 6 cylinder walking beam case cover and felt pad so that closing of No. 6 exhaust valve can be noted. Turn engine over by hand until No. 6 exhaust valve just closes (No. 1 piston will be on compression stroke) and stop when '0' mark on fanwheel is one inch before or to the right of the reference mark on the inside of the fanwheel housing. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite No. 1 segment in distributor cap. If ignition is turned 'on' to check contact opening, use first 'on' position of switch to avoid automatic cranking.

Firing Order:—1-4-2-6-3-5. No. 1 cylinder nearest radiator.

FRANKLIN

OLYMPIC SERIES 18 (1933), 18-B, C (1934)

DELCO-REMY SYSTEM

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven in tandem with generator by chain from the crankshaft. Chain is adjusted manually by shifting generator (see Generator Mounting). To set timing, assemble camshaft sprocket on camshaft flange so that '0' marks on sprocket and flange line up. Turn camshaft and crankshaft so that '2' marks on each sprocket line up and mesh chain (generator should be slacked off so that chain can be installed).

To Check Valve Timing:—With No. 1 piston on top dead center entering power stroke (both valves closed, '0' mark on fanwheel registering with reference line on fanwheel housing), set tappet clearance of No. 1 intake valve at .036" and insert .005" feeler to check valve action. Crank engine over almost one complete revolution and stop when tension on feeler indicates that valve is about to open (feeler will be gripped between rocker arm and valve stem). The '0' mark on the fanwheel should be 3 3/16-4 3/16 inches past the reference line on the fanwheel housing. If outside these limits, camshaft must be reset. Set tappet clearance at .007 inch with engine warmed up and idling.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 27/32"	.373"	5 9/32"	30°	5/16"
Exhaust	1 21/32"	.373"	5 9/32"	30°	5/16"

Tappet Clearance

Intake .....007" (hot—engine idling)
Exhaust .007" (hot—engine idling)

Valve Springs

Closed—48-52 pounds (to just seat valves).

Timing

Intake Valves		Exhaust Valves
Open ....28° after top dead center.	Open	....48° before lower dead center
Closed 50° after lower dead center	Closed	....4° before upper dead center.

Valve Grinding Note:—Cylinders must be removed from engine, valve mechanism taken off cylinder head, and cylinder head removed from cylinder (requires special tool) before valves can be ground. Special inserts are used for valve seats and spark plugs. Never attempt to remove valve seat inserts or spark plug bushings. Valves can be ground in the usual manner with cylinder head removed. In reassembling be sure that copper gasket between cylinder head and cylinder is in place, and coat gasket with Key Hot Joint Paste.

CARBURETION:—Stromberg Updraft Carburetor, Model URO-2. See Carburetor Section for complete data. Manifold heat control is automatic. Carburetor is super-charged by air intake being connected to cooling air housing. Supercharging action controlled manually by knob on left of instrument panel. Pulling out knob cuts out supercharging action.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on left side of engine (see Carburetion Section).

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

Air Cleaner:—Air Cleaner is incorporated in supercharging mechanism.

STARTER:—Model 723-C. Starter drive—through reduction gears and inboard Bendix drive with Startix automatic starting switch and Startix Circuit Breaker. See Equipment Section for complete data on Startix and Circuit Breaker. Gear reduction ratio, 14-22. Rotation of armature shaft clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 175 R.P.M. drawing 135 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5.0	70
22 "	Lock	3.0	600

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, disconnect cable, take out 3 flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put 8-10 drops medium engine oil in each of three oilers. **Yearly.** Remove plug in reduction gear case, repack gears with graphite grease.

GENERATOR:—Model 957-E. Third brush regulation with thermostat control. Thermostat contacts open at 190°F. reducing generator output 40%. Rotation is counter-clockwise at commutator end. With standard setting maximum charging rate (cold) is 19-21 amperes at 8.6 volts reached at 1800 R.P.M., or 27 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.4-8.6	1800	11-14	7.5-7.6	1900-2100

Brush Spring Tension:—14-18 ounces on each brush.

Field Fuse:—5 ampere capacity mounted in plug on commutator end plate.

Field Current:—2.8-3.5 amperes at 6 volts across field terminals.

Motoring:—4-5 amperes at 6 volts.

Mounting:—Flange mounted on right hand rear face of timing chain case and chain driven in tandem with camshaft. To remove, disconnect lead, take out two upper flange mounting screws, take off nut on rear end of lower flange mounting bolt, pull generator to rear to disengage drive coupling and lift out. Generator sprocket is mounted on a journal between generator and chain case and will not be disturbed by removal of generator if nut on forward end of lower bolt is not disturbed.

Chain Adjustment:—To adjust chain, loosen two upper generator flange mounting screws, loosen nut on forward end of lower mounting bolt, back off lock nut on adjustment set screw, and take out inspection plug in top of chain case. Then turn up adjustment screw until up-and-down play of chain midway between generator and camshaft sprockets is ⅜-½ inch (check by hooking a stiff wire under chain through the inspection hole and working wire up and down). Tighten mounting screws and lower stud nut. Chain should run noiselessly with correct adjustment. If chain hums, adjustment should be backed off slightly.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler on commutator end. Drive end bearing is oiled from the chain case.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close at 680 R.P.M. with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-V. Lighting switch mounted at lower end of steering column, controlled by lever on steering wheel. Lighting system 'depressed beam' with double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	3	S.C.	63

FUSES:—Two 20-ampere capacity fuses mounted on fuse block on back of instrument board. Generator field fuse mounted in plug on end plate is 5 amperes capacity.

HORNS:—Klaxon, Model K-26, Type 1507 (low note), 1508 (high note), vibrator type twin horns.

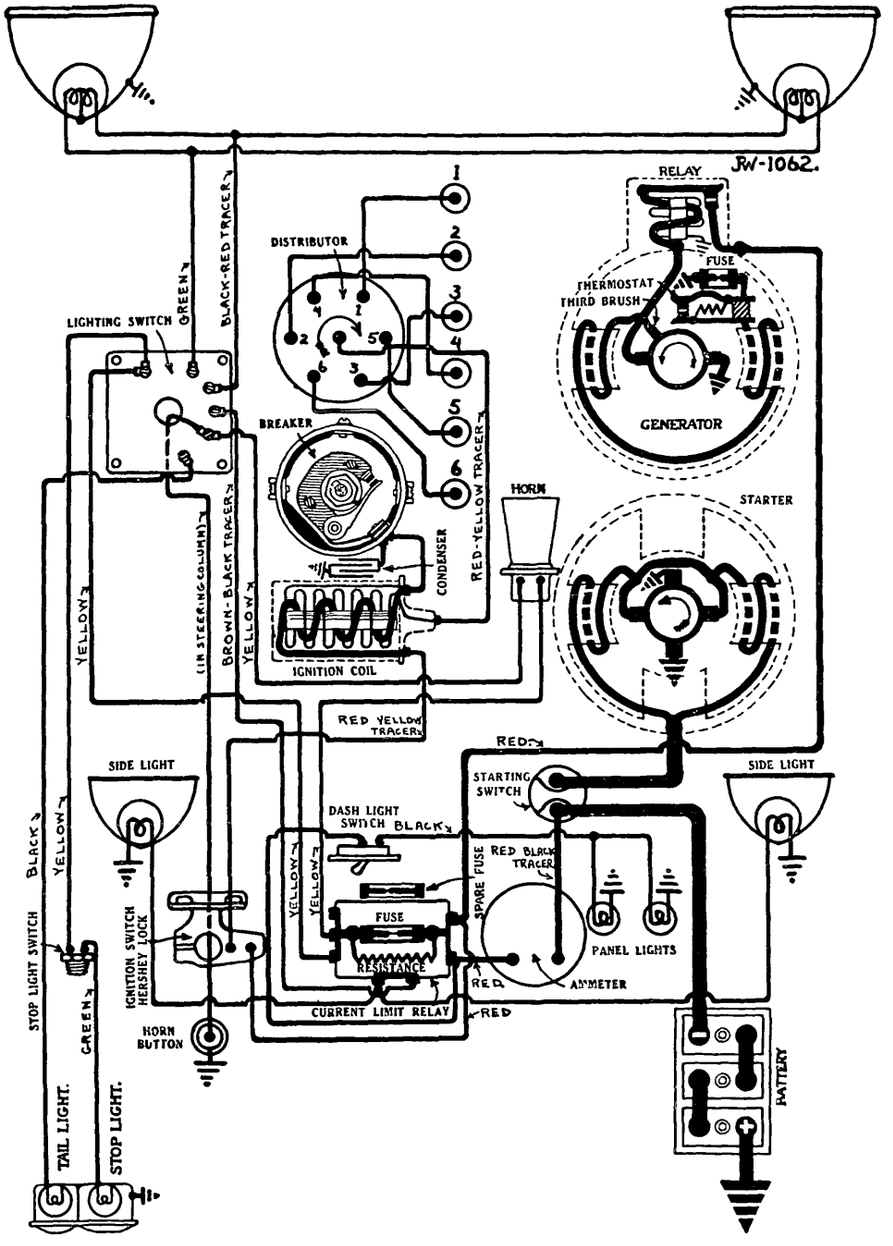
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-13, 6 volt, 86 ampere hour. The positive (+) terminal is grounded. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the back of the dash (in the front compartment). Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 639-V, K. Breaker contact gap is .018-.022 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic with an auxiliary retard controlled by the button on the dash. Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20 degrees reached at 2800 R.P.M. Manual advance is 30 degrees (engine).

Mounting:—Distributor is mounted on the cylinder head and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. Distributor can be removed without disturbing timing if the advance arm is left clamped to the distributor and the control wire and hold-down screw taken off. The distributor can then be lifted from place. In mounting distributor, make certain that the tongue on the drive shaft meshes with the slot in the oil pump shaft.



Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 1000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 1 degree or 7/64 inch (on 12½ inch flywheel) before top dead center with the spark control button pushed in corresponding to the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Make certain that spark control button is pushed all the way in and that distributor is rotated counter-clockwise as far as possible. Continue to crank engine until the flywheel mark 'Spark Full Advance' is opposite the indicator in the peephole in the front face of the flywheel housing on the right side of the engine directly above the starter. Then loosen advance arm clamp screw and rotate distributor housing until contacts begin to open. Tighten the clamp screw and connect the terminal directly opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .023-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 9/16 inches. Stem diameter, .340 inch. Stem length, 5½ inches (end of stem to top of seat). Valve lift, .3125 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .006 inch (cold). Inlet valves open at top dead center and close 40 degrees after lower dead center with the piston .4125 or 13/32 inch up on the compression stroke.

MODEL 612 (1929) SERIAL NUMBERS 848,001 UP
PRODUCTION STARTED JANUARY 2, 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .340 inch. Stem length, 5½ inches (end of stem to top of seat). Valve lift, .3175 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (cold). Exhaust valves open 40 degrees or 4.2325 inches on the flywheel before lower dead center with the piston .4125 or 13/32 inch from the bottom of the power stroke and close 10 degrees or 1.058 inches on the flywheel after top dead center with the piston 3/64 inch down on the intake stroke. Flywheel distances are correct with standard 12½ inch flywheel. Valve stem guides are removable. Oversize valves are not made.

To check valve timing, crank engine over until piston No. 1 reaches top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .006 inch. Crank engine over exactly one revolution and stop when piston reaches top dead center with flywheel mark 'D.C.1-6' opposite the indicator in the peephole at the right of the engine. The tappet clearance should be entirely taken up and the inlet valve beginning to open at this point.

To Set Valve Timing. Turn crankshaft until No. 1 piston is on top dead center with the dead center mark on the flywheel opposite the indicator. Then turn camshaft in direction of rotation until No. 1 inlet valve begins to open. Assemble the timing chain so that there are exactly 14 links between the marks on the camshaft sprocket and the crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory drive bracket. To take up timing chain, loosen the two mounting nuts on the bracket and back off the adjustment screw lock nut. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting nuts and lock nut.

STARTER:—Model 713-K. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush spring tension is 24-28 ounces. Starter cranks the engine at 120 R.P.M. drawing 150-200 amperes. Starter switch is Model 406-K.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.6	475

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove nuts on flange mounting studs. Pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles. The drive end bearing is oilless.

GENERATOR:—Model 955-Q, 955-C. The direction of rotation is counter-clockwise, viewed from the commutator end. Current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 10.5 amperes (hot) reached at 2000 R.P.M. or 30 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.7	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces. A 6 ampere field fuse is mounted on the generator end plate and can be removed by taking out the plug over the fuse mounting.

Mounting:—Generator is cradle mounted at right of engine and is driven by an extension of the water pump shaft. To remove generator, disconnect lead and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Headlights have double filament bulbs instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Instrument panel lights and tail light are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Lighting switch is Briggs and Stratton Model 40658. Stop light switch screws in forward end of Lockhead brake master cylinder at left of engine. Starter switch is mounted on the toeboard.

CURRENT LIMIT RELAY:—This device is connected in the lighting lines. It consists of a fuse block mounted on the dash with a fixed resistance connected across a 20 ampere capacity fuse. When the current of the lighting lines reaches 20 amperes the fuse will blow out causing the current to flow through the resistance. The resistance will limit the current flow to 30 amperes

FUSES:—Generator field fuse is 6 ampere capacity. Lighting fuse on block on dash is 20 ampere capacity.

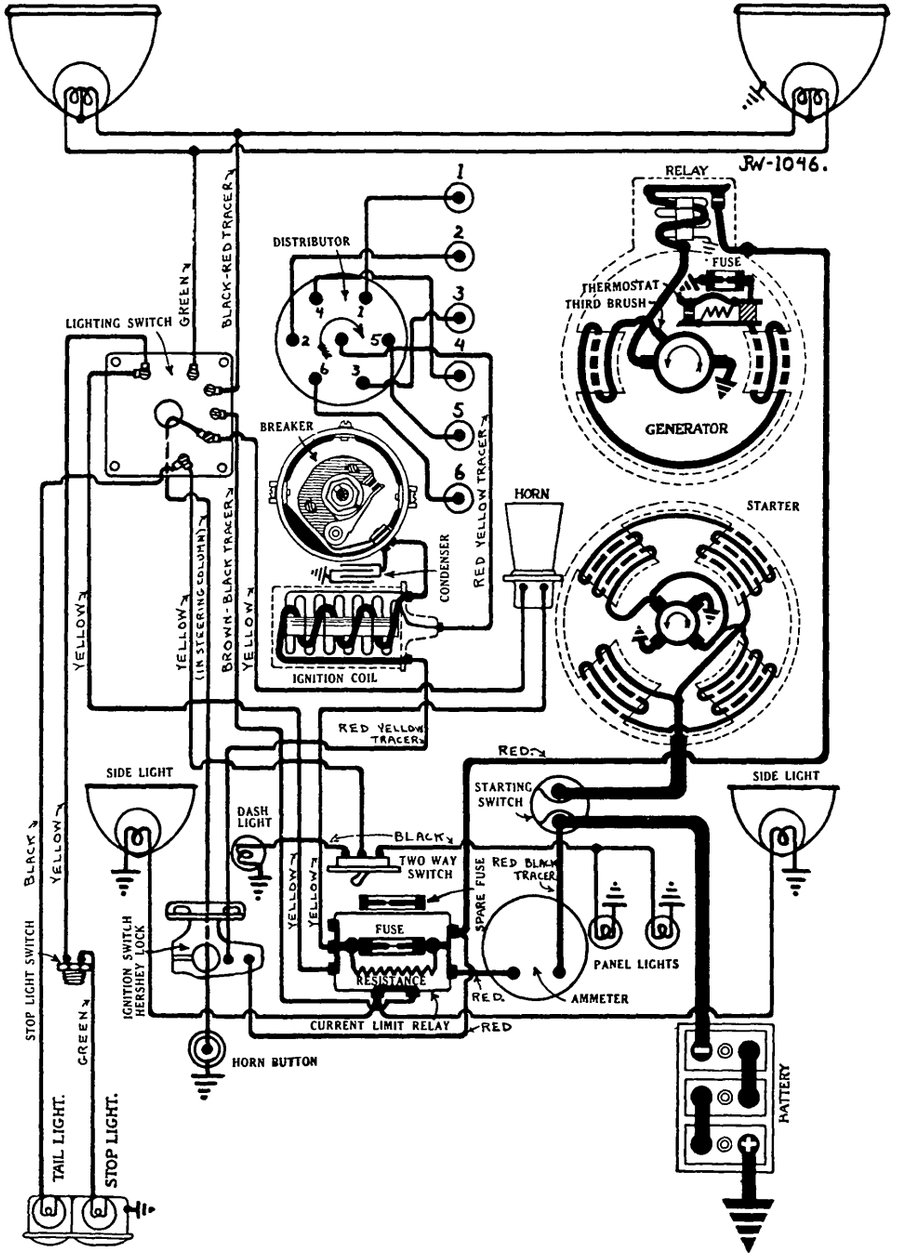
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model 528-C. Ignition coil is mounted on the rear of the dash in the front compartment. Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 639-W, 640-W. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock screw on crescent stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic with an auxiliary retard controlled by a button on the dash. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 20 degrees reached at 2600 R.P.M. (engine). Manual advance is 30 degrees (engine).

Mounting:—Distributor is mounted on the cylinder head and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. Distributor can be removed without disturbing timing if the advance arm is left clamped in place and the control wire and hold-down screw are disconnected. The distributor can then be lifted from place. In mounting distributor, make certain that the tongue on the end of the distributor shaft fits into the slot in the end of the drive shaft. The tongue is offset so that the distributor cannot be assembled incorrectly.



Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 1000 miles remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 1 degree or ⅛ inch (on standard 14⅛ inch flywheel) before top dead center with the spark control button in the fully advanced position (pushed all the way in to the dash). To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control button and make certain that distributor housing is rotated counter-clockwise as far as possible. Then continue to crank engine until flywheel mark 'Spark Full Advance' is opposite the indicator in the peephole in the front face of the flywheel housing on the left of the engine. Loosen advance arm clamp screw and rotate distributor housing until contacts begin to open. Tighten the clamp screw and connect the terminal directly opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .023-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 9/16 inches. Stem diameter, .340 inch. Stem length, 5½ inches (end of stem to top of seat). Valve lift, .3125 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clear-

ance, .006 inch (cold). Inlet valves open at top dead center and close 40 degrees or 4.931 inches on the flywheel after lower dead center with piston .4125 or 13/32 inch up on compression stroke.

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .340 inch. Stem length, 5½ inches (end of stem to top of seat). Valve lift, .3175 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (cold). Exhaust valves open 40 degrees or 4.931 inches on the flywheel before lower dead center with the piston .4125 or 13/32 inch from the bottom of the power stroke and close 10 degrees or 1.232 inches on the flywheel after top dead center with the piston .0422 or 3/64 inch down on inlet stroke. Flywheel distances are correct for standard 14⅛ inch diameter flywheel. Valve stem guides are removable. Oversize valves are not made.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke and set tappet clearance of No. 1 inlet valve at .006 inch. Turn engine over one complete revolution and stop with piston on top dead center with flywheel mark 'D.C.1-6' opposite the indicator in the peephole at the left of the engine. The tappet clearance should be taken up and the inlet valve beginning to open at this point.

To Set Valve Timing. Turn the crankshaft until piston No. 1 is on top dead center with the dead center mark on the flywheel opposite the indicator. Then turn camshaft in direction of rotation until No. 1 inlet valve is about to open. Assemble the timing chain with exactly 14 links between the marks on the camshaft sprocket and crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory shaft bracket. To take up timing chain, loosen flange mounting nuts and back off lock nut on adjustment screw. Turn up adjustment screw until chain begins to hum with engine running. Back off adjustment until chain runs noiselessly and tighten mounting nuts and lock nut.

STARTER:—Model 718-E. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 120 R.P.M. drawing 150-200 amperes. Starter switch is Model 406-K.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove nuts on flange mounting studs. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles. The drive end bearing is oilless.

GENERATOR:—Model 957-B. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 10.5 amperes (hot) reached at 1650 R.P.M. or 26 miles per hour.

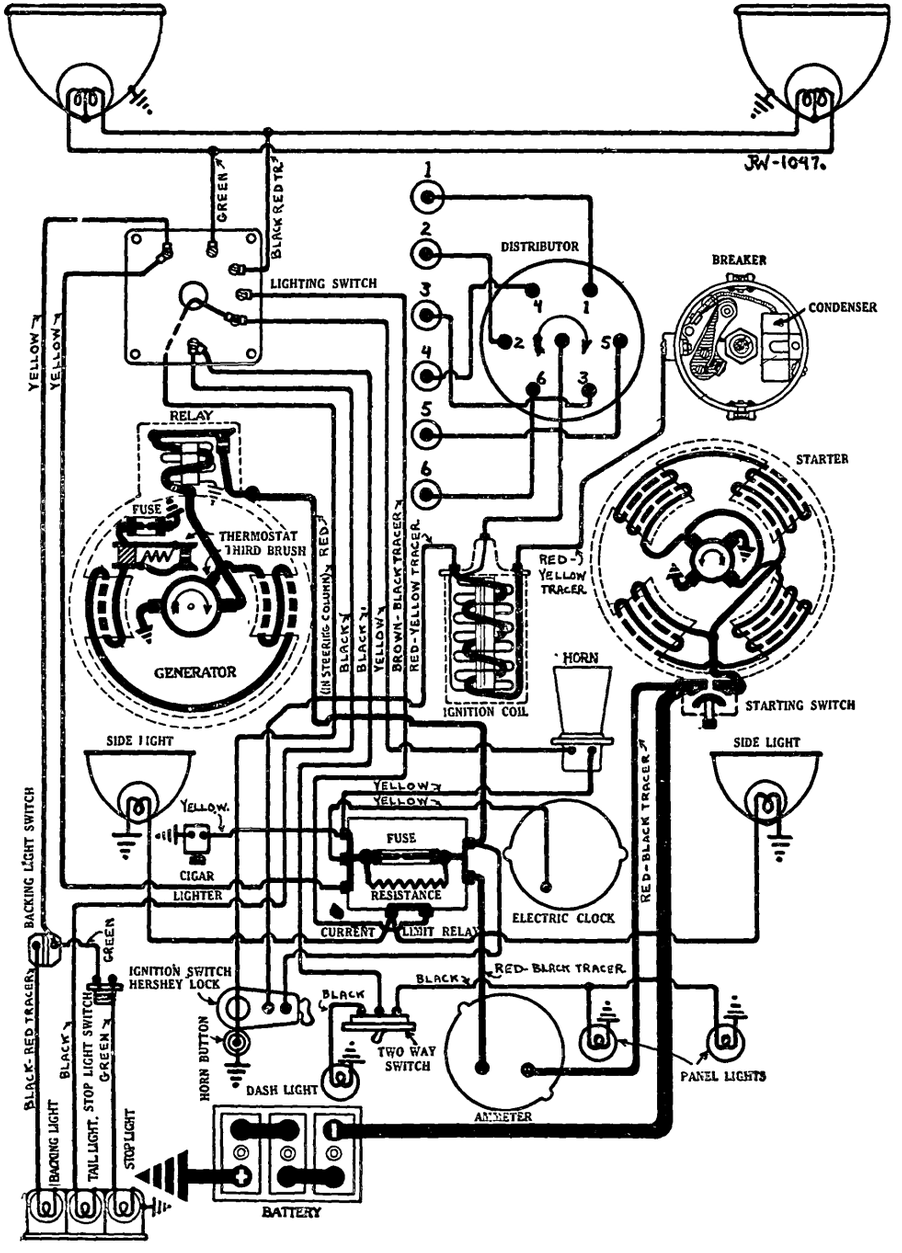
BATTERY:—Willard, Type WSB-17, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22.5 hours. Battery is mounted under driver's seat on the right side.

IGNITION: Coil Model 528-C. Ignition coil is mounted on the back of the dash and is accessible from the driving compartment. Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 640-U. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock screw on stationary contact mounting plate directly behind breaker arm and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is full automatic with an auxiliary retard controlled by a button on the dash. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 22 degrees reached at 2600 R.P.M. (engine). Manual advance is 30 degrees (engine).

Mounting:—Distributor is mounted on the cylinder head and can be removed from the right side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. The distributor can be removed without disturbing timing if the advance arm is left clamped to the distributor housing and the spark control wire is disconnected and the hold-down screw removed. In replacing distributor, make certain that the tongue on the end of the distributor shaft fits in the slot in the end of the drive shaft. The tongue is offset so that the distributor cannot be mounted incorrectly.



Oiling:—Fill the grease cup on the side of the distributor housing with medium cup grease and turn down one turn every two weeks or each 500 miles. At the same time, remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 6 degrees before top dead center with the spark control button in the fully advanced position (pushed all the way in toward the dash). To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Make certain that spark control button is in the advanced position and that distributor housing is rotated counter-clockwise as far as possible. Continue to crank engine until piston reaches the firing position when the flywheel mark 'Spark Full Advance' will be opposite the indicator in the peephole in the forward face of the flywheel housing at the right of the engine directly above the starter. Then loosen the advance arm clamp screw and rotate the distributor until contacts begin to open. Tighten the clamp screw and connect the terminal directly opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .023-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 27/32 inches. Stem diameter, .340 inch. Stem length, 6 41/64 inches (end of stem to top of seat).

GRAHAM PAIGE

MODEL 621 (1929) SERIAL NUMBERS 608,001 UP
PRODUCTION STARTED JANUARY 2, 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Valve lift, .341 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (cold). Inlet valves open at top dead center and close 45 degrees after lower dead center with piston 37/64 inch up on compression stroke.

EXHAUST VALVES:—Head diameter, 1¾ inches. Stem diameter, .340 inch. Stem length, 6 41/64 inches (end of stem to top of seat). Valve lift, .341 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (cold). Exhaust valves open 50 degrees or 6 59/64 inches before lower dead center with the piston 23/32 inch from the bottom of the power stroke and close 10 degrees or 1 25/64 inches on the flywheel with the piston 3/64 inch down on inlet stroke. Distances are correct for standard 15⅞ inch diameter flywheel. Valve stem guides are removable. Oversize valves are not made.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Turn engine over one complete revolution and stop with the piston at top dead center with the flywheel mark 'D.C.1-6' opposite the indicator in the peephole at the right of the engine. The tappet clearance should be taken up and the valve about to open at this point.

To Set Valve Timing. Turn crankshaft over until piston No. 1 reaches top dead center with the dead center mark on the flywheel opposite the indicator. Then turn camshaft in direction of rotation until No. 1 inlet valve is about to open. Assemble the timing chain so that the marks on the camshaft sprocket and the crankshaft sprocket are together and in line with a straightedge laid across the two shaft centers. An automatic idler take-up is used. The timing chain passes over the crankshaft sprocket and under the idler sprocket.

STARTER:—Model 725-G. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 90 R.P.M. drawing 150-200 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3.2	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and pedal rod linkage and remove nuts on flange mounting studs. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles.

GENERATOR:—Model 957-C. The direction of rotation is clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165° F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 10.5 amperes reached at 1400 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.5	1300	10.5	7.5	1300-1500

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by an extension of the water pump shaft. To remove generator, disconnect lead and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Headlights have double filament bulbs instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81. Instrument panel lights and tail light are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switch:—Lighting switch is Briggs and Stratton Model 40658.

CURRENT LIMIT RELAY:—This device is connected in the lighting lines. It consists of a fuse block mounted on the dash with a fixed resistance connected across a 20 ampere capacity fuse. When the current of the lighting lines reaches 20 amperes the fuse will blow out causing the current to flow through the resistance. The resistance will limit the current flow to 30 amperes

FUSES:—Generator field fuse mounted on the end of the generator is 6 ampere capacity. Lighting fuse mounted on block on dash is 20 ampere capacity.

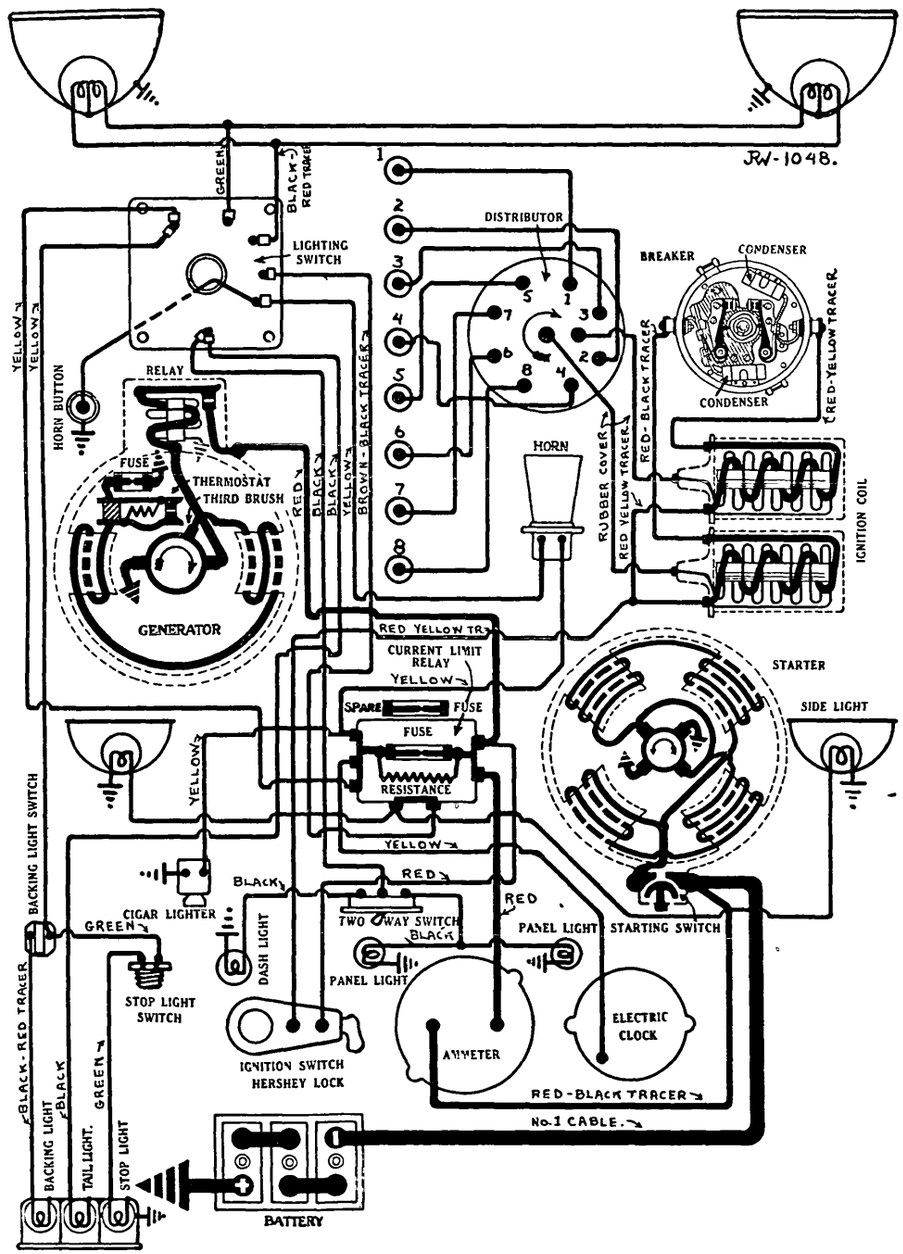
MODEL 837 (1929) SERIAL NUMBERS 848,001 UP
CUSTOM EIGHT (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-17, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22.5 hours. Battery is mounted under the driver's seat on the left side.

IGNITION:—Coil Model 528-C (2 used). Coils are mounted on the back of the dash. Ignition current is 3.6 amperes at 6 volts with engine running and 8 amperes at 6 volts with engine stopped.



Distributor Model 668-D ('29) **668-J** ('30). Breaker gap .022". Adjust contacts by loosening lock screw on stationary contact mounting plate direcly behind breaker arm and turning eccentric adjusting screw until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Breaker has two sets of contacts operating on a four sided cam. Each set of contacts controls one coil and fires the spark plugs in four cylinders. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Graham Paige engine and contacts must be synchronized for correct performance. See Timing. Distributor is full automatic with an auxiliary retard controlled by a button on the dash to prevent engine laboring under load and to provide retard for starting. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 22 degrees reached at 2600 R.P.M. (engine). Manual advance is 15 degrees (engine).

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. Distributor can be removed without disturbing timing if the advance arm is left clamped to the distributor and the manual advance wire is disconnected and the hold-down screw in the advance arm is removed. When replacing distributor make certain that the tongue on the end of the distributor shaft is engaged in the slot in the drive shaft. The tongue and slot are offset so that the distributor can not be assembled incorrectly.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 1000 miles remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1835009, and follow direction in Equipment Section to synchronize contacts. Contacts can be synchronized without tool after distributor is timed to engine by cranking engine over 90 degrees when piston No. 6 will reach firing position. If the second set of contacts do not separate at this point, loosen the two lock screws on breaker plate and turn eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the contact gap with the breaker arm on the lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine:—Breaker contacts begin to separate when piston #1 entering power stroke is 8° (827, 37 '29) 4° (Cust. '30) before top **dead center when the flywheel mark 'Spark Full Advance' is opposite the indicator in the peephole in the front face of the flywheel on the right f**

DELCO-REMY IGNITION

the engine with the manual spark control button in the fully advanced position or pushed in toward the dash. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Place spark control button in fully advanced position. Continue to crank engine until flywheel mark is opposite the indicator. Then loosen advance arm clamp screw and rotate distributor until one set of contacts begin to open. Tighten the clamp screw and connect the terminal opposite the rotor contact which is connected to the center terminal in the distributor head to the spark plug in cylinder No. 1. Connect remaining spark plugs in order 3-2-4-8-6-7-5 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Spark plug cables are not connected in this order (see diagram).

Spark Plugs:—Spark plugs are 18 MM. Metric. Gaps are .023-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches. Stem diameter, .371 inch. Stem length, 5 7/16 inches (end of stem to top of seat). Spring pressure, 39-49 pounds (valve closed). Valve lift, .370 inch. Tappet clearance, .008 inch (cold). Inlet valves open 2 degrees or .277 inch on the flywheel after top dead center and close 47 degrees or 6.51 inches on the flywheel after lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/16 inches. Stem diameter, .371 inch. Stem length, 5 7/16 inches (end of stem to top of seat). Valve lift, .370 inch. Spring pressure, 39-49 pounds (valve closed). Tappet clearance, .008 inch (cold). Exhaust valves open 43 degrees or 5.96 inches on the flywheel before lower dead center and close 2 degrees or .277 inch on the flywheel after top dead center. Flywheel distances are correct for standard 15⅞ inch flywheel. Valve stem guides are removable. Oversize valves are not made.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .008 inch. Crank engine over one complete revolution and stop when piston is 2 degrees past top dead center with the flywheel mark 'IN.OP.1-8' at the indicator in the peephole in the flywheel housing. The tappet clearance should be entirely taken up and the inlet valve about to open at this point.

To Set Valve Timing:—Turn crankshaft to No. 1 piston top dead center position, turn camshaft until No. 1 intake valve is about to open, mesh chain so there are exactly 4 links between the marks on the camshaft and crankshaft sprocket. Chain is 'duplex' type and passes over the crankshaft sprocket and under an automatic take-up idler sprocket.

STARTER:—**Model 725-G.** Starter is connected to the engine through a manual pinion shift interconnected with the starter switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 90 R.P.M. drawing 150-200 amperes. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3.2	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and pedal rod linkage and remove nuts on flange mounting studs. Then pull starter forward and lift from place.

GENERATOR:—**Model 957-C.** The direction of rotation is clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165° F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the charging rate, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 10.5 amperes (hot) reached at 1425 R.P.M. or 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.5	1370	10.5	7.5	1300-1500

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by an extension of the water pump shaft. To remove generator, disconnect lead and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Headlights have double filament bulbs instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Backing light is 6-8 volt, 21 cp. S.C. Mazda 1129. Instrument board lights, ignition switch light and tail light are each 6-8 volt, 3 cp. S.C. Mazda 63. Corner lights are 6-8 volt, 6 cp. S.C. Mazda 81.

CURRENT LIMIT RELAY:—This device is connected in the lighting lines. It consists of a fuse block mounted on the dash with a fixed resistance connected across a 20 ampere capacity fuse. When the current of the lighting lines reaches 20 amperes the fuse will blow out causing the current to flow through the resistance. The resistance will limit the current flow to 30 amperes

FUSES:—Generator field fuse is 6 ampere capacity. Lighting fuse mounted on block on dash is 20 ampere capacity.

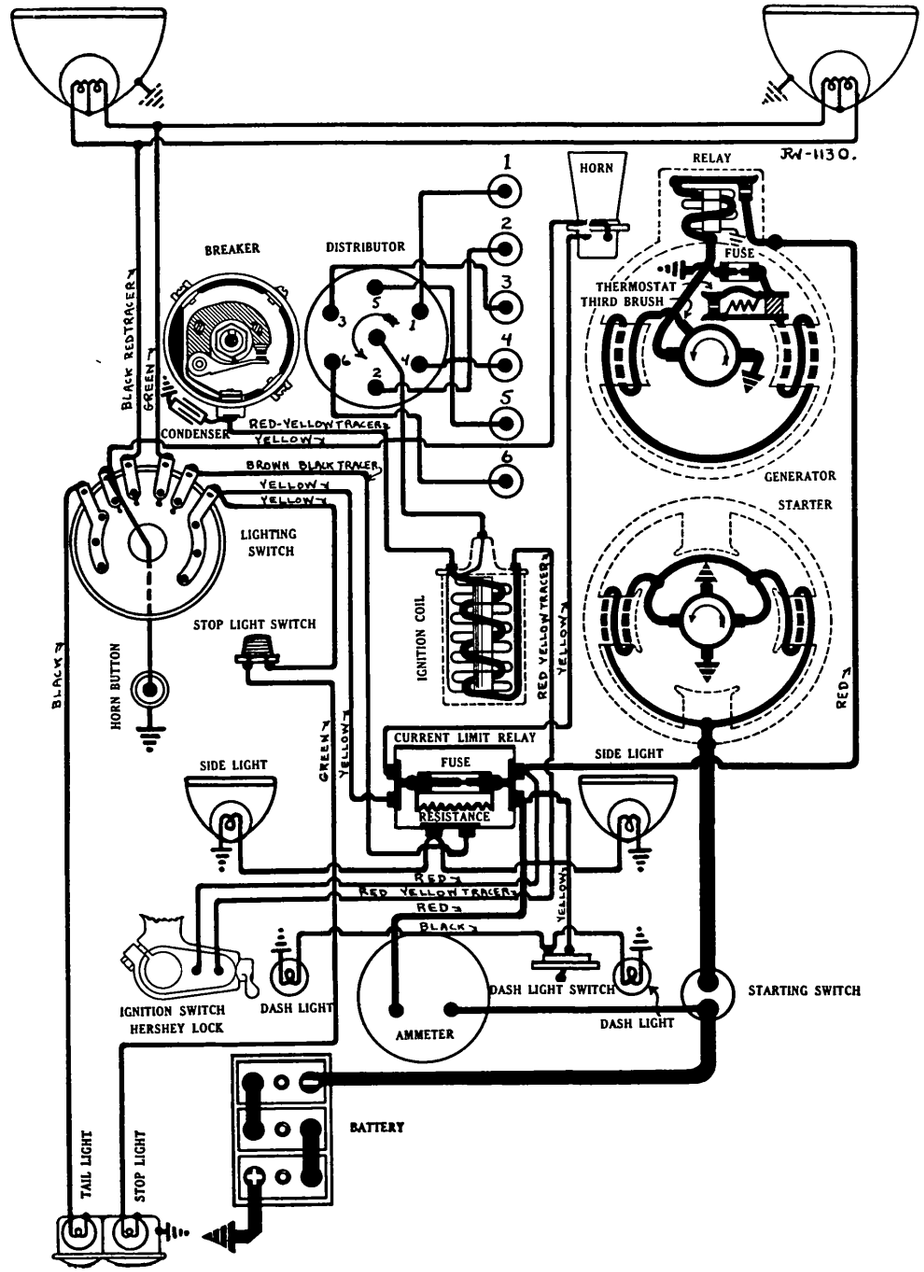
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WSB-13, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the rear of the dash. Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' coincidental steering post and ignition switch lock.

Distributor Model 639-K. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock nut on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. It is designed to operate under normal conditions in the full manual advance position with the spark control button pushed all way in toward the dash. Pulling out the button provides an auxiliary retard for starting. Maximum manual advance is 15 degrees (distributor). Automatic advance begins at 600 R P M of engine. Maximum automatic advance is 20 degrees reached at 2800 R.P.M. of the engine.



Mounting:—Distributor is mounted on the cylinder head. It may be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. The distributor may be removed without disturbing timing providing the advance arm is left in place. The manual advance control wire and hold-down screw should be disconnected and the distributor can then be lifted out. Distributor drive is through an offset tongue and slot coupling. In mounting distributor, make certain that the tongue enters the slot properly.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one full turn every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and saturate the wick in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 1 degree or 7/64 inch on the standard 12⅞ inch diameter flywheel before top dead center with the spark control button in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Place the spark control button in the fully advanced position (pushed all the way in toward the dash). Continue to crank engine over until the flywheel mark 'IGNI' which is 1 degree or 7/64 inch before the top dead center mark 'Top DC 1&6' is directly opposite the indicator on the flywheel housing. Loosen advance arm clamp screw and rotate distributor in a clockwise direction until the contacts begin to open. Tighten the clamp screw and check position of rotor to see that it is directly opposite segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are standard ⅞-18 S.A.E. Gaps are .023-.025 inch.

STANDARD SIX MODEL 44 (1930)
SERIAL NUMBERS 900,001 UP. PRODUCTION STARTED JANUARY 1, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

VALVE TIMING:—INLET VALVES:—Head diameter, 1 9/16 inches. Stem diameter, .340 inch. Stem length, 5½ inches (end of stem to top of seat). Valve lift, .3125 inch. Spring pressure, 50-55 pounds, valve closed. Tappet clearance, .010 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center. The flywheel is marked at point of inlet opening by marks 'IN.OP. 1&6' and 'TOP.DC 1&6.'

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .340 inch. Stem length, 5½ inches (end of stem to top of seat). Valve lift, .3175 inch. Spring pressure, 50-55 pounds, valve closed. Tappet clearance, .010 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 10 degrees after top dead center. The flywheel is marked at point of exhaust closing by mark 'EX.CL 1 & 6.' Valve stem guides are removable. Valves with oversize stems are not made.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Turn engine over one complete revolution and stop with piston on top dead center when the flywheel mark 'IN.OP.1-6' will be opposite the indicator in the peephole in the flywheel housing. The tappet clearance should be entirely taken up and the inlet valve about to open at this point.

To Set Valve Timing. Turn the crankshaft until No. 1 piston is on top dead center. Turn the camshaft in the direction of rotation until No. 1 inlet valve is about to open. Assemble the timing chain so that there are exactly 14 links between the marks on the camshaft sprocket and the crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory shaft bracket. To take up timing chain, loosen the two flange mounting nuts and back off the adjustment screw lock nut. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting nuts and lock nut.

STARTER:—Model 713-K. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 120 R.P.M. drawing 218 amperes at 4.9 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 406-K.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.6	65
3.6 "	1296	5.0	218
12 "	Lock	3.6	475

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove nuts on three flange mounting studs. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 955-Q. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 10.8 amperes (hot) at 7.5 volts reached at 1800 R.P.M. or 32 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.5	1550	9-12	7.3-7.7	1800-2000

Generator brush spring tension is 16-18 ounces. Shunt field current is 4-6.1 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from an extension of the water pump shaft. To remove generator, disconnect lead and loosen mounting band. Disconnect hose coupling and slide generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 700 R.P.M. or 12 miles per hour when the generator voltage reaches 7-7.4 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Briggs & Stratton Switch Model 50239. Lighting switch is mounted at the lower end of the steering column. Headlights equipped with double filament bulbs using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights or side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and it must be correctly mounted so that the tail light lead is connected to the 3 cp. filament. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

NOTE:—The stop light switch is of the hydraulic type and is screwed into the forward end of the brake master cylinder.

FUSES:—Lighting fuse mounted on fuse block on the dash is 20 ampere capacity.

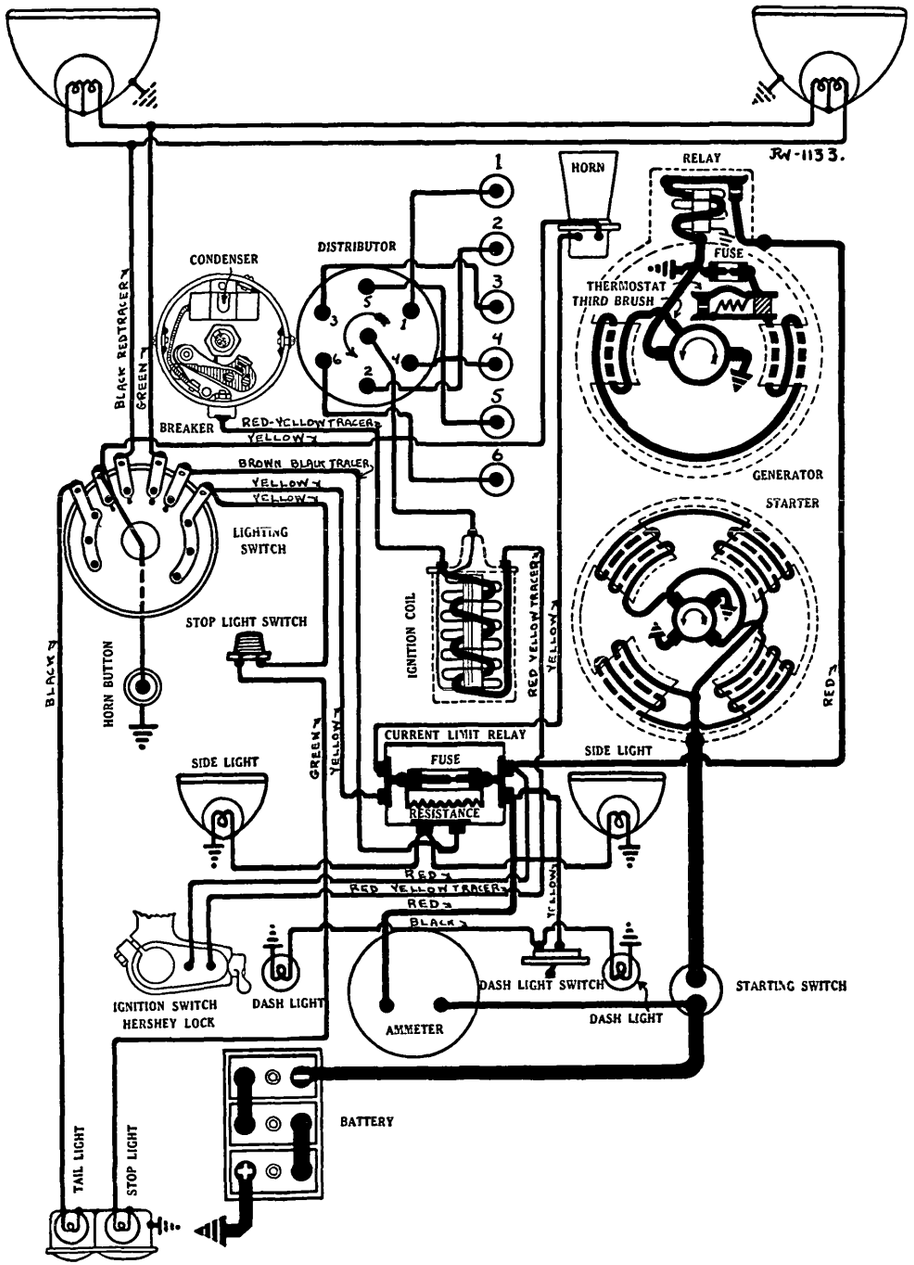
BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the rear of the dash. Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' coincidental steering post and ignition switch lock.

Distributor Model 640-W, 642-J. Breaker contacts separate .018-.024 inch. Set gap by loosening lock screw on stationary contact mounting plate behind contacts and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. It is designed to operate under all ordinary conditions with the manual advance control fully advanced with the spark control button pushed all the way in toward the dash. Pulling out the button provides an auxiliary control for starting. Maximum manual advance is 15 degrees (distributor). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2600 R.P.M. of engine.



Mounting:—Distributor is mounted on the cylinder head and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. If it is desired to remove distributor without disturbing timing setting, leave the advance arm clamped in place and disconnect the spark control wire and take out the hold-down screw in the advance arm. Distributor drive is through an offset tongue and slot coupling. The distributor cannot be mounted incorrectly if the shaft is turned until the tongue engages the slot correctly.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and saturate the wick in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are standard 7/8-18 S.A.E. Gaps are .023-.025 inch.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 2 degrees or 7/32 inch on the 12 1/8-inch flywheel before top dead center with the spark control button in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Make certain that spark control button is pushed all the way in toward the dash and that distributor housing is rotated clockwise as far as possible. Continue to crank engine until the 'Spark Full Advance' mark on the flywheel which is 2 degrees before the top dead center mark 'TOP DC 1&6' is opposite the indicator on the flywheel housing. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and check position of rotor to see that it is directly opposite the segment connected to the spark plug in cylinder No. 1.

SERIAL NUMBERS 736001 UP. PRODUCTION STARTED JANUARY 1, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

VALVE TIMING:—INLET VALVES:—Head diameter, 1 9/16 inches. Stem diameter, .340 inch. Stem length, 5½ inches (top of seat to end of stem). Valve lift, .3125 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center. The flywheel is marked 'IN.OPEN 1&6' and 'TOP DC 1&6' at the point of inlet opening.

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .340 inch. Stem length, 5½ inches (top of seat to end of stem). Valve lift, .3175 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 10 degrees after top dead center. The flywheel is marked 'EX.CLOSE 1&6' at the point of exhaust valve closing. Valve stem guides are removable. Valves with oversize stems are not made.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch. Turn engine over one complete revolution and stop with piston on top dead center when the flywheel mark 'IN.OP.1-6' will be opposite the indicator in the peephole in the flywheel housing. The tappet clearance should be entirely taken up and the inlet valve about to open at this point.

To Set Valve Timing. Turn the crankshaft until No. 1 piston is on top dead center. Turn the camshaft in the direction of rotation until No. 1 inlet valve is about to open. Assemble the timing chain so that there are exactly 14 links between the marks on the camshaft sprocket and the crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory shaft bracket. To take up timing chain, loosen the two flange mounting nuts and back off the adjustment screw lock nut. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting nuts and lock nut.

STARTER:—Model 718-E, G. Starter is connected to engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 120 R.P.M. drawing 218 amperes at 4.9 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5200	5.7	60
3.6 "	1368	4.9	218
15 "	Lock	3.2	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove nuts on three flange mounting studs. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in oiler on the commutator end of the starter every two weeks or each 500 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 957-B. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 12 ampers (hot) at 7.7 volts reached at 1600 R.P.M. or 33 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.5	1300	10-12	7.5	1300-1500

Shunt field current is 4-6.1 amperes at 6 colts. There is a six ampere field fuse mounted on the end plate which is connected in the field circuit. Brush spring tension is 16-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is cradle mounted at the right of the engine and is driven through a flexible hose coupling from an extension of the water pump shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 550 R.P.M. when the voltage of the generator reaches 7-7.4 volts and opens with a discharge current of 0-2.5 ampers. Relay contact gap is .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Briggs & Stratton Switch Model 50239. Lighting switch is mounted at lower end of steering column. Double filament headlight bulbs using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

FUSES:—Generator field fuse is 6 ampere capacity. Lighting fuse mounted on fuse block on dash is 20 ampere capacity.

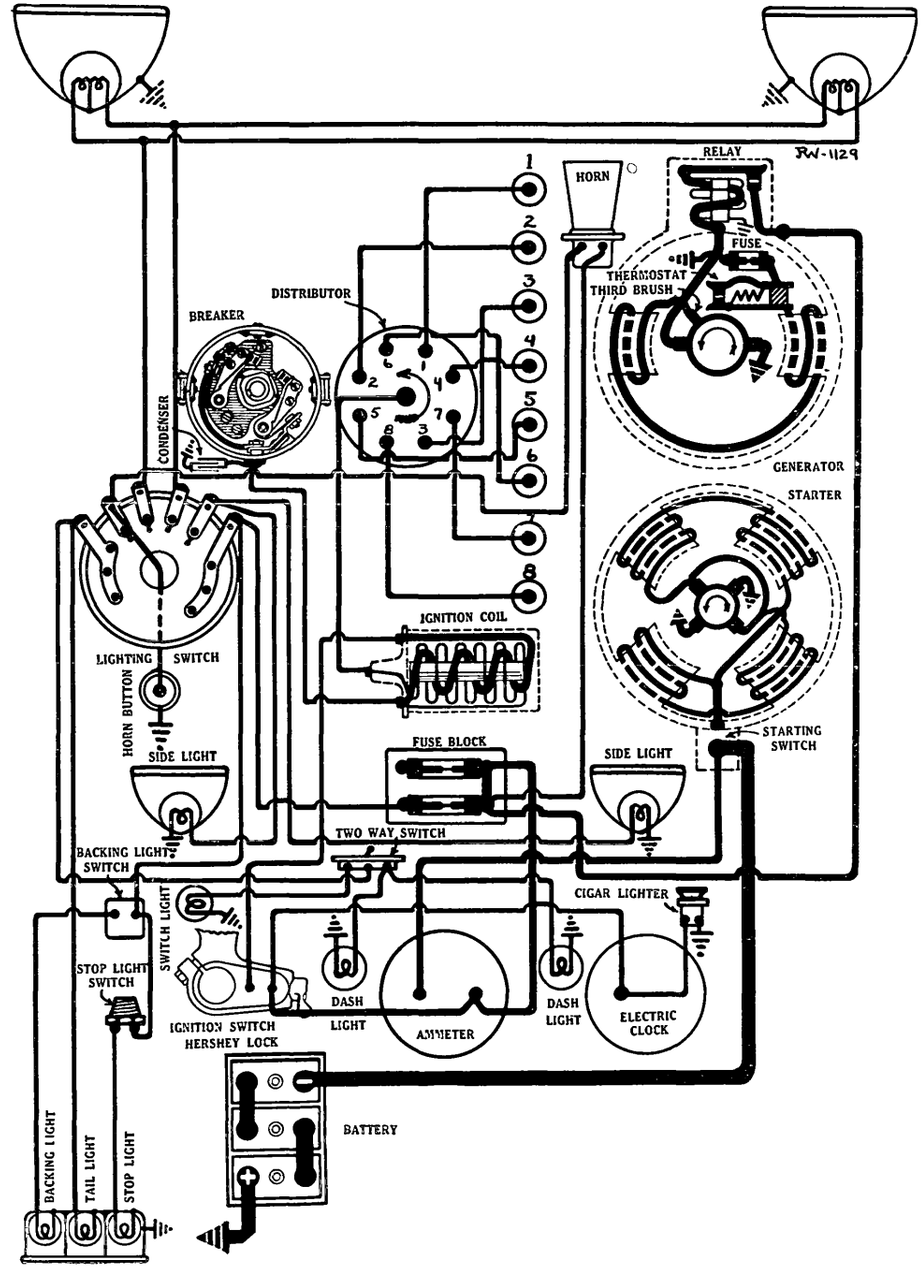
BATTERY:—Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the rear of the dash. Ignition current is 1.4 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' co-incidental steering post and ignition switch lock.



Distributor Model 660-C. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate directly behind contacts and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. It is designed to operate under all normal conditions in the fully advanced position with the spark control button pushed all the way in toward the dash. Pulling out the spark control button provides an auxiliary retard for starting. Maximum manual advance is 15 degrees (distributor). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 2600 R.P.M. of engine. The distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and can be removed from the left side. To remove distributor, disconnect the primary lead and remove the distributor head with the cables intact. Then loosen advance arm clamp screw and lift distributor from place. The distributor can be removed without disturbing the timing if the advance arm is left clamped to the distributor and the spark control wire and hold-down screw aret aken out. Distributor is driven through an offset tongue and slot coupling. The tongue and slot can only be assembled in the correct position.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one full turn every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Contacts must be synchronized so that the set mounted on the movable sub-assembly within the distributor housing begin to open at a point exactly 45 degrees (distributor) after the first set for satisfactory ignition performance. To synchronize contacts, use special Delco-Remy tool, Part No. 820738, and follow directions in the Equipment Section. The contacts can be synchronized without special equipment after the distributor has been timed to the engine by cranking the engine over 90 degrees until piston No. 6 reaches firing position when the flywheel mark 'SFADV-6' will be opposite the indicator. If the second set of contacts do not begin to open at this point, loosen the two locking screws on the base plate and turn the eccentric adjusting screw until the contacts open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .020 inch and repeat synchronization.

Timing Distributor to Engine. The breaker contacts begin to open when the piston entering power stroke reaches a position 5 degrees or 35/64 inch

on the standard 12⅛-inch diameter flywheel with the manual spark control button in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). See that spark control button is pushed all the way in toward the dash. Continue to crank engine until flywheel mark 'SFADV-1' is directly opposite the indicator in the flywheel housing on the left front side of the engine. Loosen advance arm clamp screw and rotate distributor until the contacts mounted directly on the breaker base plate begin to open. Tighten the clamp screw and check to see that rotor is directly opposite the segment connected to the spark plug in cylinder No. 1. The contacts can now be synchronized if this operation has not been completed.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are standard ⅞-18 S.A.E. Gaps are .023-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 9/16 inches. Stem diameter, .340 inch. Stem length, 5½ inches (top of seat to end of stem). Valve lift, .3125 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center. The flywheel is marked 'INTAKE OPEN' and 'TOP DC 1&8' at point of inlet opening.

EXHAUST VALVES:—Head diameter, 1 15/32 inches. Stem diameter, .340 inch. Stem length, 5½ inches (top of seat to end of stem). Valve life, .3175 inch. Spring pressure, 50-55 pounds (valve closed). Tappet clearance, .010 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 10 degrees after top dead center. The flywheel is marked 'EXHAUST CLOSED 1&8' at point of exhaust closing. Valve stem guides are removable. Valves with oversize stems are not made.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke and set tappet clearance of No. 1 inlet valve at .010 inch. Crank engine over one complete revolution and stop with piston on top dead center when the flywheel mark 'DC.1-8' is opposite the peephole in the flywheel housing. The tappet clearance should be entirely taken up and the inlet valve about to open at this point.

To Set Valve Timing. Turn crankshaft until piston No. 1 is on top dead center with dead center mark on the flywheel opposite the indicator on the flywheel housing. Turn camshaft in direction of rotation until No. 1 inlet valve is about to open. Then mesh the timing chain so that there are exactly 14 links between the marks on the camshaft sprocket and the crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory shaft bracket. To take up timing chain, loosen the two flange mounting nuts and back off the lock nut on the adjustment screw. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting nuts and lock nut.

STARTER:—Model 725-K. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 100 R.P.M. drawing 250 amperes at 4.75 volts. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5200	5.6	60
3.6 "	1368	4.9	218
15.5 "	Lock	3.2	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove nuts on three flange mounting studs. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 957-B. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 12 ampers (hot) at 7.7 volts reached at 1600 R.P.M. or 34 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.5	1300	10-12	7.5	1500

Shunt field current is 4-6.1 amperes at 6 volts. There is a six ampere field fuse mounted on the end plate which is connected in the field circuit. Brush spring tension is 16-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is cradle mounted at the right of the engine and is driven through a flexible hose coupling from an extension of the water pump shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 550 R.P.M. when the voltage of the generator reaches 7-7.4 volts and opens with a discharge current of 0-2.5 ampers. Relay contact gap is .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Briggs & Stratton Switch Model 50239. Lighting switch is mounted at lower end of steering column. Double filament headlight bulbs using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

FUSES:—Generator field fuse is 6 ampere capacity. Lighting fuse mounted on fuse block on dash is 20 ampere capacity.

GRAHAM

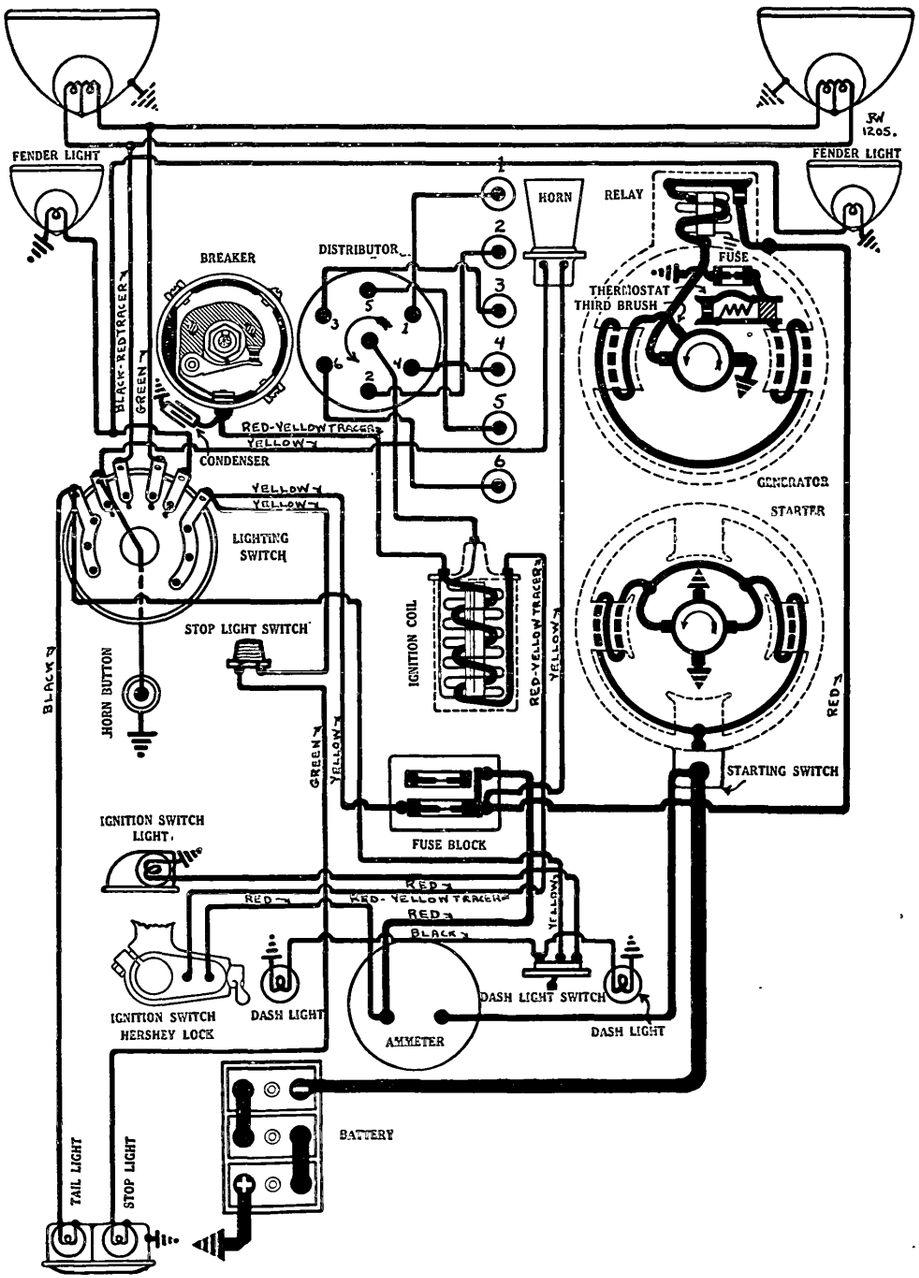
STANDARD SIX SERIES 53 (1931)
SPECIAL SIX SERIES 54 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-2-15. 6 volt, 100 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the rear of the dash. Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' coincidental steering post and ignition switch lock.

Distributor Model 632-F. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock nut on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. It is designed to operate under normal conditions in the full manual advance position with the spark control button pushed all way in toward the dash. Pulling out the button provides an auxiliary retard for starting. Maximum manual advance is 15 degrees (distributor). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2800 R.P.M. of the engine.

Mounting:—Distributor is mounted on the cylinder head. It may be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place. The distributor may be removed without disturbing timing providing the advance arm is left in place. The manual advance control wire and hold-down screw should be disconnected and the distributor can then be lifted out. Distributor drive is through an offset tongue and slot coupling. In mounting distributor, make certain that the tongue enters the slot properly.



Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one full turn every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and saturate the wick in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 1 degree (on the flywheel) before top dead center with the spark control button in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Place the spark control button in the fully advanced position (pushed all the way in toward the dash). Continue to crank engine over until the flywheel mark 'SFADV-I' which is 1 degree befor the top dead center mark 'Top DC 1&6' is directly opposite the indicator on the flywheel housing. Loosen advance arm clamp screw and rotate distributor in a clockwise direction until the contacts begin to open. Tighten the clamp screw and check position of rotor to see that it is directly opposite segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. (own design). Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.562 inches. Stem diameter, .340 inch. Stem length, 5.5 inches. Valve lift, .3145 inch. Spring pressure, 50 pounds (valve closed), 94 pounds (valve open). Tappet clearance, .010

GRAHAM

STANDARD SIX SERIES 53 (1931)
SPECIAL SIX SERIES 54 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1.469 inches. Stem diameter, .340 inch. Stem length, 5.5 inches. Valve lift, .3195 inch. Spring pressure, 50 pounds (valve closed), 94 pounds (valve open). Tappet clearance, .010 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made. The flywheel is marked 'DC.1-6' at point of inlet opening for cylinder No. 1.

To check valve timing, crank engine over until piston No. 1 reaches top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .010 inch and crank engine over exactly one revolution. Stop when the piston reaches top dead center with the flywheel mark 'D.C.1-6' directly opposite the indicator in the peephole in the flywheel housing. The tappet clearance should be taken up and the inlet valve about to open at this point.

To Set Valve Timing. Turn crankshaft until No. 1 piston reaches top dead center with the dead center mark on the flywheel opposite the indicator on the flywheel housing. Turn camshaft in direction of rotation until No. 1 inlet valve is about to open. Assemble timing chain so there are exactly 10 links between the marks on the camshaft sprocket and the crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory shaft bracket. To take up timing chain, loosen the two flange mounting nuts and back off the nut on the adjustment screw. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting nuts and the lock nut.

STARTER:—Model 714-V. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 120 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove nuts on three flange mounting studs. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 957-B. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 10.8 amperes (hot) at 7.5 volts reached at 1800 R.P.M. or 32 M.P.H.

Generator Data

There is a 6 ampere field fuse mounted under the fuse plug on the end plate. Generator brush spring tension is 16-18 ounces. Shunt field current is 4-6.1 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from an extension of the water pump shaft. To remove generator, disconnect lead and loosen mounting band. Disconnect hose coupling and slide generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 700 R.P.M. or 12 M.P.H. when the generator voltage reaches 7-7.4 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .012-.017 inch with contacts closed.

LIGHTING:—Briggs & Stratton Switch Model 50239. Lighting switch is mounted at lower end of steering column. Double filament headlight bulbs using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

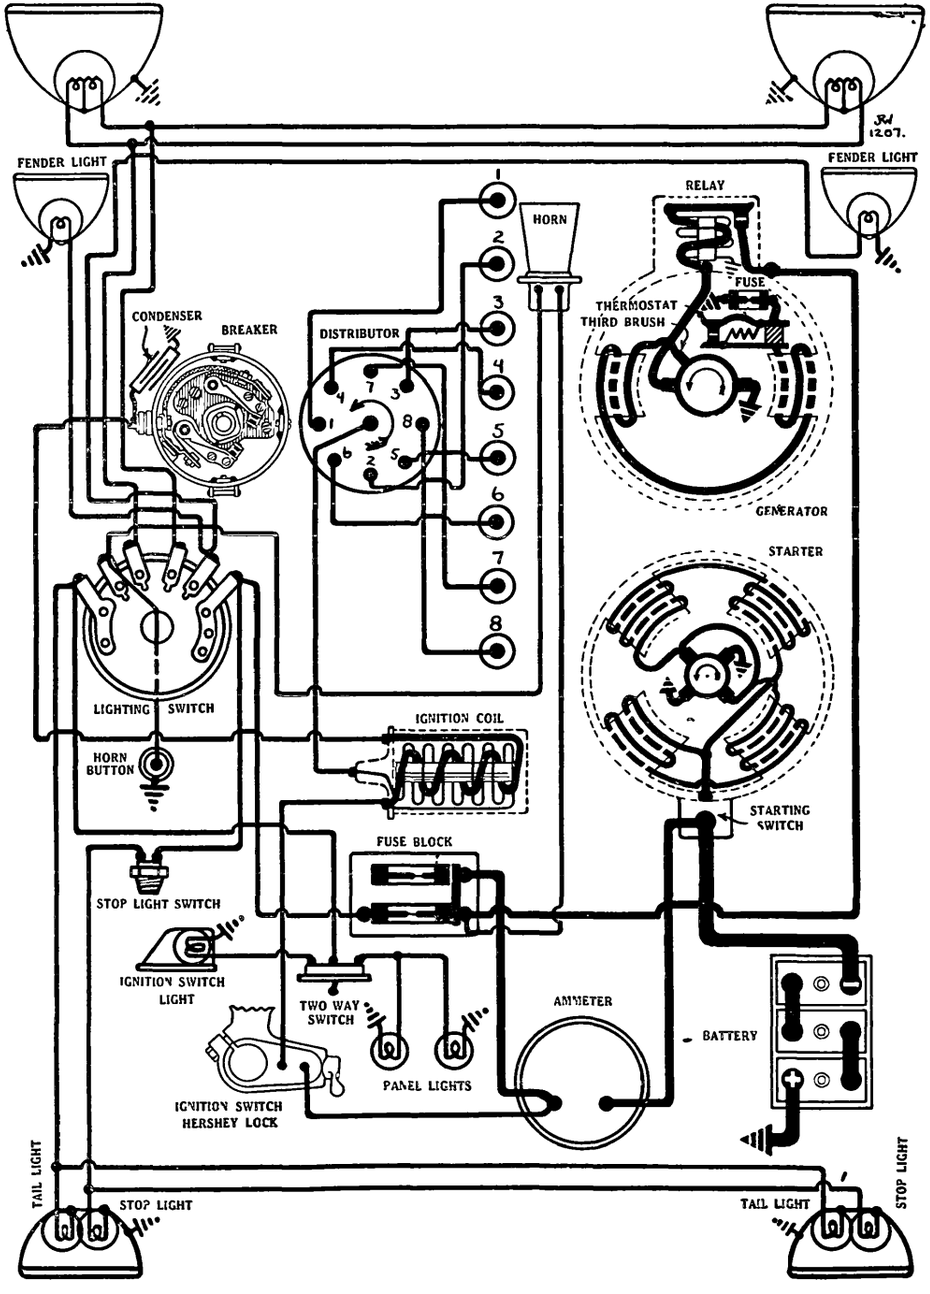
FUSES:—Generator field fuse is 6 ampere capacity. Lighting fuse mounted on fuse block on the dash is 20 ampere capacity.

GRAHAM

SPECIAL EIGHT, SERIES 49, CUSTOM EIGHT, SERIES 42 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-2-15. 6 volt, 100 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the rear of the dash. Ignition current is 1.4 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' co-incidental steering post and ignition switch lock.



Distributor Model 660-C. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate directly behind contacts and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. It is designed to operate under all normal conditions in the fully advanced position with the spark control button pushed all the way in toward the dash. Pulling out the spark control button provides an auxiliary retard for starting. Maximum manual advance is 15 degrees (distributor). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 2600 R.P.M. of engine. The distributor has two sets of contacts operating on a four sided cam Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and can be removed from the left side. To remove distributor, disconnect the primary lead and remove the distributor head with the cables intact. Then loosen advance arm clamp screw and lift distributor from place. The distributor can be removed without disturbing the timing if the advance arm is left clamped to the distributor and the spark control wire and hold-down screw are taken out. Distributor is driven through an offset tongue and slot coupling. The tongue and slot can only be assembled in the correct position.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down one full turn every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Contacts must be synchronized so that the set mounted on the movable sub-assembly within the distributor housing begin to open at a point exactly 45 degrees (distributor) after the first set for satisfactory ignition performance. To synchronize contacts, use special Delco-Remy tool, Part No. 1838182, and follow directions in the Equipment Section. The contacts can be synchronized without special equipment after the distributor has been timed to the engine by cranking the engine over 90 degrees until piston No. 6 reaches firing position when the flywheel mark "SFADV-6' will be opposite the indicator. If the second set of contacts do not begin to open at this point, loosen the two locking screws on the base plate and turn the eccentric adjusting screw until the contacts open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .020 inch and repeat synchronization.

Timing Distributor to Engine. The breaker contacts begin to open when the piston entering power stroke reaches a position 5 degrees (on the flywheel) with the manual spark control button in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compres-

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

sion stroke (the up stroke with both valves open). See that spark control button is pushed all the way in toward the dash. Continue to crank engine until flywheel mark 'SFADV-1' is directly opposite the indicator in the flywheel housing on the left front side of the engine. Loosen advance arm clamp screw and rotate distributor until the contacts mounted directly on the breaker base plate begin to open. Tighten the clamp screw and check to see that rotor is directly opposite the segment connected to the spark plug in cylinder No. 1. The contacts can now be synchronized if this operation has not been completed.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. (own design). Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 9/16 inches. Stem diameter, .300 inch. Stem length, 4.891 inches. Valve lift, .3145 inch. Spring pressure, 50 pounds (valve closed), 94 pounds (valve open). Tappet clearance, .010 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1.312 inches. Stem diameter, .300 inch. Stem length, 4.891 inches. Valve lift, .3195 inch. Spring pressure, 50 pounds (valve closed), 94 pounds (valve open). Tappet clearance, .010 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made. The inlet opening point for cylinder No. 1 is indicated on the flywheel by the mark 'DC.1-8'.

To check valve timing, crank engine over until piston No. 1 is on top dead center entering power stroke and set tappet clearance of No. 1 inlet valve at .010 inch. Crank engine over one complete revolution and stop with piston on top dead center when the flywheel mark 'DC.1-8' is opposite the peephole in the flywheel housing. The tappet clearance should be entirely taken up and the inlet valve about to open at this point.

To Set Valve Timing. Turn crankshaft until piston No. 1 is on top dead center with dead center mark on the flywheel opposite the indicator on the flywheel housing. Turn camshaft in direction of rotation until No. 1 inlet valve is about to open. Then mesh the timing chain so that there are exactly 10 links or 11 pins (Series 49), 14 links or 15 pins (Series 42) between the marks on the camshaft sprocket and crankshaft sprocket.

To Adjust Timing Chain. Timing chain is adjusted by shifting the water pump and accessory shaft bracket. To take up timing chain, loosen the two flange mounting nuts and back off the lock nut on the adjustment screw. Then turn up the adjustment screw until the chain begins to hum with the engine running. Back off the adjustment until the chain runs noiselessly and tighten the mounting nuts and lock nut.

STARTER:—**Model 725-K, M.** Starter is connected to engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 100 R.P.M. drawing 250 amperes at 4.75 volts. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.6	60
3.6 "	1368	4.9	218
16 "	Lock	3.0	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove nuts on three flange mounting studs. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 1000 miles of operation. The drive end bearing is oilless.

GENERATOR:—**Model 957-B.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 12 amperes (hot) at 7.7 volts reached at 1600 R.P.M. or 34 M.P.H.

Operating Timing

Intake .010" (hot).
Exhaust .010" (hot)-.012" (cold).

Spring Pressure

Closed ..... 50 pounds
Open ..... 94 pounds

Timing

Intake Valves	Exhaust Valves
Open—At top dead center.	Open—40° before lower dead center.
Close—40° after lower dead center.	Close—10° after top dead center.

To Check Valve Timing. Crank engine over until piston No. 6 is on top dead center entering power stroke. Set tappet clearance of No. 6 exhaust valve at .012 inch. Turn engine one complete revolution and stop when the flywheel mark 'EXCL.1-6' (which is 1 1/16 inches past the top dead center mark 'DC.1-6') is opposite the indicator. The No. 6 exhaust valve should close at this point.

To Set Valve Timing. Turn crankshaft until piston No. 1 is on top dead center. Rotate camshaft in direction of rotation until the mark on the camshaft sprocket is exactly 5 inches from the mark on the crankshaft sprocket. Mesh timing chain so there are 10 links or eleven link pins between the marks (inclusive of the tooth meshed directly opposite the mark on the sprockets).

Timing Chain Adjustment. Timing chain is adjusted by shifting accessory drive sprocket mounting (water pump bracket). To take up chain, loosen two flange mounting capscrews, back off lockscrew on adjustment setscrew, turn up adjustment screw until chain begins to hum, back off adjustment until chain runs noiselessly, tighten locknut and mounting screws. Adjustment should be made at six month intervals.

STARTER:—**Model 714-V.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks engine at 120 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove nuts on three flange mounting studs. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every two weeks or each 500 miles of operation. The drive end bearing is oilless.

GENERATOR:—**Model 957-B.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 10.8 amperes (hot) at 7.5 volts reached at 1500 R.P.M. or 32 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.3-8.5	1300	9-12	7.3-7.6	1300-1500

There is a 6 ampere field fuse mounted under the fuse plug on the end plate. Generator brush spring tension is 14-18 ounces. Shunt field current is 4-6.1 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from an extension of the water pump shaft. To remove generator, disconnect lead and loosen mounting band. Disconnect hose coupling and slide generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay closes at 700 R.P.M. or 12 M.P.H. when the generator voltage reaches 7-7.4 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**(1931) B & S Switch, Model 50239. (1932) Clum Switch, Model 9218.** Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	21-21	DC	1110
Fender lights	6-8	3	SC	63
Dash and tail lights	6-8	3	SC	63
Stop light	6-8	15	SC	87
Dome light	6-8	6	SC	81

FUSES:—Generator field fuse is 6 ampere capacity. Lighting fuse mounted on fuse block on the dash is 20 ampere capacity.

GASOLINE GAUGE:—**K-S Telegauge** hydrostatic type (see Carburetion Section).

FUEL PUMP:—**A.C. Type B** mechanical fuel pump (see Carburetion Section)

HORNS:—Klaxon Model K-14. Vibrator type mounted under hood. Current draw 7 amperes.

GRAHAM

'BLUE STREAK' EIGHT, MODEL 57 (1932)

DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate under floor mat near right hand rear door or under front seat cushion.

ENGINE NUMBER:—Stamped on plate on right side of crankcase. This series 1015001 up.

BATTERY:—**Willard, Type WS-2-15.** 6 volt, 15 plate, 100 ampere hour (20 hour rate. Starting capacity 122 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted under right front seat. Battery size, 7 1/16 inches wide, 10 5/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 528-C.** Coil mounted on dash. Ignition current is 1.4 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped). Ignition switch is Oakes 'Hershey' type co-incidental ignition switch and steering column lock.

Distributor Model 662-E (first cars). Two breaker arm, 4 lobe cam with semi-automatic advance. Must be synchronized—see Timing. Manual advance controlled by button on dash (ordinary running position with button pushed in—spark advanced, pull button out to retard for hand cranking).

Breaker Gap:—Set at .020". Hold within limits of .018-.024".

Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Manual Advance:—Maximum 30° (engine). Used as a retard only.

Cam Angles—Closed 34°, open 11° (distributor) when synchronized).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	500	2	.....	1000
8.5	.....	2050	17	.....	4100

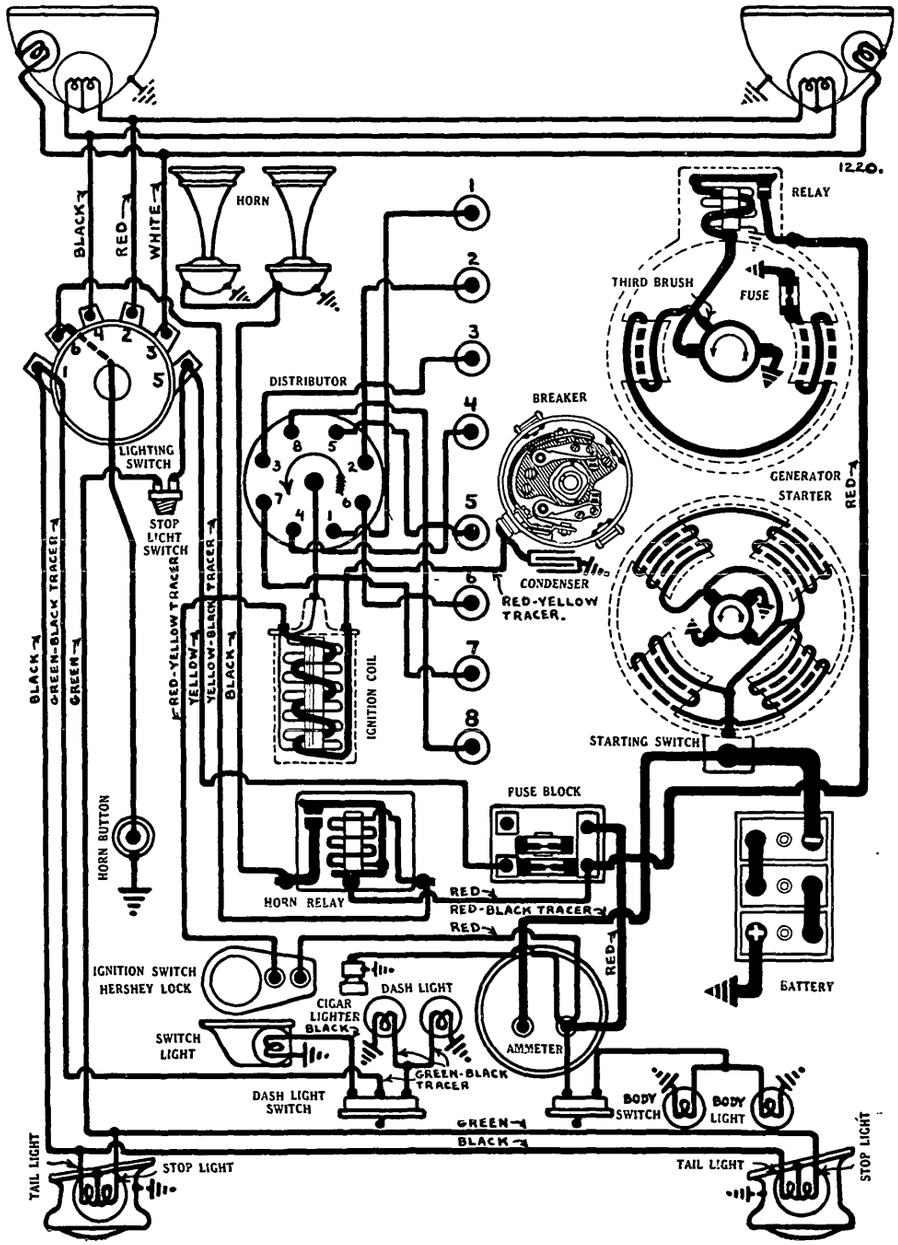
Distributor Model 661-J (later cars). Single breaker, 8 lobe cam type with full automatic advance. No synchronization of contacts required.

Breaker Gap:—Set at .015". Hold within limits of .0125-.0175".

Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of contact arm.

Cam Angles—Closed 31°. Open 14° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	500	2	.....	1000
8.5	.....	2050	17	.....	4100



Mounting:—Distributor mounted on cylinder head. To remove, disconnect primary lead and manual advance control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out. Distributor is driven through offset coupling and can only be replaced in correct position.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one full turn. Keep cup filled with medium cup grease.

1000 Miles.—Take off distributor cap and rotor. Put light oil in wick oiler in center of shaft. Apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 3° or 5/16" on flywheel before top dead center with manual spark control advanced. To set timing, advance spark control button (push button in toward dash), check distributor to see that it is rotated clockwise as far as possible—to secure full manual advance, rotate crankshaft with No. 1 piston on compression stroke until flywheel mark 'SA-1' (which is 3° or 5/16" before top dead center mark 'DC-1') is opposite pointer on flywheel housing left side. Loosen advance arm clamp bolt, rotate distributor until first set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Connect spark plugs as indicated on diagram.

Synchronization of Contacts—First method—as part of timing operation. After timing is completed, rotate crankshaft 90 degrees until No. 6 piston reaches firing position with flywheel mark 'SFAD-6' opposite pointer. Loosen two lockscrews on movable breaker plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open,

GRAHAM

'BLUE STREAK' EIGHT, MODEL 57 (1932)
DELCO-REMY SYSTEM

tighten locking screws. Check contact gap. If ouside limits of .018-.024 inch, reset at .022 inch. repeat synchronization.

Second Method:—using synchronizing tool. Use Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Champion Type C-4. Set gaps at .024 inch.

VALVE TIMING:—Valves at left of engine. Camshaft driven by three sprocket chain drive (in tandem with generator). Manual adjustment by shifting generator. First cars manufactured engine No. 1015001 to 1015031 used same valves as Model 49 (1931). Specifications Engine No. 1015031 up as follows:

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.4325-1.4425"	.3405-.341"	4 15/16"	45°	.3145"
Exhaust	1.3175-1.3075"	.3405-.341"	4 15/16"	45°	.3195"

Tappet Clearance

Intake & Exhaust (operating).....010 (hot). Exhaust (timing) .012" (cold)

Spring Pressure

Engine No. 1015032 to 1016994		Engine No. 1016994 Up	
Inner Spring	20-22 pounds (2 1/16")		47½-52½ pounds (2 3/16")
	33-36 pounds (1¾")		103-109 pounds (1⅞")
Outer Spring	30-34 pounds (2 3/16")		
	71-74 pounds (1⅞")		

NOTE:—Double springs used only on Engine Numbers 1015032 to 1016994. A single spring is used on all engines after No. 1016994. This new type single spring can be used for replacement on engines using the double valve spring.

Timing

Intake Valves	Exhaust Valves
Open—At top dead center.	Open—40° before lower dead center.
Close—40° after lower dead center.	Close—10° after top dead center.

To Check Valve Timing. Set tappet clearance No. 8 exhaust valve at .012". Turn engine over with No. 1 piston on compression until piston is 10° past top dead center with flywheel mark 'EC-1-8' directly opposite pointer on left of housing. No. 8 exhaust valve should close at this point. Allowable variation of closing point, 2 flywheel teeth. Reset tappet clearance at .010 inch (hot).

To Set Valve Timing. Rotate crankshaft until flywheel mark 'DC-1' is opposite pointer on left side of housing (top dead center position pistons No. 1 and 8). Mesh chain so that there are 10 links or eleven pins between marks on camshaft sprocket and crankshaft sprocket (begin count with chain pin opposite mark on camshaft sprocket and mesh the eleventh pin opposite mark on crankshaft sprocket). This is equivalent to 5" between marks.

Timing Chain Adjustment. Loosen two flange mounting nuts on water pump mounting flange, loosen lock nut on adjusting screw, turn up adjusting screw until chain begins to hum with engine running at equivalent of 25 M.P.H., back off adjusting screw until chain runs noiselessly, tighten locknut and mounting screws. Adjust chain every six months.

STARTER:—Model 725-K Manual pinion engagement connected to starting switch lever (switch mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 " "	Lock	3	600

Mounting:—Starter flange mounted on right front face flywheel housing. To remove, disconnect cable and starting pedal linkage, take off nuts on 3 flange mounting bolts, pull starter straight forward to clear housing, lift from place.

Oiling:—1000 Miles. Put 8-10 drops light oil in commutator end oiler. Drive end bearing oilless.

GENERATOR:—Model 957-B (first cars). Third brush control type. To adjust, loosen small round headed lockscrew on commutator end plate, remove cover band, shift third brush (by hand) counter-clockwise to increase charging rate, clockwise to decrease charging rate, tighten lockscrew. Maximum charging rate 18 amperes (cold), 8.5 volts, at 1300 R.P.M.

Generator Data

Cold Test

Amperes	Volts	R.P.M.
18-20	8.3-8.5	1300

Note:—This generator originally furnished with thermostat. Thermostat is removed at factory when generator is installed in car.

Brush spring tension 14-18 ounces. Shunt field current 4.0-6.1 amperes at 6 volts. A 6 ampere field fuse is mounted on the commutator end plate.

GENERATOR:—Model 965-V. Third brush control type (no thermostat). To adjust charging rate, loosen small round lock screw on end plate, shift third brush (by hand) counter-clockwise to increase, or clockwise to decrease charging rate. Tighten lock screw. Rotation is counter-clockwise at commutator end. Maximum charging rate is 20 amperes (cold), 8.3 volts, 1900 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.2-8.4	1900	13-15	7.7-8.0	1800-2000

Mounting:—Generator cradle mounted at right of engine. Driven through flexible hose coupling by extension of water pump shaft. To remove, disconnect lead, disconnect drive coupling, loosen mounting clamp band, lift generator from place.

Oiling:—500 Miles. But 8-10 drops light oil in oiler at each end of generator.

RELAY:—Model 265-B. Mounted on generator. Contacts close at 550 R.P.M. (generator) when voltage reaches 7-7.4 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch Model 9318. Switch mounted at lower end of steering column. Controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament bulbs. Parking bulbs in headlights.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	32-21	DC	1116
Parking bulbs	6-8	3	SC	63
Dash lights	6-8	3	SC	63
Stop and tail lights	6-8	21-2	DC	1158
Body lights	6-8	3	SC	63

Note:—Stop and tail lights use double filament bulb. Tail light wire (black) must be connected to 2 cp. filament.

FUSES:—Lighting fuse mounted on fuse block on dash. 20 ampere capacity. Generator field fuse 6 ampere capacity.

HORNS:—Twin horns mounted under engine hood. Controlled by horn relay. Horns: Klaxon Model K-26-B (matched tone), Type 1407 low note, Type 1408 high note. Current draw 6.0-8.5 amperes at 6 volts (Type 1407) 5.0-6.5 amperes at 6.0 volts (Type 1408).

Horn Relay Model 266-T:—Pressing horn button completes horn relay circuit, energizing relay winding, closing relay contacts and completing horn circuit. Horn current does not pass through horn button. Horn relay requires .25 amperes to close contacts. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—AC mechanical type fuel pump mounted at left of engine (see Carburetion Section).

GRAHAM

STANDARD SIX MODEL 65 (1933), SERIAL NUMBERS 1,605,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate under floor mat near right rear door or under front seat cushion.

ENGINE NUMBER:—Stamped on plate on right side of crankcase.

ENGINE:—Six cylinder, 'L' head type, 3¼x4½" bore and stroke, 224 cubic inch displacement, rated at 25.35 H.P., develops 85 H.P. at 3400 R.P.M. Standard compression ratio 6.5-1.

BATTERY:—Willard, Type WS-1-13, 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate). Starting capacity 105 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to frame.

Mounting:—In cradle under right front seat.
Dimensions:—Width, 7 1/16". Length, 9 1/16". Height, 8 13/16".

IGNITION:—Coil Model 536-U, R. Unit with switch (primary lead between coil and ignition switch protected by armored cable).
Ignition Current:—2.0 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).

Ignition Switch:—Model 428-H. Located at left of instrument panel. Connected to coil by armored cable (primary lead).

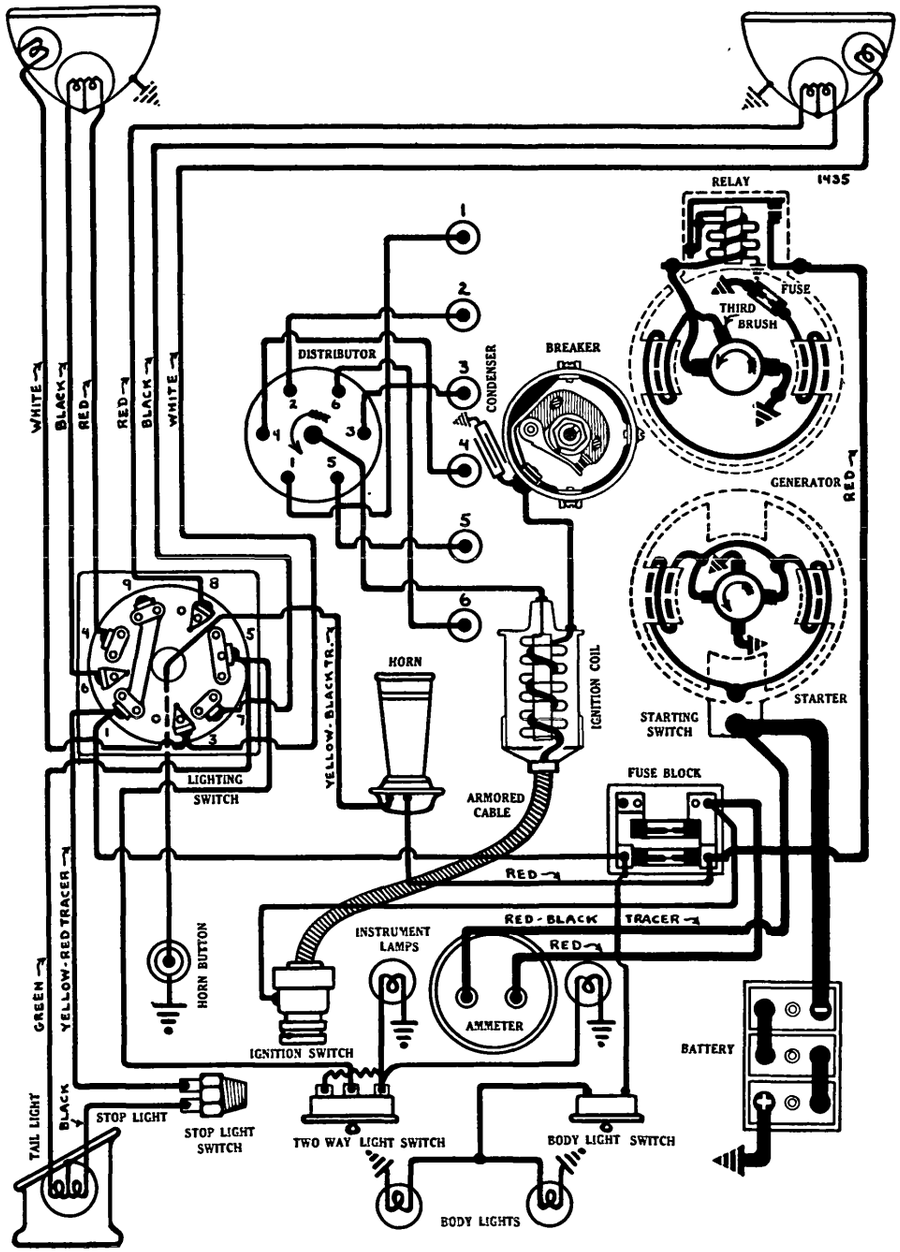
Distributor Model 632-Z. Single breaker, 6 lobe cam, full automatic advance type. Breaker contacts adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.
Breaker Gap:—Set at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Cam Angles—Closed 36°, open 24° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		500	2		1000
10.5		1950	21		3900

Mounting:—Distributor mounted on left hand side of cylinder head. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out. Distributor shaft is driven through an offset tongue-and-slot coupling.

Oiling:—1000 Miles. Turn down grease cup on side of shaft housing two full turns. Keep cup filled with medium cup grease. Take off distributor cap and rotor, saturate wick oiler in center of shaft with light engine oil, put one drop of oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.



IGNITION TIMING:—Standard setting, 3° or 5/16" (flywheel), .0037" (piston travel) before top dead center.

To Set Ignition Timing. With No. 1 piston on compression stroke turn engine over by hand until piston reaches firing position (3° before top dead center) with flywheel mark 'SA-1' directly opposite pointer in inspection hole in flywheel housing. This mark is 3° or 5/16" before the top dead center mark 'DC-1'. Then loosen clamp bolt in advance arm, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Std. Champion Type C-4-X. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at left of engine is chain driven from the crankshaft in tandem with accessory drive sprocket. Chain is adjusted manually by shifting accessory sprocket (see below). Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and

GRAHAM

STANDARD SIX MODEL 65 (1933), SERIAL NUMBERS 1,605,001 UP
DELCO-REMY SYSTEM

6 are on top dead center with flywheel mark 'D-C-1' at indicator in inspection hole in flywheel housing, mesh chain so there are exactly ten links or eleven pins between the marks on the sprockets (begin counting with pin in line with tooth meshed opposite mark on crankshaft sprocket and mesh tooth in line with the eleventh pin opposite mark on camshaft sprocket).

To Check Valve Timing. With piston No. 6 on top dead center entering power stroke set tappet clearance of No. 6 intake and exhaust valves at .012". Turn engine over one complete revolution and stop with piston on top dead center with flywheel mark 'D-C-1' in line with indicator in inspection hole in flywheel housing. No. 6 intake valve should begin to open at this point. No. 6 exhaust valve should close 10° after this point with flywheel mark 'E-C-1' at indicator. Reset tappet clearance at .010" (intake and exhaust) with engine hot.

Timing Chain Adjustment:. Chain should be adjusted at least every 6000 miles. To take up chain, loosen two flange mounting screws on accessory sprocket mounting (water pump bracket) and back off adjustment screw lock nut. Turn up adjustment screw until chain begins to hum with engine running, back off adjustment until chain runs noiselessly, tighten lock nut and mounting screws.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.562"	34075"	5.5"	30°	318"
Exhaust	1.467"	34075"	5.5"	45°	327"

Tappet Clearance

	Operating	Timing
Exhaust	.010" (hot)	.012" (cold)
Intake	.010" (hot)	.012" (cold)

Valve Springs

Closed	55 pounds
Open	95 pounds

Timing—Intake Valves

Open—at top dead center.
Close—40° or 4 3/16" (flywheel), .4125" (piston) after lower dead center.

Timing—Exhaust Valves

Open—40° or 4 3/16" (flywheel), .4125" (piston) before lower dead center.
Close—10° or 1 3/64" (flywheel), .0422" (piston) after top dead center.

CARBURETION:—Detroit Lubricator Updraft Carburetor, Model 51. See Carburetor Section for complete data. Manifold heat control is operated manually by button below instrument panel. Choke is operated manually by button on lower center of instrument panel.

Air Cleaner:—Oil-wetted wire mesh type. Remove at three-month intervals, clean by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type mounted at left of crankcase and driven by eccentric on camshaft (see Carburetion Section). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model 734-N, 734-P (R.H.D.). Starter drive, overrunning clutch and manual pinion shift connected to starting switch pedal linkage (Switch Type No. 820052 mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Flange mounted on right hand forward face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take off nuts on flange mounting bolts, pull starter forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive bearing in pinion housing is oilless.

GENERATOR:—Model 965-V. Third brush regulation. Rotation counter-clockwise at commutator end. With standard setting maximum charging rate is 17-19 amperes (cold) at 8.2-8.4 volts reached at 1900 R.P.M. or approximately 25 M.P.H.

Charging Rate Adjustment. Loosen the small round lock screw on the commutator end plate, take off comutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
17-19	8.2-8.4	1900	13-15	7.7-8.0	1800-2000

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.75-2.25 amperes at 6 volts across field terminals.

Field Fuse:—6 ampere capacity.

Mounting:—Cradle mounted at right of engine and driven through flexible shaft from the water pump shaft. To remove, disconnect lead, disconnect drive shaft coupling, loosen mounting clamp band, lift generator out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Relay contacts close when generator voltage reaches 6.75-7.5 volts and open with discharge current of 0-2.5 amperes.
Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Clum Switch Model 9463. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system uses double-filament bulbs for 'depressed beam' dimming and switch has additional 'passing' position in which the uppper filament (depressed beam) of the left hand headlight and lower filament (driving beam) of the right hand headlight are lighted (see diagram). Stop and tail light uses a double filament bulb.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.

Body Lights	6-8	3	S.C.	63

FUSES:—Lighting fuse mounted on fuse block on rear of dash is 20 ampere capacity. A spare fuse is mounted on the fuse block. Generator field fuse is 6 ampere capacity.

HORNS:—Klaxon Model K-31, Type 1362 (high note), Type 1363 (low note) where matched tone twin horns are installed. Current draw 4.0-6.5 amperes at 6 volts.

GRAHAM

STANDARD EIGHT MODEL 64 (1933), SERIAL NUMBERS 1,800,001 UP
CUSTOM EIGHT MODEL 57-A (1933), SERIAL NUMBERS 1,020,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate under floor mat near right rear door or under front seat cushion.

ENGINE NUMBER:—Stamped on plate on right hand side of crankcase.

ENGINE:—Eight cylinder, 'L' head type, 3⅛x4″ bore and stroke, 245.4 cubic inch displacement, rated at 31.25 H.P., develops 95 H.P. at 3400 R.P.M. Standard compression ratio 6.5-1.

BATTERY:—Willard, Type WS-2-15, 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate). Starting capacity 122 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to frame.

Mounting:—In cradle under right hand front seat.

Dimensions:—Width, 7 1/16″. Length, 10 5/16″. Height, 8 13/16″.

IGNITION:—Coil Model 536-U,R. Unit with switch (primary lead between switch and coil protected by armored cable).

Ignition Current:—2.0 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).

Ignition Switch:—Model 428-H. Assembled as unit with coil by means of armored cable protecting primary lead.

Distributor Model 661-J. Single breaker, 8 lobe cam, full automatic advance type. No synchronization of contacts necessary. Breaker contacts adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.

Breaker Gap:—Set contact gap at .015″. Hold within limits of .0125-.0175″.

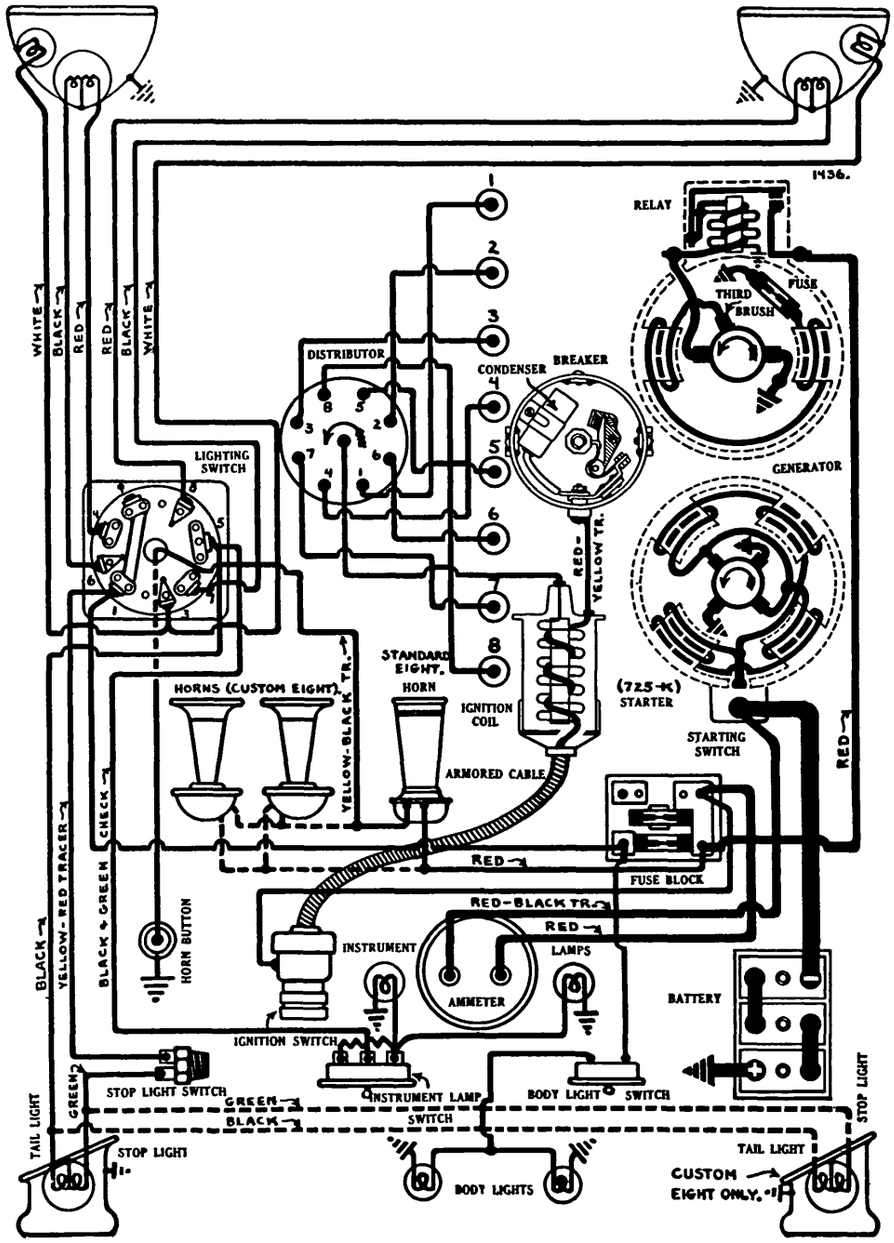
Breaker Arm Spring Tension:—19-23 ounces measured at point directly behind contacts with spring scale at right angles to back of breaker arm.

Cam Angles—Closed 31°, open 14° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		500	2		1000
8.5		2050	17		4100

Mounting:—Mounted on left hand side of cylinder head. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—1000 Miles. Turn down grease cup on side of shaft housing two full turns. Keep cup filled with medium cup grease. Take off distributor cap and rotor, saturate wick oiler in center of shaft with light engine oil, oil breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.



IGNITION TIMING:—Standard setting 3° or 5/16″ (flywheel), .0034″ (piston travel) before top dead center.

To Set Ignition Timing. With No. 1 piston on compression stroke, turn engine over by hand until piston reaches firing position (3° before top dead center) with flywheel mark 'SA-1' directly opposite pointer in inspection hole in flywheel housing. This mark is 3° or 5/16″ before top dead center mark 'D-C-1'. Then loosen clamp bolt in advance arm, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Std. Champion Type C-4-X. Set gaps at .025″.

VALVE TIMING:—Camshaft Setting. Camshaft at left of engine is chain driven from the crankshaft in tandem with the accessory sprocket. Chain is adjusted manually by shifting accessory sprocket mounting (see below). Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 8 are on top dead center with flywheel mark 'D-C-1' opposite indicator in inspection hole in flywheel housing, mesh chain so that there are exactly ten links or eleven pins between marks on sprockets (begin counting with pin in line with tooth meshed opposite mark on crankshaft

GRAHAM

CUSTOM EIGHT MODEL 57-A (1933), SERIAL NUMBERS 1,020,001 UP
DELCO-REMY SYSTEM

sprocket and mesh the tooth in line with the eleventh pin opposite the mark on the camshaft sprocket).

To Check Valve Timing. With piston No. 8 on top dead center entering power stroke, set tappet clearance of No. 8 intake and exhaust valves at .012". Turn engine over one complete revolution and stop with piston on top dead center with flywheel mark 'D-C-1' at indicator in inspection hole in flywheel housing. No. 1 intake valve should begin to open at this point. Turn engine over 10° further and stop with flywheel mark 'E-C-1' at indicator. No. 1 exhaust vailve should close at this point. Reset tappet clearance at .010" running clearance (intake and exhaust) with engine hot.

Timing Chain Adjustment. Chain should be adjusted at least every 6000 miles. To take up chain, loosen two flange mounting screws on accessory sprocket mounting (water pump bracket) and back off adjustment screw lock nut. Turn up adjustment screw until chain begins to hum with engine running, back off adjustment until chain runs noiselessly, tighten lock nut and mounting screws.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.375"	.34075"	4.894"	45°	.3145"
Exhaust	1.350"	.34075"	4.894"	45°	.3195"

Tappet Clearance

	Operating	Timing
Intake	.010 (hot)	.012" (cold)
Exhaust	.010" (hot)	.012" cold)

Valve Springs

Closed	50 pounds
Open	109 pounds

Timing—Intake Valves

Open—At top dead center.

Close—40° or 4 3/16"—Standard, 3 59/64"—Custom (flywheel), .371" (piston) after lower dead center.

Timing—Exhaust Valves

Open —40° or 4 3/16"—Standard, 3 59/64"—Custom (flywheel), .371" (piston) before lower dead center.

Close—10° or 1 3/64"—Standard, 63/64"—Custom (flywheel), .037" (piston) after top dead center.

CARBURETION:—Detroit Lubricator Updraft Carburetor Model 51. See Carburetor Section for complete data. Manifold heat control is operated manually by button below instrument panel with seasonal adjustment at carburetor. Choke is operated manually by button on lower left center of instrument panel.

Air Cleaner:—Oil-wetted wire mesh type. Remove complete unit at three-month intervals, clean by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type mounted on left side of crankcase and driven by eccentric on camshaft (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model 734-N, 734-P (R.H.D.) Standard. 725-K, 725-M Custom Models. Starter drive—Overrunning clutch and mechanical pinion shift connected to starting switch pedal (starter switch Type No. 820052 mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data—Models 734-N, P

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.0	475

Starter Data—Models 725-K, M

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	60
16 "	Lock	3.0	600

Mounting:—Flange mounted on right hand forward face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take off nuts on flange mounting bolts, pull starter forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive bearing in pinion housing is oilless.

GENERATOR:—Model 965-V. Third brush regulation. Rotation counter-clockwise at commutator end. With standard setting maximum charging rate is 17-19 amperes (cold) at 8.2-8.4 volts reached at 1700 R.P.M. or approximately 25 M.P.H.

Charging Rate Adjustment. Loosen the small round lock screw on the commutator end plate, take off comutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
17-19	8.2-8.4	1900	13-15	7.7-8.0	1800-2000

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.75-2.25 amperes at 6 volts across field terminals.

Field Fuse:—6 ampere capacity.

Mounting:—Cradle mounted at right of engine and driven through flexible shaft from the water pump shaft. To remove, disconnect lead, disconnect drive shaft coupling, loosen mounting clamp band, lift generator out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Relay contacts close when generator voltage reaches 6.75-7.5 volts and open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Clum Switch Model 9463. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system uses double-filament bulbs for 'depressed beam' dimming and switch has additional 'passing' position in which the uppper filament (depressed beam) of the left hand headlight and lower filament (driving beam) of the right hand headlight are lighted (see diagram). Stop and tail light uses a double filament bulb.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116
Parking Bulbs	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158
Body Lights	6-8	3	S.C.	63

FUSES:—Lighting fuse mounted on fuse block on rear of dash is 20 ampere capacity. A spare fuse is mounted on the fuse block. Generator field fuse is 6 ampere capacity.

HORNS:—(Custom Eight). Klaxon Model K-26-C, Type 1413 (low note), 1414 (high note), twin horns (matched tone) mounted under engine hood. Horn relay is not used. Current draw of horns 6.0-8.5 amperes at 6 volts (low note), 5.0-6.5 amperes at 6 volts (high note).

SERIAL NUMBER:—First number, 1,615,001. On plate under floor mat near right rear door or under front seat cushion.

COMPRESSION:—Ratio—6.5-1 std. head.
Pressure—110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 536-L,(Std.), 536-M (Deluxe) 536-K (RHD.).
Ignition Current—2 amperes (running), 4 amperes (stopped).
Ignition Switch—Delco-Remy Model 431-H (536-L), 431-J (536-M), 431-K (536-K).

Distributor Model 632-Z.—Single breaker, 6 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor.
Breaker Gap—Set gap at .018". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Manual Advance—30° (engine—adjustment only).
Cam Angles (Distributor Degrees) — Closed 36°. Open 24°.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	2	1000
10½	1950	21	3900

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....3° BTDC..... .0037" BTDC.

Timing:—With #1 piston on compression, crank engine over until piston is 3° or 5/16" before top dead center, stop when flywheel mark '/SA-1' lines up with pointer on housing (inspection hole in right front face of flywheel housing), loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).
Motor Gauge—Weidenhoff Adapter #102, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion #4, ⅞ SAE. Std. type.
Spark Plug Gaps—.025". Limits, .023-.027".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburettor, Fuel Pump and Gasoline Gauge.

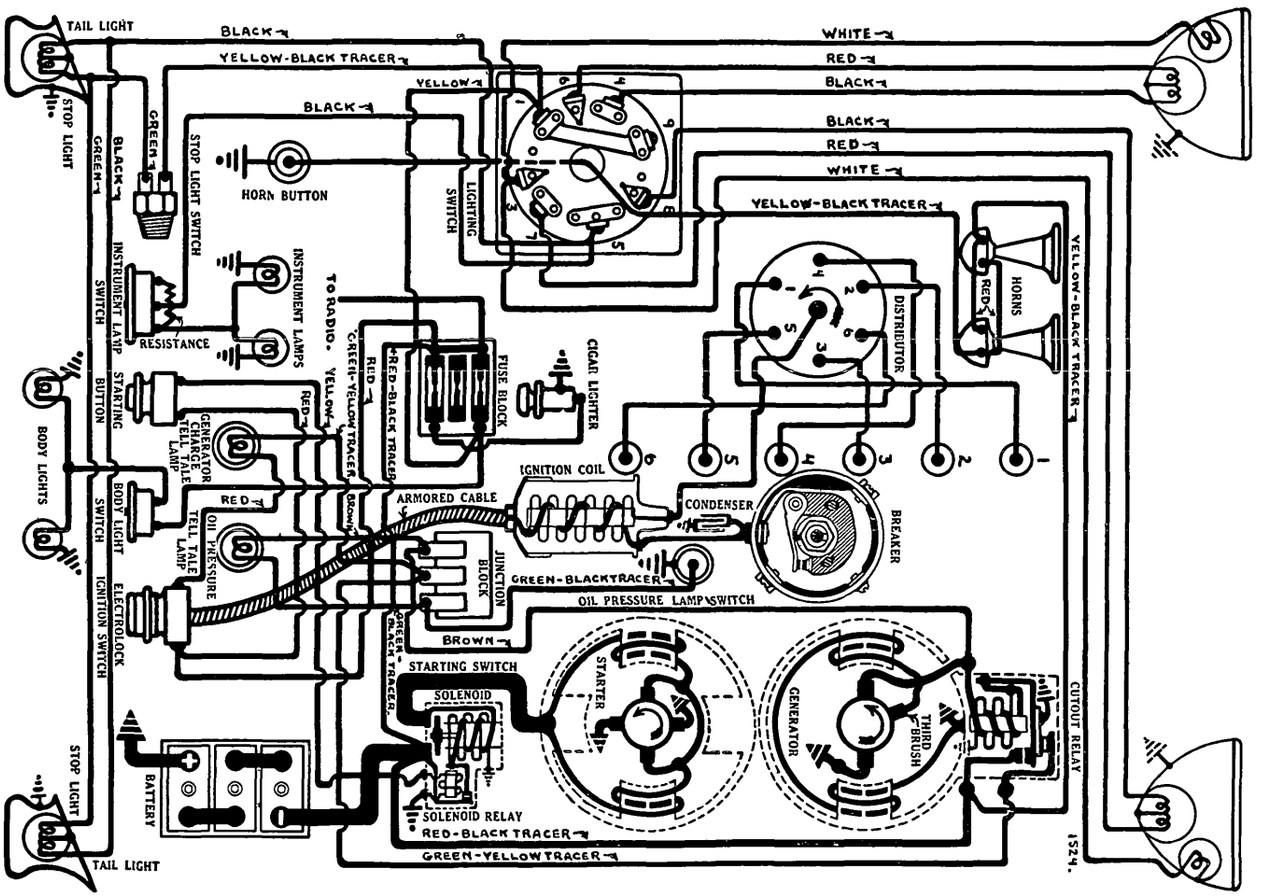
Carburetor:—Stromberg, Model EX-22, 1¼" downdraft type.

Fuel Pump:—AC, Type R.

Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—Set tappet clearance #6 exhaust valve at .012". This valve should close with piston 10° after top dead center when flywheel mark 'EC-1' lines up with pointer on housing in inspection hole in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #102, Rod #2.



Tappet Clearance:—.010" all valves with engine hot.

Valve Spring Pressure:—94-96 lbs. at 1⅞" (with load).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—(Standard). Williard, Type WS-1-13. 6 volt, 13 plate, 86 A.H. capacity (20 hour rate).
Starting Capacity—105 amperes for 20 minutes.
Special—cars with radio). Willard, Type WH-2-15. 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right hand front seat.

STARTER:—Model 734-U, 738-D. Armature No. 823881. Model 738-A, 738-E (R.H.D.). Solenoid type starting switch used only with 734-U (Solenoid Switch

Type 1517) and 738-A (Solenoid Switch Type 1512).
Rotation—Counter-clockwise at commutator end.
Cranking Engine—180-190 amperes, 5 volts.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Solenoid Switch Type 1517 (734-U), 1512 (738-A). Pushbutton Switch Type 1388, 86. Starting switch and pinion shift operated by solenoid on starter field frame. Solenoid operated through relay and controlled by pushbutton switch on instrument panel. See Equipment Section for complete data.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out flange mounting capscrews.

GENERATOR:—Model 935-E. Armature No. 1854856. Third brush control type.
Charging Rate Adjustment—Take off commutator cover band, loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lockscrew.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.

SPECIAL GENERATORS:—Model 935-V (Radio), 931-V (Police). See Equipment Section for complete data.
Mounting:—Pivot mounted at right front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator away from engine until side-play on belt midway between fan and cranckshaft pulleys is 1", tighten clamp bolt before slacking off on generator, tighten pivot bolts.

CUTOUT RELAY:—Model 265-S (935-E Generator). Relay has an extra set of grounding contacts above armature for generator charging indicator signal light control. See Signal Lights.
Cuts in—6.75-7.5 volts.
Cuts out—0-2.5 ampere discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Clum Switch Model 9463. Switch mounted at lower end of steering column controlled by lever on steering wheel. Special 'passing' position of switch provided between 'city driving' (depressed beam) and 'country driving' (bright beam). Passing position provides assymmetrical passing beam (depressed beam left hand headlight, bright beam right hand headlight). Headlights aimed straight ahead. Headlight bulbs are prefocused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlight	32-21	2320-C
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Signal Lights	3	64 (DC)

SIGNAL LIGHTS:—Consist of Generator Charging Indicator (left hand) and Oil Pressure Indicator (right hand) signal lights in instrument cluster, Signal lights are standard double contact 3 cp. bulbs Mazda 64.

Generator Charging Indicator. Signal should light when ignition is turned on and should go out when generator begins to charge battery. If lamp does not light with ignition on and engine not running, ground signal lamp lead at generator relay to ground. If lamp does not light, replace bulb. If signal does not go out at driving speeds, see that auxiliary contacts on cutout relay open when main contacts close.

Oil Pressure Indicator. Signal should light with engine idling and should go out when oil pressure reaches 25 pounds. If signal remains lighted or flashes at speeds above idling, check for excessive oil dilution, lack of oil or no oil pressure. To check signal lamp, ground signal lamp lead at oil pressure regulator on side of crankcase. Lamp should light with engine running at idling speed or faster. If lamp does not light, replace bulb.

FUSES:—**Lighting**—Two 20 ampere Type 3AG-20 fuses on fuse block under dash. One extra fuse mounted on block.

Generator Field—(935-J Generator). 6 amperes in regulator case.

HORNS:—Klaxon, Model K-31, Type 1363 (Std.), K-26L, Type 1608 (Deluxe). Single horn or matched pair, blended tone.

NOTE:—Supercharged Special Eights use the Custom Eight Model 69 engine. See data on Custom Eight for Carburetor, Distributor, and Ignition Timing for Supercharged Model 67.

SERIAL NUMBER:—First number, 1,805,001. On plate under floor mat near right rear door or under front seat cushion.

COMPRESSION:—Ratio—6.7-1 std. aluminum head. **Pressure**—110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 536-L (Std.), 536-M (Deluxe), 536-K (RHD.).
Ignition Current—2 amperes (running), 4 amperes (stopped).
Ignition Switch—Delco-Remy Model 431-H (536-L), 431-J (536-M), 431-K (536-K).
Distributor Model 661-X. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control. No synchronization required.
Breaker Gap:—Set gap at .018".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees) — Closed 31°. Open 14°.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	500	2	1000
8½	2050	17	4100

Vacuum Spark Control Model 680-N. Provides additional spark advance for intermediate speed range except when car is suddenly accelerated or operated with wide open throttle when spark will be retarded by return spring in unit. Vacuum unit not effective at idling (closed throttle positions) as vacuum connection on carburetor is below throttle valve.

Vacuum Spark Advance

Advance (eng. Degs.)	Vacuum (Ins. of Mercury)
Start	7 minimum.
10-12	9-13

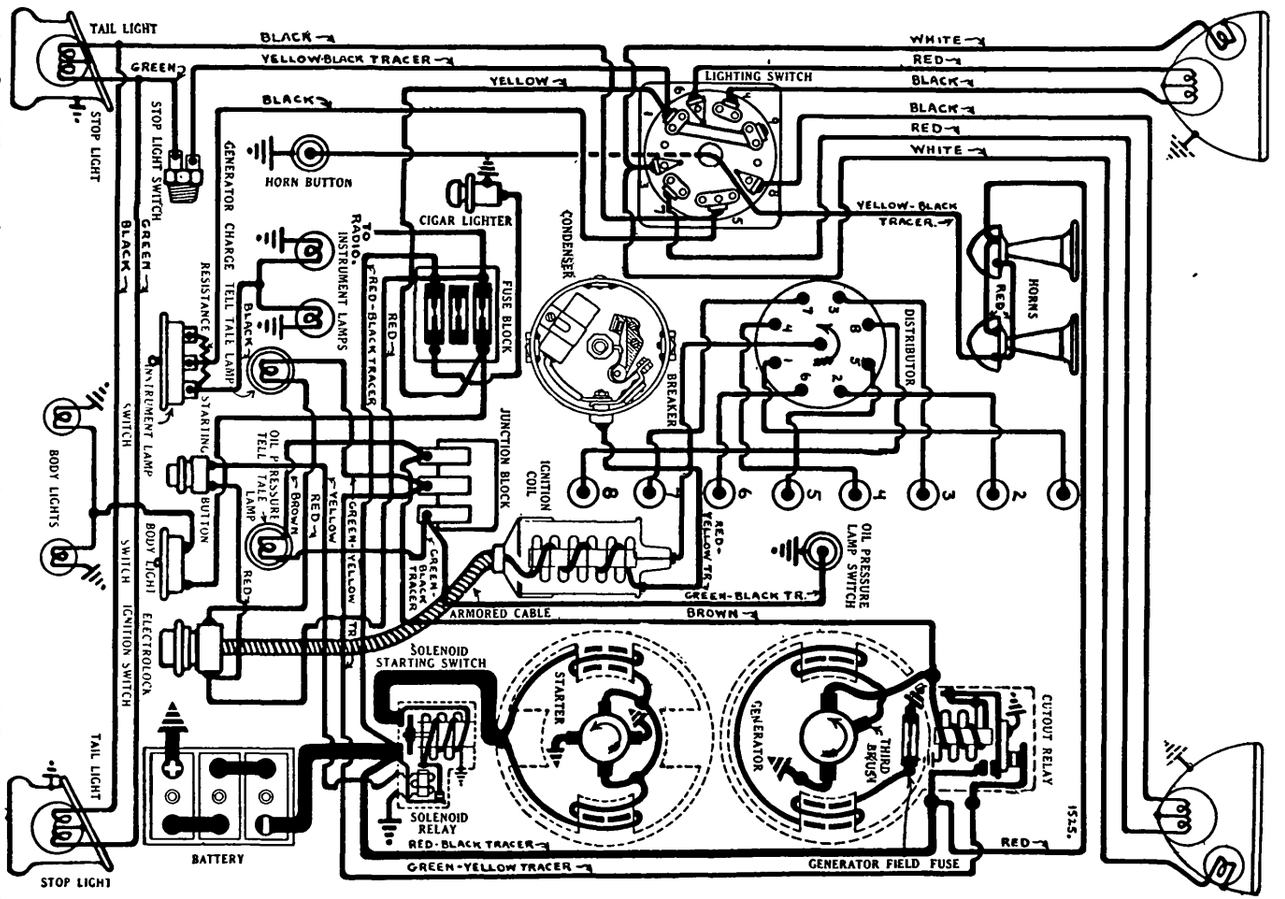
IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....3° BTDC..... .0034" BTDC.
Timing:—With #1 piston on compression turn engine over until piston is 3° or 5/16" before top dead center, stop when flywheel mark '/SA-1' lines up with pointer on housing (inspection hole in right hand front face of flywheel housing), loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap check spark plug cable connection (see diagram).
Synchronization—No synchronization required.
Motor Gauge—Weidenhoff Adapter #102, Rod #40.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.
Spark Plugs:—Champion Type C-7. 18 MM. Metric type.
Spark Plug Gaps—.025". Limits, .023-.027".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump and Gasoline Gauge.

Carburetor:—Stromberg, Model URO-2, 1½" updraft type.

Fuel Pump:—AC, Type R.



Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—Set tappet clearance #8 exhaust valve at .012". This valve should close with piston 10° past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right hand front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #102, Rod #40.

Tappet Clearance:—.010" all valves with engine hot.

Valve Spring Pressure:—103-109 lbs. at 1⅞" (with load).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—(Standard) Willard, Type WS-2-15. 6 volt, 15 plate 100 A.H. capacity (20 hour rate).
Starting Capacity—122 amperes for 20 minutes.
(Special—cars with radio). Willard, Type WH-2-15. 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right front seat.

STARTER:—Model 734-U, 738-D. Armature No. 823881. Model 738-A, 738-E (R.H.D.). Solenoid type starting switch used only with 734-U (Solenoid Switch Type 1517) and 738-A (Solenoid Switch Type 1512).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.
Cranking Engine—190-200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Solenoid Switch Type 1517 (734-U), 1512 (738-A). Pushbutton Switch Type 1388, 86. Starting switch and pinion shift operated by solenoid on starter field frame. Solenoid operated through relay and controlled by pushbutton switch on instrument panel. See Equipment Section for complete data.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out flange mounting capscrews.

GENERATOR:—Model 967-M. Armature No. 1844827. Third brush control type.

Charging Rate Adjustment:—Take off commutator cover band, losen lockscrew on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate, tighten lockscrew.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-19	8.2-8.4	1900
Hot	13-15	7.7-8.0	1800-2000

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—1.75-2.25 amperes at 6.0 volts.

Field Fuse—6 ampere capacity.

SPECIAL GENERATORS:—Model 967-N. Used only on cars equipped with radio. See Equipment Section for complete data.

Mounting:—Cradle mounted on right hand side of crankcase. Driven through hose coupling by water pump shaft. To remove, disconnect drive coupling, loosen mounting clamp band.

CUTOUT RELAY:—Model 265-S (967-M Generator). Relay has an extra set of grounding contacts above armature for generator charging indicator signal light control. See Signal Lights.

Cuts in—6.75-7.5 volts.

Cuts out—0-2.5 ampere discharge.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

LIGHTING:—Clum Switch Model 9463. Switch mounted at lower end of steering column controlled by lever on steering wheel. Special 'passing' position of switch provided between 'city driving' (depressed beam) and 'country driving' (bright beam). Passing position provides assymmetrical passing beam (depressed beam left hand headlight, bright beam right hand headlight). Headlights aimed straight ahead. Headlight bulbs are prefocused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlight	32-21	2320-C
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Signal Lights	3	64 (DC)

SIGNAL LIGHTS:—Consist of Generator Charging Indicator (left hand) and Oil Pressure Indicator (right hand) signal lights in instrument cluster, Signal lights are standard double contact 3 cp. bulbs Mazda 64.

Generator Charging Indicator. Signal should light when ignition is turned on and should go out when generator begins to charge battery. If lamp does not light with ignition on and engine not running, ground signal lamp lead at generator relay to ground. If lamp does not light, replace bulb. If signal does not go out at driving speeds, see that auxiliary contacts on cutout relay open when main contacts close.

Oil Pressure Indicator. Signal should light with engine idling and should go out when oil pressure reaches 25 pounds. If signal remains lighted or flashes at speeds above idling, check for excessive oil dilution, lack of oil or no oil pressure. To check signal lamp, ground signal lamp lead at oil pressure regulator on side of crankcase. Lamp should light with engine running at idling speed or faster. If lamp does not light, replace bulb.

FUSES:—Lighting—Two 20 ampere Type 3AG-20 fuses on fuse block under dash. One extra fuse mounted on block.

Generator Field—6 amperes in generator.

HORNS:—Klaxon Model K-26L. Type 1603 and 1604. Twin horns with blended tone. Vibrator type. Horn current 6.0-8.5 amperes at 6.0 volts (low note), 5.0-6.5 amperes at 6.0 volts (high note).

NOTE:—Carburetor, Distributor, and Ignition Timing data given below apply also to the Model 67 Supercharged Special Eight. See previous page for remainder of data on Model 67 Supercharged Special Eight and for all data on Model 67 (not supercharged).

SERIAL NUMBER:—First number 1,025,001. On plate under floor mat near right rear door or under front seat cushion.

COMPRESSION:—Ratio—6.7-1 std. aluminum head.
Pressure—110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 539-F. Assembled as unit with switch.
Ignition Current—2 amperes (running) 4 amperes (stopped).
Ignition Switch—Delco-Remy Model 431-J.

Distributor Model 661-Y. Double breaker, 8 lobe cam, full automatic advance type with auxiliary Vacuum Spark Control. Stationary contacts are used to time ignition. Movable contacts are used to load coil (open and close 10° before stationary set). Contacts must be synchronized—See Timing.
Breaker Gap—Set at .015". Limits, .0125-.0175"
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees) — Closed 37°. Open 8°. With movable contacts properly set to load coil (see Synchronizing directions).

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	1½	400
5¼	1000	10½	2000
7¾	2000	15½	4000

Vacuum Spark Control Model 680-P. Provides additional spark advance for intermediate speed range except when car is suddenly accelerated or is operated with wide open throttle when spark will be retarded by return spring in unit. Vacuum unit not effective at idling speeds (closed throttle position) as vacuum connection on carburetor is above throttle valve.

Vacuum Advance

Degrees (engine)	Vacuum (Ins. of Mercury)
Start	10" minimum
10-12	16" maximum

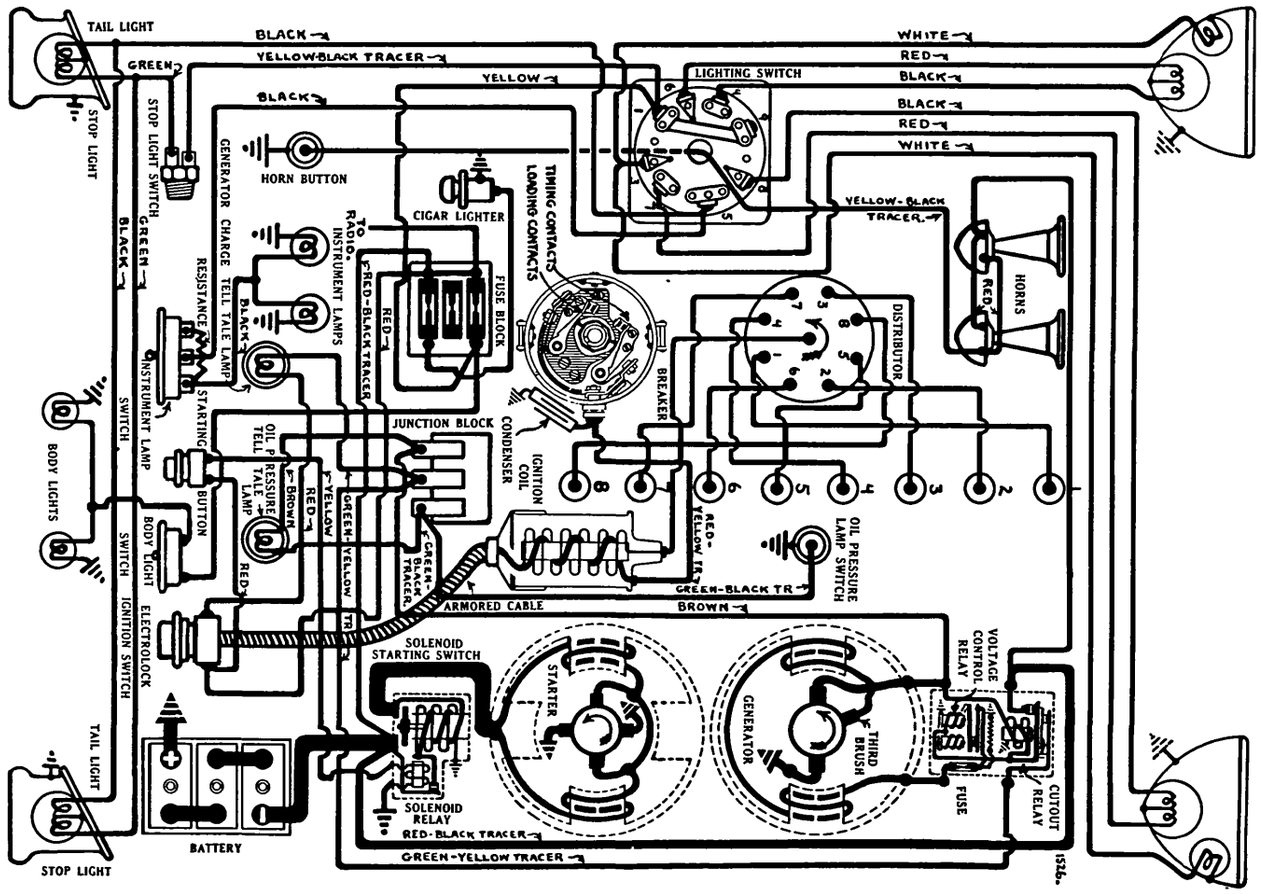
IGNITION TIMING:— Flywheel Degs. Piston Position
Timing Contacts.....6° BTDC..... .0135" BTDC.
Loading Contacts .....14-16° BTDC..... .....
Timing (Stationary Contacts):—With #1 piston on compression, turn engine over until piston is 6° or 5/8" before top dead center, stop when flywheel mark '/SA-1' lines up with pointer on housing (inspection hole in right hand front face of flywheel housing), loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).

Synchronization (Movable Contacts): — Movable contacts are set to open and close 8-10° before stationary or timing contacts. Use Delco-Remy special tool, Part #1838182, place tool in position on top of breaker cam, rotate distributor until stationary contacts just open, note point on center scale of tool directly opposite fixed point on distributor cup, then rotate distributor 35° so that point on end scale 8-10° less than original reading on center scale is opposite the same point on the distributor cup, loosen lockscrews on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts just open, tighten lockscrew. This tool (#1838182) was developed for use in synchronizing Type 660 and 662 distributors (4 lobe cam—alternate opening) but can be used to set 661-Y distributors for this special irregular opening and closing interval.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champmpion, Type C-7. 18 MM. Metric.
Spark Plug Gaps:—.023". Limits, .023-.027".



CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-32, 1½" plain tube downdraft type.

Fuel Pump:—AC, Type R.

Gasoline Gauge:—K-S Telegauge.

Supercharger:—Supercharger consists of a centrifugal fan or blower mounted directly below the carburetor (downdraft type) which takes the fuel mixture from the carburetor and delivers it to the intake manifold. Supercharger is driven through a worm and gear from the accessory shaft at the right of the crankcase. Lubrication is entirely automatic. The upper half of the supercharger rotor casing is water-jacketed to control mixture tem-

perature. Carburetor is adjusted in the usual manner.

VALVE TIMING:—To Check Timing—Set tappet clearance #8 exhaust valve at .012". This valve should close with piston 10° past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right hand front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.010" all valves with engine hot.

Valve Spring Pressure:—1⅞" with load of 103-109 lbs.

LUBRICATION:—Crankcase Capactiy—6 quarts.

Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—(Std.) Willard, Type WS-2-15. 6 volt, 15 plate, 100 A.H. capacity (20 hour rate).

Starting Capacity—122 amperes for 20 minutes.

(Cars with radio). Willard, Type WH-2-15. 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under right hand front seat.

STARTER:—Model 734-U. Armature No. 823881.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Cranking Engine—190-200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Solenoid Switch Type 1517 controlled by Pushbutton Switch Type 1386. Starting switch and pinion shift operated by solenoid mounted on starter field frame. Solenoid operated through relay and controlled by pushbutton switch on instrument panel. See Equipment Section for complete data.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out flange mounting capscrews.

GENERATOR:—Model 967-L. Armature No. 1855966. Third brush control type with external voltage regulation. Voltage Control Relay combined with Cutout Relay in case on generator field frame. See Equipment Section for complete data.

Charging Rate Adjustment:—Use test meters to check generator output. Connect jumper wire from 'F' generator terminal to ground—important as voltage regulator must be shorted out while adjustment being made. Take off commutator cover band, shift third brush by hand, counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw, remove jumper wire.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.3-8.7	2100
Hot	12-15	7.6-8.0	2800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. (all brushes).
Field Current—2.1-2.5 amperes at 6.0 volts.
Field Fuse—6 ampere (in regulator case).

Mounting:—Flange mounted on rear face of Supercharger gear housing at right of crankcase. To remove, take out flange mounting capscrews, pull generator to rear to disengage drive coupling.

RELAY-REGULATOR (CONTROL UNIT):—Model 5544 (967-L Generator). Consists of Cutout Relay and Voltage Control Relay in case on generator field frame. Cutout Relay has extra set of grounding contacts above armature for generator charging indicator signal light control. See Signal Lights. See Equipment Section for complete data on Voltage Control Relay.

Cutout Relay

Cuts in—6.4-6.8 volts.
Cuts out—3 ampere discharge maximum.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Air Gap—.028-.040" between armature and core (armature down against stop), armature travel (between armature and stop).

LIGHTING:—Clum Switch Model 9463. Switch mounted at lower end of steering column controlled by lever on steering wheel. Special 'passing' position of switch provided between 'city driving' (depressed beam) and 'country driving' (bright beam). Passing position provides assymmetrical passing beam (depressed beam left hand headlight, bright beam right hand headlight). Headlights aimed straight ahead. Headlight bulbs are prefocused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlight	32-21	2320-C
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Signal Lights	3	64 (DC)

SIGNAL LIGHTS:—Consist of Generator Charging Indicator (left hand) and Oil Pressure Indicator (right hand) signal lights in instrument cluster, Signal lights are standard double contact 3 cp. bulbs Mazda 64.

Generator Charging Indicator. Signal should light when ignition is turned on and should go out when generator begins to charge battery. If lamp does not light with ignition on and engine not running, ground signal lamp lead at generator relay to ground. If lamp does not light, replace bulb. If signal does not go out at driving speeds, see that auxiliary contacts on cutout relay open when main contacts close.

Oil Pressure Indicator. Signal should light with engine idling and should go out when oil pressure reaches 25 pounds. If signal remains lighted or flashes at speeds above idling, check for excessive oil dilution, lack of oil or no oil pressure. To check signal lamp, ground signal lamp lead at oil pressure regulator on side of crankcase. Lamp should light with engine running at idling speed or faster. If lamp does not light, replace bulb.

FUSES:—Lighting—Two 20 ampere Type 3AG-20 fuses on fuse block under dash. One extra fuse mounted on block.

Generator Field—6 ampere in regulator case.

HORNS:—Klaxon Model K-26G. Types 1781, 1782 or 1779, 1778. Matched horns, blended tone. Vibrator type. Current draw—6.0-8.5 amperes at 6.0 volts (low note), 5.0-6.5 amperes at 6.0 volts (high note).

SERIAL NUMBER:—First number, 1,700,001. On plate on floor within body back of right front seat.

COMPRESSION:—Ratio—5.8-1 Std. cast-iron head, 6.87-1 optl. aluminum head.
Pressure—95-100 lbs. (5.8-1 head), 115 lbs. (6.87-1 head) at 50 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model 536-J. Mounted on the dash.
Ignition Current—2 amperes idling, 4 stopped.
Ignition Switch:—Model 431-U (switch and cable). Connected to coil by armored cable.

Distributor Model 622-Z (Cast-iron head), 623-A (Al. Head). Single breaker, 6 lobe cam, full automatic advance type with Auxiliary vacuum spark control.
Breaker Gap—Set at .018". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 36°. Open 24° distributor.

Automatic Advance—622-Z.

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	2	800
3	600	6	1200
7	1300	14	2600

Automatic Advance—623-A.

Start	400	2	800
9	1400	18	2800

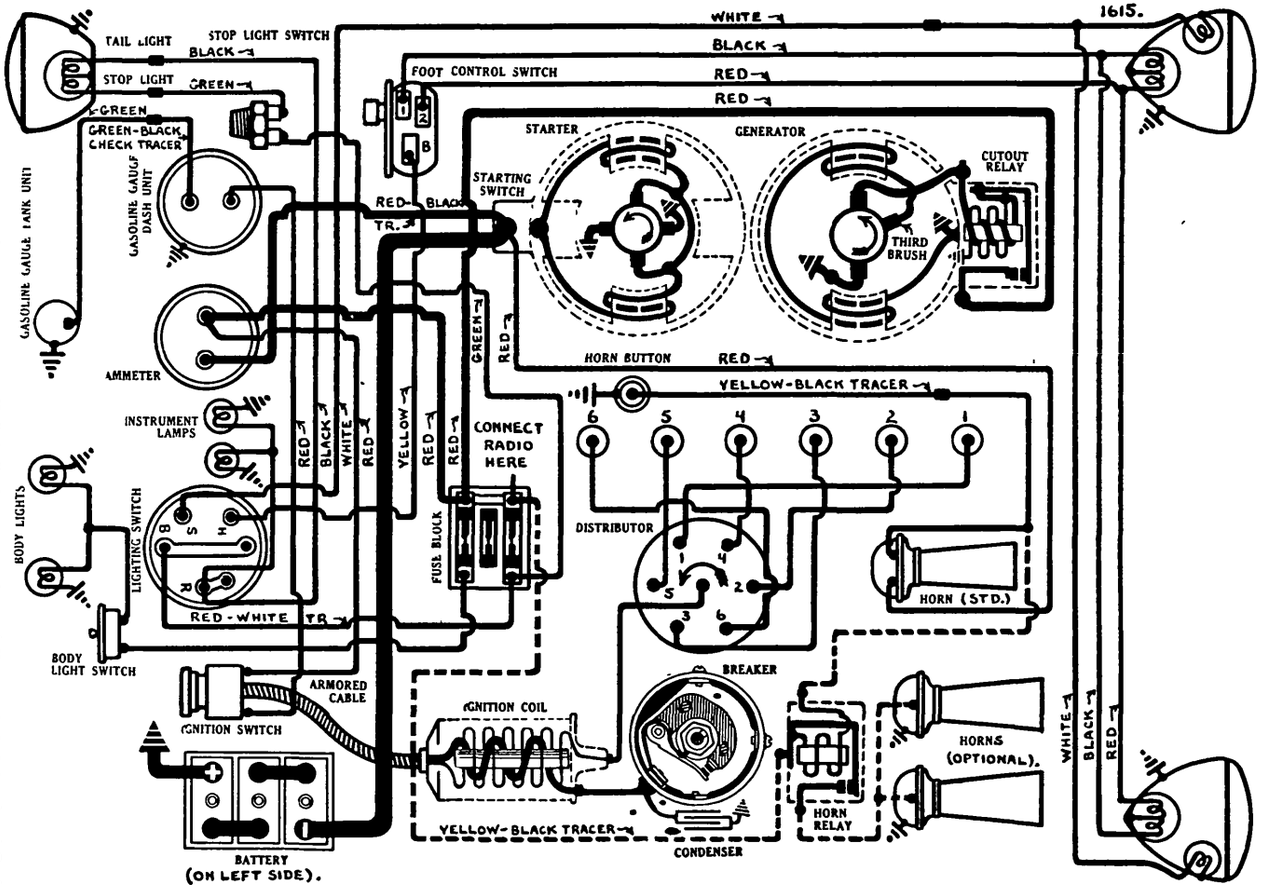
Vacuum Spark Control Model 680-N—Provides additional advance for intermediate speeds above idling except when engine is suddenly accelerated or is operated with wide open throttle when spark will be retarded by return spring in unit.

Vacuum Spark Advance.

Engine Degrees	Vacuum
Start	7" of HG Minimum.
10-12°	9-13" of HG.

Removal:—Distributor mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Pos.
Cast-iron Heads ....5 1/3° BTDC.....0111" BTDC.
Aluminum Heads ..2° BTDC.....0016" BTDC.
Timing (All engines)—With #1 piston on compression, turn engine over until piston is 5 1/3° or ½" (engines with cast-iron heads), 2° or 3/16" engines with Aluminum heads) before top dead center, stop when flywheel mark '/SA-1' lines up with indicator on housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.
Motor Gauge—Weidenhoff Adapter #102, Rod #2.



Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type C-7. 18 MM. Metric.
Spark Plug Gaps—Set at .025". Limits .023-.027".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump and Gasoline Gauge.
Carburetor:—Stromberg, Model EX-22 or EXV-2, 1¼" downdraft type.

Fuel Pump:—AC. Type P-1521392 diaphragm type.
Gasoline Gaug : AC. electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .025" past top dead center when flywheel mark 'EC-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #102, Rod #2.
Tappet Clearance:—.010" all valves with engine hot.
Valve Spring Pressure:—32.2-34.2 lbs. at 1 21/32" valve closed). 71-75 lbs. at 1⅜" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WS-1-13, R-1-13 (Export), 6 volt, 13 plate, 86 A.H. capacity (20 hour rate).
Starting Capacity—105 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.
Cars with Radio—Type WH-1-13. RH-1-13 (Export). 6 volt, 13 plate, 102 A.H. capacity (20 hour rate). Starting capacity 120 amperes for 20 minutes.

STARTER:—Model 738-J. Armature No. 823881.
Starter Drive—Manual pinion shift with overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Performance—60 R.P.M., 175 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 ft. lbs.	Lock	3.63	475

Starting Switch:—Mounted on starter field frame. Operated by pinion shift lever (starting pedal).

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting capscrews

GENERATOR:—Model 937-Y. Armature No. 1859794. Air-cooled. Third brush control type.
Charging Rate Adjustment—Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.
Maximum Charging Rate—18 amperes (cold), 15 amperes (hot), 8.3 volts, 2000 R.P.M., 22-23 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000
Hot	13-15	7.7-8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ozs., all brushes.
Field Current—3.5-4.5 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. To remove, slack off drive belt, disconnect water pump coupling, loosen mounting clamp band.

Belt Adjustment:—Belt adjustment provided at fan bracket. With correct adjustment sideplay of belt should be 1" midway between pulleys.

SPECIAL GENERATOR:—Model 936-L. Used on cars with radio. See Equipment Section for complete data.

CUTOUT RELAY:—Model 265-B. Mounted on generator. See Equipment Section for complete data.
Cuts in—6.75-7.5 volts.
Cuts out—0-2.5 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

LIGHTING:—Switch Model 479-P. Foot Control Switch Model 465-V. Foot switch used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No
Headlamps	32-21	2320-C.
Parking	1½	55.
Instrument	1	51.
Stop and Tail	21-2	1158.
Body lights	3	63.

FUSES: — Lighting — Two 20 ampere fuses on fuse block on dash. One extra fuse mounted on fuse block.

HORNS:—Klaxon Model K-16 Type 2001 Std. Model K-26-G Type 1794 (high note) Type 1795 (low note) or Model K-33-C Type 2036 (high note) Type 2035 (low note) optional equipment. Optional horns are matched tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts (minimum) to close contacts Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.
Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—First number, 1,635,001. On plate on floor inside right rear door (sedans), or under right seat (coupes).

COMPRESSION:—Ratio—6.5-1 Std. aluminum head.
Pressure—105 lbs. at cranking speed (60 R.P.M.)

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 536-J. Mounted on the dash.
Ignition Current—1.8 amps. (idling), 3 (stopped).
Ignition Switch—Model 431-U. Connected to coil by armored cable.

Distributor Model 632-Z. Single breaker, 6 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor.
Breaker Gap—Set at .018". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 36°. Open 24° distributor.
Manual Advance—30° (engine) adjustment at distributor only.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	2	1000
10½	1950	21	3900

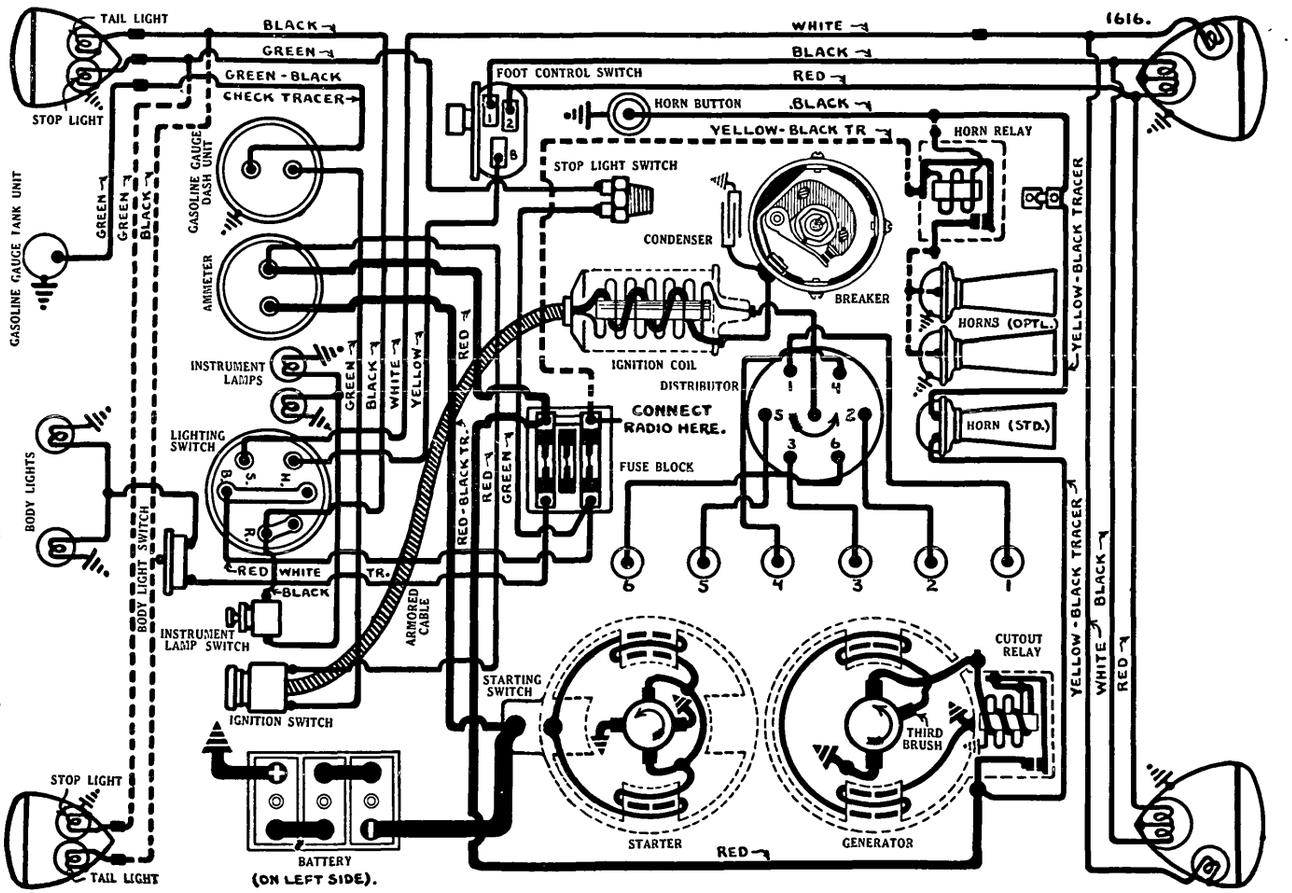
Removal—Mounted on left hand side of cylinder head. Driven by offset tongue-and-slot coupling. Take out hold-down screw in advance arm, lift out.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... 3° BTDC. ..... .0037" BTDC.
Timing—With #1 piston on compression, turn engine over until piston is 3° or 5/16" on flywheel before top dead center, stop when flywheel mark '/SA-1' lines up with pointer in inspection hole in right front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, check spark plug connections (rotor must be opposite #1 segment in cap).
Motor Gauge—Weidenhoff Adapter #102, Rod #2.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion, Type C-7. 18 MM. Metric.
Spark Plug Gaps—Set at .025". Limits .023-.027".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.



Carburetor:—Stromberg, Model EX-23, 1¼" downdraft type.
Automatic Choke—Stromberg.
Fuel Pump:—A.C., Type P-1521674 diaphragm type.
Gasoline Gauge:—A.C., electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .0422" past top dead center when flywheel mark 'EC-1' lines up with indicator in inspection hole in right front of face of flywheel housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #102, Rod #2.
Tappet Clearance:—.010" all valves with engine hot.
Valve Spring Pressure:—50-55 lbs. at 2 3/16" (valve closed). 94-99 lbs. at 1⅞" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WS-1-13, R-1-13 (Export). 6 volt, 13 plate, 86 A.H. capacity (20 hour rate).
Starting Capacity—105 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—In cradle under left front seat.

Cars with Radio—Willard, Type WH-1-13, RH-1-13 (Export). 6 volt, 13 plate, 102 A.H. capacity (20 hour rate). Starting capacity 120 amperes for 20 minutes.

STARTER:—Model 738-D. Armature No. 823881. Model 738-E (R.H.D.). Manual pinion shift operated by starting switch pedal. Drives through overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.
Cranking Performance—60 R.P.M., 180-190 amps.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on right hand front face of flywheel housing. Take out flange mounting screws.

GENERATOR:—Model 936-D. Armature No. 1854856. Air-cooled. Third brush control type.
Charging Rate Adjustment—Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.
Maximum Charging Rate—20 amperes (cold), 15 amperes (hot), 8.5 volts, 2400 R.P.M., 23-24 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Generator pivot mounted at right front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen mounting bolts, pull generator away from engine until belt sideplay midway between pulleys is 1", tighten mounting bolts.

SPECIAL GENERATORS:—Model 936-E (cars with radio), Model 931-V (Police Service). See Equipment Section for complete data.

CUTOUT RELAY:—Model 265-H. Mounted on generator. See Equipment Section for complete data on this unit.
Cuts In—6.75-7.5 volts, 11 M.P.H.
Cuts Out—0-2.5 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017".

LIGHTING;—Switch Model 479-P. Foot Control Switch Model 465-V. Foot control switch is used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1½	55
Instrument	1	51
Tail, Body Lights	3	63
Stop	15	87

FUSES:—Lighting. Two 20 ampere fuses on fuse block on dash. One spare fuse mounted on fuse block.
Generator Field—6 ampere capacity in regulator case (special 931-V only).

HORNS:—Klaxon Model K-16, Type 2001 or K-26-L, Type 1608 Standard. Model K-33-C, Type 1909 (low note), Type 1910 (high note) optional. Optional horns are matched tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.
Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—First number, 1,810,001. On plate on floor inside right rear door (sedans), or under right seat (coupes).

COMPRESSION:—Ratio—6.7-1 Std. aluminum head.
Pressure—115 lbs. at cranking speed (60 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 536-J. Mounted on dash.
Ignition Current—1.8 amperes idling, 3 stopped.
Ignition Switch:—Model 431-U. Connected to coil by armored cable.

Distributor Model 661-X. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .018".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles—Closed 31°. Open 14° distributor.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	2	1000
8½	2050	17	4100

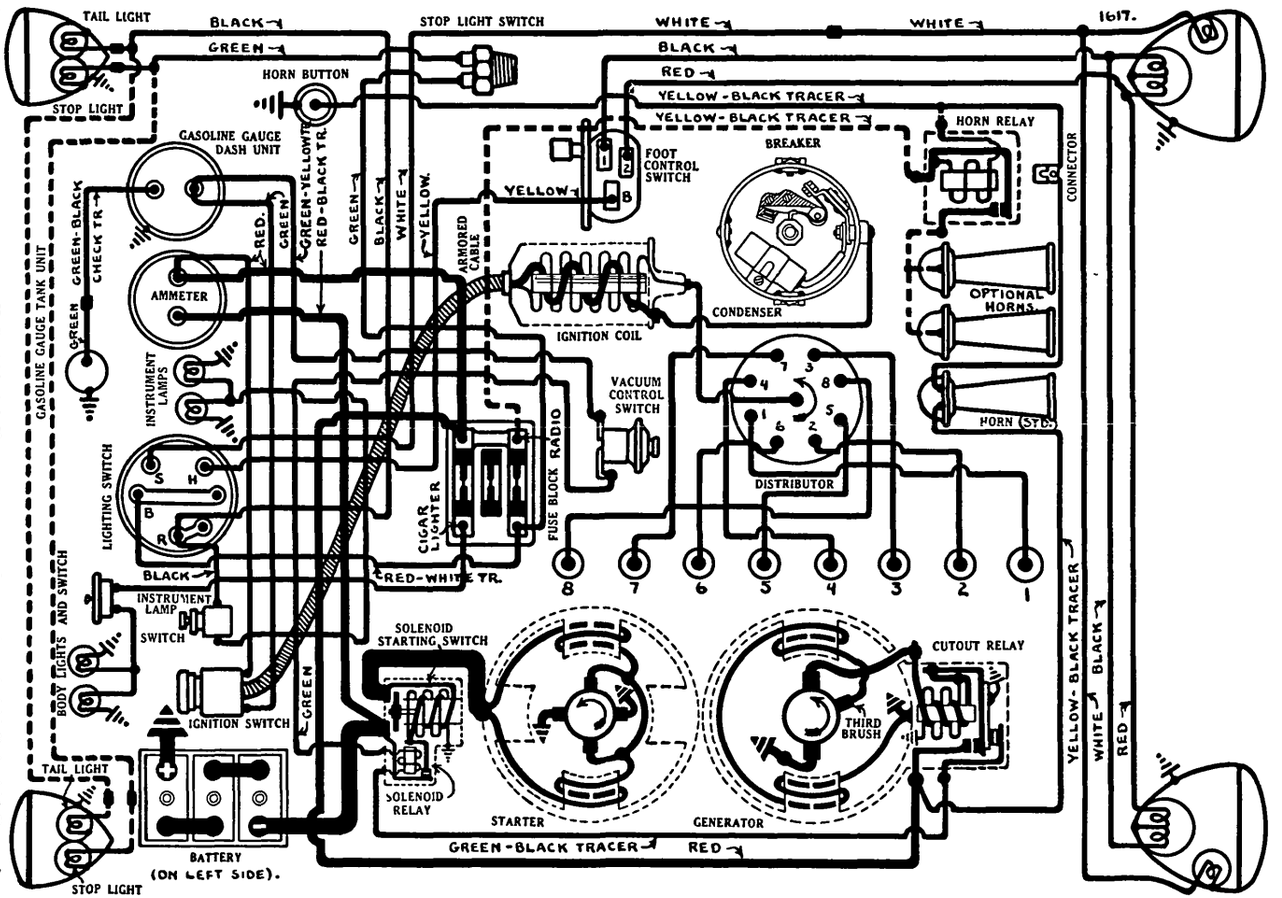
Vacuum Spark Control Model 680-N:—Provides additional spark advance for intermediate engine speeds except when car is suddenly accelerated or operated with wide open throttle when spark will be retarded by return spring in unit. Vacuum unit not effective at idling or closed throttle position since vacuum connection on carburetor is above throttle valve.

Vacuum Spark Advance

Degrees (Engine)	Vacuum (Ins. of Hg.)
Start	7" minimum
10-12	9-13"

NOTE—⅛" movement of vacuum unit plunger is equal to approximately 3° advance.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines.....3° BTDC.....0034" BTDC.
Timing—With #1 piston on compression, turn engine over until piston is 3° or 5/16" on flywheel before top dead center, stop when flywheel mark '/SA-1' lines up with indicator in inspection hole in right front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, check spark plug connections (rotor must be opposite #1 segment in cap).
Motor Gauge—Weidenhoff Adapter #102, Rod #40.
Firing Order:—1-6-2-5-8-3-7-4 (see diagram).



Spark Plugs:—Champion, Type C-7. 18 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EE-14, 1" dual, downdraft type.
Automatic Choke—Stromberg.
Fuel Pump:—A.C., Type 1521674 diaphragm type.
Gasoline Gauge:—A.C., electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .037" past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #102, Rod #40.

Tappet Clearance:—.010" all valves with engine hot.

Valve Spring Pressure:—50 lbs. at 2 3/16" (valve closed). 106 lbs. at 1⅞" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WS-2-15, R-2-15 (Export). 6 volt, 15 plate, 100 A.H. capacity (20 hour rate).
Starting Capacity—122 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—In cradle under left front seat.
Cars with Radio—Willard, Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.

STARTER:—Model 734-U, 738-A (R.H.D.). Armature No. 823881. Solenoid operated pinion shift and starting switch type. Solenoid controlled by accelerator pedal. Starter drives through overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Performance—60 R.P.M., 190-200 amps.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Solenoid Type 1517 (734-U), 1512 (738-A). Vacuum Switch Type 1600. See Equipment Section for complete data. Solenoid is controlled by vacuum switch (operated by accelerator pedal), and is combination starting switch and pinion shift.

Removal:—Starter is flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 936-F. Armature No. 1854856. Air-cooled. Third brush control type.

Charging Rate Adjustment—Loosen lockscrew on commutator end plate. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Maximum Charging Rate—20 amperes (cold), 15 amperes (hot), 8.5 volts, 2400 R.P.M., 23-24 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Generator pivot mounted at right front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen mounting bolts, pull generator away from engine until belt sideplay midway between pulleys is 1", tighten mounting bolts.

SPECIAL GENERATORS:—Model 936-G. Used on cars with radio. See Equipment Section for complete data.

CUTOUT RELAY:—Model 265-S. Mounted on generator. Has special ground contacts for starter solenoid control. See Equipment Section for complete data on this unit.
Cuts In—6.75-7.5 volts.
Cuts Out—0-2.5 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017".

LIGHTING:—Switch Model 479-P. Foot Control Switch Model 465-V. Foot control switch used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1½	55
Instrument	1	51
Tail, Body Lights	3	63
Stop	15	87

FUSES:—Lighting—Two 20 ampere fuses on fuse block on dash. One extra fuse mounted on fuse block.
Generator Field—6 ampere capacity in regulator case (radio generator only).

HORNS:—Klaxon Model K-26-L, Type 1608 Standard. Model K-33-C Type 1909 (low note), Type 1910 (high note) optional. Optional horns are matched tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.
Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—First number, 1,035,001. On plate on floor inside right rear door (sedans) or under right seat (coupes).

COMPRESSION:—**Ratio**—6.7-1 Std. aluminum head. **Pressure**—120 lbs. at cranking speed (60 R.P.M.)

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 539-M.** Mounted on dash. **Ignition Current**—1.8 amperes idling, 3 stopped. **Ignition Switch**—Model 431-U (switch and cable). Connected to coil by armored cable.

Distributor Model 661-Y. Double breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control. Stationary contacts are used for timing. Movable contacts are used to load coil (open and close 10° before timing contacts). Contacts must be synchronized—see Timing.

Breaker Gap—Set at .018".

Breaker Arm Spring Tension—19-23 ounces.

Cam Angles—Closed 37°. Open 8° distributor. With movable contacts properly set to load coil. See Synchronization directions.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	1.5	400
5.25	1000	10.5	2000
7.75	2000	15.5	4000

Vacuum Spark Control Model 680-P—Provides additional spark advance for intermediate engine speeds except when engine is suddenly accelerated or is operated with wide open throttle when spark is retarded by return spring in unit. Not effective at idling speeds since vacuum connection on carburetor is above throttle valve.

Vacuum Spark Advance

Engine Degrees	Vacuum
Start	10" of HG. Minimum
10-12°	16" of HG. Maximum

Removal:—Distributor mounted on left side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position Stat'ry (timing) contacts 3° BTDC. ..... .0034" BTDC. Movable (loading) contacts 11-13° BTDC.

Timing (Stationary Contacts)—With #1 piston on compression, turn engine over until piston is 3° before top dead center, stop when flywheel mark '/SA-1' lines up with pointer in right front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is directly opposite #1 segment in distributor cap. Check movable contacts as directed below.

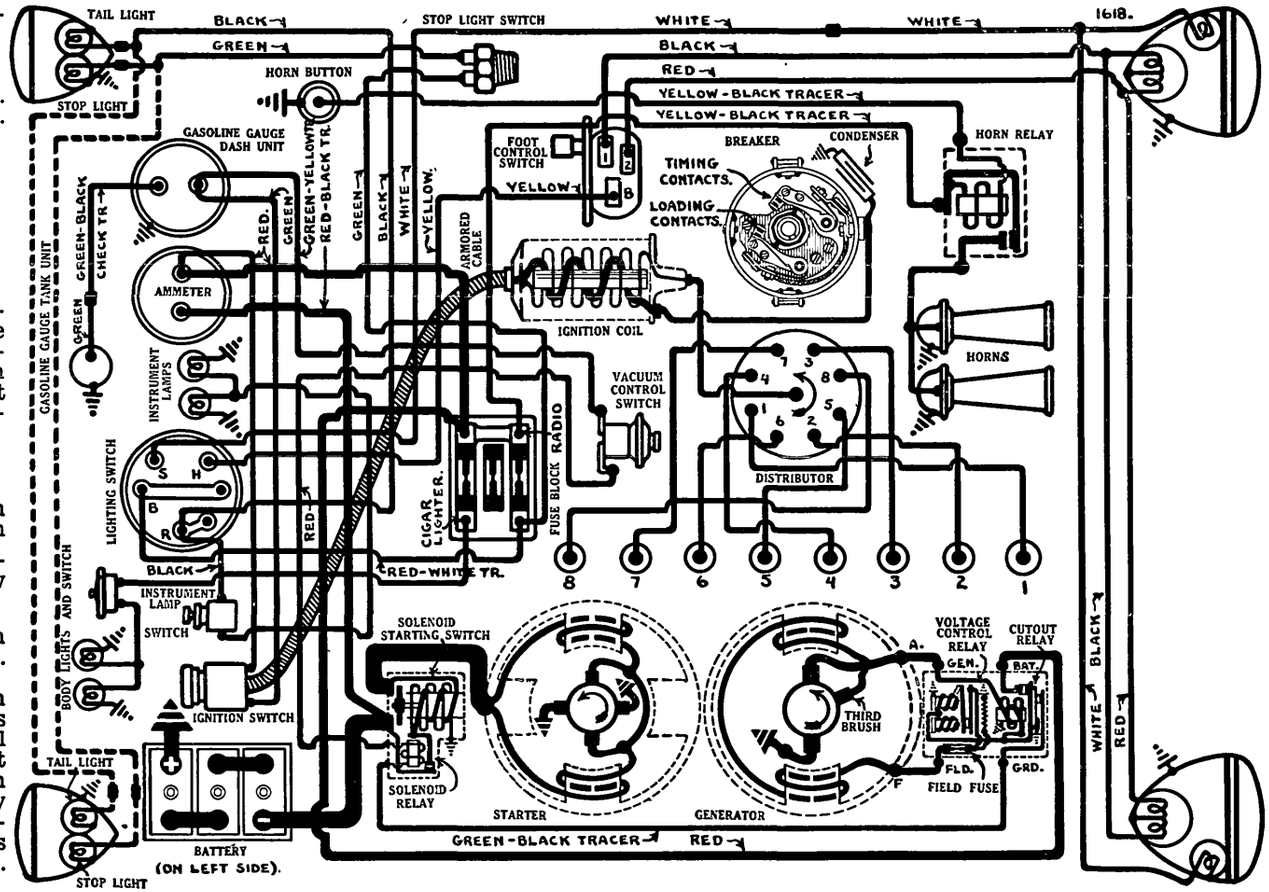
Synchronization (Movable Contacts)—These contacts are set to open and close 8-10° before timing contacts. Use Delco-Remy Synchronizing tool, Part #1838182 (not designed for this distributor but may be used). Place tool in position on top of breaker cam, rotate distributor until stationary (timing) contacts just open, note point on center scale directly opposite fixed point on distributor cup, then rotate distributor 35° so that point on end scale 8-10° less than original reading on center scale lines up with same point on distributor cup, loosen lockscrews on sub-plate carrying movable contacts, turn eccentric adjusting screw until contacts open, tighten lockscrews.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion, Type C-7. 18 MM. Metric. **Spark Plug Gaps**—Set at .025". Limits .023-.027".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.



Carburetor:—Stromberg, Model EX-32, 1¼" downdraft type.

Automatic Choke—Stromberg.

Fuel Pump:—AC. Type 1521674 diaphragm type.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .037" past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right hand front face of flywheel

housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.
Tappet Clearance:—.010" all valves with engine hot.
Valve Spring Pressure:—50 lbs. at 2 3/16" (valve closed). 106 lbs. at 1⅞" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WS-2-15, R-2-15 (Export). 6 volt, 15 plate, 100 A.H. capacity (20 hour rate).
Starting Capacity—122 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.
Cars with Radio—Willard, Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plate, 119 A.H. capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.

STARTER:—Model 734-U, 738-A (RHD). Armature No. 823881.
Starter Drive—Solenoid operated pinion shift. Starter drives through overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.
Cranking Performance—60 R.P.M., 190-200 amps.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Solenoid Type 1517 (734-U), 1512 (738-A). Vacuum Switch Type 1600. See Equipment Section for complete data. Solenoid is combination starting switch and pinion shift and is controlled through relay in solenoid case by vacuum switch operated by accelerator pedal.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 936-G . Armature No. 1854856. Third brush control in conjunction with Voltage Control Relay (two-step charging rate). See Equipment Section for complete data on Voltage Control Relay.

Charging Rate Adjustment—Use test meters to check generator output. Short out regulator by connecting jumper wire between 'F' terminal on generator and ground on generator frame. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw. Remove jumper wire.

Maximum Charging Rate—23 amperes (cold), 20 amperes (hot), 8.8 volts, 2800 R.P.M., 24-25 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	20-23	8.5-8.8	2800
Hot	16-20	8.1-8.5	3100

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—2.3-2.6 amperes at 6.0 volts.

Field Fuse—6 ampere in regulator case.

Removal:—Generator pivot mounted at right front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Loosen mounting bolts, pull generator away from engine until belt sideplay midway between pulleys is 1", tighten mounting bolts.

CONTROL UNIT:—Model 5590. Mounted on generator. Consists of Cutout Relay and Voltage Control Relay in a single case. See Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.4-6.8 volts.
Cuts Out—0-3.0 ampere discharge current.
Relay Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop). .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Switch Model 479-P. Foot Control Switch Model 465-V. Foot switch used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1½	55
Instrument	1	51
Tail, Body Lights	3	63
Stop	15	87

FUSES:—Lighting—Two 20 ampere on fuse block on dash. One extra fuse mounted on fuse block.
Generator Field—6 ampere in regulator case.

HORNS:—Klaxon Model K-33-C, Type 1909 (low note), 1910 (high note). Matched tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts.
Current Draw—.8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.
Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—First number 300,001 (80, 80A), 315,001 (85). On plate on floor inside right door.

COMPRESSION:—Ratio 6.8-1. Pressure 115 lbs. at 50 R.P.M.

VACUUM READING:—Gauge should show steady reading of 15-17" with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model 536-J. Mounted on dash.

Ignition Current—2 amperes idling, 4 stopped.

Ignition Switch:—Delco-Remy Model 431-U. Switch and cable assembly. Connected to coil by armored cable.

Distributor Model 623-A. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .018". Limits .018-.024".

Cam Angle or Dwell—Closed 36°. Open 24° Distributor degrees.

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 829092. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	2	800
9	1400	18	2800

Vacuum Spark Control Model 680-N, 681-C. Provides additional advance for intermediate speeds above idling except when engine is suddenly accelerated or is operated with wide open throttle when spark will be retarded by return spring in unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	7"
10-12°	9-13"

Distributor Removal:—Mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All engines ..... 2° BTDC ..... .0016" BTDC

To Set Timing—With #1 piston on compression, turn engine over until piston is 2° or 3/16" before top dead center, stop when flywheel mark '/SA-1' lines up with indicator on housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type C-7. 18 MM. Metric.

Spark Plug Gap—Set at .025". Limits .023-.027".

CARBURETION:—Carburetor—Marvel B-2-SU-10-1673 (80, 80A), 1690 (85). Downdraft type with manual choke control.

NOTE—See Carburetion Section for recommended jet changes on 1673 ('36) carburetors before Carburetor Serial No. 5093894.

See article in Carburetor Section for data.

Idle Adjustment—With engine hot, close throttle, see that choke control button on instrument panel is pushed in, set throttle stopscrew so that engine idles at 300 R.P.M. or 5-7 M.P.H., turn idle adjusting screw out until engine begins to roll, then turn screw in until engine begins to miss, finally turn screw out until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever has four holes for pump link engagement, set for seasonal requirements as follows:
#1—(Min. stroke) High test fuel or hot climate.
#2—Recommended for moderate climate.
#3—Cold climate or low test fuel.
#4—(Max. stroke) Extremely cold weather.

Fast Idle:—Integral with carburetor. No adjustment.

See article in Carburetor Section for data.

Air Cleaner:—80, 80A—A.C. #1525951 oil-wetted type standard. Heavy duty oil bath type optional.
85—Burgess oil-bath type standard.

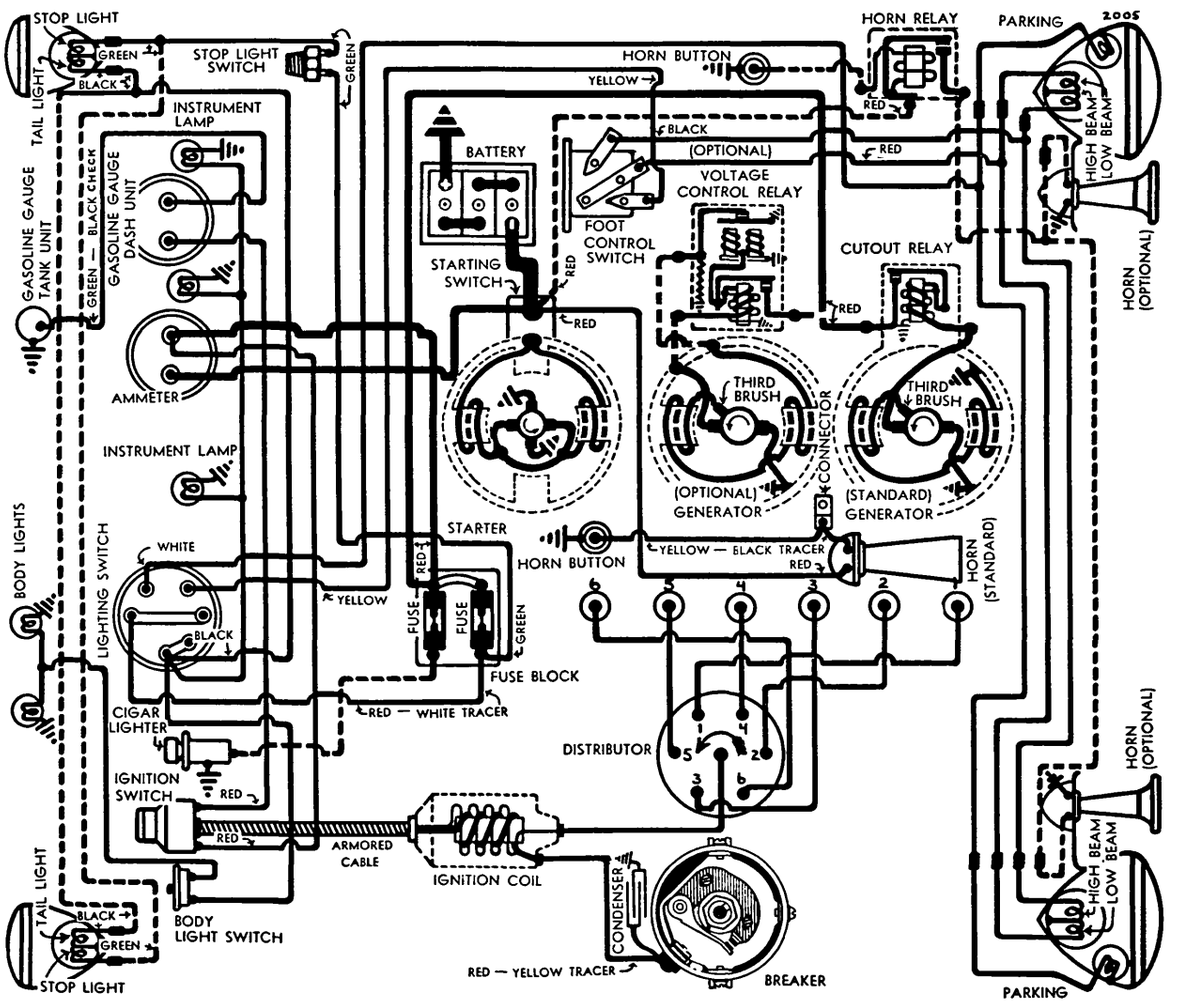
Fuel Pump:—AC. Type P #1523008. Diaphragm type.

See article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric. 80, 80A—Dash unit NG-7842-D (early), NG-8042-D (late). Tank unit—NG-7823-T.

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston .0079" past top dead center when flywheel mark 'EC.-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine warm.



Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Tappet Clearance:—.010" all valves. Engine hot.

Valve Spring Pressure:—32.2-34.2 lbs. at 1 21/32" (valve closed), 71-75 lbs. at 1⅜" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—40 lbs. at 30 M.P.H.

BATTERY:—Willard, WHT-1-90, RHT-1-90 (Export). 6 volt, 13 plate, 90 ampere hour capacity (20 hour rate).

Starting Capacity—114 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.0 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under front seat.

Cars with Radio—Willard Type WHT-2-105, RHT-2-105 (Export). 6 volt, 13 plate, 105 ampere hour capacity (20 hour rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes.

Grounded Terminal & Location—Same as above.

STARTER:—Model 738-V. Armature No. 823881.

Drive—Manual pinion shift with overrunning clutch. Full travel—⅛" clearance between pinion and housing.

Cranking Engine—60 R.P.M., 175 amperes.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting capscrews.

Starting Switch:—Delco-Remy No. 820052. Monted on starter field frame. Operated by pinion shift lever (starting pedal).

GENERATOR:—Model 937-Y, Armature No. 1859794. Model 936-L (Radio). Armature No. 1860284. Third brush control. External voltage (Step-voltage) control (936-L). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Connect test ammeter in charging line at 'BAT' terminal. On 936-L model short out Voltage Control Relay by connecting jumper wire from generator field 'F' terminal to frame. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten lockscrew. Remove jumper wire (936-L).

Maximum Charging Rate (937-Y)—18 amps. (cold), 15 amps. (hot), 8.3 volts, 2000 R.P.M., 22-23 M.P.H. (936-L)—23 amperes (cold) at 8.8 volts, 2800 R.P.M., 23-26 M.P.H., 20 amps. (hot) at 8.5 volts, 3100 R.P.M.

Performance Data—937-Y

	Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000
Hot	13-15	7.7-8.0	2400

Performance Data—936-L

Cold	20-23	8.5-8.8	2800
Hot	16-20	8.1-8.5	3100

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—(937-Y) 23-27 ounces (all brushes). (936-L) 22-26 ozs. (main), 16-20 ozs. (third).

Field Current—(937-Y) 3.5-4.5 amperes, (936-L) 2.3-2.6 amperes, at 6 volts.

Removal:—Cradle mounted at left front of engine with fan belt drive. To remove, slack off drive belt, disconnect water pump coupling, loosen mounting clamp band.

Belt Adjustment:—Belt adjustment provided at fan bracket. With correct adjustment sideplay of belt should be 1" between pulleys.

SPECIAL GENERATOR:—Model 933-R (Police Service). Model 5596 Current and Voltage Regulator used in conjunction with this generator.

See article in Electrical Equipment Section.

CUTOUT RELAY:—Model 265-B. Used on 937-Y generator. Mounted on generator.

See article in Electrical Equipment Section.

Cuts In—6.75-7.5 volts.

Cuts Out—0-2.5 amperes discharge.

Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

CONTROL UNIT (STEP-VOLTAGE TYPE):—Mod. 5585. Used on 936-L generator. Consists of Cutout Relay and Voltage Control Relay in single case on generator field frame.

See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.4-6.8 volts.

Cuts Out—3 amperes at 6.3 volts, discharge.

Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70° F.

Contacts Close—7.3-7.7 volts at 70° F.

Contact Gap—.008-.013".

Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop)

LIGHTING:—Headlamps—Corcoran-Brown, Prefocused type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower driving beams controlled by foot selector switch.

Switches

Lighting—Delco-Remy Model 481-Y.

Foot Selector—Delco-Remy Model 471-P.

Stop Lamp—Hydraulic type mounted on master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1½	55
Stop and Tail	21-3	1158
Instrument, Body	3	63

FUSES:—Lighting—One 20 ampere fuse mounted on fuse block on rear side of dash panel. Extra fuse on fuse block.

Cigar Lighter—One 20 ampere fuse on fuse block.

HORNS:—Klaxon Model K-16 Type 2001 Std. Twin horns optional. Twin horn set consists of Model K-33B Type 1873 (left hand—high note), Model K-33C Type 2156 (right hand—low note) built in headlamp support and operated by horn relay.

	Current at 6 volts.	Air Gap
K-33B 1873	11-13 amperes	.036-.040"
K-33C 2156	11-13 "	.042-.046"

Horn Relays:—80, 80A. Model 266-T. Requires .25 amps. at 2 volts min. to close contacts. Current draw .8 amps.

Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.

Air Gap—.012-.017" with contacts closed.

85—Model 271-A. Closes at 2.7-4.0 volts.

Contact Gap—.015-.025". **Air Gap**—.010-.014".

SERIAL NUMBER:—First number—200,001 (90, 90-A), 100,101 (110). On plate on floor within body back of right front seat.

COMPRESSION:—Ratio 6.7-1 Std. aluminum head. No optl. hds. Pressure 115 lbs. (90, 90-A), 120 lbs. (110) at cranking speed.

VACUUM READING:—Gauge should show steady reading of 15-17" with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model 536-J (90, 90-A), 539-M (110).

Ignition Current—1.8 amperes idling, 3 stopped.

Ignition Switch—Delco-Remy Model 431-U. Switch and cable assembly connected to coil by armored cable.

Distributor Mod. 623-A (90, 90-A), 623-E (110). Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .018". Limits .018-.024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 829092. Capacity .20-.25 mfds.

Automatic Advance—623-A.

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	2	800
9	1400	18	2800

Automatic Advance—623-E

Start	300	2	600
6	1000	12	2000

Vacuum Spark Control Model 681-C. Provides additionel advance for intermediate speeds above idling except when engine is suddenly accelerated or is operated with wide open throttle when spark will be retarded by return spring in unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	7"
10-12°	9-13"

Distributor Removal:—Mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—

	Flywheel Degrees	Piston Pos.
All engines	TDC	0000" TDC

To Set Timing—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'IGN' lines up with indicator on right front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-9. 14 MM. Metric.

Spark Plug Gap—Set at .025". Limits .023-.027".

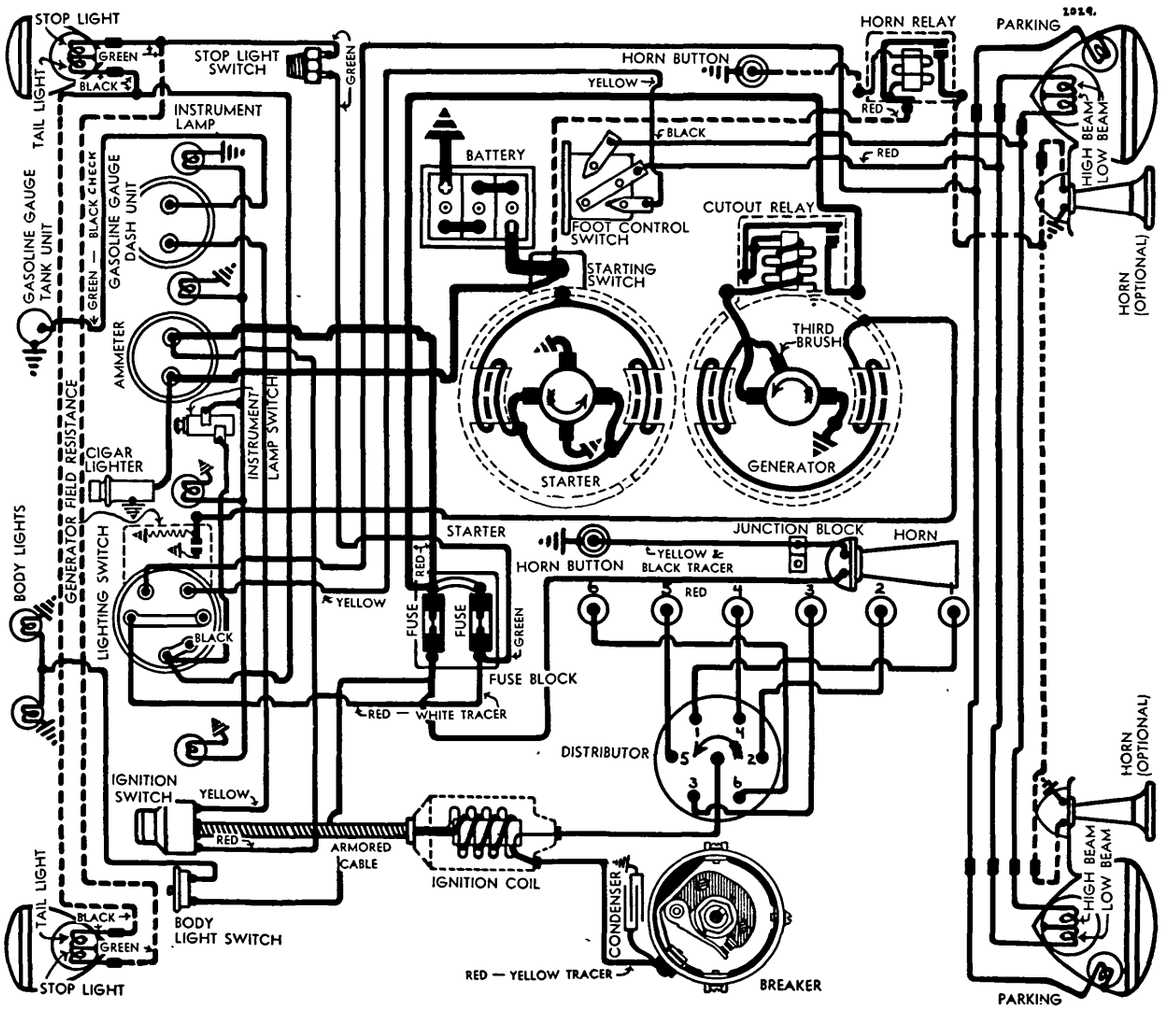
CARBURETION:—Carburetors—Marvel Model B-2 No. 10-1678 (90, 90-A), B-3 No. 10-1680 (110). 1¼" (90, 90-A) and 1½" (110) downdraft type with manual choke control. See Carburetion Section for adjustment, overhaul and Jet Specifications.

NOTE—See Carburetion Section for recommended jet changes on carburetors before carburetor No. 5092447 (90, 90-A), and No. 5090942 (110). Also changes in Accelerating Pump Assembly (after carburetor No. 6002388) and Vacuum Step-up Spring (after first 300 cars) on Supercharger models only.

NOTE—Do not adjust carburetors until engine is warmed up so that engine is idling at slow or hot idling speed.

Idling Adjustment—With engine hot, close throttle, see that choke control button on dash is pushed in; set throttle stopscrew so that engine idles at 5-7 M.P.H. or 350 R.P.M., turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever has four holes for pump link engagement as follows:
#1—(Min stroke)—High test fuel or hot climate.
#2—Recommended standard setting.
#3—Recommended setting for B-3 carburetors (after carburetor No. 6002387) with No. 194-540 Accelerating Pump Assembly.
#4—(Max. stroke)—Low test fuels or low temps.



Fast Idle:—Integral with carburetor. No adjustment. See article for this carburetor in Carburetion Sec.

Air Cleaner:—AC. #1526750 (90, 90-A), #1526753 (110) oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type P #1523008 (90, 90-A), Type R #1523009 (110). Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Motometer Electric. Early type—NG-7842-D (dash), NG-7818-T (tank); Late type—NG-8042-D (dash), NG-7823-T (tank).

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston .0088" past top dead center (90, and 110) and .0472" past top dead center (90-A)

when flywheel mark 'EC-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Tappet Clearance—.010" all valves. Engine hot.

Valve Spring Pressure:—34 lbs. at 2 3/16" (valve closed), 87 lbs. at 1⅞" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—50 lbs. at 30 M.P.H.

BATTERY:—Willard Type WHT-1-90, RHT-1-90 (Export). 6 volt, 13 plate, 90 ampere hour capacity (20 hour rate).

Starting Capacity—114 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.0 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under front seat.

Cars with Radio:—Type WH-1-13, RH-1-13 (Export). 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

STARTER:—Model 738-T, 738-X (RHD). Armature No. 823881.

Drive—Manual pinion shift (738-T), solenoid pinion shift (738-X), with overrunning clutch.

Cranking Engine—200 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (738-T):—Delco-Remy No. 820052. Mounted on starter field frame. Operated by pinion shift lever (starting pedal).

(738-X)—Solenoid Switch Type 1516. Starter Push Switch Type 1388. Solenoid switch controlled through relay by push switch on instrument panel. See article in Equipment Section.

Solenoid Switch

Close against 70 lbs. pull with .5" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.2 volts max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

GENERATOR:—Model 948-B. Armature No. 1853593. Third brush regulation, lighting switch control. Field resistance on switch is shorted out with lamps turned on, increasing generator output. Special switch position between 'Off' and 'Park' provides this high charging rate with lamps off. See 'Lamp Control Generators' in Equipment Section. Ventilated by fan on drive pulley.

Charging Rate Adjustment—Pull light switch out to first position (lights off, resistance shorted out), connect test ammeter in line at 'BAT' terminal, loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lockscrew. Push light switch to 'Off' position.

Maximum Charging Rate—21 amperes (cold), 18 amperes (hot), 8.5 volts, 2400 R.P.M., 38-40 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).

Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen mounting bolts, swing generator away from engine until belt sideplay midway between pulleys is 1", tighten mounting bolts.

SPECIAL GENERATOR:—Model 934-F (Police Service). See article in Equipment Section. Control Unit (Current and Voltage Regulator Model 5597) used in conjunction with this generator.

CUTOUT RELAY:—Mod. 265-H. Mounted on generator. See article in Equipment Section.

Cuts In—6.75-7.5 volts, 11 M.P.H.

Cuts Out—0-2.5 amperes discharge current.

Contact Gap—.015-.025".

Air Gap—.012-.017".

LIGHTING:—Headlamps—Corcoran - Brown, Pre-focused type. Headlamps aimed straight ahead (upper beams with lenses in place). Upper and lower driving beams controlled by foot selector switch.

Switches

Lighting—Delco-Remy Model 481-Z.

Foot Selector—Delco-Remy Mod. 471-P, 471-U (RHD)

Stop Lamp—Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instr., Body	3	63
Tail	3	63
Stop	15	87

FUSES:—Lighting—20 ampere fuse mounted on fuse block on dash.

Body Lights and Standard Horn—20 ampere fuse on fuse block. One extra fuse mounted on fuse block.

HORNS:—Klaxon Model K-26-L. Type 1608 Standard. Klaxon Model K-33-B Type 1864 (left side—high note), K-33-C Type 2155 (right side—low note) optl. All horns are vibrator type. Optional horns are matched tone and operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
1608	6.5-8.6	.025-.029"
1864 (left side—high)	11-13	.036-.040"
2155 (right side—low)	11-13	.042-.046"

Horn Relay:—Model 266-T. Requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.

Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number 215,001 (95), 130,001 (116). On plate on floor inside right rear door or under front seat (coupes).

COMPRESSION:—Ratio 6 7-1 std. aluminum hd. Pressure 115 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 15-17" with engine idling at 5-7 M P H.

IGNITION:—Coil Model 536-J (95), 539-M (116).

Ignition Current—1.8 amperes idling, 3 stopped (95), 2½ amperes idling, 5 stopped (116).

Ignition Switch:—Delco-Remy Model 435-P. Switch and cable assembly conected to coil by armored cable

Distributor Model 623-A (95), 623-S (116):—Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap— 018". Limits 018- 024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No 829092. Capacity .20-.25 mfds

Automatic Advance—623-A

Distributor Degrees	R P M	Engine Degrees	R P.M.
Start	400	2	800
9	1400	18	2800

Automatic Advance—623-S

Start	275	2 0	550
3 0	400	6 0	800
8 0	1000	16 0	2000

Vacuum Spark Control Model 681-G. Provides additional advance for intermediate speeds above idling except when engine is suddenly accelerated or is operated with wide open throttle when spark will be retarded by return spring within unit

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	5-7"
10° Maximum	14-18"

Distributor Removal:—Mounted on cylinder head To remove, take out hold-down screw in advance arm (not necessary to disconnect vacuum line).

IGNITION TIMING:—

	Flywheel Deg.	Piston Position
Model 95 engine	TDC	0000" TDC
Model 116 engine	4° ATDC	0063" ATDC

To Set Timing—With #1 piston on compression turn engine over until piston is 4° or 0063" after top dead center (116) or at top dead center (95), stop when flywheel mark 'IGN' lines up with indicator (under cover) on right front face of housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Firing Order:—1-5-3-6-2-4 See diagram.

Spark Plugs:—Champion Type J-9. 14 MM. Metric.

Spark Plug Gap—Set at 025".

CARBURETION:—Carburetors—Marvel Model B-2 No. 10-1691 (95). Model B-3 No. 10-1744 (116). 1¼" (95), 1½" (116) downdraft type with manual choke control.

See article in Carburetion Section for data.

NOTE—See article in Carburetion Section for recommended changes on carburetors before car serial numbers 217175 (95), 132010 (116).

Idling Adjustment—With engine hot, close throttle, set dash choke control button in 'off' position, set throttle stopscrew so that engine idles at 350 R.P.M. or 5-7 M P H, turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever has four holes for pump link engagement as follows:
#1—(Min stroke)—High test fuel or hot climate.
#2—Recommended standard setting.
#3—Slightly cooler temperatures.
#4—Extremely cold temperatures or low test fuel.

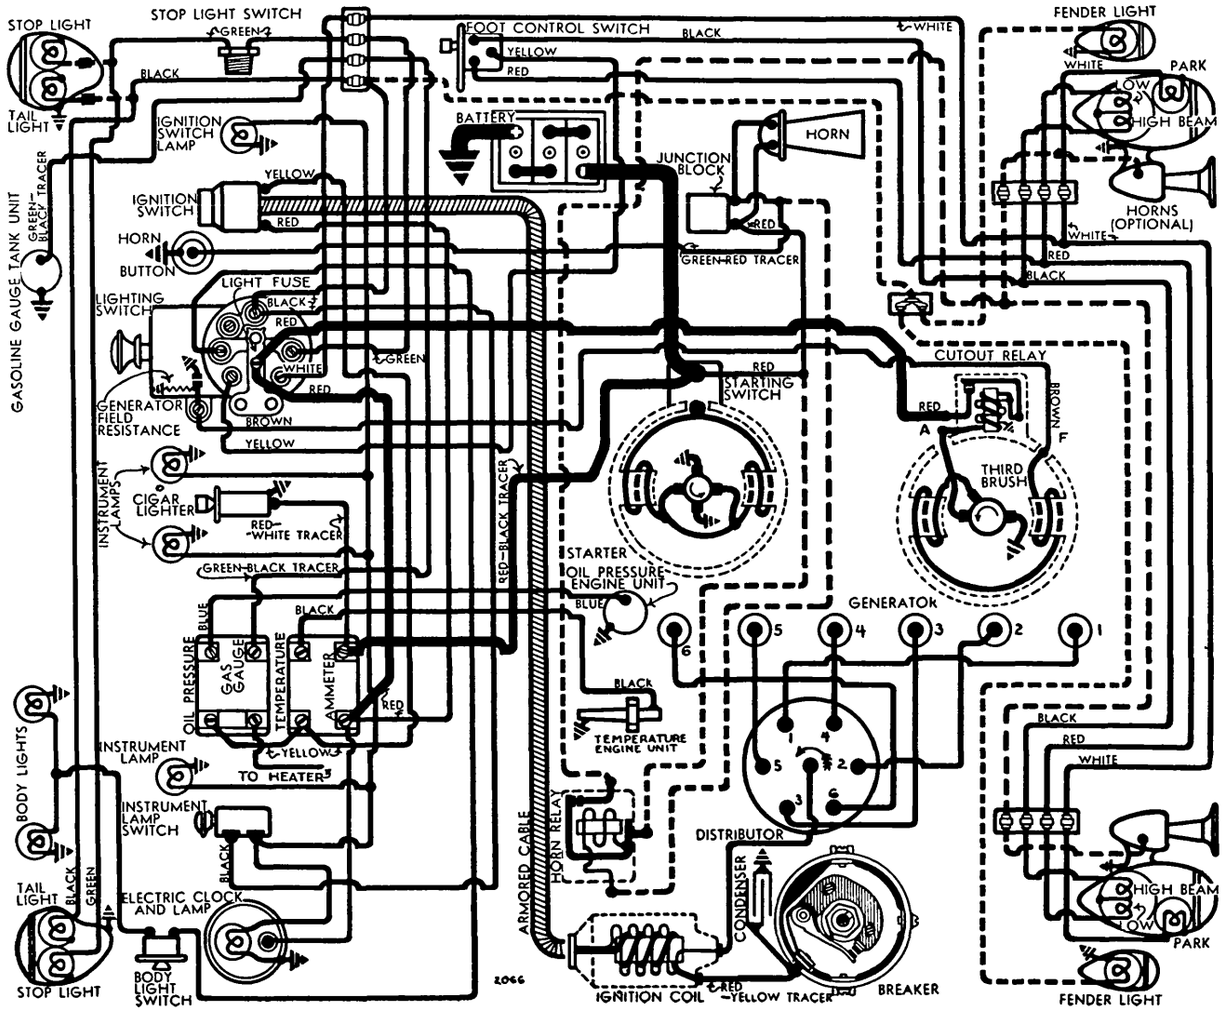
Fast Idle:—Integral with carburetor. No adjustment.

Air Cleaner:—Burgess.

Fuel Pump:—AC. Type P #1523008 (95), Type R #1523009 (116). Diaphragm type.

See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. Dash unit (gas and oil gauge one assembly)—K-S#6090. Tank unit—K-S#6120.



See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston 11° or .0472" (95) and 4½° or .0079" (116) past top dead center when flywheel mark 'EC-1' lines up with indicator in right front face of housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Tappet Clearance—.010" all valves, engine hot.

Valve Spring Pressure:—34 lbs. (valve closed), 87 lbs. (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—40 lbs. at 30 M.P.H.

Oil Pressure Gauge—King-Seeley Electric. Dash unit (oil gauge and gas gauge one assembly) K-S #6090. Motor unit K-S #6125.

See article in Mechanical Equipment Section.

BATTERY:—(95) Willard, Type WHT-1-90, RHT-1-90 (Exp.). 6 volt, 13 plate, 90 AH. capacity (20 hr. rate).

Starting Capacity—114 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.0 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under drivers seat.

(116) Willard, Type WHT-1-105, RHT-1-105 (Exp.). 6 volt, 15 plate, 105 AH. capacity (20 hr. rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes. Grounded Terminal and Location (as above).

Radio—95 & 116:—Willard, Type WHT-2-120, RHT-2-120 (Exp.). 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).

Starting Capacity—152 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.9 minutes. Grounded Terminal and Location (as above).

STARTER:—Model 738-T, X (RHD). Armature No. 823881.

Drive—Manual pinion shift (738-T), solenoid pinion shift (738-X), with overrunning clutch.

Cranking Engine—200 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (738-T):—Delco-Remy No. 820052. Mounted on starter field frame. Operated by pinion shift lever (starter pedal).

(738-X)—Solenoid Switch Type 1516. Starter Push Switch Type 1388. Solenoid switch controlled thru relay by push switch on instrument panel.

Solenoid Switch

Close against 70 lbs. pull with .5" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.2 volts max. **Open**—1.6-2.0 volts.

Contact Gap—.030-.045". **Air Gap**—.010-.014" closed.

GENERATOR:—Model 948-B. Armature No. 1853593. Third brush regulation, lighting switch control. Field resistance on switch is shorted out with lamps turned on, increasing generator output. Special switch position between 'Off' and 'Park' provides this high charging rate with lamps off. Generator is ventilated by fan on drive pulley.

See article in Electrical Equipment Section.

Charging Rate Adjustment—With light switch in first position (lights off, resistance shorted out), connect test ammeter in line at 'BAT' terminal, loosen lockscrew on commutator endplate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lockscrew. Return light switch to 'off' position.

Maximum Charging Rate—21 amperes (cold), 18 amperes (hot), 8.5 volts, 2400 R.P.M., 38-40 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	18-21	8.2-8.5	2400
Hot	15-18	7.9-8.3	2900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen mounting bolts, swing generator away from engine until belt sideplay midway between crankshaft and generator pulleys is 1", tighten mounting bolts.

GENERATOR (CARS WITH RADIO):—Model 948-Z and Model 5812 Control Unit. See Model 120 page (following) for complete data and diagram for this generator and control unit.

SPECIAL GENERATOR:—Model 934-F (Police Service). Pulley #1861565 for City Police, #1861564 for State Police.

Control Unit (Model 5597)—Current and Voltage Regulator used with this generator.

See article in Electrical Equipment Section.

CUTOUT RELAY:—Model 265-H. Mounted on generator.

See article in Electrical Equipment Section.

Cuts In—6.75-7.5 volts, 11 M.P.H.

Cuts Out—0-2.5 amperes discharge current.

Contact Gap—.015-.025".

Air Gap—.012-.017".

LIGHTING:—Headlamps—Hall, pre-focused type. Headlamps aimed straight ahead (upper beams with lenses in place). Upper and lower driving beams controlled by foot selector switch mounted on floor board to left of clutch pedal.

Switches

Lighting—Delco-Remy Model 481-X.

Dash Light Switch—Delco-Remy Model 1410.

Foot Selector—Delco-Remy Model 471-P, 471-U (RHD).

Stop Lamp—Hydraulic type mounted on brake master cylinder.

Bulb Specification

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Tail, Dome, Fender	3	63
Parking, Inst.	1½	55
Stop	15	87

FUSES:—Lighting—20 ampere fuse mounted on lighting switch.

HORNS:—Klaxon Model K-26-L. Type 1608 (standard). Twin horns K-33-B, type 1873 (right side—high note), K-33-C, type 2156 (left side—low note) or K-33-S type 2059 (low note), 2060 (high note). Twin horns with horn relay optional. All horns are vibrator type.

Horn Type	Current at 6 volts	Air Gap
1608 (std.)	6.5-8.5	.025-.029"
1873 (rt. side-high)	11-13	.036-.040"
2156 (left side-low)	11-13	.042-.046"
2059 (low)	11-13	.042-.046"
2060 (high)	10-12	.032-.036"

Horn Relay:—Model 271-A.

Contact Point Opening—.015-.030".

Points Close—2.7-4.0 volts.

Air Gap—.010-.025" (closed).

SERIAL NUMBER:—First number 110,001 (sedans), 120,001 (coupes). On plate on floor inside right rear door or under front seat (coupes).

COMPRESSION:—Ratio—6.7-1 std aluminum head.
Pressure—115 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 15-17" with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model 539-M. Mounted on the dash.
Coil Draw—2½ amperes idling, 5 stopped.

Ignition Switch:—Delco-Remy Model 435-P. Switch and cable assembly. Connected to coil by armored cable.

Distributor Model 623-S:—Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .018". Limits .018-.024".
Cam Angle or Dwell—36° (closed), 24° (open).
Breaker Arm Spring Tension—17-21 ounces.
Condenser—Part No. 829092. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	275	2.0	550
3.0	400	6.0	800
8.0	1000	16.0	2000

Vacuum Spark Control Model 681-C. Provides additional advance for speeds above idling except when engine is suddenly accelerated or is operated with wide open throttle when spark will be retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	7"
10-12°	9-13"

Distributor Removal:—Mounted on cylinder head. To remove, take out hold-down screw in advance arm (not necessary to disconnect vacuum line).

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All engines ..... 4° ATDC ..... .0069" ATDC

To Set Timing—With #1 piston on compression, turn engine over until piston is 4° or .0069" after top dead center, stop when flywheel mark 'IGN' lines up with indicator (under cover) on right front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.
Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-9. 14 MM. Metric.
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Marvel Model B-3 No. 10-1744, 1½" downdraft type with manual choke control.
See article in Carburetion Section for data.
NOTE—See Carburetion Section for recommended changes to improve gasoline economy on cars before Serial No. 6115944.
Idle Adjustment—With engine hot, close throttle, set dash control button in 'off' position, adjust throttle lever stopscrew so that engine idles at 5-7 M.P.H., turn idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

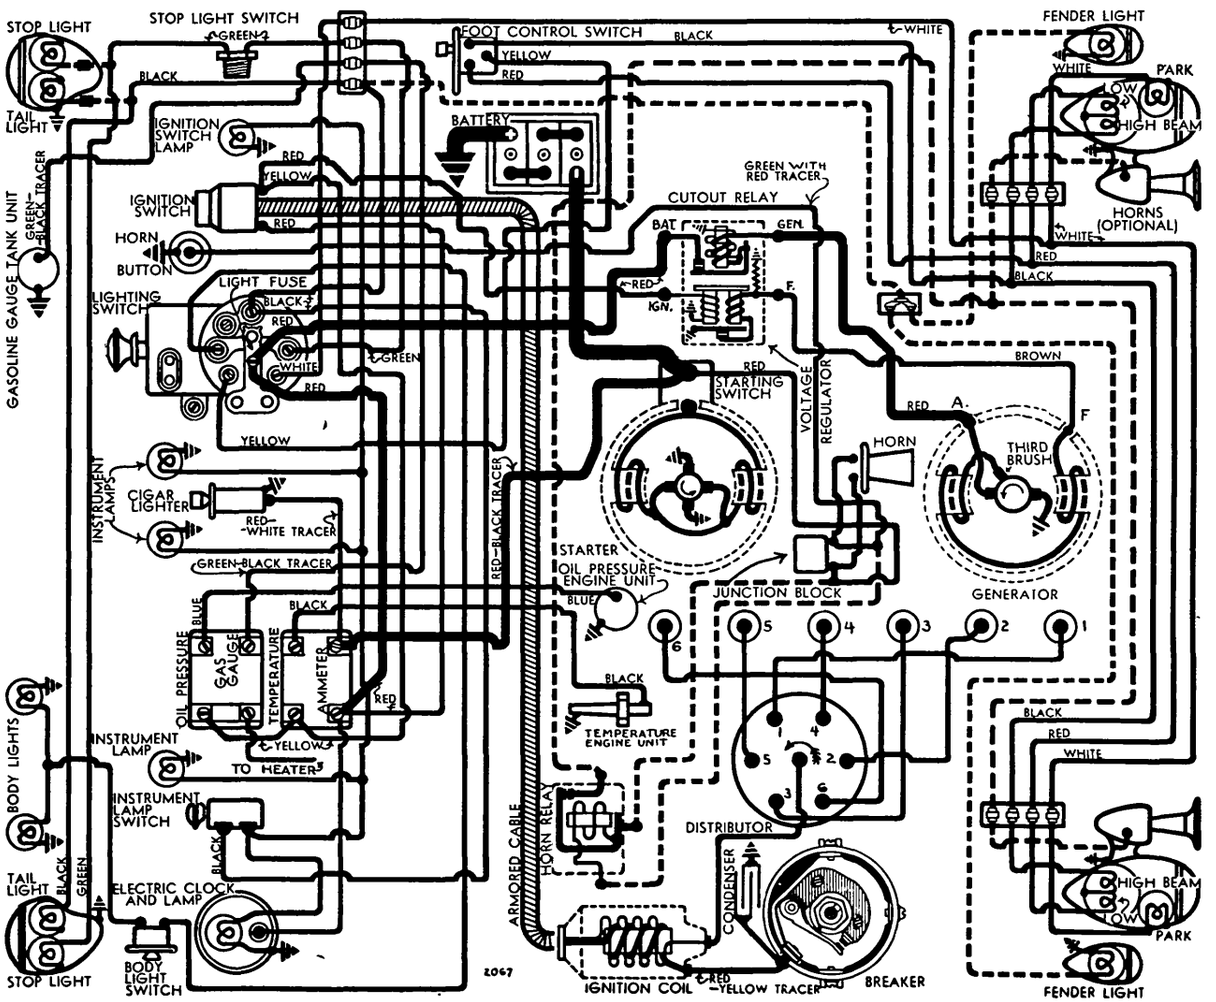
Accelerating Pump Setting—Pump lever has four holes for link engagement as follows:
#1 (Min. stroke)—High test fuel or hot climate.
#2—Recommended standard setting.
#3—Cooler temperatures or winter setting.
#4—Extreme cold or low test fuel.

Fast Idle:—Integral with carburetor. No adjustment.
Air Cleaner:—Burgess oil-wetted type standard.

Fuel Pump:—AC. Type R #1523009. Diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. K-S No. 6090 (dash unit—assembly with oil pressure gauge), No. 6120 (tank unit).

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston .0088" past top dead center when flywheel mark 'EC-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #2.



Tappet Clearance:—.010" all valves, engine hot.

Valve Spring Pressure:—34 lbs. (valve closed), 87 lbs. (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—45 lbs. at 30 M.P.H.

Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6090 (dash unit—assembly with gasoline gauge), No. 6125 (engine unit).

BATTERY:—Willard, Type WHT-1-105, RHT-1-105 (Exp.). 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).

Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.9 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.

Radio—Willard, Type WHT-2-120, RHT-2-120 (Exp.). 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—152 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.9 minutes.
Grounded Terminal & Location—Same as above.

STARTER:—Model 738-T, X (RHD). Armature No. 823881.
Drive—Manual pinion shift (738-T), solenoid pinion shift (738-X), with overrunning clutch.
Cranking Engine—200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 ft. lbs.	Lock	3.63	475

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (738-T):—Delco-Remy No. 820052. Mounted on starter field frame. Operated by pinion shift lever (starter pedal).
(738-X)—Solenoid Switch Type 1516. Starter Push Switch Type 1388. Solenoid switch controlled through relay by push-switch on instrument panel.

Solenoid Switch

Close against 70 lbs. pull with .5" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.2 volts max. **Open**—1.6-2.0 volts.
Contact Gap—.030-.045". **Air Gap**—.010-.014" closed.

GENERATOR:—Model 948-Z. Armature No. 1854856. Fixed third brush control with external vibrating voltage regulator. Ventilated by fan on drive pulley. NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator Data below.
NOTE—Do not operate generator on open circuit.
Maximum Charging Rate—22 amperes at 8.0 volts (cold), 18 amperes at 8.0 volts (hot). Reached at car speed of 30-35 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	18	8.0	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third).
Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen mounting bolts and clamp bolt, swing generator away from engine until belt sideplay midway between crankshaft and generator pulley is 1", tighten clamp bolt and mounting bolts.

SPECIAL GENERATOR:—Model 934-F (Police Service). Pulley No. 1861565 for City Police, No. 1861564 for State Police.
Control Unit Model 5597—Vibrating type Voltage and Current Regulator used with this generator.
See article in Electrical Equipment Section.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5812. Mounted on engine side of dash. Consists of Cutout Relay and Vibrating type Voltage Regulator.
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—3 amperes discharge.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper betwen 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Hall, pre-focused type. Headlamps aimed straight ahead (upper beams with lenses in place). Upper and lower driving beams controlled by foot selector switch mounted on floor board to left of clutch pedal.

Switches

Lighting—Delco-Remy Model 481-X.
Dash Light Switch—Delco-Remy Model 1410.
Foot Selector—Delco-Remy Model 471-P, 471-U (RHD),
Stop Lamp—Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Tail, Dome, Fender	3	63
Parking, Instr.	1½	55
Stop	15	87

FUSES:—Lighting—20 amp. fuse mounted on lighting switch.

HORNS:—Klaxon Model K-26-L, Type 1608 (standard). Twin horns K-33-B, Type 1873 (right side—high note), K-33-C, Type 2156 (left side—low note) or K-33-S Type 2059 (low note), 2060 (high note). Twin horns with horn relay optional. All horns are vibrator type.

Horn Type	Current at 6 volts	Air Gap
1608 (Std.)	6.5-8.5	.025-.029"
1873 (rt. side—high)	11-13	.036-.040"
2156 (left side—low)	11-13	.042-.046"
2059 (low)	11-13	.042-.046"
2060 (high)	10-12	.032-.036"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.
Contact Gap:—.015-.030".
Air Gap:—.010-.025" with contacts closed.

HUDSON

SUPER SIX MODEL (1929) SERIAL NUMBERS 825415 UP
PRODUCTION STARTED JANUARY 1, 1929
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

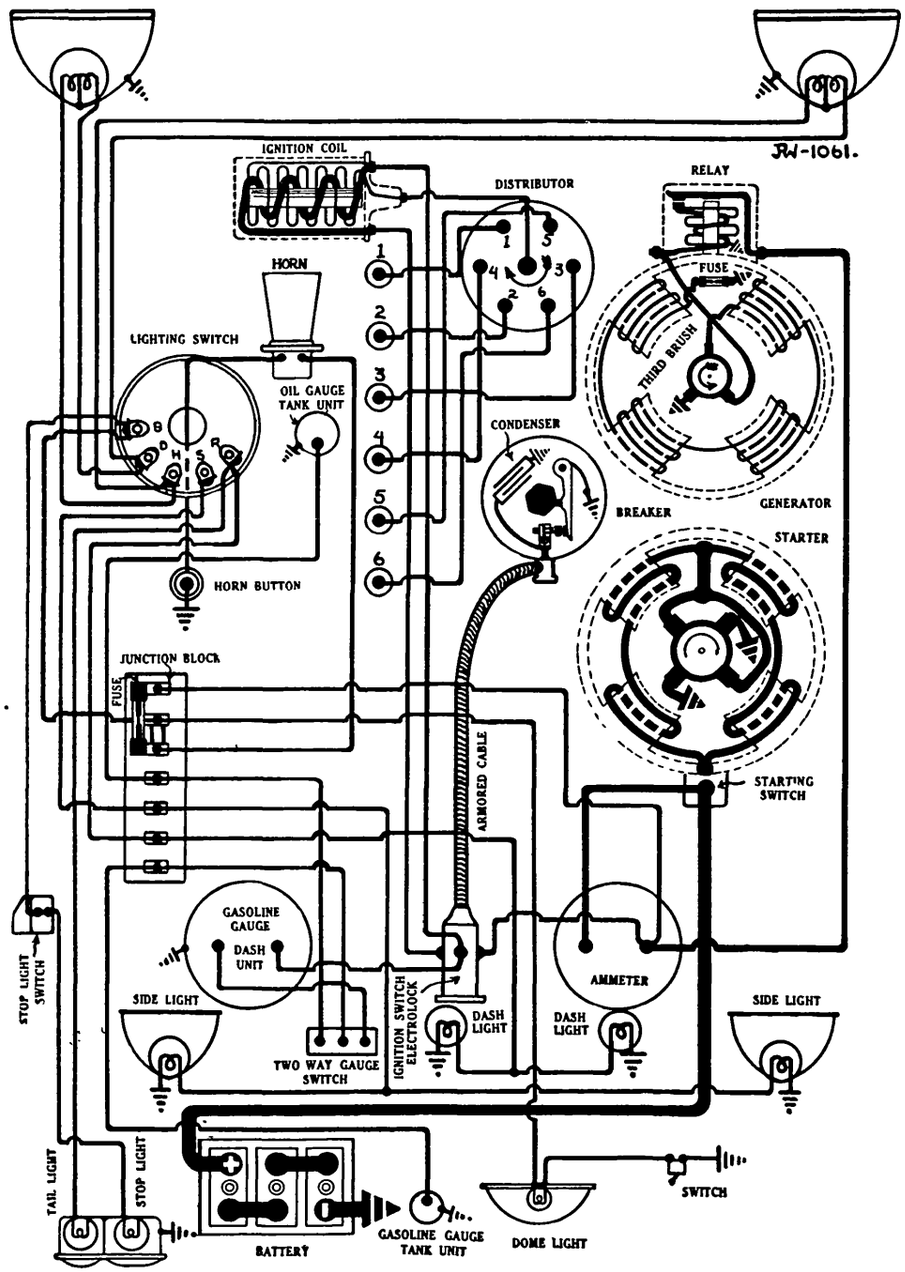
BATTERY:—Exide, Type 3-XI-15-IG, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model IG-4065. Coil is mounted on the front of the engine block. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGA-4058. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 28 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 36 degrees (engine) reached at 3200 R.P.M. Electrolock ignition switch is standard equipment.

Mounting:—Distributor is mounted on the crank case at the right of the engine. To remove distributor, disconnect manual advance rod and remove distributor head with cables intact. Then disconnect Electrolock at dash and take out two bolts in distributor mounting flange. Then lift distributor out and remove with Electrolock as a unit. The Electrolock can be removed from the distributor by taking off the nut on the terminal stud inside the case and pulling the Electrolock cable, ferrule and stud straight out from the distributor housing.

Oiling:—Put 6 or 8 drops of light engine oil in the oiler on the side of the distributor housing each 500 miles. Each 250 miles put one drop of oil on the breaker arm pivot pin. Every 5000 miles remove the distributor head and rotor and put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 3 teeth on the flywheel before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control lever. Continue to crank engine until the punch mark on the flywheel (which is three teeth before the top dead mark 'DC-1-6') is opposite the pointer on the inspection hole in the left side of the flywheel case. Then loosen the advance arm clamp screw and rotate the distributor until contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 2 1/32 inches. Stem diameter, .373 inch. Stem length, 6 inches. Valve life, 11/32 inch. Spring pressure, 96 pounds. Tappet clearance, .004-.006 inch.

EXHAUST VALVES:—Head diameter, 1 27/32 inches. Stem diameter, .373 inch. Stem length, 6¾ inches. Valve lift, 19/64 inch. Spring pressure, 75 pounds. Tappet clearance, .006-.008 inch. Valve stem guides are removable. Oversize valves are not made.

HUDSON

SUPER SIX MODEL (1929) SERIAL NUMBERS 825415 UP
PRODUCTION STARTED JANUARY 1, 1929
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

Valve Timing:—Inlet valves open 7 degrees after top dead center with the piston 5/64 inch down on the intake stroke. To check valve timing, crank engine over until No. 1 piston is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .004 inch. Then turn engine over one complete revolution and stop with the piston 7 degrees past top dead center with the flywheel mark '1.0' directly opposite the indicator in the inspection hole in the front face of the flywheel housing at the left of the engine. The tappet clearance should be taken up and No. 1 inlet valve about to open at this point.

To Adjust Timing Chain. Timing chain is adjusted by rotating the eccentric accessory shaft mounting. To take up timing chain, take out the three flange mounting bolts and rotate the flange in a clockwise direction (facing forward) by means of a special wrench until there is approximately ⅛ inch movement on the circumference of the coupling between the water pump and the generator. Replace the mounting bolts. If it is necessary to shift the flange to line up the bolt holes, back off the adjustment slightly.

To Set Valve Timing:—Sprockets and chain are marked. In assembling chain (with chain adjustment turned to minimum position), mesh chain teeth opposite the two marked pins on chain between the two marked sprocket teeth on each sprocket.

STARTER:—Model MUA-4001. Starter is connected to the engine through a sliding gear shift interconnected with the starting switch. Pressing down on the starting pedal meshes the gears and closes the starting switch. When the pedal is released a spring reverses these operations. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 1¾-2¼ pounds. Starter cranks the engine at 110 R.P.M. drawing 250 amperes at 5.5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4200	6	50
2 "	1500	5.3	130
4 "	1000	5.0	200
6 "	600	4.6	275
8 "	450	4.2	340
22 "	Lock	3.5	500

M unting:—Starter is cradle mounted on special mounting bracket at the right of the engine. The starting switch is built in the bracket. To remove starter, loosen the mounting clamp band and lift starter from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAB-4008. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by friction between the mounting stud and the end plate. With standard car setting, maximum charging rate is 15 amperes (cold) reached at 1300 R.P.M. of the generator armature.

Generator Data

Cold Test (72°F.)			Hot Test (206°F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4	6.8	630	4	6.8	790
10	7.4	800	10	7.6	1240
14	7.8	1020	12.5	8.0	1550
15	8.0	1300	11	7.8	2000
12	7.8	1950			

Motoring at 355-390 R.P.M. generator draws 4.7-5.2 amperes at 6 volts. Shunt field current is 6.1-6.8 amperes at 6 volts. Each coil draws 24.4-27.2 amperes at 6 volts. Brush spring tension is 1-1.5 pounds. The fuse in the field circuit is 7.5 ampere capacity.

Mounting:—Generator is cradle mounted on special bracket at right of engine. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles of operation.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay closes at 545-625 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current must not exceed 5 amperes at closing of contacts. Contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Switch Model 10717. Lighting switch is mounted at base of steering column. Double filament headlights using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switch:—Soreng-Manegold Switch, Model 2560-A was also used.

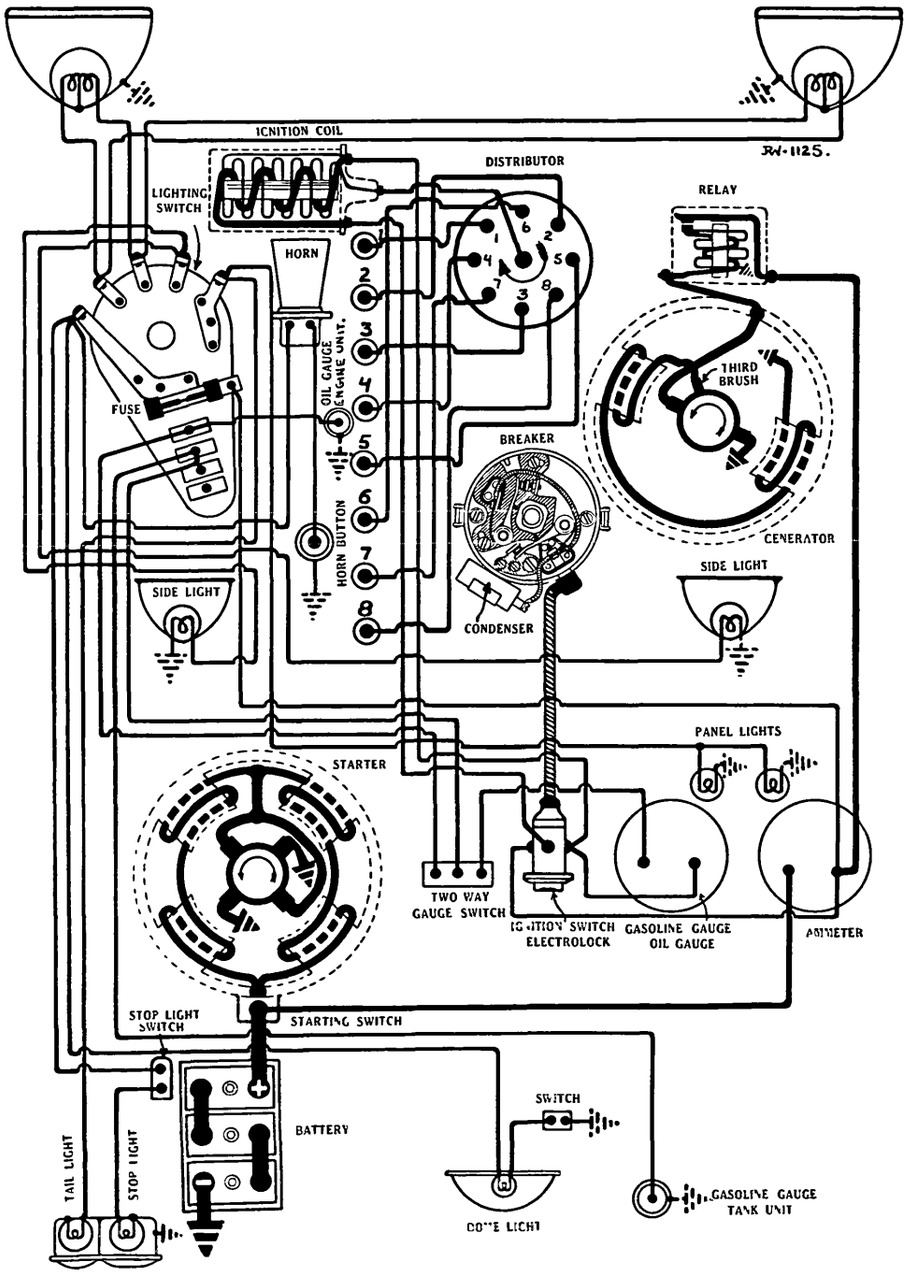
FUSES:—Generator field fuse is 7.5 ampere capacity. Lighting fuse mounted on junction block on dash is 20 ampere capacity.

HUDSON

GREAT EIGHT (1930) SERIAL NUMBERS 893,402 UP
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Exide, Type 3-XI-13-1G, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model CE-4012. Coil is mounted on the front of the engine block. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is a Model 9-B Electrolock.



Distributor Model IGH-4009. Breaker contacts separate .020 inch. Set contact gap (first set mounted on stationary base plate) by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The second set of contacts (mounted on movable sub-plate) are adjusted by loosening lock nut on stationary contact mounting stud and turning up stud to secure correct adjustment. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees (engine) reached at 4000 R.P.M. of engine. There are two sets of contacts on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. The contacts must be synchronized for correct ignition performance. See Timing.

Mounting:—Distributor is mounted on the accessory drive bracket at the right of the engine. An Electrolock is used. This must be removed with the distributor as a unit. To remove distributor, first loosen Electrolock from dash mounting. Take off primary lead and remove distributor head with cables intact. Then remove hold-down screw in advance arm and lift distributor from place. See full directions in Equipment Section on removing Electrolock from distributor.

Oiling:—Fill the oiler on the side of the distributor shaft with light engine oil every 2000 miles. At the same time remove the distributor head and rotor and put a few drops of oil on each of the breaker arm pivot pins and coat the face of the breaker cam with a light film of vaseline or light cup grease.

Timing:—Synchronization of Contacts. Full directions on synchronization of contacts will be found in Equipment Section listed under 'Auto-Lite Distributors.' The contacts can be synchronized without special equipment after the distributor has been timed to the engine by cranking the engine over 90 degrees from firing position of piston No. 1 when piston No. 6 will reach firing position and the flywheel mark 'DC 3&6' will be opposite the indicator in the inspection hole in the flywheel case. If the second set of contacts do not begin to open at this point, loosen the two lock screws on the movable sub-plate and shift the plate until the contacts begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .020-.024 inch with breaker arm on lobe of cam.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly fully retarded. To set timing, crank engine over until piston No. 1 enters compression stroke. This can be checked by noting valve tappet positions (both valves should be closed) or by removing the spark plug in cylinder No. 1 and cranking engine over until compression is felt when a finger is placed over the spark plug port. Loosen hold-down screw in advance arm and rotate distributor clockwise as far as possible. Then continue to crank engine over until flywheel mark 'DC 1&8' is in line with the

HUDSON

GREAT EIGHT (1930) SERIAL NUMBERS 893,402 UP
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

indicator in the inspection hole in the front face of the flywheel housing on the right side of the engine. Then loosen advance arm clamp bolt and rotate distributor housing until the set of contacts mounted on the base plate begin to open. Tighten the clamp bolt and check to see that the segment directly opposite the rotor in the distributor head is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

After setting ignition the car should be given a road test and the setting changed slightly to give the best performance. A slight spark knock should be audible when the car is accelerated from fifteen to twenty-five miles per hour with wide open throttle for the best performance. If the knock is too noticeable, loosen the advance arm hold-down screw and retard the spark one division on the scale by rotating the distributor in a clockwise direction. If no knock is heard the spark should be advanced by turning the distributor one division counter-clockwise. Give the car a final road test.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .020-.022 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1½ inches. Stem diameter, .3085 inch. Stem length, 5 1/16 inches. Valve lift, .312 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .003-.005 inch (hot).

EXHAUST VALVES:—Head diameter, 1⅜ inches. Stem diameter, .3085 inch. Stem length, 5 1/16 inches. Valve lift, .327 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .005-.007 inch (hot).

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40′ before top dead center with piston .0494" from top of stroke. No flywheel mark is provided but timing can be checked with a timing gauge. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Two pins on the timing chain exactly 20 links apart are marked. Two adjacent teeth on both camshaft and crankshaft sprocket are also marked. Mesh chain so that marked pins on chain are meshed between the marked teeth on each sprocket with arrow on chain pointing in direction of rotation. In this position piston No. 1 will be on top dead center with flywheel mark 'D.C.1&8' at indicator and No. 1 exhaust valve just closing and No. 1 intake valve opening. Chain adjustment must be in position of minimum adjustment.

Timing Chain Adjustment. Timing chain is adjusted by rotating the eccentric accessory shaft bushing at the right of the engine. To take up timing chain, loosen the three flange mounting bolts in the accessory bracket under the distributor (the two bolts nearest the engine must be taken out). Then use a special wrench to rotate the notched flange in front of the accessory bracket in a clockwise direction (facing forward) until the play in the shaft is approximately ⅛ inch (measured on the circumference of the generator drive coupling). Replace the mounting bolts. If it is necessary to shift the flange to line up the bolt holes, back off the adjustment slightly. If the bracket is ever taken off the car, the pipe plug in the side of the housing should be taken out and one half pint of engine oil poured into the housing before the engine is operated.

STARTER:—Model MAD-4110, MAD-4108. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 125 R.P.M. drawing 125 amperes at 5.5 volts. Brush spring tension is 44-56 ounces. The starting switch is mounted on the starter field frame and is operated by a flexible control on the dash. Starter switch is Model MU-2208-S.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58.2
.7 "	2355	5.5	100
3.0 "	1260	5.0	200
5.7 "	770	4.5	300
8.85 "	425	4.0	400
20.2 "	Lock	4.0	730

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and ammeter lead and starting switch control. Then take out three flange mounting cap screws. Pull starter forward to clear drive and lift from place.

GENERATOR:—Model GAM-4102. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush by prying on the brush mounting plate with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by friction between the mounting plate and the end plate. With standard car setting, the maximum charging rate is 14-16 amperes (cold) at 8 volts reached at 1900 R.P.M. or 27 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	620
2	6.9	710
5	7.1	830
10	7.8	1090
14	7.9	1490
15	8.0	1900

Shunt field current is 4.08-4.52 amperes at 6 volts. Generator motoring draws 4.46-4.94 amperes at 6 volts. Brush spring tension is 22-25 ounces on main brushes and 31-34 ounces on third brush.

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from the accessory drive shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

RELAY:—Model CB-4016. Relay is mounted on the generator end plate. Relay closes at 900 R.P.M. when the generator voltage reaches 7 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 8000-A. Lighting switch is mounted at base of the steering column. The junction block is incorporated with the lighting switch. Headlights are equipped with double filament bulbs and use the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking or side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Lighting fuse mounted on junction block on switch is 20 ampere capacity.

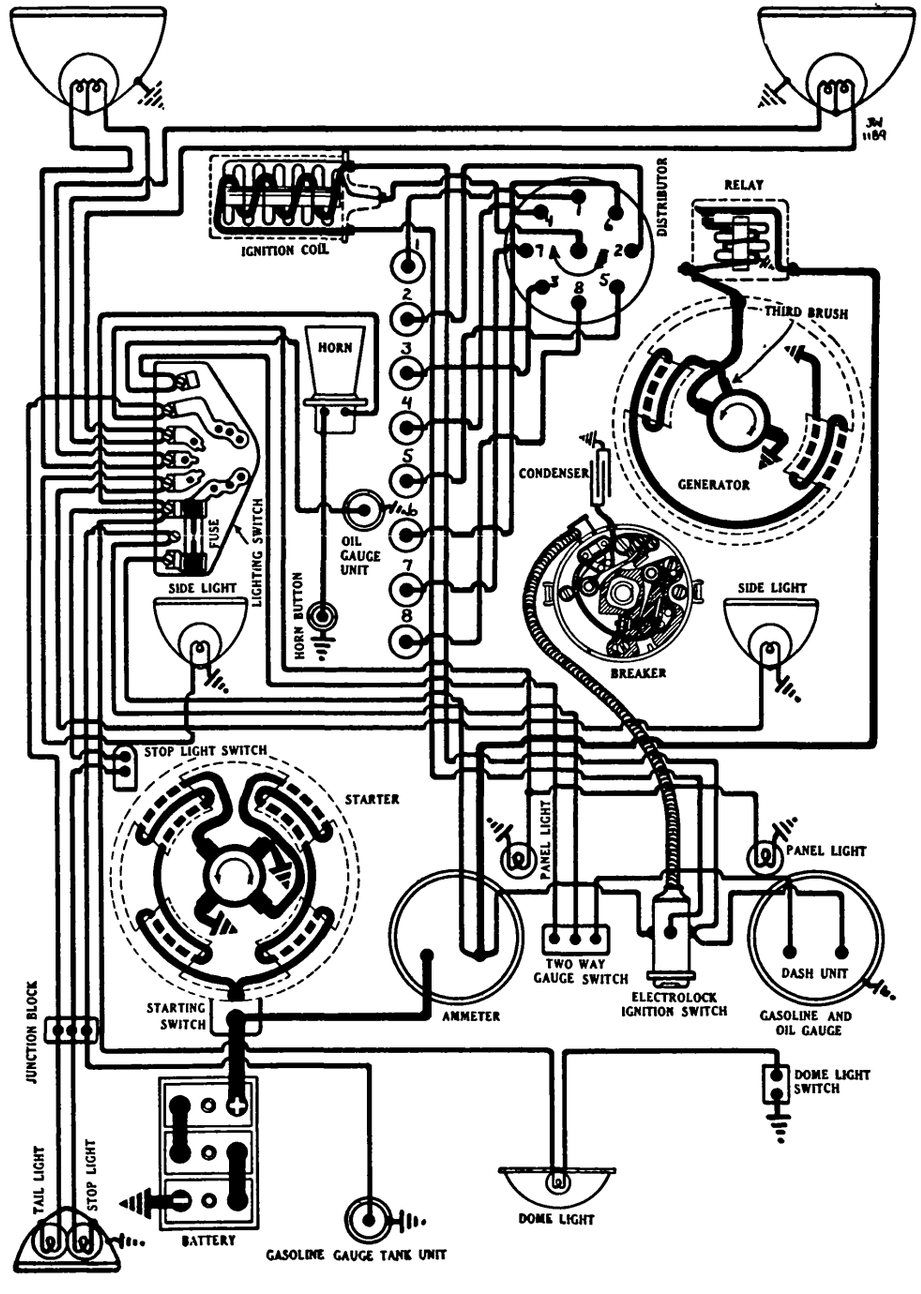
GREATER EIGHT (1931)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Exide, Type 3-XI-13-1G. 6 volt, 105 ampere hour. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model CE-4015, 4017. Coil is mounted on front of the engine block. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. The ignition switch is a Model 9-B Electrolock.



Distributor Model IGH-4009-A. Breaker contacts separate .020 inch. Set contact gap (first set mounted on stationary base plate) by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The second set of contacts (mounted on movable sub-plate) are adjusted by loosening lock nut on stationary contact mounting stud and turning up stud to secure correct adjustment. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M of engine. Maximum automatic advance is 25 degrees (engine) reached at 4000 R.P.M. of engine. There are two sets of contacts on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. The contacts must be synchronized for correct ignition performance. See Timing.

Mounting:—Distributor is mounted on the accessory drive bracket at the right of the engine. An Electrolock is used. This must be removed with the distributor as a unit. To remove distributor, first loosen Electrolock from dash mounting. Take off primary lead and remove distributor head with cables intact. Then remove hold-down screw in advance arm and lift distributor from place. See full directions in Equipment Section on removing Electrolock from distributor.

Oiling:—Fill the oiler on the side of the side of the distributor shaft with light engine oil every 2000 miles. At the same time remove the distributor cap and rotor and put a few drops of oil on each of the breaker arm pivot pins and coat the face of the breaker cam with a light film of vaseline or light cup grease.

Timing:—Synchronization of Contacts. Full directions on synchronization of contacts will be found in Equipment Section listed under 'Auto-Lite Distributors.' The contacts can be synchronized without special equipment after the distributor has been timed to the engine by cranking the engine over 90 degrees from firing position of piston No. 1 when piston No. 6 will reach firing position and the flywheel mark 'DC 3&6' will be opposite the indicator in the inspection hole in the flywheel case. If the second set of contacts do not begin to open at this point, loosen the two lock screws on the movable sub-plate and shift the plate until the contacts begin to open. Tighten the lock screws and check the contact gap. It must be within limits of .018-.020 inch with breaker arm on lobe of cam.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly fully retarded. To set timing, crank engine over until piston No. 1 enters compression stroke. This can be checked by noting valve tappet positions (both valves should be closed) or by removing the spark plug in cylinder No. 1 and cranking engine over until compression is felt when a finger is placed over the spark plug port. Loosen hold-down screw in advance arm and rotate distributor clockwise as far as possible. Then continue to crank engine over until flywheel mark 'DC 1&8' is in line with the

GREATER EIGHT (1931)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

indicator in the inspection hole in the front face of the flywheel housing on the right side of the engine. Then loosen advance arm clamp bolt and rotate distributor housing until the set of contacts mounted on the base plate begin to open. Tighten the clamp bolt and check to see that the segment directly opposite the rotor in the distributor head is connected to the spark plug is cylinder No. 1. Connect the remaining spartk plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

After setting ignition the car should be given a road test and the setting changed slightly to give the best performance. A slight spark knock should be audible when the car is accelerated from fifteen to twenty-five miles per hour with wide open throttle for the best performance. If the knock is too noticeable, loosen the advance arm hold-down screw and retard the spark one division on the scale by rotating the distributor in a clockwise direction. If no knock is heard the spark should be advanced by turning the distributor one division counter-clockwise. Give the car a final road test.

If the car is run with ethylzed gasoline exclusively, the spark should be set ⅞ inch before top dead center (on the flywheel). Set breaker so that contacts open when the top dead center marks "D.C.1-8' and 'D.C.3-6' are ⅞ inch before the pointer in the inspection hole in the flywheel housing.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. A.C. Type G-10. Gaps are .022 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1½ inches. Stem diameter, .3085 inch. Stem length, 5 1/32 inches. Valve lift, .312 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .003-.005 inch (hot).

EXHAUST VALVES. Head diameter, 1⅜ inches. Stem diameter, .3085 inch. Stem length, 5 1/32 inch. Valve life, .327 inch. Spring pressure, 50 pounds (valve closed). Tappet clearance, .005-.007 inch (hot).

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10°40' before top dead center with piston .0494" from top of stroke. No flywheel mark is provided but timing can be checked with a timing gauge. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Two pins on the timing chain exactly 20 links apart are marked. Two adjacent teeth on both camshaft and crankshaft sprocket are also marked. Mesh chain so that marked pins on chain are meshed between the marked teeth on each sprocket with arrow on chain pointing in direction of rotation. In this position piston No. 1 will be on top dead center with flywheel mark 'D.C.1&8' at indicator and No. 1 exhaust valve just closing and No. 1 intake valve opening. Chain adjustment must be in position of minimum adjustment.

Timing Chain Adjustment. Timing chain is adjusted by rotating the eccentric accessory shaft bushing at the right of the engine. To take up timing chain, loosen the three flange mounting bolts in the accessory bracket under the distributor (the two bolts nearest the engine must be taken out). Then use a special wrench to rotate the notched flange in front of the accessory bracket in a clockwise direction (facing forward) until the play in the shaft is approximately ⅛ inch (measured on the circumference of the generator drive coupling). Replace the mounting bolts. If it is necessary to shift the flange to line up the bolt holes, back off the adjustment slightly. If the bracket is ever taken off the car, the pipe plug in the side of the housing should be taken out and one half pint of engine oil poured into the housing before the engine is operated.

STARTER:—Model MAB-4034. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 125 R.P.M. drawing 125 amperes at 5.5 volts. Brush spring tension is 44-56 ounces. The starter switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.2 "	420	4.0	400
17.0 "	Lock	3.0	525
24.0 "	Lock	4.0	720

Mounting:—Starter is flange mounted at the left of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and ammeter lead. Remove starter switch control wire. Then take out three flange mounting cap screws. Pull starter forward to clear Bendix and lift from place.

GENERATOR:—Model GAM-4302 (first cars), GAM-4303 (later cars). Rotation is counter-clockwise at commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush by prying on the brush mounting plate with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by friction between the mounting plate and the end plate. With a standard car setting, the maximum charging rate is 14-16 amperes (cold) at 8 volts reached at 1900 R.P.M. or 27 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	620
2	6.9	710
5	7.1	830
10	7.8	1090
14	7.9	1490
15	8.0	1900

Shunt Field Current—4.08-4.52 amperes at 6.0 volts.
Motoring Current—4.46-4.94 amperes (GAM-4302), 4.94-5.46 (GAM-4303) at 6 volts.
Brush Spring Tension—8-13 ozs. (GAM-4302), 22-27 ozs. (GAM-4303).

Mounting:—Generator is cradle mounted at right of engine and is driven through a flexible hose coupling from the accessory drive shaft. To remove generator, disconnect lead and drive coupling and loosen mounting clamp band. Then slide generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every 1000 miles.

RELAY:—Model CB-4016 (GAM-4302), CB-4008 (GAM-4303. On generator. Relay closes at 900 R.P.M. when the generator voltage reaches 7 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 ameperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 8050-A. Lighting switch is mounted at base of the steering column. The lighting fuse is mounted on the switch and two extra terminals are provided which act as junctions for the oil and gasoline gauge lines. Headlights are equipped with double filament bulbs and use the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking and side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Lighting fuse mounted on lighting switch is 20 ampere capacity.

HUDSON

SUPER SIX MODEL (1933), SERIAL NUMBERS 1,300,501 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on dash under engine hood. First serial number 1,300,501.

ENGINE NUMBER:—Stamped on left hand side of cylinder block opposite No. 3 cylinder. First serial number 2001.

ENGINE:—Six cylinder, 'L' head type, 2 15/16x4¾" bore and stroke, 193 cubic inch displacement, rated at 20.7 H.P., develops 73 H.P. at 3200 R.P.M. (standard compression head engine) or 80 H.P. at 3200 R.P.M. (high compression head engine). Standard compression ratio 6.2-1. Optional high compression ratio 7.1-1. Standard compression head engines are not marked. High compression head engines may be distinguished by plate on left hand side of engine designating engine as 7.1 compression ratio to be operated only with ethylized fuel.

BATTERY:—Exide, Type 3-VXA-15-1, 6 volt, 15 plate, 100 ampere capacity (20 hour rate). Starting capacity 114 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—In cradle on right hand frame member under driver's seat.
Dimensions:—Width, 7". Length, 10 9/32". Height, 9 7/32".

IGNITION:—Coil Model IG-4605. Mounted on dash. Connected to ignition switch by armored cable (primary lead).
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped).
Ignition Switch:—Type 16-S Electrolock assembled as unit with coil. Switch has two 'on' positions. First 'on' position with key turned approximately ⅛ turn to right is used for timing or to secure gasoline gauge reading when automatic cranking is not desired. Second 'on' position with key turned to extreme right (approximately ¼ turn) is ordinary running position with ignition on and Startix operative.

Distributor Model IGB-4074A. Single breaker, 6-lobe cam, full automatic advance type. To adjust contact gap, loosen lock nut on stationary contact stud, turn up stud, tighten lock nut.

Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.020".

Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm with spring scale centered on arm and at right angles to breaker arm.

Cam Angles—Closed 40°. Open 20° (distributor degrees).

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	0		800
4		825	8		1650
8		1250	16		2500
12		1675	24		3350
15		2000	30		4000

Mounting:—Distributor mounted at right center of crankcase and driven from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—2000 Miles. Fill distributor base to level of oiler under distributor cup with light engine oil. Take off distributor cap and rotor, put one drop of oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Three distinct ignition settings are used, depending upon type of engine (compression ratio) and fuel characteristics:
1. Standard head—standard fuel:—Top dead center.
2. Standard head—Ethyl fuel:—¾" (flywheel), or .0262" (piston travel) before top dead center.
3. High compression head—Ethyl fuel:—Top dead center.

To Set Ignition Timing. Loosen hold-down screw in advance plate, rotate distributor clockwise to extent of advance plate slot, tighten screw. With No. 1 piston on compression, turn engine over by hand until piston reaches top dead center with flywheel mark 'U.D.C.1-6/' at the pointer in the inspection hole in the right hand forward face of the flywheel housing (mark should be ¾ inch before mark for Standard head Ethyl fuel setting). Loosen hold-down screw in advance plate, rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw. See that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

HUDSON

SUPER SIX MODEL (1933), SERIAL NUMBERS 1,300,501 UP
AUTO-LITE SYSTEM

If ignition is turned on to check contact opening, use first 'on' position of switch to avoid automatic cranking (see 'Ignition Switch').

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. Champion Type J-7. Set gaps at .020-.025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is gear driven from the crankshaft. Gears are marked. Mesh gears so that marks are adjacent and in line with straightedge across the shaft centers.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10° before top dead center with piston .0528" from top of stroke. No flywheel mark is provided at this point. Reset tappet clearance at .006" (hot).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅜"	5/16"	5 3/32"	45°	11/32"
Exhaust	1⅜"	5/16"	5 3/32"	45°	11/32"

Tappet Clearance		Valve Springs	
Intake	.004" (hot).	Closed	53 pounds
Exhaust	.006" (hot).		

CARBURETION:—Marvel Updraft Carburetor, Model VE-3 (see Carburetor Section for complete data). Manifold heat control is automatic. Carburetor choke control is operated manually by button on instrument panel.

Fuel Pump:—A.C. Mechanical fuel pump mounted on right hand side of crankcase and operated by eccentric on camshaft (see Carburetion Section for complete data).

Gasoline and Oil Gauge:—Motometer electric type combination gasoline and oil gauge (see Carburetion Section). Gauge operates as gasoline gauge with ignition turned 'on'. Oil reading obtained by pressing button on selector switch under center of instrument board.

STARTER:—Model MAJ-4025. Starter drive—Inboard Bendix drive with Startix automatic starting switch (mounted with relay on left hand side of engine block). See Equipment Section for complete data on Startix. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
.3 lb. ft.	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
19.0 "	Lock	4.0	805

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, take out 3 flange mounting cap screws, pull starter straight forward to clear Bendix, lift out.

GENERATOR:—Model GAM-4503. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amperes (cold) at 8 volts reached at 2400 R.P.M. Signal light (generator tell-tale) used instead of dash ammeter.

Charging Rate Adjustment. Take off commutator cover band. Shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction. For all charging rate adjustments an ammeter must be connected in the generator line at the relay.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	700	0	6.4	760
4	6.9	880	4	6.9	1040
7	7.0	1000	8	7.3	1400
10	7.2	1180	10	7.5	1600
14	7.8	1520	12.8	7.9	2550
17	8.0	2400	12.2	7.8	3200
15.2	7.9	3200			

Brush Spring Tension:—18-22 ounces on each brush.
Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.
Motoring:—4.94-5.46 amperes at 6.0 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts under generator forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, swing generator out or away from engine, tighten adjustment bolt before slacking off on generator, tighten mounting bolts. Belt tension should be just enough to drive fan and generator without slipping.

Oiling:—1000 Miles. Put 3-4 drops light engine oil in oiler at each end. Ball bearing at drive end is packed with grease when assembled. Plain bearing at commutator end is oiled by wick in oil well.

RELAY:—Model CBA-4002. Special type with auxiliary contacts and terminal for operation of generator charge tell-tale. Tell-tale contacts are closed with main contacts open, and open when main contacts close (as generator begins to charge battery). Relay contacts close when generator voltage reaches 7.0-8.0 volts with charging current of not more than 5 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". Air Gap:—.010-.030" (contacts closed).

SIGNAL LIGHTS:—These consist of battery charge tell-tale and oil pressure tell-tale lights mounted on instrument panel instead of conventional ammeter and oil pressure gauge. Light bulbs are standard 6-8 volt, 3 cp. D.C Mazda Number 64 and can be removed by turning light counter-clockwise slightly to release bayonet socket pin. See article in Equipment Section.

Battery Charge Tell-tale. Under ruby reflector on right center of instrument panel. Tell-tale should light when ignition is turned 'on' with car stopped and should continue to burn until generator begins to charge (when relay contacts close). If tell-tale light does not burn when ignition is turned on and at idling speeds, check bulb by grounding tell-tale terminal on relay (left hand terminal) to generator field frame. If tell-tale does not light, replace bulb. If lamp lights when terminal is grounded, check auxiliary contact spring, contacts, and ground strap. See that auxiliary contacts are closed with main contacts open. If tell-tale lamp lights when car is operated at speeds above idling speed, the generator or relay is defective.

Oil Pressure Tell-tale. Under ruby reflector or left center of instrument panel. Tell-tale should light when ignition is turned 'on' with car stopped but should go out when car is operated. Tell-tale should not light or flash at speeds above idling. If tell-tale does not light when ignition is turned on, check bulb by grounding terminal on oil pressure check valve or control switch (on right side of crankcase) to engine. If tell-tale does not light, replace bulb. If tell-tale does not flash at idling speeds, disassemble check valve and clean out by-pass hole behind plunger, see that terminal pin is straight and clean, and that plunger is free to move in housing.

LIGHTING:—Soreng-Manegold Switch, Model B-5670-A. Dimmer Switch Model C-2100-A. Lighting switch mounted on back of instrument board and controlled by push-pull button at lower left center of instrument panel. Headlights equipped with double filament bulbs for 'depressed beam' dimming controlled by foot-operated switch on toeboard. Parking bulbs (in headlights) or fender lights are standard equipment. Stop and tail light fitted with double filament bulb.

	Lamp Sizes			
Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking or Fender Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Tell-tale Lights	6-8	3	D.C.	64
Stop and Tail Lights	6-8	21-2	D.C.	1158
Dome Lights	6-8	15	S.C.	87

FUSES:—30 ampere capacity fuse mounted on back of lighting switch.

HUDSON

GREATER EIGHT (1932-33)

AUTO-LITE SYSTEM

SERIAL NUMBER:—Stamped on plate on dash under engine hood. First numbers as follows.

	Standard Model	Sterling Model	Major Model
1932	930,770	62,884	250,001
1933	936,703		251,117

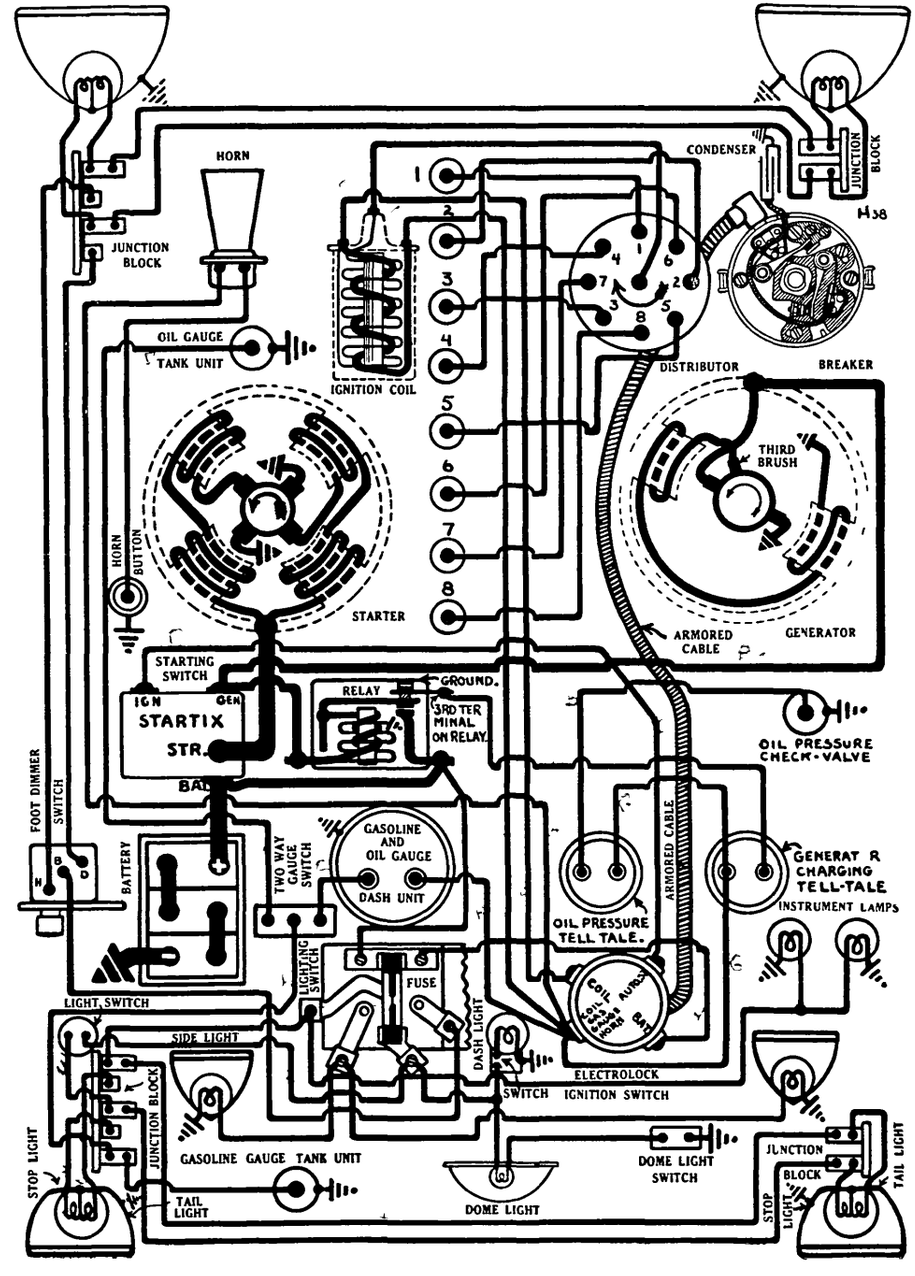
ENGINE NUMBER:—Stamped on left hand side of engine block opposite No. 1 cylinder First number 50,000 (1932), 63,501 (1933).

ENGINE:—Eight cylinder, 'L' head type, 3x4½" bore and stroke, 254 cubic inch displacement, rated at 28 8 H.P., develops 101 H P. at 3600 R.P M. (standard compression head engine) or 110 H P. at 3600 R P.M. (optional high compression head engine). Standard compression ratio 5 8-1. High compression ratio 6.5-1. Compression ratio of each engine is marked by figure cast in upper surface of cylinder head casting.

BATTERY:—Exide, Type 3-VXA-15-1, 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate). Starting capacity 114 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—In cradle on left hand frame side rail under driver's seat.
Dimensions:—Width, 7". Length, 10 7/32". Height, 9 7/32".

IGNITION:—Coil Model CE-4017. Coil mounted on cylinder head above water header.
Ignition Current:—2 amperes at 6 volts (engine running), 5 amperes at 6 volts (engine stopped).
Ignition Switch:—Type 15-S Electrolock assembled as unit with distributor Switch has two 'on' positions. Left hand 'on' position is timing position and should be used for setting timing or gasoline gauge reading when automatic cranking is not desired Right hand 'on' position is regular running position with ignition on and Startix operative.
Distributor Model IGH-4009B. Two breaker arm, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine Contacts must be synchronized (see Timing)
Breaker Gap:—Set at .020". This is important. Gap must not exceed .020".
Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm.
Cam Angles—Closed 34 5° Open 10 5° (distributor) when synchronized.

Automatic Advance



Degrees	Distributor	R P M	Degrees	Engine	R P M
Start		400	0		800
4		760	8		1520
8		1130	16		2260
12		1500	24		3000
17 5		2000	35		4000

Mounting:—On accessory bracket at right front of engine. Electrolock must be removed as unit with distributor. To remove, disconnect wires and free Electrolock at dash, take off distributor cap, take out hold-down screw in advance plate, lift distributor out (see Equipment Section for data on Electrolock).

IGNITION TIMING:—Three distinct ignition settings are used, depending upon type of engine (compression ratio) and fuel characteristics:
1. Standard head—standard fuel·—Top dead center.
2. Standard head—Ethyl fuel:—1¼" (flywheel) or .0625" (piston travel) before top dead center.
3. High compression head—Ethyl fuel·—Top dead center.

To Set Ignition Timing. Loosen hold-down screw in advance plate, rotate distributor clockwise to full extent of advance plate slot, tighten hold-down screw. With No. 1 piston on compression stroke, turn engine over by hand until piston reaches top dead center with flywheel mark 'D C 1-8" opposite pointer in inspection hole in right hand front face of flywheel housing (or 1¼" before the pointer on standard compression engines uing Ethyl fuel exclusively). Then loosen hold-down screw in advance plate, rotate distributor counter-clockwise until first or fixed set of contacts open, tighten hold-down screw, see that rotor is directly opposite No 1 segment in distributor cap (see diagram), connect spark plugs as indicated The second or movable set of contacts must be timed by synchronizing contacts and car should be tested for correct performance after timing has been completed (see below).

Synchronization of Contacts—first method. After first or fixed set of contacts has been timed to engine (above) turn engine over 90 or ¼ rev-

HUDSON

GREATER EIGHT (1932-33)

AUTO-LITE SYSTEM

olution to firing position of piston No. 6 with flywheel mark 'D.C.3-6/' at indicator (or 1¼" before for Ethyl fuel setting). Then loosen lock screws on movable breaker sub-plate carrying second set of contacts. shift plate until second or movable set of contacts begin to open, tighten lock screws.

Synchronization of Contacts—second method. Use special Auto-Lite synchronizing tool and follow complete directions in Equipment Section.

Final Performance Test. Car should be road tested after ignition has been set, to check performance. A slight spark knock should be audible when the car is accelerated from 10 to 25 M.P.H. with wide open throttle on a level road. If the knock is too noticeable, loosen hold-down screw and retard setting by turning distributor one-half division on scale clockwise at a time until knock can just be heard by driver. If knock is not heard, advance setting by turning distributor counter-clockwise one division on the scale at a time until knock becomes audible. Continue test and change adjustment until correct setting is secured.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—AC. Type G-8 (1932), A-7 (1933) 18 MM. Metric type. Type K-12 (14 MM. Metric) used with Super Power Dome Head (high compression) for 1932 only. **Spark Plug Gaps**—.022" (limits .020-.025") all models.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by chain from the crankshaft in tandem with accessory sprocket. Chain is adjusted manually (see below). Sprockets are marked by marks on two adjacent teeth on each sprocket. Mesh chain so that there are 18 links or 19 pins between marks on sprockets (begin count with pin in line with tooth meshed between marks on camshaft sprocket and mesh tooth in line with nineteenth pin between marks on crankshaft sprocket.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open approximately 10° before top dead center with piston .0494" from top of stroke. No flywheel mark is provided at this point. Reset tappet clearance at .004" (hot).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1½"	5/16"	5 3/32"	45°	11/32"
Exhaust	1⅜"	5/16"	5 3/32"	45°	11/32"

NOTE—Valve length 5 1/32" for 1932 models.

Tappet Clearance		Valve Springs	
Intake	.004" (hot).	Closed	53 pounds.
Exhaust	.006" (hot).		

Timing Chain Adjustment. Adjust chain at end of first 1500 miles and at 5000-mile intervals throughout life of car, or whenever play on circumference of generator coupling exceeds ⅛" (excluding slack of coupling bolts). To take up chain, loosen three bolts in accessory bracket (top inside and lower bolt pass through notches in eccentric and must be removed). Engage special wrench on eccentric nut between bracket and chain case, turn nut clockwise until slack on coupling is ⅛", tighten mounting bolts (slack off adjustment slightly if necessary in order to insert bolts). If bracket is taken off engine, take out pipe plug directly above shaft and fill bracket with ½ pint engine oil before engine is operated.

CARBURETION:—Marvel Updraft Carburetor, Model VH-4 (see Carburetor Section for complete data). Manifold heat control is automatic. Choke is manually controlled by button on instrument panel.

Gasoline and Oil Gauge:—Motometer electric type gasoline and oil gauge (see Carburetion Section).

STARTER:—Model MAB-4041. Starter drive—Inboard Bendix drive with Startix automatic starting switch (mounted with relay on left hand side of engine block). See Equipment Section for complete data on Startix. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb ft	4000	5.5	46
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	420	4.0	400
24.0 "	Lock	4.0	725

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, take out 3 flange mounting screws, pull starter straight forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put 3-4 drops light engine oil in oiler at each end of armature shaft (fill cups once).

GENERATOR:—Model GAL-4344 ('32), 4544 ('33). Third brush control. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amps. at 8.0 volts (cold) reached at 1900 R.P.M. Signal (charging tell-tale) light used instead of dash ammeter. Test ammeter must be connected in generator line when charging rate is checked or adjusted.

Charging Rate Adjustment. Take off commutator cover band. Shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700
4	6.4	740	4	6.9	900
8	7.1	900	8	7.4	1150
12	7.4	1120	10	7.7	1340
17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush Spring Tension:—18-22 ounces on each brush.
Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.
Motoring:—4.27-4.73 amperes at 6.0 volts.

Mounting:—Cradle mounted at right of engine and driven by shaft from accessory bracket. To remove, disconnect lead, disconnect drive coupling, loosen mounting clamp band, lift generator out.

Oiling:—1000 Miles. Put 3-4 drops light engine oil in oiler at each end (fill oil cups once.

RELAY:—Model CBA-4001 ('32), 4002 ('33). Has auxiliary contacts and terminal for operation of generator charge tell-tale. Tell-tale contacts are closed with main contacts open, and open when main contacts close (as generator begins to charge battery). Relay contacts close when generator voltage reaches 7.0-8.0 volts with charging current of not more than 5 amperes and open with discharge current of .5-2.5 amperes.
Contact Gap:—.025-.035". **Air Gap:**—.010-.030" (contacts closed).

SIGNAL LIGHTS:—These consist of battery charge tell-tale and oil pressure tell-tale lights mounted on instrument panel instead of conventional ammeter and oil pressure gauge. Light bulbs are standard 6-8 volt, 3 cp. D.C. Mazda Number 64 and can be removed by turning light counter-clockwise slightly to release bayonet socket pin. For complete data see 'Signal Light' article in Equipment Section.

LIGHTING:—Soreng-Manegold Switch, Model B-5670-A. Dimmer Switch Model C-2100-A. Lighting switch mounted on back of instrument board and controlled by push-pull button at lower left center of instrument panel. Headlights equipped with double filament bulbs for 'depressed beam' dimming controlled by foot-operated switch on toeboard. Parking bulbs (in headlights) or fender lights are standard equipment. Stop and tail light fitted with double filament bulb.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights (1932)	6-8	32-32	DC.	1000
Headlights (1933)	6-8	21-21	DC.	1110
Park, Fender, Instrmt.	6-8	3	SC.	63
Signal Lights	6-8	3	DC.	64
Stop (1932)	6-8	15	SC.	87
Tail (1932)	6-8	3	SC.	63
Stop & Tail (1933)	6-8	21-3	DC.	1158
Dome	6-8	15	SC.	87

FUSES:—30 ampere capacity fuse mounted on back of lighting switch.

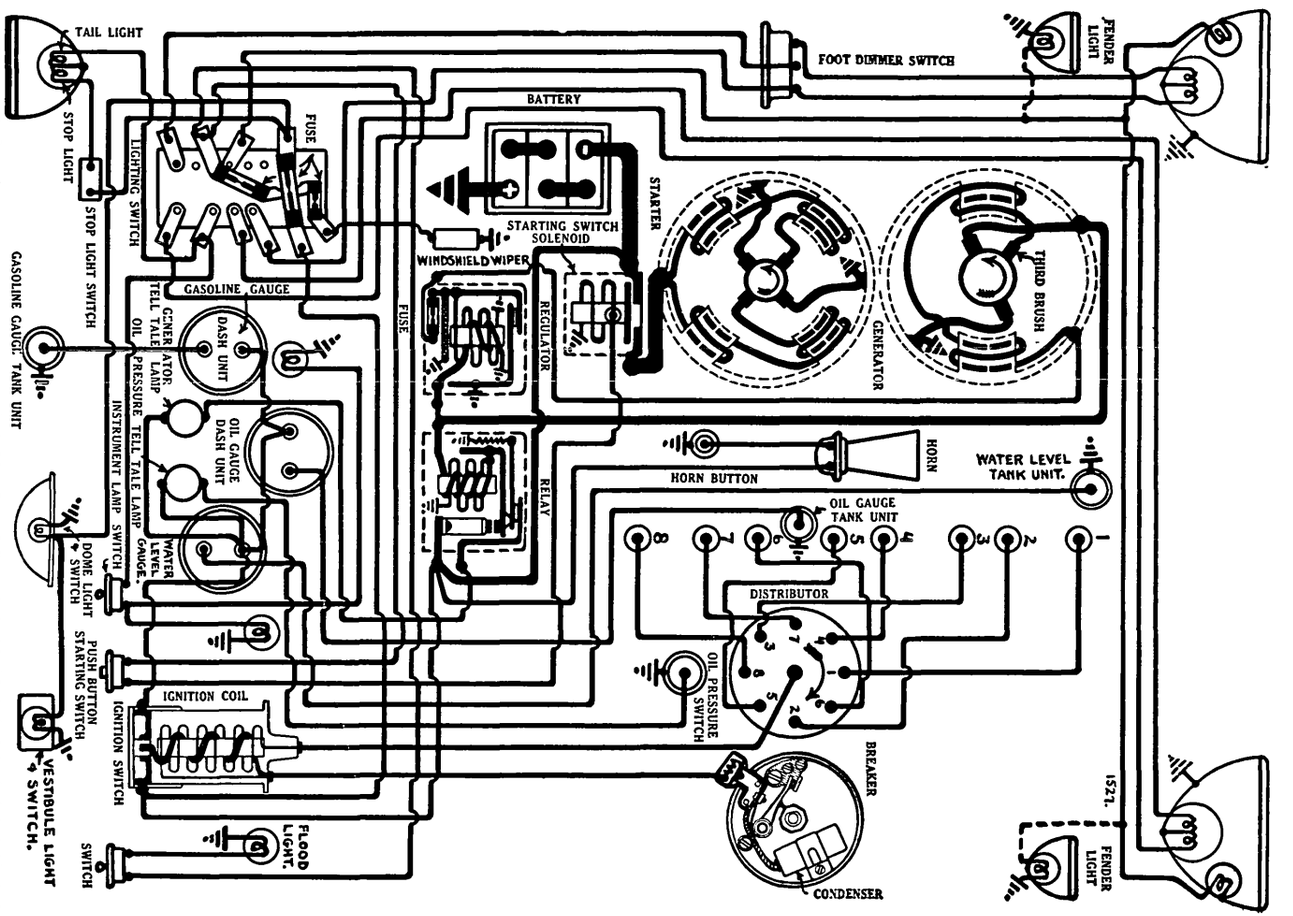
SERIAL NUMBER:—Stamped on plate on engine side of dash (under hood). First number, Model LL 252,000. Model LT 950,000.

COMPRESSION:—Ratio—(LL) 5.75-1 std. cast-iron hd. (LT) 6.25-1 std. aluminum composite head.
Pressure—5.75-1 hd. 80 lbs. at 125 R.P.M., 116 lbs. at 219 R.P.M. 6.25-1 head. All spark plugs must be removed and throttle wide open for readings.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model CE-4304. Lock coil type. Resistor mounted on distributor.
Ignition Current—2.5 amperes (running), 4.5 amperes (stopped).

Distributor Model IGP-4001-A. Single breaker, 8 lobe cam, full automatic advance type. No synchronization required.
Breaker Gap—Set gap at .020". Limits, .018-.020".
Breaker Arm Spring Tension—18 ozs. (minimum), 20 ozs. (maximum).
Cam Angles—Closed 27.5°. Open 17.5° (distributor).



Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
4	760	8	1520
8	1120	16	2240
12	1500	24	3000
17½	2000	35	4000

IGNITION TIMING:— Flywheel Degs. Piston Position Initial Setting (all engines) at TDC. ..... .0000" TDC.
Timing (Initial Setting):—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'U.D.C.' registers with pointer in inspection hole (left hand front face of flywheel housing above starter), loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then rotate distributor slowly counter-clockwise until contacts begin to open, tighten hold-down screw, check rotor position and spark plug connections (see diagram). This top dead center setting should be checked by road-testing car and spark advanced as much as operating conditions and fuel rating will allow (see below).
Timing (Final Setting):—With engine at normal operating temperature and running at 8 M.P.H. in high gear on level road, accelerate engine rapidly and note performance from 10 to 15 M.P.H. With correct setting a slight spark knock should be noticed. If no knock is heard, loosen hold-down screw in advance arm and rotate distributor one graduation counter-clockwise. If knock is too severe, rotate distributor one graduation clockwise. Final setting must not be beyond maximum advance mark on flywheel (¾" before top dead center mark ('U.D.C.').
Motor Gauge—Weidenhoff Adapter #114, Rod #44.
Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—Champion, Type J-7. 14 MM. Metric.
Spark Plug Gap—.022".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke (Climatic Control), Fuel Pump, and Gasoline and Oil Level Gauge.
Carburetor:—Carter, Model 282-S (LL, LT), 299-S (LTS). 1¼" plain tube, downdraft type.
Automatic Choke—Carter Climatic Control (282-S).
Fuel Pump:—A.C., Type R..
Gasoline Gauge:—Motometer, electric type.

LUBRICATION:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears by oscillating plunger type pump. Pump mounted on right hand side of crankcase.
Normal Oil Pressure—3 pounds.
Oil Pressure Relief Valve—Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch). See Signal Lights under Lighting for data.
Capacity and Oil—9 qts. (dry), 7 qts. (refill). Use SAE #30 (above 40°F.), #20-W (40° to 0°F.).

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" before top dead center when a point on the flywheel approximately 3.97 teeth before the dead center mark 'U.D.C.' lines up with the indicator on the housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Tappet Clearance:—.006" Int., .008" Exh., engine hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—9 quarts (dry), 7 quarts (refill).

Normal Oil Pressure—3 pounds.

BATTERY:—Exide, Type XTL-19-17F, 6 volt, 19 plate, 120 ampere hour capacity.

Starting Capacity—106 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under front floor boards, left hand side.

STARTER:—Model MAB-4061. Armature No. MAB-2113. Starter drive—Inboard Bendix.

Rotation—Counter-Clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (new brushes).

Cranking Engine—150 R.P.M., 120-125 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE:—Lock torque figures correct without switch.

Starting Switch: — Type SS-4001. Solenoid type switch mounted on starter field frame and controlled by pushbutton switch on instrument panel.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two flange mounting bolts.

GENERATOR: — Model GBK-4602. Armature No. GBK-2055. Ventilated, third brush control type with external voltage regulator. See Equipment Section for complete data on Voltage Regulator.

Charging Rate Adjustment:—Use test meters to check generator output. Short out voltage regulator by connecting short jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Remove jumper wire.

Maximum Charging Rate—22 amperes (cold), 8.0 volts, 2400 R.P.M. or 28 M.P.H.

Performance Data

Cold—Regulator Inoperative—Hot			Amperes	Volts	R.P.M.
Amperes	Volts	R.P.M.			
0	6.4	800	0	6.4	840
4	6.7	980	4	6.8	1025
8	7.0	1085	8	7.15	1200
12	7.3	1300	12	7.5	1450
16	7.55	1500	16	7.85	1760
22	8.0	2200	18	8.0	2400

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ounces.

Field Current—3.75-4.15 amperes at 6.0 volts.

Motoring—4.46-4.94 amperes at 6.0 volts.

Field Fuse—7½ ampere capacity in knurled cup under regulator case.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator out or away from engine until slight pull is felt on belt, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

CUT-OUT RELAY: — Model CBA-4002. Mounted on dash. Relay has extra set of contacts above armature for charge tell-tale light control.

Cuts in—6.4 volts, 750 R.P.M. or 8 M.P.H. Limits, 6.5-7.25 volts.

Cuts out—.5-2.5 ampere discharge.

Contact Gap—.025-.035" with upper contacts closed.

Air Gap—.010-.030" with contacts closed.

VOLTAGE REGULATOR:—Mod. TC-4102A. Two Charge Regulator mounted on engine side of dash. See article in Electrical Equipment Section for complete data.

Contacts Open—7.86-8.27 volts at 70°F.

Contacts Close—6.46-6.86 volts at 70°F.

Contact Gap—.005" minimum.

Core Gap—.030" plus or minus .001" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5640-A, C-5640-A (without windshield wiper fuse). Soreng Manegold Foot Control Switch. Foot control switch provides assymetric 'meeting' beam (lower beam left hand headlight, upper beam right hand headlight). Operative only with lighting switch in 'Country Driving' position. Headlight bulbs are pre-focused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument, Flood	3	63
Dome, Vestibule	15	87
Stop and Tail	21-2	1158
Signal	3	64 (DC.)

SIGNAL LIGHTS:—Battery charge tell-tale and oil pressure tell-tale light mounted on instrument panel. Light bulbs are standard 3 cp. DC. bulbs, Mazda No. 64. To remove bulbs, turn light counter-clockwise slightly to release bayonet socket pin.

Battery Charge Tell-tale. At left of instrument cluster. Tell-tale should light with ignition turned on and should go out when gentrator begins to charge battery (relay contacts closed). If tell-tale does not burn when ignition turned on, check bulb by grounding tell-tale terminal on relay to generator field frame. If tell-tale does not light, replace bulb. If lamp lights, check auxiliary contact spring, contacts and ground resistor. See that auxiliary contacts are closed with main contacts open. If tell-tale lights at speeds above idling (8 M.P.H.), generator or relay is defective.

Oil Pressure Tell-tale. At right of instrument cluster. Tell-tale should light with ignition turned on but should go out when engine is operated (light should flash at idling speeds). Tell-tale should not light or flash at speeds above idling. If tell-tale does not light when ignition is turned on, check bulb by grounding terminal on oil pressure check valve (right side of crankcase) to engine. If tell-tale does not light, replace bulb. If tell-tale does not flash at idling speeds, disassemble check valve and clean out by-pass hole behind plunger, see that terminal pin is straight and clean, and that plunger is free.

FUSES:—Lighting—Two 20 ampere capacity fuses on back of lighting switch.

Windshield Wiper—7½ ampere capacity fuse on lighting switch (not used on all cars).

Generator Field—7½ ampere capacity.

SERIAL NUMBER:—First number, 53-101. On plate on engine side of dash. All model numbers will carry prefix '53'.

COMPRESSION:—**Ratio**—6.25-1 (Std. cast-iron head). 7.0-1 (Optl. aluminum-iron composite head.) **Pressure**—116 lbs. at 219 R.P.M. (6.25-1 head), 127 lbs. at 207 R.P.M. (7.0-1 head) with all spark plugs removed and throttle wide open.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 350 R.P.M.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on these cars. See article in Electrical Equipment Section for complete description, wiring diagram and trouble shooting.

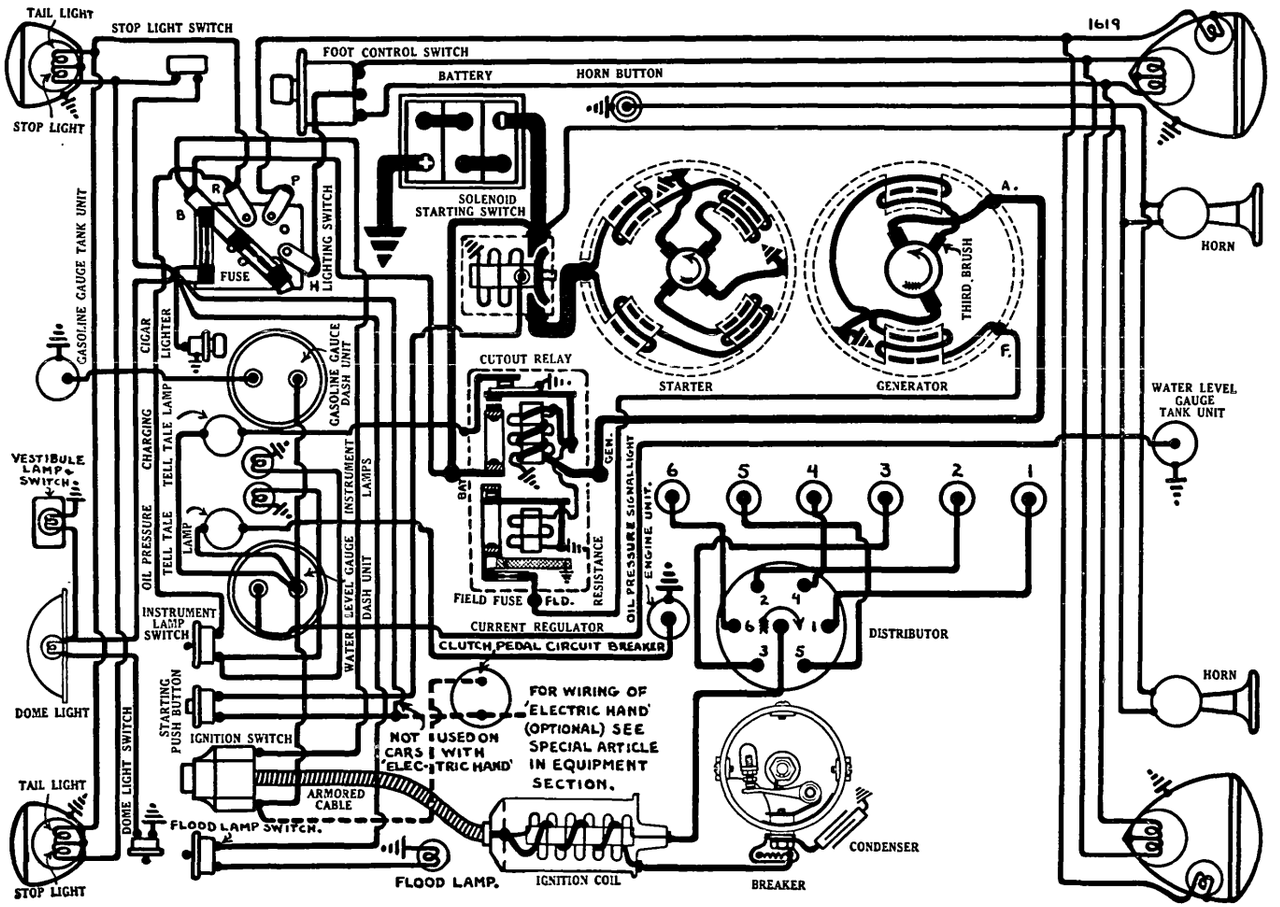
IGNITION:—**Coil Model IG-4616.** Resistance unit mounted on distributor connected in primary circuit.

Ignition Current—2.5 amperes idling, 4.5 stopped. **Ignition Switch**—Mitchellock Model 24-B, Type 6509. Connected to coil by armored cable.

Distributor Model IGB-4301-A (first 3790 cars), IGB-4301-B (Eng. No. 73791 up). Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-22 ounces.
Cam Angles—Closed 40°. Open 20°. (distributor).

Automatic Advance—IGB-4301-A

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
3	720	6	1440
6	1040	12	2080
9	1360	18	2720
12	1680	24	3360
15	2000	30	4000



Automatic Advance—IGB-4301-B

Start	300	0	600
3	400	6	800
5	615	10	1230
10	1150	20	2300
14	1580	28	3160

Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm, lift out.

IGNITION TIMING:— Flywheel Deg. Piston Pos.
First 3790 cars.....4½° or ½" BTDC. .....0101" BTDC.
Eng. No. 73791 up.....At TDC. ..... .0000" TDC.
Timing Initial Setting)—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC.-1-6/' lines up with pointer on edge of inspection hole in left front face of flywheel housing above starter after Eng. No. 73791, or ½" before this point on first cars. Loosen hold-down screw in advance arm, turn distributor clockwise to limit of advance arm slot, then turn distributor slowly counter-clockwise until contacts just open, tighten hold-down screw, see that rotor is opposite #1 segment in distributor cap. Car should then be road-tested and spark advanced as much as operating conditions and fuel will allow.
Timing (Final Setting)—With engine at normal operating temperature, and running at 8 M.P.H. in high gear on level road, accelerate engine rapidly and note performance from 10-15 M.P.H. A slight spark knock should be noticed. If no knock is heard, loosen hold-down screw and advance distributor one graduation on scale (turn distributor counter-clockwise). If knock is too severe, retard distributor one graduation (clockwise). Repeat test until satisfactory setting is secured. Final setting must not be beyond maximum advance mark on flywheel (¾" before mark 'UDC.1-6/).
Motor Gauge—Weidenhoff Adapter #114, Rod #44.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—Champion Type J-7-S. 14MM. Metric
Spark Plug Gaps—Set at .022".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Carter, Model 309-S, 1¼", downdraft type with drop-bar type Fast Idle.
Automatic Choke—Carter Climatic Control integral with carburetor.
Fuel Pump:—A.C., Type R-1521540 diaphragm type.
Gasoline Gauge:—King-Seeley electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10° 40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before the dead center mark 'UDC.1-6' lines up with the pointer on the housing. No flywheel mark provided. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Tappet Clearance:—.006" Int., .008" Exh., engine hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill). **Normal Oil Pressure**—3 pounds.

BATTERY:—National, Type ST-3-17X. 6 volt, 17, plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor boards.

STARTER:—Model MAB-4060. Armature MAB-2114.
Starter Drive—Inboard Bendix, Type A-1588.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—150 R.P.M., 125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Lock torque figures correct without switch.

Starting Switch:—Type SS-4001. Solenoid type switch mounted on starter field frame controlled by pushbutton switch on instrument panel. See Equipment Section.
Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

GENERATOR:—Model GBK-4602-1. Armature No. GBK-2055. Ventilated, third brush control type with external voltage regulation (two-step charging rate). See Equipment Section for complete data on Regulator.
Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate. Remove jumper wire.
Maximum Charging Rate—22 amperes (cold) or 18 amperes (hot), 8.0 volts, 2400 R.P.M., 28 M.P.H.

Performance Data

Cold—Regulator Inoperative—Hot			
Amperes	Volts	R.P.M.	Amperes Volts R.P.M.
0	6.4	800	0 6.4 840
4	6.7	980	4 6.8 1025
8	7.0	1085	8 7.15 1200
12	7.3	1300	12 7.5 1450
16	7.55	1500	16 7.85 1760
22	8.0	2200	18 8.0 2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Current—3.75-4.15 amperes at 6.0 volts.
Field Fuse—5 amperes in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator out from engine until slack on belt midway between crankshaft and generator pulleys is 1¼" (measure from straightedge across pulleys), tighten mounting bolts.

REGULATOR:—Model TC-4304-A. Consists of Cutout Relay and Current Regulator (Two-rate relay) in a single case on the dash. See Equipment Section for complete article on these units. Cutout relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Soreng-Manegold Switch Model 5770-A. R.B.M. Foot Control Switch, Model 1076, A. Foot switch used to control Country Driving (high) and City (low) beams with lighting switch in driving or second position. Headlight bulbs are pre-focused type.

Bulb Specifcations

Postion	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument	3	63
Signal Lights	3	64 (DC)
Stop & Tail	21-2	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Tell-tale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

HORNS:—Auto-Lite Type HA-4003, 4004 (Std), Klaxon Model KQ-26-M, Type 1716 (high note), 1717 (low note) matched tone, twin horns (optil.).

FUSES:—Lighting—Two 20 ampere capacity on switch.
Generator Field—5 ampere in regulator.

SERIAL NUMBER:—First number, (HT) 54-101, (HU) 55-101, (HHU) 56-101. On plate on engine side of dash. All model numbers will carry these prefixes: '54', '55', or '56'.

COMPRESSION:—**Ratio**—6.0-1 (std. cast-iron head), 7.0-1 (optl. aluminum-iron composite head). **Pressure**—110 lbs. at 150 R.P.M. (6.0-1 head), 128 lbs. at 150 R.P.M. (optl. 7.0-1 head) with all spark plugs removed and throttle wide open.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 350 R.P.M.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on Models HT, HU, standard on Model HHU. See article in Electrical Equipment Section for complete description, wiring diagram, and trouble shooting.

IGNITION:—**Coil Model CE-4606.** Resistance mounted on distributor connected in primary circuit. **Ignition Current**—2.5 amperes idling, 4.5 stopped. **Ignition Switch**—Mitchellock Model 24-B, Type 6509. Connected to coil by armored cable.

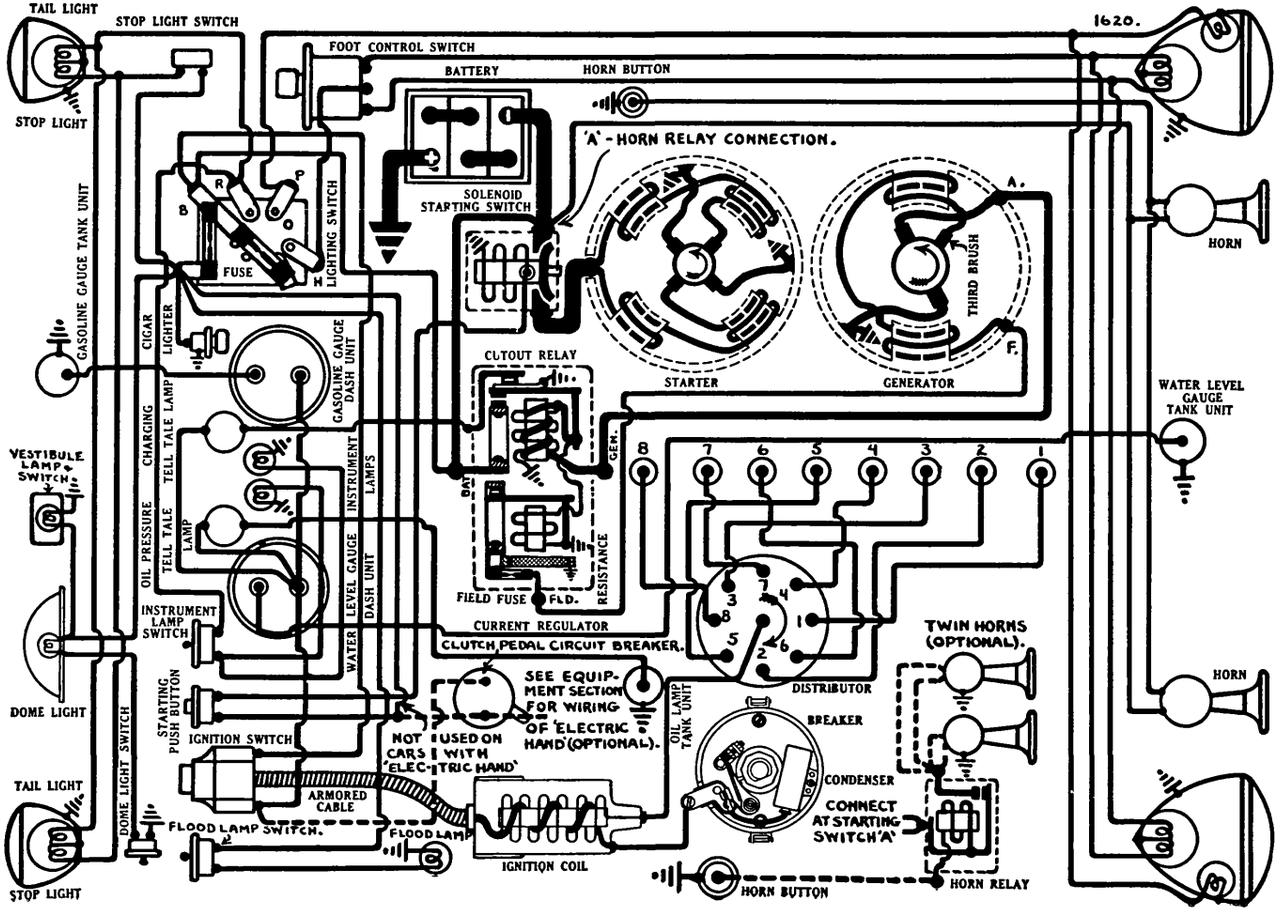
Distributor Model IGP-4001-A (first 10246 cars), IGP-4001-B (Eng. No. 65247 up). Single breaker, 8 lobe cam, full automatic advance type. **Breaker Gap**—Set at .020". Limits .018-.020". **Breaker Arm Spring Tension**—18 ozs. minimum, 20 ozs. maximum. **Cam Angles**—Closed 27.5°. Open 17.5°. (distributor).

Automatic Advance—IGP-4001-A

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
4	760	8	1520
8	1120	16	2240
12	1500	24	3000
17½	2000	35	4000

Automatic Advance—IGP-4001-B

Start	300	0	600
3	400	6	800
5	575	10	1150
10	1025	20	2050
15	1475	30	2950
17.5	1700	35	3400



Removal:—Mounted on right hand side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
First 10246 cars.....4½° or ½" BTDC..... .0089" BTDC.
Eng. No. 65247 up.....At TDC. .0000" TDC.
Timing (Initial Setting)—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC.1-8/' lines up with pointer in inspection hole in left front face of flywheel housing above starter (after 10247 cars, or ½" before this point on first cars). Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then turn distributor slowly counter-clockwise until contacts just open, tighten hold-down screw, see that rotor is opposite #1 segment in distributor cap. Car should then be road-tested and spark advanced as much as operating conditions and fuel will allow.
Timing (Final Setting)—With engine at normal operating temperature, and running at 7 M.P.H. in high gear on level road, accelerate engine rapidly and note performance from 10-15 M.P.H. A slight spark knock should be noticed. If no knock is heard, loosen hold-down screw and advance distributor one graduation on scale (turn distributor counter-clockwise). If knock is too severe, retard distributor one graduation (turn distributor clockwise). Repeat test until satisfactory setting is secured. Final setting must not be beyond maximum advance mark on flywheel ¾" before mark 'UDC.1-8/').
Motor Gauge—Weidenhoff Adapter #114, Rod #44.
Firing Order:—1-6-2-5-8-3-7-4. See diagram.
Spark Plugs:—Champion Type J-7-S. 14 MM. Metric.
Spark Plug Gaps—Set at .022".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter, Model 310-S, 1¼" downdraft type with drop-bar type Fast Idle.
Automatic Choke—Carter Climatic Control.
Fuel Pump:—A.C., Type R-1521540 diaphragm type.
Gasoline Gauge:—King-Seeley electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10° 40' or .0494" before top dead center when a point on the flywheel approximately 3.97 teeth before the dead center mark 'UDC.1-8' lines up with the indicator on the housing. Reset tappet clearance .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.
Tappet Clearance:—.006" Int., .008" Exh., engine hot.
Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—7 qts. (refill). **Normal Oil Pressure**—3 pounds.

BATTERY:—Exide, Type XTL-19-17-F. 6 volt, 19 plate, 108 A.H. capacity (20 hour rate).
Starting Capacity—130 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor.

STARTER:—Model MAB-4061, 4075 (beginning with engin #68336. Armature MAB-2113.
Drive—Inboard Bendix (barrel), Type A-1673.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—150 R.P.M., 125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200

16	7.55	1500	16	7.85	1760
22	8.0	2200	18	8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Current—3.75-4.15 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Loosen pivot bolts and clamp bolt, pull generator out from engine until slack on belt midway between fan and generator pulleys is 1¼" (measure from straightedge across pulleys), tighten mounting bolts.

REGULATOR:—Model TC-4304-A. Consists of Cut-out Relay and Current Regulator (Two-rate relay) in a single case on the dash. See Equipment Section for complete article on these units. Cutout relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Soreng-Manegold Switch Model 5770-A. R.B.M. Foot Control Switch, Model 1076, A. Foot switch used to control Country Driving (high) and City (low) beams with lighting switch in driving or second position. Headlight bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument	3	63
Signal Lights	3	64(DC)
Stop & Tail	21-2	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge tell-tale and Oil Pressure tell-tale lights mounted in instrument cluster. See Equipment Section for complete data.

HORNS:—Auto-Lite Type HA-4003, 4004 (Std. on HT, HU). Klaxon Model K-33-C, Type 1901 high note, 1902 low note, (Optl. on HT, HU, Std. on HHU). Klaxon horns are matched tone, twin horns, operated by horn relay.

Horn Relay:—Model 268-T. Current draw .8 amps.
Contact Gap—.015-.025".
Air Gap—.012-.017 with contacts closed.

FUSES:—Lighting—Two 20 ampere on switch.
Generator Field—5 ampere in regulator.

NOTE:—'Electric Hand' Bendix electro-pneumatic type gear shift optional on all models. See article in Electrical Equipment Section for specifications, trouble shooting and repair.

SERIAL NUMBER:—First number—63-101. Stamped on plate on dash under engine hood.

COMPRESSION:—Ratio 6.25-1 Std cast-iron head, 7.0-1 Optl. high compression aluminum head. Check compression pressure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
Std. 6.25-1	116 lbs. at 219 R.P.M.
Optl. 7.0-1	127 lbs. at 207 R.P.M.

VACUUM READING—Gauge should show steady reading of 18-20" of HG. with engine idling at 350 R.P.M.

IGNITION:—Coil Model IG-4633. Resistor unit mounted on distributor terminal is connected in series with coil primary.

Coil Draw—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6696. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton No. 50184, Mitchell No. 6095.

Distributor Model IGB-4301B. Single breaker, 6 lobe cam, full automatic advance type.

Breaker Gap—Set at .020". Limits .018-.020".

Cam Angle or Dwell—40° (closed), 20° (open).

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IGB-1025J. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	400	6	800
5	615	10	1230
10	1150	20	2300
14	1580	28	3160

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting section for adjustment in accordance with octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC	.000" TDC.

NOTE—High octane type fuel must be used in engines with high compression 7.0-1 aluminum head.

To Set Timing (Initial Setting)—With #1 piston on compression, turn engine over until flywheel mark 'UDC.1-6/' lines up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

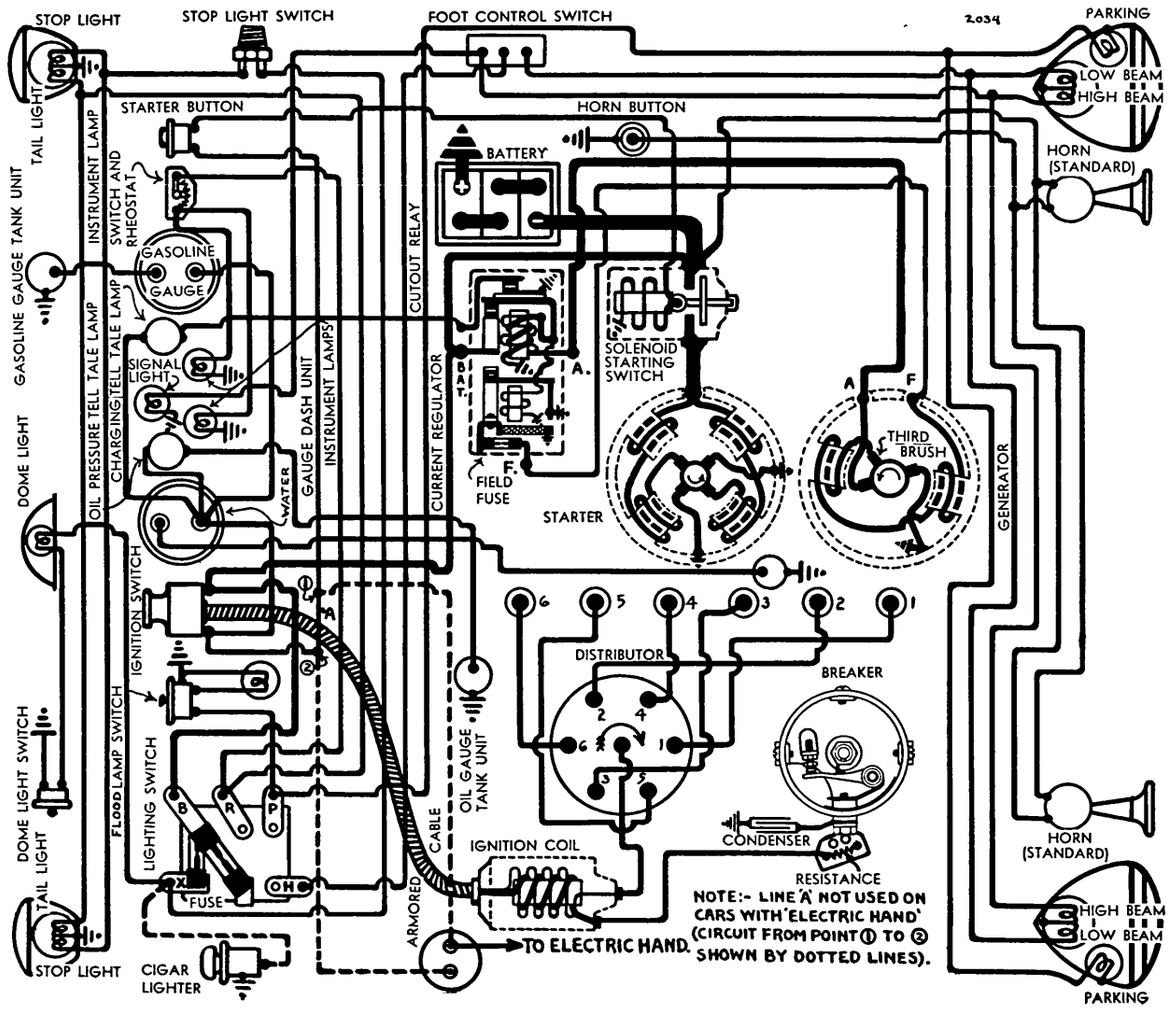
Final Setting—Check ignition setting by road testing car. With engine warm and running in high gear on level road, a slight spark knock should be evident when car is accelerated from 10-15 M.P.H. with wide open throttle. Adjust by loosening hold-down screw in advance arm and rotating distributor one graduation on scale counter-clockwise (if no knock evident) or clockwise (if knock too severe). Repeat test until slight knock is evident. Final setting must not be more than ¾" on flywheel before 'UDC.1-6/' mark.

Timing (Motor Gauge)—Weidenhoff #114 Adapter, #44 Rod.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (Std. 6.25-1 eng.). J-9 (Optl. 7.0-1 eng.). 14MM Metric type.

Spark Plug Gaps—.025" (Std. engine), .022" (Optl. H.C. engine).



CARBURETION:—Carburetor—Carter Mod. 329-S, 1¼" downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Adjust throttle stopscrew so that speed is 350 R.P.M. or 7 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ½-1 turn open from seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link engagement. Change for seasonal requirements as follows:

Center Hole—Normal summer temperatures.
Inner Hole (Min. stroke)—Extreme hot weather.
Upper Hole (Max. stroke)—Extreme cold weather.

Fast Idle:—Integral with carburetor. No adjustment required. See article on Carter Fast Idle in Carburetion Section.

Automatic Choke:—Carter Climatic Control. See article in Carburetion Section.

Air Cleaner:—AC. #1526650 Std. #1526651 on cars with Electric Hand. Heavy duty oil-bath type optl.

Fuel Pump:—AC. Type R #1521450. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—King-Seeley Electric. See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance—.006" intake, .008" exhaust with engine hot.

Valve Spring Pressure—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when point on flywheel approximately 3.94 teeth before dead center mark 'UDC.1-6/' lines up with pointer in inspection hole in left front face of housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff #114 Adapter, #44 Rod.

LUBRICATION:—Crankcase Capacity—5 qts. refill.

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal Light—Used instead of pressure gauge. Controlled by oil pressure regulator valve. See complete article in Equipment Section.

BATTERY:—National. Type ST-317X. 6 volt, 17 plate, 96 ampere hour (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor board.

STARTER:—Madel MAB-4075. Armature MAB-2113.

Drive—Inboard Bendix, Type A-1673.

Cranking Engine—150 R.P.M. 120-125 amps. at 5 vs.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

Starting Switch:—Solenoid Switch Type SS-4001. Controlled by pushbutton switch (R.B.M. Model 1800) on dash. Operative with ignition turned 'on'. On cars with Electric Hand clutch must be disengaged also. See article in Equipment Section.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

GENERATOR:—Model GAR-4701-6. Armature GAR-2077. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 22.8 amperes at 8.0 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold Regulator Inoperative			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	780	0	6.4	820
4	6.7	930	4	6.8	1000
8	6.95	1060	8	7.1	1180
12	7.25	1210	12	7.35	1400
16	7.6	1440	16	7.8	1790
22.8	8.0	2400	18.4	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ozs. (new brushes).

Field Curent—3.51-3.89 amperes at 6.0 volts.

Motoring Current—5.32-5.88 amperes at 6 volts.

Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Swing generator away from engine until slack on belt midway between fan pulley and generator pulley is 1¼" (measure from straightedge across pulleys).

RELAY-REGULATOR:—Model TC-4304A. Mounted on engine side of dash. Consists of Cutout Relay and Current Regulator (two-rate charging control). See Equipment Section article for complete data. Cutout Relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts. 8 M.P.H.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Head lamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch.

Headlamp Beam Indicator—In lower portion of speedometer dial. Lighted when upper beams in use.

Switches

Lighting—R.B.M. Model 1650.

Foot Selector—R.B.M. Model 1082.

Instrument Lights—Soreng-Manegold Mod. K2060A.

Stop Light—Motometer Model 58012-C hydraulic type mounted in brake line on left frame side rail in channel at rear.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instrument	1	55
Signal Lights	1	51
Stop and Tail	21-3	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Telltale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity on switch.

Generator Field—5 ampere in regulator.

HORNS:—E.A. Vibrator type. Twin horns.

NOTE:—'Electric Hand' Bendix electro-pneumatic type gear shift optional on all models. See article in Electrical Equipment Section for specifications, trouble shooting and repair.

SERIAL NUMBER:—First number (64) 64101, (65) 65101, (66) 66101, (67) 67101. On plate on engine side of dash. All model numbers will carry these prefixes: '64', '65', '66', or '67'.

COMPRESSION:—Ratio 6.0-1 Std. cast-iron head, 7.0-1 Optl. high compression aluminum head. Check compression pressure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
Std. 6.0-1	110 lbs. @ 150 R.P.M.
Optl. 7.0-1	128 lbs. @ 150 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 350 R.P.M.

IGNITION:—**Coil Model CE-4617.** Resistor unit mounted on distributor terminal is connected in series with coil primary.

Resistance Unit—Part No. SP-4009.

Coil Draw—2.5 amperes idling, 4.5 amps. stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6696. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton No.50184, Mitchell No. 6095.

Distributor Model IGP-4001B. Single breaker, 8 lobe cam, full automatic advance type.

Breaker Gap—Set at .020". Limits .018-.020".

Cam Angle or Dwell—27½° (closed), 17½° (open).

Breaker Arm Spring Tension—18 ozs. minimum, 20 ozs. maximum.

Condenser—Part No. IG-2671. Capacity .20-.25 mfds.

Automatic Advance

3	400	6	800
5	575	10	1150
10	1025	20	2050
15	1475	30	2950
17.5	1700	35	3400

Distributor Removal:—Mounted on right side of crankcase. To remove take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting Section for adiustment in accordance with octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC	.00" TDC

NOTE—High octane type fuel must be used in engines with high compression 7.0-1 aluminum head.

To Set Timing (Initial Setting)—With #1 piston on compression turn engine over until flywheel mark 'UDC 1-8/' lines up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen hold-down screw in dvance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open. Tighten hold-down screw.

Final Setting—Check ignition setting by road testing car. With engine warm and running in high gear on level road, a slight spark knock should be evident when car is accelerated from 10-15 M.P.H. with wide open throttle. Adjust by loosening hold-down screw in advance arm and rotating distributor one graduation on scale counter-clockwise (if no knock evident) or clockwise (if knock too severe). Repeat test until slight knock is evident. Final setting must not be more than ¾" on flywheel before 'UDC 1-8/' mark.

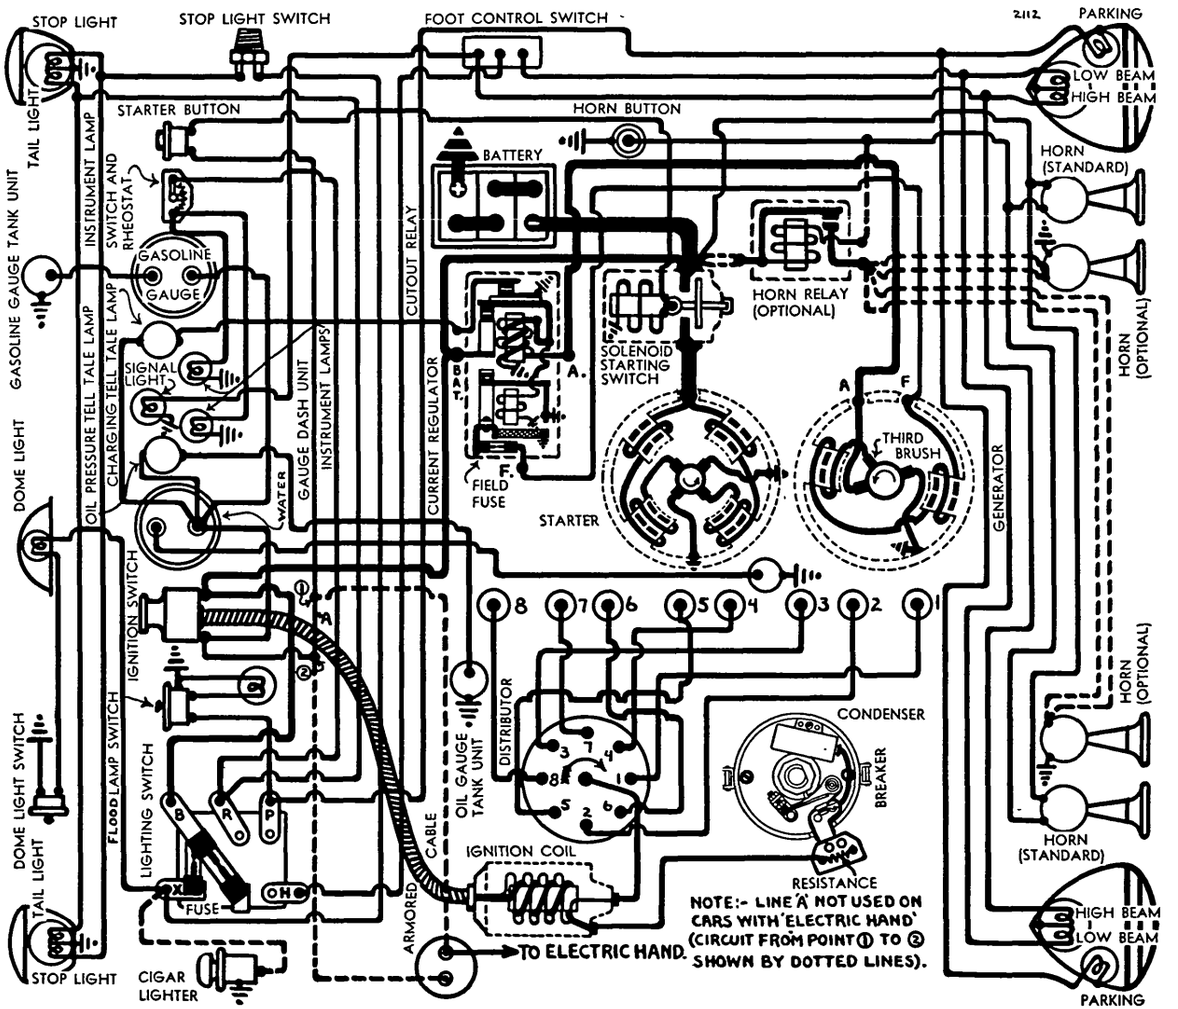
Timing (Motor Gauge)—Weidenhoff #114 Adapter, #44 Rod.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion Type J-8. (Std. 6.0-1 engines), J-9 (Optl. 7.0-1 engines). 14MM. Metric type.

Spark Plug Gaps—.025" (Std. engine), .022" (Optl. H.C. engine).

CARBURETION:—**Carburetor**—Carter Model 330-S, 1¼" downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.



NOTE:—Do not adjust carburetor until engine warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Adjust throttle stopscrew so that speed is 350 R.P.M. or 7 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ½-1 turn open from seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link engagement. Change for seasonal requirements as follows:

Center Hole—Normal summer temperatures.
Inner Hole (Min. stroke)—Extreme hot weather.
Upper Hole (Max. stroke)—Extreme cold weather.

Fast Idle:—Integral with carburetor. No adjstment required. See article on Carter Fast Idle in Carburetion Section.

Automatic Chok :—Carter Climatic Control. See article in Carburetion Section.

Air Cleaner.—AC. #1526650 Std. # 1526651 on cars with Electric Hand. Heavy duty oil-bath type optl.

Fuel Pump:—AC. Type R #1521450. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—King-Seeley Electric. See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" before top dead center when a point on flywheel approximately 3.94 teeth before the dead center mark 'UDC.1-8/' lines up with pointer in inspection hole in left front face of housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Tappet Clearance:—.006" Int., .008" Exh., hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal Light—Used instead of pressure gauge. Controlled by oil pressure regulator valve. See complete article in Equipment Section.

BATTERY:—National, Type ST-319X. 6 volt, 19 plate, 108 ampere hour (20 hour rate).

Starting Capacity—135 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor bds.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Bendix (barrel) Type A-1673.

Cranking Engine—150 R.P.M. 120-125 amps,. at 5 v.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

Starting Switch:—Solenoid Switch Type SS-4001. Controlled by pushbutton switch (R.B.M. Model 1800) on dash. Operative with ignition turned 'on.' On cars with Electric Hand clutch must be disengaged also. See article in Equipment Section.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

GENERATOR:—Model GAR-4701-6. Armature GAR-2077. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 22.8 amperes at 8.0 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold — Regulator Inoperative — Hot

Amperes	Volts	R.P.M.	Ampere	Volts	R.P.M.
0	6.4	780	0	6.4	820
4	6.7	930	4	6.8	1000
8	6.95	1060	8	7.1	1180
12	7.25	1210	12	7.35	1400
16	7.6	1440	16	7.8	1790
22.8	8.0	2400	18.4	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ozs. (new brushes).

Field Current—3.51-3.89 amperes at 6.0 volts.

Motoring Current—5.32-5.88 at 6.0 volts.

Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Swing generator away from engine until slack on belt midway between fan pulley and generator pulley is 1¼" (measure from straight-edge across pulleys).

RELAY-REGULATOR:—Model TC-4304A. Mounted on engine side of dash. Consists of Cutout Relay and Current Regulator (two-rate charging control). See Equipment Section article for complete data. Cut-out Relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts, 8 M.P.H.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch.

Headlamp Beam Indicator—In lower portion of speedometer dial. Lighted when upper beams in use.

Switches

Lighting—R.B.M. Model 1650.

Foot Selector—R.B.M. Model 1082.

Instrument Lights—Soreng-Manegold Model K2060A.

Stop Light—Motometer Model 58012-C hydraulic type mounted in brake line on left frame side rail in channel at rear.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instrument	1	55
Signal Lights	1	51
Stop and Tail	21-3	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Telltale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

FUSES:—Lighting—Two 20-ampere capacity on switch. **Generator Field**—5 ampere in regulator.

HORNS:—E. A. Vibrator type. Twin horns.

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift) optional equipment. See article in Electrical Equipment Section for complete data.

SERIAL NUMBER:—First number 73-101. Stamped on plate on right front door hinge pillar above top hinge.

COMPRESSION:—Ratio—6.25-1 Std. cast-iron head. 7.0-1 Optl. 'Super Power Dome' aluminum alloy head.

NOTE—High octane fuel must be used with this head.

Pressure—Check pressure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
6.25-1	103 lbs., 170 R.P.M.
7.0-1	119 lbs., 170 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model IG-4644. Service winding (coil less switch and cable) IG-3224S.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 7063. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton, Mitchell No. 6095. B. & S. #50184. **Key Series**—H601-H1100.

Distributor Model IGW-4013-A. Single breaker, 6 lobe cam, full automatic advance type.

Breaker Gap—Set at .020".

Cam Angle or Dwell—35° (closed), 25° (open).

Breaker Arm Spring Tension—16-20 ounces.

Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
5	520	10	1040
10	1150	20	2300
14	1575	28	3150

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting for adjustment dependent on Octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC	.0000" TDC

NOTE—High Octane fuel must be used in engines with 7.0-1 high compression aluminum head.

To Set Timing (Initial Setting)—With #1 piston on compression, crank engine over until flywheel mark 'UDC.1-6/', lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

Final Ignition Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm). Slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced beyond ¾" before 'UDC.1-6/' mark on flywheel.

Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #44.

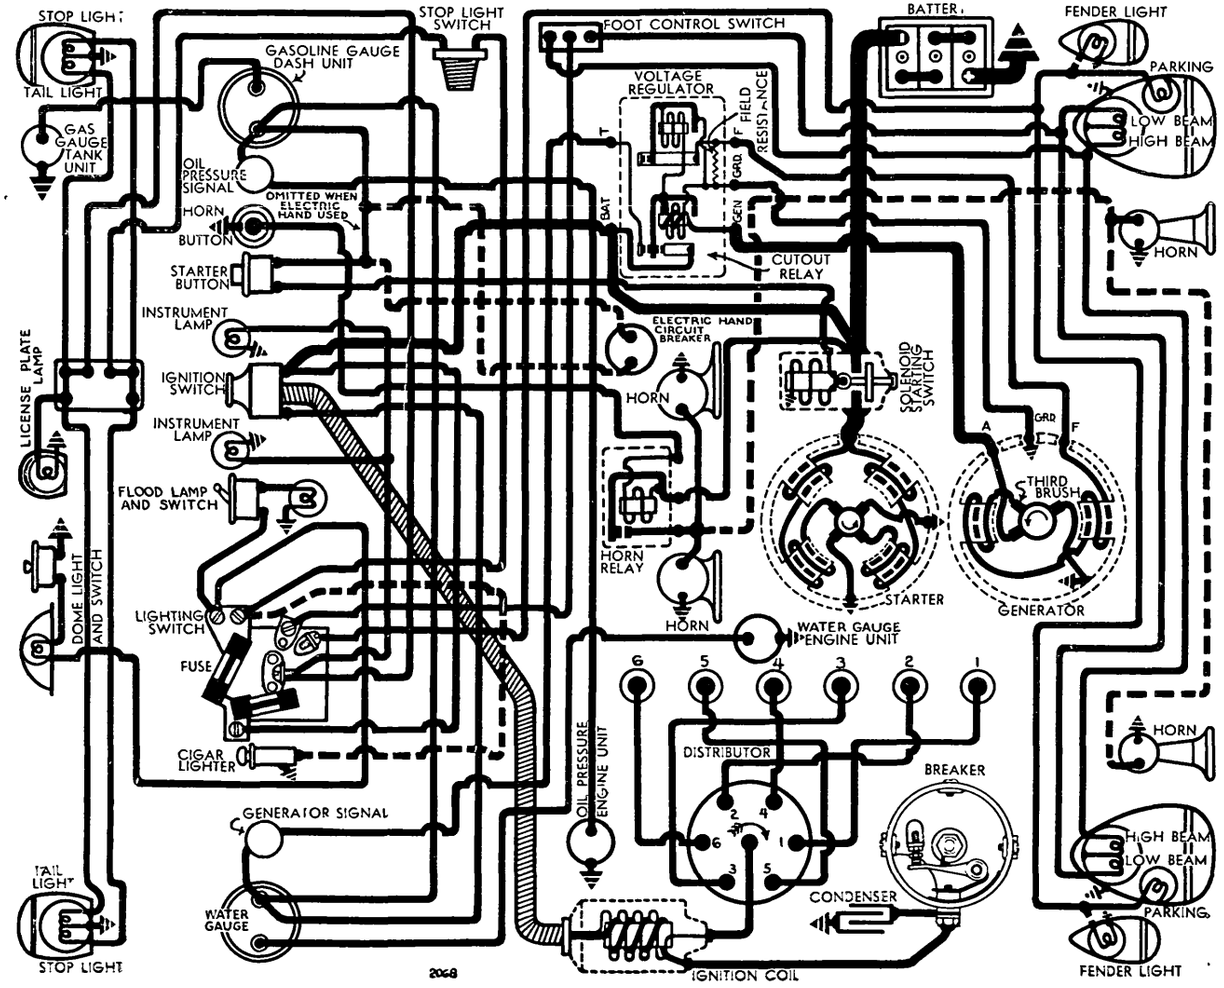
Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (Std. 6.25-1 head), H-10 (Optl. 7.0-1 head), 14 MM. Metric type.

Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Carter, Model WDO Type 344-S. Duplex or dual downdraft type.

See Article in Carburetion Section.



Idle Adjustment—Engine must be warm so that fast idle and automatic choke control inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn each idle adjusting screw, in succession, in until engine begins to miss, then slowly out until engine fires smoothly. Final setting should be ¼-¾ turn out from inner seated position and screws must be adjusted equally so that engine fires smoothly on all cylinders. Readjust throttle stopscrew if necessary.

Accelerating Pump Setting—Adjustable for minimum and maximum stroke. Requires partial dismantling of carburetor to change setting (see article in Carburetion Section for complete directions).

Fast Idle:—Integral with carburetor. See Carburetion Section for checking and adjusting directions.

Automatic Choke:—Carter Climatic Control mounted on carburetor. See article in Carburetion Equipment Section.

Air Cleaner:—AC #1528161 (Std.), #1528160 (Cars with Electric Hand), oil-wetted type. Oil-bath type optional.

Fuel Pump:—AC. Type AK #1523289 diaphragm type std., Type AB #1523290 combination fuel-and-vacuum type optional. See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 6190 (dash unit), 5835 (tank unit). See article in Carburetion Equipment Section.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10° 40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face of flywheel housing. Reset tappet clearance at .006" hot.

Tappet Clearance:—.006" Int., .008" Exh., Hot.

Valve Spring Pressure—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. refill.

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Use instead of pressure gauge. Controlled by oil pressure regulator valve. See article in Electrical Equipment Section.

BATTERY:—National. Type ST-317X. 6 volt, 17 plate, 96 ampere hour (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In left front fender. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel Type Bendix No. A-1673.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 RPM., 120-125 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter. Controlled by pushbutton on instrument board (RBM Model 1815). Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GCJ-4803-A. Armature GCJ-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum output controlled by third brush. Do not adjust third brush for output greater than shown in table below (with field terminal grounded to render regulator inoperative). Actual charging rate controlled by regulator setting. See Regulator Section below.

Performance Data

Cold Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out clamp bolt and two pivot bolts.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until slack in belt midway between generator and fan pulleys is ¾-1¼" (measured with straightedge across pulleys).

REGULATOR:—Models VRD-4003A, B. Voltage Type. Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for generator charge signal control. **See Article in Electrical Equipment Section.**

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting (VRD-4003A)—7.4-7.9 volts hot.

Setting (VRD-4003B)—7.7-8.2 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 MPH. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

LIGHTING:—Headlamps—Hall, Pre-focused type. Lenses interchangeable. Aim headlamps straight ahead with top of beam 39" above floor level at 25' (car unloaded, upper beams lighted). Upper and lower beams controlled by foot selector switch with lighting switch in driving (right hand) position.

Switches

Lighting—R.B.M.

Foot Selector—R.B.M. No. 1076.

Dome Light—R.B.M. No. 1220.

Stop Light—R.B.M. No. 965.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	50-21	2520
Park, Instrument	1½	55
Signals, Service	1	51
Fender (Optional)	3	63
Stop—Tail	21-3	1158
License Plate	3	63
Dome	15	87

SIGNAL LIGHTS:—Battery Charge indicator and Oil Pressure Indicator mounted on instrument board. Similar to design used previously except that bulb lights up word 'Not' on dials. See article in Electrical Equipment Section.

FUSES:—Lighting—Two 20 ampere capacity on back of lighting switch.

HORNS:—Delco-Remy Model K-33-S Std., K-33-F Optl. Blended tone, twin horns operated by relay.

Horn	Current (6 volts)	Air Gap
K-33-S, 2051 (low note)	11-13 amps	.042-.046"
K-33-S, 2052 (high note)	10-12 "	.032-.036"
K-33-F, 2117 (low note)	11-13 "	.040-.044"
K-33-F, 2118 (high note)	9-11 "	.032-.036"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 v. **Contact Gap**—.015-.030". **Air Gap**—.010-.025".

NOTE:—Electric Hand (Bendix type Electropneumatic gear shift) optional equipment. See article in Electrical Equipment Section for complete data.

SERIAL NUMBER:—First number—101 with prefix of car model (74, 75, 76, or 77) preceding number. Stamped on plate on right front door hinge pillar post above top hinge.

COMPRESSION:—Ratio—6.25-1 Std. cast-iron head. **Pressure**—103 lbs. at 170 R.P.M. Check pressure by removing all spark plugs and cranking engine with throttle wide open.

VACUUM READING:—18-20" steady reading with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model CE-4625. Service winding (coil less switch and cable) CE-3224S.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 7063. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. Mitchell No. 6095. B. & S. #50184. **Key Series**—H601-H1100.

Distributor Model IGP-4008-A. Single breaker, 8 lobe cam, full automatic advance type.

Breaker Gap—Set at .020".

Cam Angle or Dwell—29° (closed), 16° (open).

Breaker Arm Spring Tension—18 ounces minimum, 20 ounces maximum.

Condenser—Part No. IG-2671. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0.	600
3.0	400	6.0	800
8.5	900	17.0	1800
13.0	1300	26.0	2600
17.5	1700	35.0	3400

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting Section for adjustment in accordance with octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC.	.000" TDC.

To Set Timing (Initial Setting)—With #1 piston on compression turn engine over until flywheel mark 'UDC 1-8/' lines up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open. Tighten hold-down screw.

Final Setting—Check ignition setting by road testing car. With engine warm and running in high gear on level road, a slight spark knock should be evident when car is accelerated from 10-15 M.P.H. with wide open throttle. Adjust by loosening hold-down screw in advance arm and rotating distributor one graduation on scale counter-clockwise (if no knock evident) or clockwise (if knock too severe). Repeat test until slight knock is evident. Final setting must not be more than ¾" on flywheel before 'UDC 1-8/' mark.

Timing (Motor Gauge)—Weidenhoff #114 Adapter, #44 Rod.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

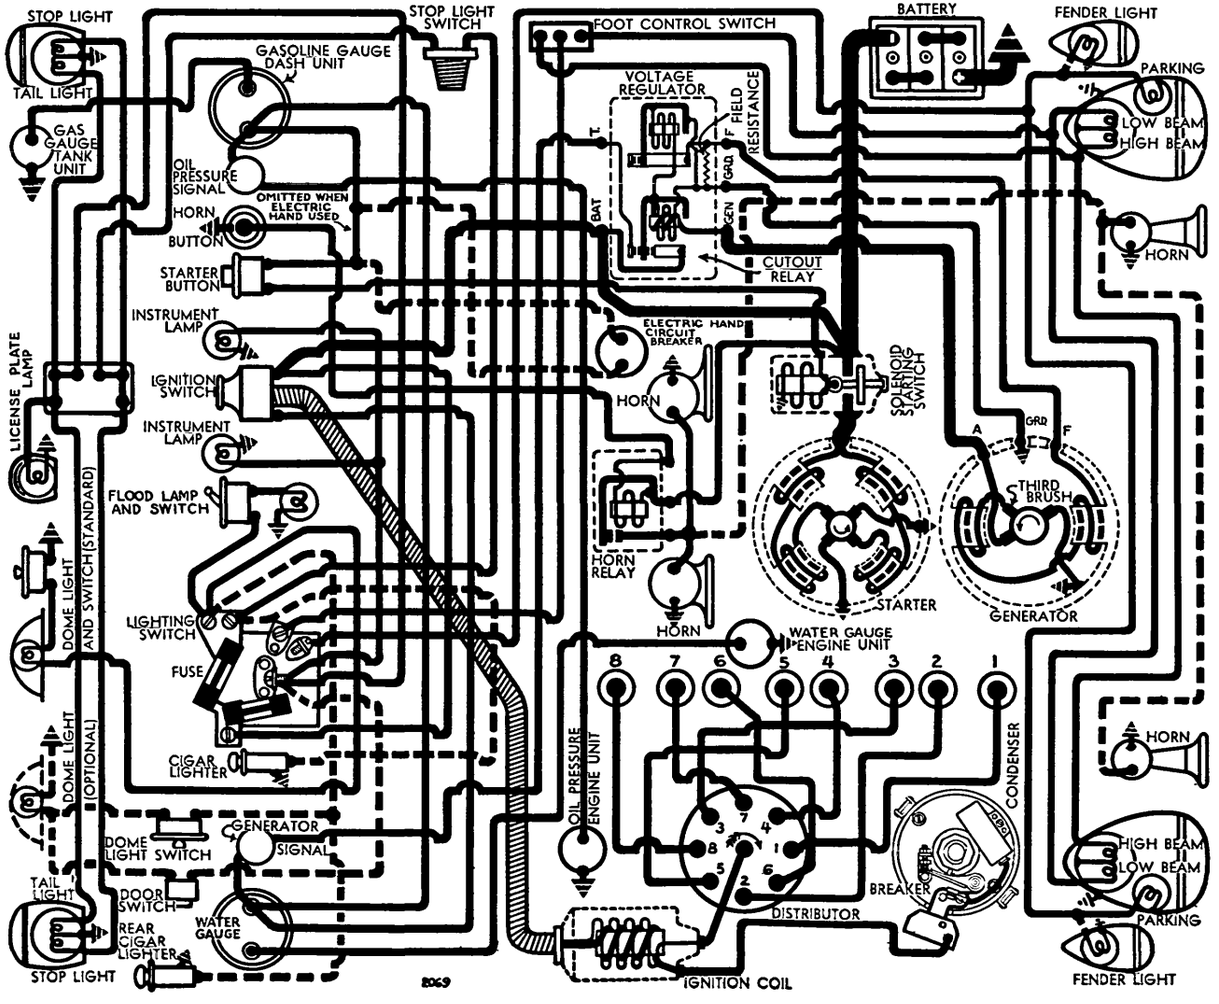
Spark Plugs:—Champion Type J-8. 14 MM. Metric. **Spark Plug Gap**—Set at .025".

CARBURETION:—Carburetor—Carter, Model WDO Type 344-S. Duplex or dual downdraft type. **See article in Carburetion Section.**

Idle Adjustment—Engine must be warm so that fast idle and automatic choke control inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn each idle adjusting screw, in succession, in until engine begins to miss, then slowly out until engine fires smoothly. Final setting should be ¼-¾ turn out from inner seated position and screws must be adjusted equally so that engine fires smoothly on all cylinders. Readjust throttle stopscrew if necessary.

Accelerating Pump Setting—Adjustable for minimum and maximum stroke. Requires partial dismantling of carburetor to change setting (see article in Carburetion Section for complete directions).

Fast Idle:—Integral with carburetor. See Carburetion Section for checking and adjusting directions.



Automatic Choke:—Carter Climatic Conrtol mounted on carburetor. See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528161 (Std.), #1528160 (cars with Electric Hand), oil-wetted type. Oil-bath type optional.

Fuel Pump:—AC. Type AK #1523289 diaphragm type std., Type AB #1523290 combination fuel-and-vacuum type optional. See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 6190 (dash unit), 5835 (tank unit). See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" before top dead center when a point on flywheel approximately 3.94 teeth before the dead center mark 'UDC.1-8/' lines up with pointer in inspection hole in left front face of housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Tappet Clearance:—.006" Int., .008" Exh., hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal Light—Used instead of pressure gauge. Controlled by oil pressure regulator valve. **See Article in Mechanical Equipment Section.**

BATTERY:—National, Type ST-319X. 6 volt, 19 plate, 108 ampere hour (20 hour rate).

Starting Capacity—135 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In left front fender. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel Type Bendix No. A-1673.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 RPM., 120-125 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter. Controlled by pushbutton on instrument board (RBM Model 1815). Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GCJ-4803-A. Armature GCJ-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum output controlled by third brush. Do not adjust third brush for output greater than shown in table below (with field terminal grounded to render regulator inoperative). Actual charging rate controlled by regulator setting. See Regulator Section below.

Cold Performance Data			Hot Performance Data		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out clamp bolt and two pivot bolts.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until slack in belt midway between generator and fan pulleys is ¾-1¼" (measured from straightedge across pulleys).

REGULATOR:—Models VRD-4003A, B. Voltage Type. Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for generator charge signal control. **See article in Electrical Equipment Section.**

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting (VRD-4003A)—7.4-7.9 volts hot.

Setting (VRD-4003B)—7.7-8.2 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 MPH. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

LIGHTING:—Headlamps—Hall, Pre-focused type. Lenses interchangeable. Aim headlamps straight ahead with top of beam 39" above floor level at 25' (car unloaded, upper beams lighted). Upper and lower beams controlled by foot selector switch with lighting switch in driving (right hand) position.

Switches

Lighting—R.B.M.

Foot Selector—R.B.M. No. 1076.

Dome Light—R.B.M. No. 1220.

Stop Light—R.B.M. No. 965.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	50-21	2520
Park, Instrument	1½	55
Signals, Service	1	51
Fender (Optional)	3	63
Stop-Tail	21-3	1158
License Plate	3	63
Dome	15	87

SIGNAL LIGHTS:—Battery Charge indicator and Oil-Pressure Indicator mounted on instrument board. Similar to design used previously except that bulb lights up word 'Not' on dials. See article in Electrical Equipment Section.

FUSES:—Lighting—Two 20 ampere capacity on back of lighting switch.

HORNS:—Delco-Remy Model K-33-S Std., K-33-F Optl. Blended tone, twin horns operated by relay.

Horn	Current (6 volts)	Air Gap
K-33-S, 2051 (low note)	11-13 amps.	.042-.046"
K-33-S, 2052 (high note)	10-12 "	.032-.036"
K-33-F, 2117 (low note)	11-13 "	.040-.044"
K-33-F, 2118 (high note)	9-11 "	.032-.036"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.

Contact Gap—.015-..030". **Air Gap**—.010-.025".

HUPMOBILE

CENTURY SIX MODEL A (1929)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Willard, Type RSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under the left front seat.

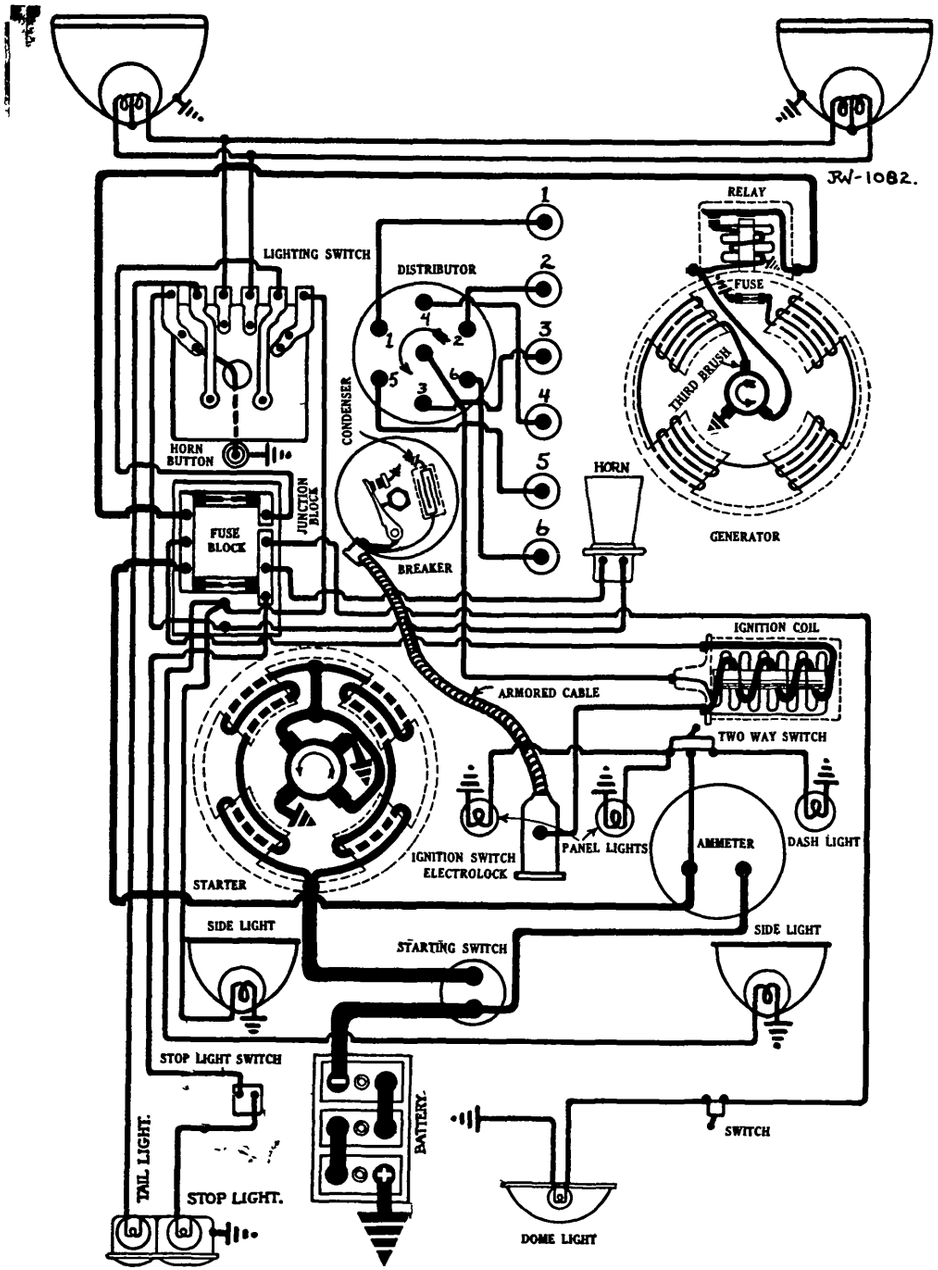
IGNITION:—Coil Model IG-4065. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGC-4003. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with the breaker arm on lobe of the cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 30 degrees (engine). Automatic advance begins at 1000 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 3600 R.P.M. An Electrolock ignition switch is standard equipment.

Mounting:—The Electrolock must be removed as a unit with the distributor whenever the distributor is taken off the car. The Electrolock can then be removed by taking off the nut on the terminal stud inside the distributor case and pulling out the Electrolock cable, ferrule and stud assembly. To remove distributor, disconnect Electrolock at dash and remove distributor head with cables intact. Then take out mounting screw and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control fully advanced To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control. Continue to crank engine until piston reaches top dead center. Then loosen the advance arm clamp screw and rotate distributor until the contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 counter-clockwise around the distributor head.



Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Long. Gaps are .025 inch.

VALVE TIMING:—Specifications. Head diameter, 1½ inches. Valve lift, 5/16 inch. Spring pressure, 51 pounds (maximum) compressed to 2 3/16 inches. Tappet clearance (hot—running), .008 inch (intake and exhaust).

Timing:—Inlet valves open 4 degrees after top dead center and close 51 degrees after lower dead center. Exhaust valves open 47 degrees before lower dead center and close at top dead center.

To Check Valve Timing:—Set tappet clearance No. 1 exhaust valve at .010". This valve should close with piston on top dead center entering intake stroke when flywheel mark 'DC/1-6' lines up with finished boss on front face of clutch housing. Reset tappet clearance at .008" (hot).

HUPMOBILE

CENTURY SIX MODEL A (1929)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model MN-4109. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 1¼-1½ pounds. Startet switch is Model SW-4002.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	50
.7 "	2800	5.5	100
2.9 "	1500	5.0	200
5.5 "	850	4.5	300
8.2 "	420	4.0	400
12.5 "	Lock	3.0	550

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove three flange mounting cap screws. Then pull starter forward and lift from place.

GENERATOR:—Model GAJ-4106. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 15 amperes at 8 volts reached at 1600 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4	6.8	780			
12.4	7.6	1200	11.9	8.0	1800
15	8.0	1600			
14.4	7.8	2000			

Brush spring tension is 2¼-2¾ pounds. Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 3 amperes at 6 volts. A five ampere fuse is connected in the field circuit.

Mounting:—Generator is mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and back off timing chain adjustment set screw. Take off cover plate on front of chain case and remove nut on end of generator shaft. Then take out flange mounting cap screws and pull generator to the rear, being careful not to disturb the timing chain.

Timing Chain Adjustment:—Timing chain is adjusted by shifting the generator. To take up timing chain, loosen the generator flange mounting screws and turn up the adjustment set screw until the chain begins to hum with the engine running. Then back off adjustment screw until chain runs noiselessly and tighten mounting screws. With proper adjustment there should be one-half inch up and down play in the chain.

Oiling:—Put 4 or 5 drops of light engine oil in the generator bearing oiler every two weeks or each 500 miles of operation.

RELAY:—Model CB-4012. Relay is mounted on the generator. Relay closes at 650 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch, Model 40738. Lighting switch is mounted at base of steering column. Double filament headlights using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

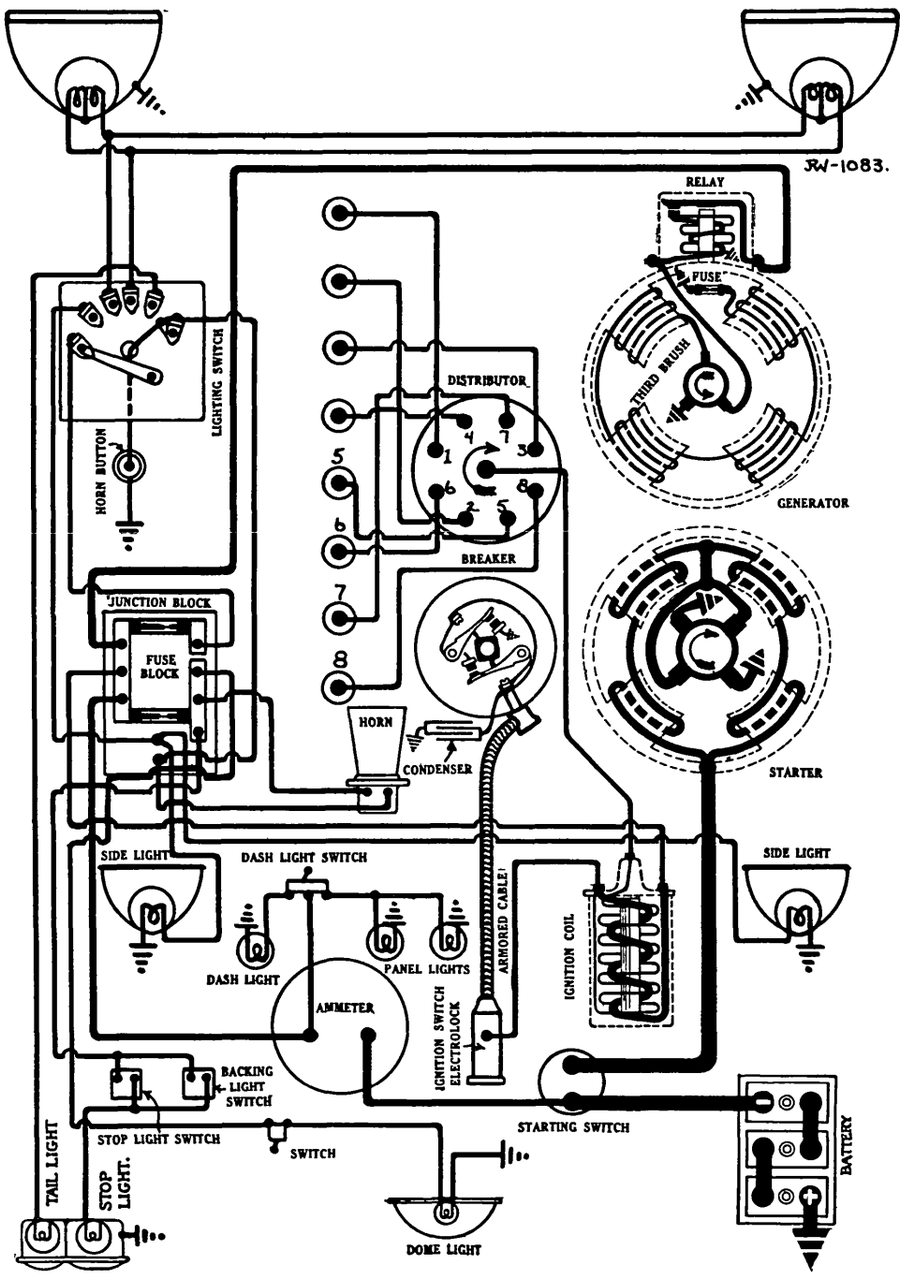
FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuses on junction block are 15 ampere capacity.

HUPMOBILE

CENTURY EIGHT MODEL M (1929)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Willard, Type SJRR-4, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model IG-4065. Coil is mounted on the dash. Ignition current is 1.5-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.



Distributor Model IGH-4002. Breaker contacts separate .018-.020 inch. There are two sets of contacts on a four sided cam. Set contact gap on contacts with breaker arm mounted on base plate by loosening the two lock screws on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Set the contact gap on the other contacts with breaker arm mounted on movable plate by loosening the lock nut on the stationary contact mounting stud and turning up the stud to secure the correct gap. Resurface contacts when necessary with a fine flat contact file. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual adavnce is 38 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. **Maximum automatic advance is 16 degrees reached at 3600 R.P.M. The two sets of contacts open alternately at intervals of 45 degrees which corresponds** with the firing interval of 90 degrees of the engine crankshaft. Contacts must be synchronized for satisfactory ignition performance. See Timing. The ignition switch is a Type 5-A Electrolock.

Mounting:—Distributor is mounted at right of engine. The Electrolock must be removed with the distributor as a unit whenever the distributor is taken off the car. To remove distributor, disconnect Electrolock at the dash, disconnect manual spark control and remove distributor head with cables intact. Then take out hold-down screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. To synchronize contacts connect a six volt test lamp across the contacts by connecting one lamp lead to the insulated breaker arm terminal inside the distributor case and grounding the other lamp lead to the distributor housing. The lamp will burn when the contacts open and will go out as the contacts close. Then block open the set of contacts with the breaker arm mounted on the stationary base plate. Turn on the ignition. Turn the distributor shaft until the other set of contacts begin to open and the lamp lights. Note the position of the leading line scratched on the tail of the distributor rotor and clip the special synchronizing tool on the edge of the distributor directly opposite this line. Then remove the insulation from between the breaker contacts and block open the other set. Continue to turn distributor shaft until the other line on the rotor (which is just 45 degrees after the first line) is opposite the synchronizing pointer. If the lamp does not light at this point, indicating that the contacts are just opening, loosen the lock screw on the movable base plate and turn the eccentric adjusting screw until the contacts open. The contacts are then properly synchronized.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 9 degrees before top dead center with the manual spark control fully advanced. To set timing,

HUPMOBILE

CENTURY EIGHT, MODEL M (1929)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control. Continue to crank engine until piston reaches firing position. Then loosen advance arm clamp screw and rotate distributor until one set of contacts begins to open. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1.

NOTE:—The flywheel mark is 9 degrees or 1 1/16 inches on the flywheel before the top dead center mark '1-8 D.C.'

Firing Order:—The firing order is 1-4-7-3-8-5-2-6.

Spark Plugs:—Spark plugs are Metric. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 15/32 inches. Stem diameter, .325 inch. Stem length, 6⅞ inches. Valve lift, 11/32 inch. Spring pressure, 46-50 pounds (spring compressed to 2 11/16 inches). Tappet clearance, .008 inch (hot) running, or .010 inch for timing. Inlet valves open 4 degrees after top dead center and close 51 degrees after lower dead center.
EXHAUST VALVES. Head diameter, 1 21/64 inches. Stem diameter, .325 inch. Stem length, 6⅞ inches. Valve lift, 11/32 inch. Spring pressure, 46-50 pounds (spring compressed to 2 11/16 inches). Tappet clearance, .008 inch (hot) running, or .010 inch for timing. Exhaust valves open 47 degrees before lower dead center and close at top dead center. Valve stem guides are removable. Valves with oversize stems are made.

To Check Valve Timing. Crank engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet and exhaust valves at .010 inch. Crank engine over one complete revolution and stop with piston on top dead center with flywheel mark '1-8 D.C.' opposite indicator in peephole in flywheel housing. No. 1 inlet valve should be about to open and No. 1 exhaust valve closed at this point. Reset tappet clearance at .007 inch running clearance with engine hot.

To Set Valve Timing. Turn crankshaft until piston No. 1 is on top dead center with flywheel mark '1-8 D.C.' at indicator. Rotate camshaft until the two 'X' marks on the camshaft sprocket are in line with the lower edge of a straightedge resting on the crankshaft and the camshaft thrust plunger (the straightedge will not be on the shaft centers). Assemble the timing chain.

STARTER:—Model ML-4139. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 1½-2 pounds. Starter cranks the engine at 145 R.P.M. drawing 125 amperes at 5.4 volts. Starter switch is Model SW-4202.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3288	5.5	44
1.15 "	1950	5.5	100
4.2 "	1040	5.0	200
7.85 "	650	4.5	300
11.45 "	360	4.0	400
22.4 "	Lock	4.0	730

Mounting:—Starter is sleeve mounted at right of engine on rear of flywheel case. To remove starter, take up floor boards in front compartment, disconnect cable and remove large pilot mounting screw directly above starter sleeve. Then pull starter to the rear to clear Bendix and lift from place.

Oiling:—Starters manufactured after Feb. 1929, are equipped with oilers for commutator end and intermediate bearings. Put 4 or 5 drops of light oil in each oiler every 1000 miles.

GENERATOR:—Model GAG-4106. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by tapping on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 17 amperes (cold) at 8 volts reached at 1250 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	570
5	7.0	730
10	7.3	900
16	8.0	1400

Motoring, generator draws 5-5.5 amperes at 6 volts. Shunt field current is 4.3 amperes at 6 volts. Brush spring tension is 1¼-1½ pounds.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, take off oil filler and cover plate on front of chain case and remove nut in end of generator shaft. Disconnect drive shaft at rear of generator. Back off chain adjustment set screw and take out three flange mounting cap screws. Then pull generator to the rear and tie up chain to prevent it slipping on camshaft sprocket.
Adjustment of Timing Chain:—Timing chain is adjusted by shifting generator. To take up timing chain, loosen the flange mounting cap screws and turn up adjustment set screw until the chain begins to hum with the engine running. Then back off adjustment screw until chain runs noiselessly and tighten mounting screws.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks or each 500 miles of operation.

RELAY:—Model CB-4012. Relay is mounted on the generator. Relay closes at 550 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch, Model 40585. Lighting switch is mounted at base of steering column. Double filament headlights using the second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuses mounted on junction block on dash are 15 ampere capacity.

HUPMOBILE

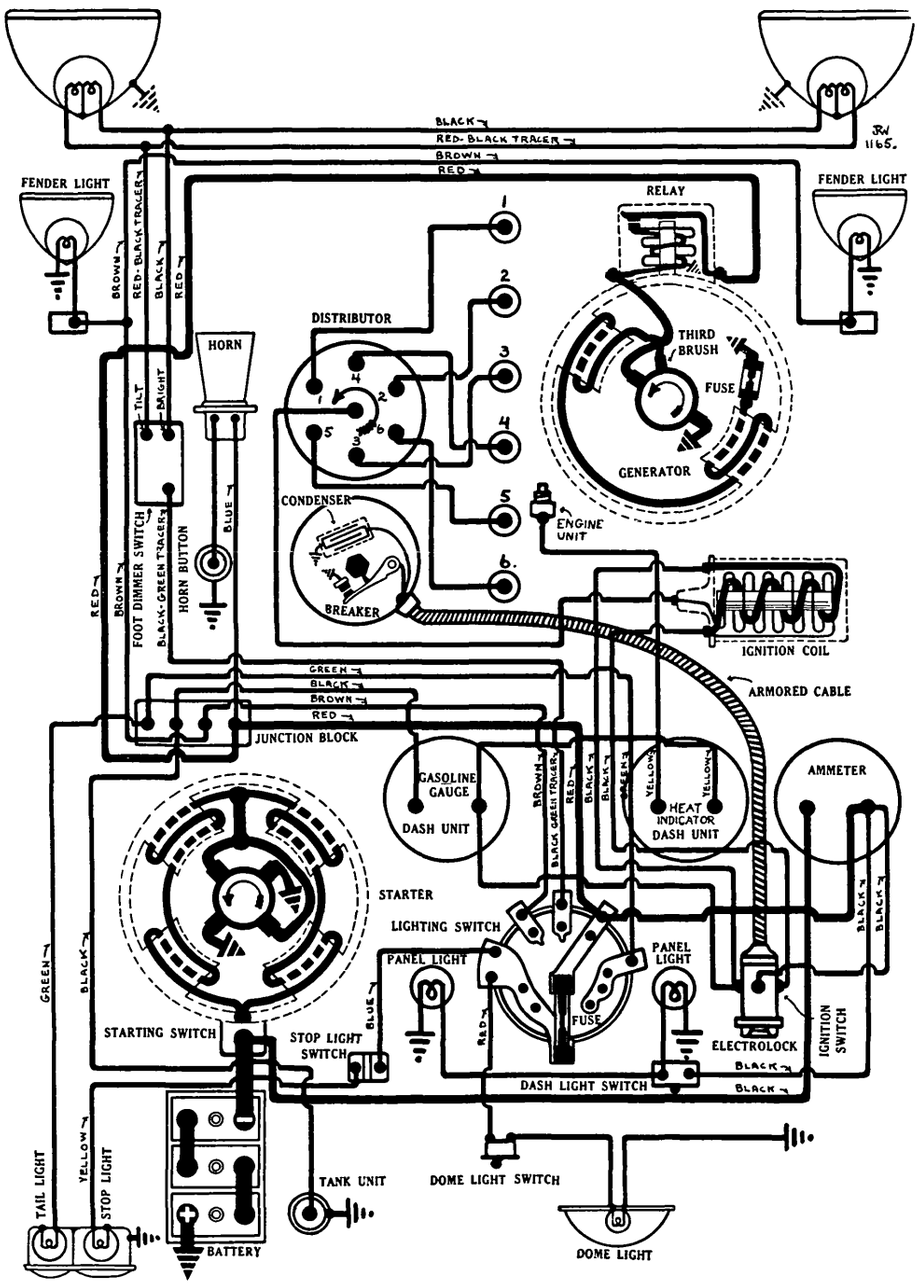
SIX CYLINDER MODEL S (1930)
CENTURY SIX MODEL (1930-31), MODEL 214 (1932)
AUTO-LITE SYSTEM

BATTERY:—Willard, Type WSB-13, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model IG-4080. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. The ignition switch is an Electrolock Type 9-B. The Electrolock must be removed as a unit with the distributor whenever the distributor is taken off the car.

Distributor Model IGC-4028 ('30) 4046 ('31-32). Breaker Gap .018-.020". To set breaker gap, loosen locknut on stationary contact mounting stud and turn up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic with an auxiliary retard for starting. Retard is controlled by a button on the dash. For all ordinary operation, the button should be left in the fully advanced position (pushed all the way in toward the dash). Maximum manual advance is 30 degrees (engine). Automatic advance begins at 1000 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 3600 R.P.M. of engine .

Mounting:—Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. The oil pump is mounted on the opposite end of the shaft at the right of the engine. To remove distributor, disconnect Electrolock at dash and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place. The Electrolock and distributor must be removed as a unit. Full directions on removing Electrolock from the distributor will be found in the Equipment Section.



Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and put a drop of oil on the breaker arm pivot pin and a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches top dead center. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control button (push button toward dash). Crank engine over until piston No. 1 reaches top dead center when the flywheel mark 'DC/1-6' will be in line with the finished boss on the flywheel housing in the inspection hole at the right of the engine. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1 (see diagram).

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 17/32 inches. Stem diameter, .366 inch. Stem length, 4 59/64 inches. Valve lift, 5/16 inch. Tappet clearance, .008 inch (hot). Inlet valves open 4 degrees after top dead center and close 51 degrees after lower dead center. To check valve timing, set tappet clearance of cylinder No. 1 at .010 inch. Crank engine over until piston No. 6 is at top dead center entering power stroke when the flywheel marks 'D.C./1-6' will be directly in line with the finished bosses on the

HUPMOBILE

SIX CYLINDER MODEL S (1930)
CENTURY SIX MODEL (1930-31), MODEL 214 (1932)
AUTO-LITE SYSTEM

front face of the clutch housing at the right of the engine. Both the inlet and exhaust valves of cylinder No. 1 should be closed and the punch marks on the crankshaft sprocket and camshaft sprocket should be in line with the sprocket centers wtih all slack taken up in the driving side of the chain.

EXHAUST VALVES. Head diameter, 1 17/32 inches. Stem diameter, .366 inch. Stem length, 4 59/64 inches. Valve lift, 5/16 inch. Tappet clearance, .008 inch (hot). Exhaust valves open 47 degrees before lower dead center and close at top dead center. Valve stem guides are removable. Valves with oversize stems are made in regular sizes of .002, .004, .008 inch oversize. Valves are also made .002 inch oversize with a .024 inch oversize head.

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—**Model MAC-4221 ('30), MAJ-4003 ('31-32).** Drives engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. Starter switch is Model MU-2208-S. Switch is mounted on the starter field frame and is operated by a flexible control from the starting button on the dash.

Starter Data—Model MAC-4221

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000-5000	6	50
3 "	1350	5	200
5.5 "	900	4.5	300
13.5 "	Lock	3	550

Starter Data—Model MAJ-4003

Torque	R.P.M.	Volts	Amperes
.3 lb. ft.	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
19.0 "	Lock	4.0	805

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting switch control wire and take out flange mounting screws. Then pull starter forward to clear drive and lift from place.

GENERATOR:—**Model GAL-4124 ('30), 4324 ('31-32).** Rotation is counter-clockwise viewed from commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate are held in position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 16-17 amperes at 8 volts reached at 1900 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	600
8	7.1	900
17	8.0	1900
12	7.7	3200

Brush Spring Tension—22-25 ozs. (main brushes GAL-4124), 31-34 ozs. (third brush GAL-4124), 8-13 ozs. (all brushes GAL-4324).
Shunt Field Current—4.08-4.52 amperes at 6.0 volts.
Field Fuse—7½ ampere capacity on generator field frame.
Motoring Current—4.27-4.73 amperes at 6.0 volts.

Mounting:—Generator is flange mounted at right of the engine on the rear of the chain case and is driven by the timing chain. To remove generator, disconnect lead and back off timing chain adjustment set screw. Remove plate on front face of chain case and take off nut on end of generator shaft. Then take out flange mounting cap screws and pull generator to the rear, being careful not to disturb the timing chain.

Timing Chain Adjustment. The timing chain should be adjusted at the end of the first 1000 miles and checked after every 5000 miles of operation. To adjust timing chain, loosen the three flange mounting screws and the lock nut on the adjusting set screw. Then turn up the adjusting screw until the chain begins to hum with the engine running. Back off the screw until the chain runs noiselessly and tighten the lock nut and the flange mounting screws.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—**Model CB-4014.** Relay is mounted on the generator. Relay contacts close at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at the lower end of the steering column. Headlights are fitted with double filament bulbs using a second 21 cp. filament controlled by a dimmer switch on the toeboard instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Lighting switch is Briggs and Stratton, Model 40956. Dimmer switch is Clum Model 9197.

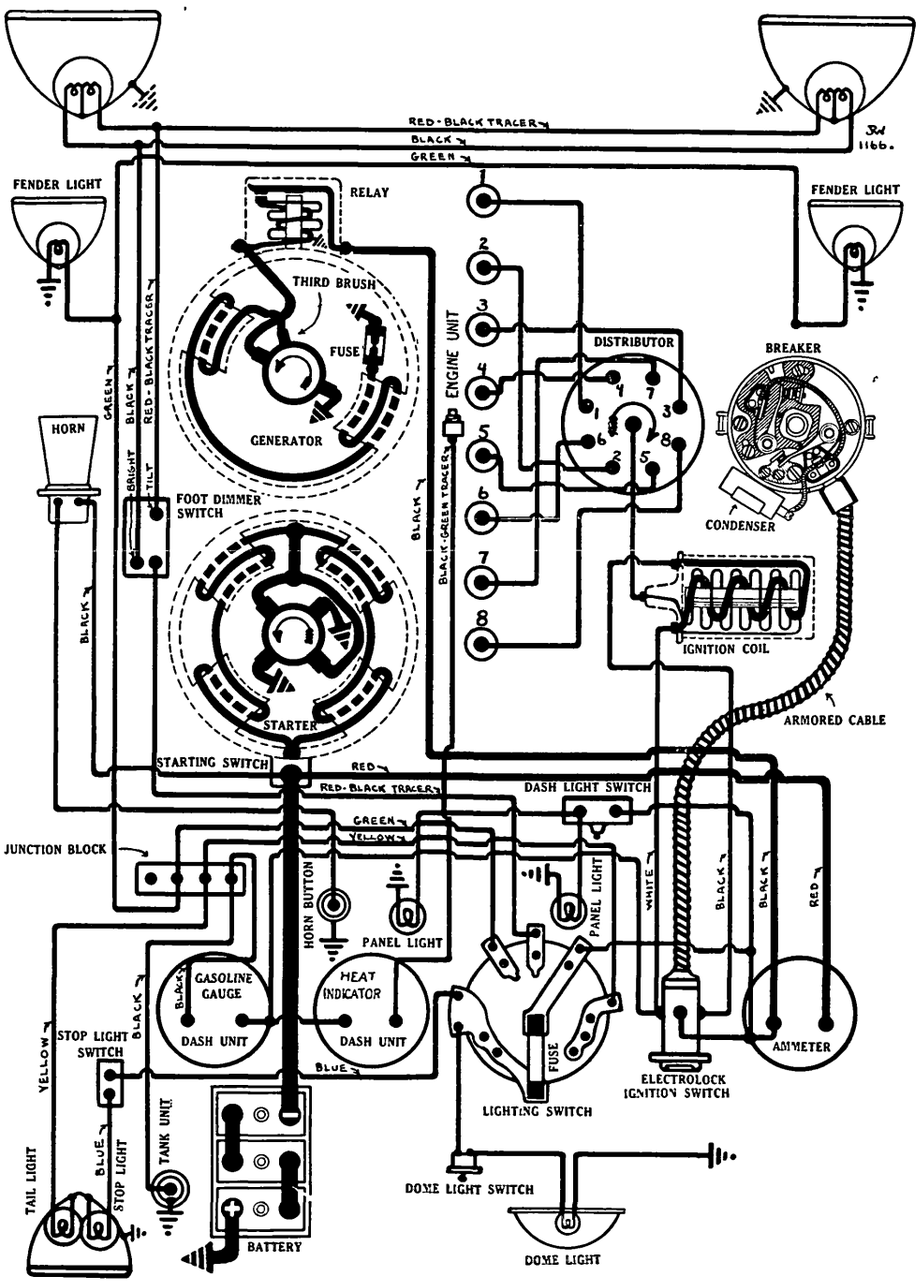
FUSES:—Generator field fuse is 7½ ampere capacity. Lighting fuse mounted on the back of the lighting switch is 20 ampere capacity.

HUPMOBILE

CENTURY EIGHT, MODEL L (1930-31), MODEL 218 (1932)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Willard, Type WJ-2-13, 6 volt, 110 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model CE-4014. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. The ignition switch is a Type 9-B Electrolock. The Electrolock must be removed as a unit with the distributor whenever the distributor is taken off the car. Full details of the Electrolock will be found in the Equipment Section.



Distributor Model IGH-4008-C. Breaker contacts separate .020-.022 inch. Set contact gap (first set mounted on stationary base plate) by loosening lock screws on stationary contact mounting plate and turning up eccentric adjusting screw. The second set of contacts (mounted on movable sub-plate) are adjusted by loosening lock nut on stationary contact stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic with an auxiliary retard for starting, controlled by a button on the dash. The normal running position is with the spark control button pushed all the way in toward the dash (fully advanceed). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 16 degrees (engine) reached at 3600 R.P.M. Distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. The contacts must be accurately synchronized to insure this firing interval for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head at the right side of the engine. To remove distributor, disconnect Electrolock at dash and remove distributor head with cables intact. Then disconnect manual spark control wire and take out hold-down screw in advance arm. Lift distributor from place.

Oiling:—Put 8 to 10 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and put a drop of oil on each of the breaker arm pivot pins and put a small bit of vaseline on he face of the breaker cam.

Timing:—Synchronization of Contacts. Full directions on synchronization of contacts will be found in the Equipment Section under 'Auto-Lite Distributors'. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 90 degrees from firing position of piston No. 8 when piston No. 5 will reach top dead center entering power stroke. If the second set of contacts do not begin to open at this point, loosen the two lock screws on the mounting sub-plate and shift the plate and contact assembly until the contacts begin to open. Tighten the lock screws and check the contact gap.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches top dead center with the breaker assembly and manual spark control fully retarded. To set timing, crank engine over until piston No. 8 enters compression stroke (the up stroke with both valves closed). Fully retard manual spark control by pulling the spark control button all the way out from the dash. Crank engine over

HUPMOBILE

CENTURY EIGHT, MODEL L (1930-31), MODEL 218 (1932)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

until piston reaches top dead center when the flywheel mark 'D.C./1-8' will be exactly in the center of the inspection hole in the front face of the flywheel at the right of the engine. Then loosen advance arm clamp screw and rotate distributor until the first set of contacts (mounted directly on base plate) begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 8. Connect the remaining spark plugs in order 5-2-6-1-4-7-3 clockwise around the distributor head. The firing position with manual spark control fully advanced is 20 degrees or 2¼ inches on the flywheel before top dead center.

Firing Order:—The firing order is 1-4-7-3-8-5-2-6.

Spark Plugs:—Spark plugs are 18 MM. etric. Gaps are .028-.030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 7/16 inches. Stem diameter, .341 inch. Valve lift, .285 inch. Tappet clearance, .007 inch (hot). Inlet valves open 1 degree after top dead center and close 51 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 11/32 inches. Stem diameter, .341 inch. Valve lift, .285 inch. Tappet clearance, .014 inch (hot). Exhaust valves open 47 degrees before lower dead center and close 3 degrees after top dead center.

To check valve timing, set tappet clearance of No. 1 inlet valve at .010 inch and No. 1 exhaust valve at .020 inch. Then turn engine over until piston No. 8 reaches top dead center entering power stroke with the flywheel mark '1-8/DC' in line with the center of the inspection hole in the flywheel housing at the right of the engine. The exhaust valve in No. 1 cylinder should just close and the inlet valve just begin to open at this point. There should be nine links on the timing chain between the '0' marks on the camshaft sprocket and crankshaft sprocket at this point. Reset the tappet clearance at .007 inch (inlet) and .014 inch (exhaust) for operating.

STARTER:—Model MAD-4113. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. The starter switch is Model MU-2208-S. Switch is mounted on the starter field frame and is controlled by a button on the dash.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58.2
.7 "	2355	5.5	100
3.0 "	1260	5.0	200
5.7 "	770	4.5	300
8.85 "	425	4.0	400
20.2 "	Lock	4.0	730

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting switch control wire. Then take out large pilot mounting screw in flywheel housing directly above starter sleeve. Pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the starter bearing oiler every two weeks or each 500 miles of operation.

GENERATOR:—Model GAL-4138 (first cars), GAL-4338. Rotation is counter-clockwise at commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate is held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 17 amperes at 8 volts reached at 1900 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	600
8	7.1	900
17	8.0	1900
12	7.7	3200

Brush Spring Tension—22-25 ozs. (main), 31-34 ozs. (third) on Model GAL-4138, 8-13 ozs. (all brushes) on Model GAL-4338.
Shunt Field Current—4.08-4.52 amperes at 6.0 volts.
Field Fuse—7½ ampere capacity on generator field frame.
Motoring Current—4.27-4.73 amperes at 6.0 volts.

Mounting:—Generator is mounted on a swinging bracket at the left of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen mounting clamp bolt. Swing generator toward engine and slip off drive belt. Then take out mounting pivot bolts under generator field frame and lift generator from place.

Belt Adjustment. The fan belt tension should be inspected every 1000 miles. To take up fan belt, loosen adjustment clamp bolt and pivot mounting bolts under generator. Then pull generator to left away from the engine until correct belt tension is secured and tighten clamp bolt and mounting bolts. Do not tighten belt more than is necessary to drive fan and water pump without slipping as excessive tension will cause generator bearing wear.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles.

RELAY:—Model CB-4012 (first), CB-4011. Mounted on the generator. Closes at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch, Model 40956. Lighting switch is mounted on the dash. Headlights are equipped with double filament bulbs controlled by a foot switch mounted on the toeboard. A second 21 cp filament is used instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Dimmer switch is Clum Model 9197.

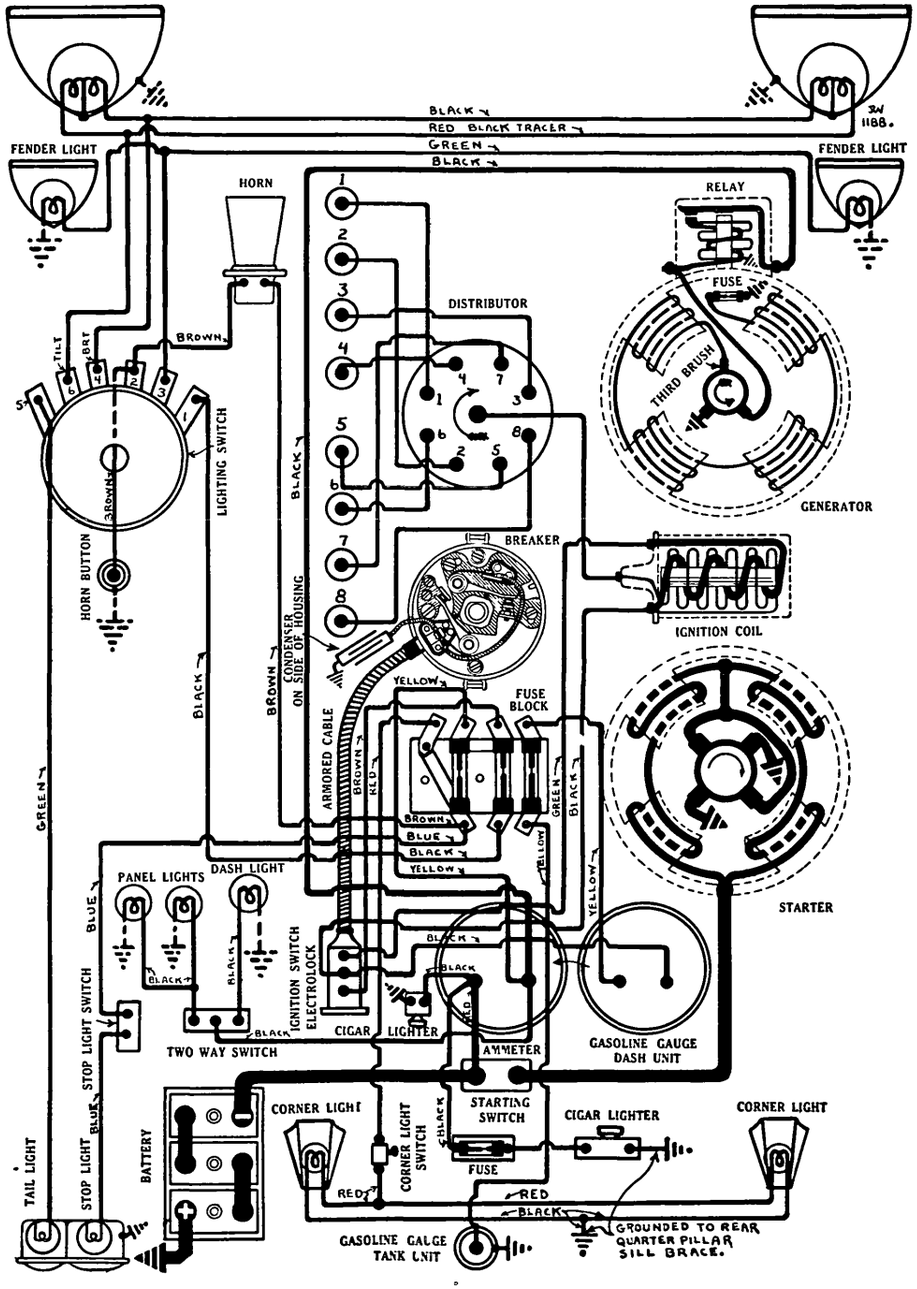
FUSES:—Generator field fuse is 7½ ampere capacity. Lighting fuse mounted on the back of the switch is 20 ampere capacity.

HUPMOBILE

MODEL C (1930-31), SERIAL NUMBERS C-5001 UP
MODEL 221 (1932)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Willard, Type SJRR-4, 6 volt, 120 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model CE-4001. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. The ignition switch is an Electrolock, Type 5-A (1930) or 5-B (1931). Electrolock must be removed with the distributor as a unit whenever the distributor is taken off the car. Full details covering the Electrolock will be found in the Equipment Section.



Distributor Model IGH-4008. Breaker contacts separate .020-.022 inch. Set contact gap (first set mounted on stationary base plate) by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The second set of contacts (mounted on movable sub-plate) are adjusted by loosening lock nut on stationary contact mounting stud and turning up stud. Resurface contacts with a fine flate contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic with an auxiliary retard for starting. This is controlled by a button on the dash. The normal running position is with the button pushed all the way in toward the dash (fully advanced). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 16 degrees (engine) reached at 3600 R.P.M. of engine. Distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. The contacts must be synchronized to insure the correct interval for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, first disconnect Electrolock at dash and remove distributor head with cables intact. Then disconnect manual spark control and take out hold-down screw in advance arm. Lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor cap and rotor and put a drop of oil on each of the breaker arm pivot pins and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Full directions on synchronizing contacts will be found in Equipment Section listed under 'Auto-Lite Distributors.' Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over exactly 90 degrees from firing position of piston No. 8 when piston No. 5 will reach firing position. If the second set of contacts do not begin to open at this point, loosen the two lock screws on the movable sub-plate on which contacts are mounted and shift plate until contacts open. Tighten the lock screws and check the contact gap. The advance firing position for piston No. 5 is not marked on the flywheel but a mark can be made 9° or 1" before the dead center mark '4-5' for this purpose.

Timing Distributor to Engine:—Standard setting 9° or 1" (on flywheel) before top dead center with manual control advanced (pushed in toward dash). To set timing, crank engine over until piston No. 8 reaches firing position with the straight line mark on the flywheel (which is 9 or 1"

HUPMOBILE

MODEL 221 (1932)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

before the dead center mark '1-8') lines up with the indicator on the housing. See that manual spark control button is pushed in. Then loosen advance arm clamp screw, rotate distributor until stationary contacts begin to open, tighten clamp screw, see that rotor segment is opposite No. 8 terminal in distributor head, connect spark plugs as indicated on diagram.

Firing Order:—The firing order is 1-4-7-3-8-5-2-6.

Spark Plugs:—Spark plugs are 18MM. Metric. Champion No. 8. Gaps are .028-.030 inch. Champion No. 7 should be used on engines that run hot, and No. 10 on cold engines.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, 11/32 inch. Stem length, 5 13/16 inches. Valve lift, .285 inch. Tappet clearance, .007 inch (hot). Inlet valves open 1 degree after top dead center and close 51 degrees after lower dead center. The allowable variation is plus or minus 2 degrees for valve opening and plus 6 or minus 0 degrees for valve closing.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, 11/32 inch. Stem length, 5 13/16 inches. Valve lift, .285 inch. Tappet clearance, .014-.015 inch (hot). Exhaust valves open 47 degrees before lower dead center and close 3 degrees after top dead center. The allowable variation is plus 0 or minus 6 degrees for valve opening and plus 6 or minus 0 degrees for valve closing. Valve stem guides are removable. Valves with oversize stems are made in regular sizes of .002, .004 and .008 inch oversize. Valves are also made with .002 inch oversize stem and .024 inch oversize head.

NOTE.—To set valve timing, tappet clearance of No. 1 inlet valve should be set at .010 inch and No. 1 exhaust valve at .020 inch. There should be 11 links of the timing chan between the marks on the camshaft sprocket and the crankshaft sprocket.

To Check Valve Timing:—Set tappet clearance No. 1 exhaust valve at .020". This valve should close with the piston on top dead center entering intake stroke when the flywheel mark '1-8' lines up with the indicator on the housing. Reset tappet clearance at .014-.015" (hot).

STARTER:—Model MAB-4021. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. Starter switch is Model SW-4002.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	4020	5.5	46
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
24.0 "	Lock	4.0	720

Mounting:—Starter is sleeve mounted at right of engine on rear of flywheel housing. To remove starter, take up floor boards in front compartment, disconnect cable and take out large pilot mounting screw in flywheel housing directly above starter sleeve. Then pull starter to the rear to clear drive and lift from place.

GENERATOR:—Model GAG-4118. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by prying on brush mounting plate with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate are held in any position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate of 15-17 amperes is reached at 1400 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
0	6.3	580
8	7.2	820
16	8.0	1400
12	7.6	2150

A 7½ ampere field fuse is connected in the field circuit. Brush spring tension is 22-27 ounces. Shunt field current is 3.99-4.41 amperes at 6 volts. Generator motoring draws 5.13-5.67 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and back off generator timing chain adjustment set screw. Remove cover plate on front face of chain case and take off nut on end of Generator shaft. Take out three flange mounting cap screws. Then pull generator to the rear and tie up timing chain to prevent it slipping on camshaft sprocket.

Timing Chain Adjustment. Timing chain is adjusted by shifting generator. This adjustment should be made after the first 100 miles and checked after every 5000 miles of operation. To adjust timing chain, loosen the three flange mounting screws and turn up the adjustment set screw until the chain begins to hum with the engine running. Then back off the set screw until the chain runs noiselessly and tighten the mounting screws.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles of operation. The drive end bearing is oiled from the chain case.

RELAY:—Model CB-4012. Relay is mounted on the generator. Relay closes at 625 R.P.M. when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Soreng-Manegold Lighting Switch. Lighting switch is mounted at the base of the steering column. Headlights are equipped with double filament bulbs using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights (for parking) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Lighting switch is Model 6050-A. Clum Model 9022 also used.

FUSES:—Generator field fuse is 7½ ampere capacity. Lighting fuses mounted on block on dash (left side, under hood) are 15 ampere capacity.

NOTE:—Gasoline gauge used only on 1931 models. The gauge line passes through the bus-bar on which the spare fuse is mounted.

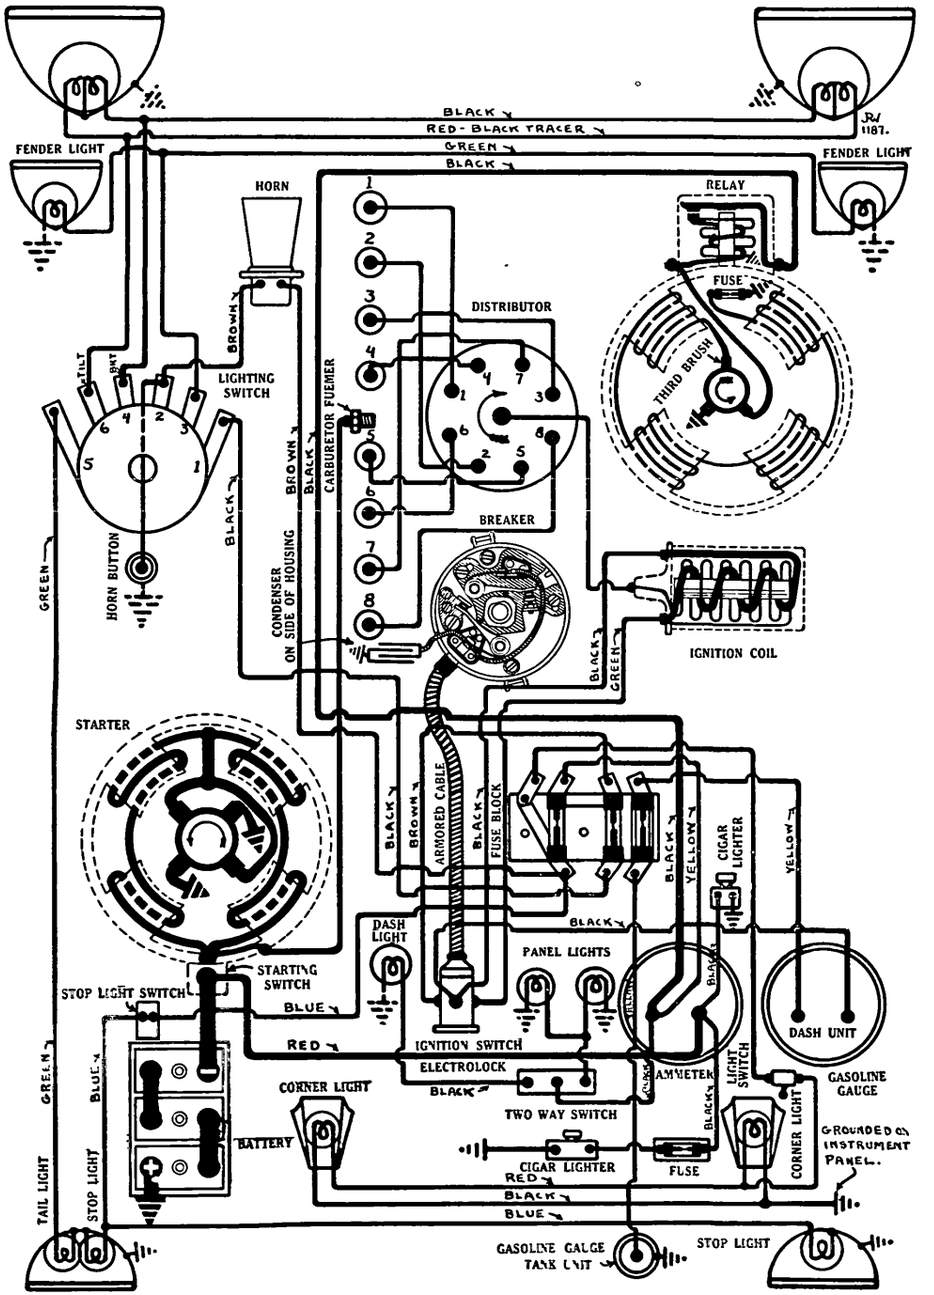
MODELS H & U (1930-31), SERIAL NUMBERS H & U-5001 UP
MODELS 225 AND 237 (1932)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Willard, Type SJRR-5, 6 volt, 130 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 145 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model CE-4001. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. The ignition switch is an Electrolock, Type 5-A (1930) or 5-B (1931). The electrolock must be removed with the distributor as a unit whenever the distributor is taken off the car.



Distributor Model IGH-4008. Breaker contacts separate .020-.022 inch. Set contact gap (first set mounted on stationary base plate) by loosening lock screws on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The second set of contacts (mounted on movable sub-plate) are adjusted by loosening lock nut on stationary contact mounting stud and turning up stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is of full automatic type with an auxiliary retard for starting controlled by a button on the dash. The normal running position is with the spark control button pushed all the way in toward the dash (the fully advanced position). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 16 degrees (engine) reached at 3600 R.P.M. of engine. Distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. The contacts must be synchronized to secure the exact firing interval for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and can be removed from the right side. To remove distributor, first disconnect Electrolock at the dash and remove the distributor head with cables intact. Then disconnect spark control wire and take out hold-down screw in advance arm. Lift distributor from place and remove distributor and Electrolock as a unit. For complete instructions on the Electrolock see Equipment Section.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor cap and rotor and put one drop of oil on the breaker arm pivot pins and put a small bit of vaseline on the face of the breaker cam.

IGNITION TIMING:—Timing Distributor to Engine. Standard setting 9° or 1" (on the flywheel) before top dead center with manual spark control advanced (pushed in toward instrument panel). To set timing, crank engine over until piston No. 8 reaches firing position with the straight line mark on the flywheel (which is 9° or 1" before the dead center mark '1-8') lined up with the indicator on the flywheel housing. See that manual spark control is pushed in. Then loosen advance arm clamp screw, rotate distributor until first (stationary) set of contacts begin to open, tighten clamp screw, see that rotor segment is opposite No. 8 terminal in distributor cap, connect spark plugs as indicated on diagram.

Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Auto-Lite tool and follow complete directions in Equipment Section. Contacts can be synchronized after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 5 will reach firing position (9° before top dead center with spark control fully

AUTO-LITE IGNITION

advanced. If the second set of contacts do not begin to open at this point, loosen the two lock screws on the movable sub-plate and shift plate until contacts begin to open. Tighten the lock screws and check the contact gap.

NOTE:—The advance firing point for piston No. 5 is not marked on the flywheel. A mark can be made on the flywheel 9° or 1" before the dead center mark '4-5'.

Firing Order:—The firing order is 1-4-7-3-8-5-2-6.

Spark Plugs:—Spark plugs are 18MM. Metric. Champion No. 8. Gaps are .030 inch. Use Champion No. 7 on engines which run hot, and No. 10 on cold engines.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.745 inches. Stem diameter, .3405 inch. Stem length, 6 13/16 inches. Valve lift, .285 inch. Tappet clearance, .007 inch (hot). Inlet valves open 1 degree after top dead center and close 51 degrees after lower dead center. The allowable variation is plus 0 or minus 6 degrees for valve opening and plus 6 or minus 0 degrees for closing.

EXHAUST VALVES:—Head diameter, 1.590 inches. Stem diameter, .3405 inch. Stem length, 6 13/16 inches. Valve lift, .285 inch. Tappet clearance, .014-.015 inch. Exhaust valves open 47 degrees before lower dead center and close 3 degrees after top dead center. The allowable variation is plus 0 or minus 6 degrees for valve opening and plus 6 or minus 0 degrees for closing. Valve stem guides are removable. Valves with oversize stems are made in regular .002, .004 and .008 inch oversizes. Valves are also made with .002 inch oversize stem and .024 inch oversize head.

NOTE:—In setting valve timing, the tappet clearance of No. 1 inlet valve should be set at .010 inch and No. 1 exhaust valve at .020 inch. There should be 11 links in the timing chain between the marks on the camshaft sprocket and the crankshaft sprocket.

To Check Valve Timing:—Set tappet clearance No. 1 exhaust valve at .020". This valve should close with the piston on top dead center entering intake stroke when the flywheel mark '1-8' lines up with the indicator on the housing. Reset tappet clearance at .014-.015" (hot).

STARTER:—**Model MR-4102.** Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 12-16 ounces. Starting switch is Model SW-2725. It is mounted on the starter field frame. There is a terminal on the starter for the carburetor fuemer connection.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.8	70
1.5 "	1210	5.7	100
6.1 "	675	5.4	200
11.6 "	440	4.9	300
17.2 "	300	4.5	400
45.9 "	Lock	4.0	830

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and fuemer lead and starting pedal linkage. Then remove large pilot mounting screw in flywheel housing directly above starter sleeve. Pull starter forward to clear drive and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the drive end of the starter every two weeks or each 500 miles of operation.

GENERATOR:—**Model GAG-4118.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by prying on the mounting plate with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 15-17 amperes at 8 volts reached at 1400 R.P.M.

Generator Data

Amperes	Volts	R.P.M
0	6.3	580
8	7.2	820
16	8.0	1400
12	7.6	2150

A 7½ ampere field fuse is connected in the field circuit. Generator brush spring tension is 22-27 ounces. Shunt field current is 3.99-4.41 amperes at 6 volts. Generator motoring draws 5.13-5.67 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and back off chain adjustment set screw. Remove cover on front face of chain case and take off nut on end of generator shaft. Then take out three flange mounting screws and pull generator to the rear. Tie up the timing chain to prevent chain slipping on camshaft sprocket.

Timing Chain Adjustment. Timing chain is adjusted by shifting generator. The timing chain should be taken up after the first 100 miles and should be checked every 5000 miles. To adjust chain, loosen three flange mounting screws and turn up adjustment set screw until chain begins to hum with engine running at equivalent of 25 miles per hour. Back off set screw until chain runs noiselessly and tighten mounting screws.

RELAY:—**Model CB-4012.** Relay is mounted on the generator. Relay closes at 625 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—**Soreng-Manegold Switch.** Lighting switch is mounted at base of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights (for parking) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Lighting switch is Model 6050-A. Clum Model 9022 also used.

FUSES:—Generator field fuse is 7.5 ampere capacity. Lighting fuses mounted on fuse block (left side, under hood) are 15 ampere capacity.

NOTE:—The gasoline gauge is used only on 1931 models. The gauge line goes through the bus-bar on which the spare fuse is mounted.

HUPMOBILE

SERIES 216, MODEL B (1932), SERIAL NUMBERS 5001 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On right side of dash under hood.

ENGINE NUMBER:—Stamped on left side of crankcase.

BATTERY:—**Willard, Type WH-2-15,** 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Battery mounted on left frame member under driver's seat. Positive (+) terminal is grounded. Battery size 7 1/16 inches wide, 10 5/16 inches long, 9 5/16 inches high.

IGNITION:—**Coil Model IG-4080.** Coil is mounted on dash. Ignition current 1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped). Ignition switch is a Type 5-B Electrolock—see Equipment Section for complete data on this switch.

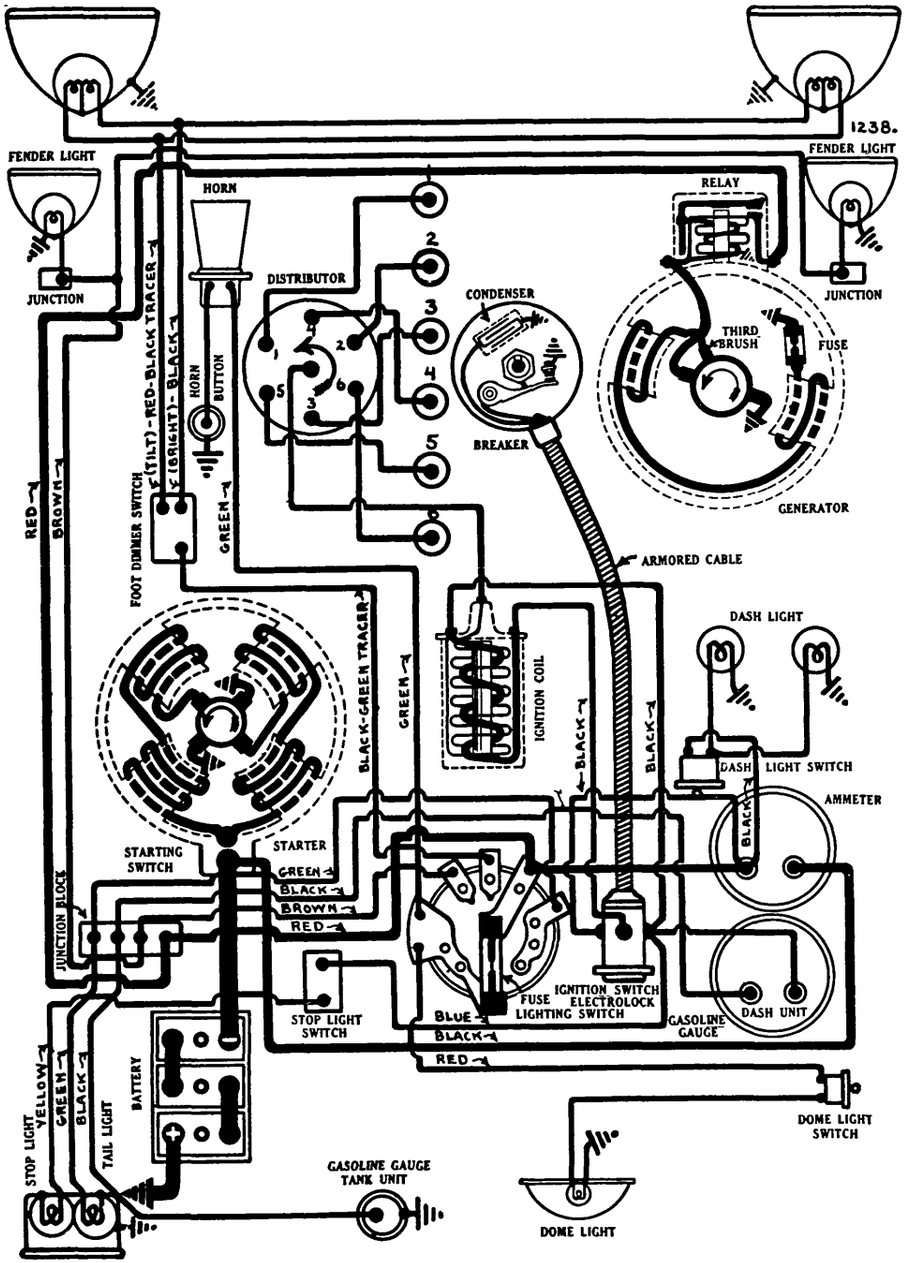
Distributor Model IGC-4053. Single breaker arm, 6-lobe cam type with semi-automatic advance. Manual spark advance controlled by button at extreme left of instrument panel. Ordinary running position, spark fully advanced, button pushed in. Pull button out to retard spark. Breaker gap set at .015-.018 inch. To set gap, loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut. Resurface contacts when necessary with a fine flat contact file. Breaker arm spring tension 16-22 ounces (measured at tip of breaker arm with spring scale in line with center of contacts and at right angles to arm). Maximum manual advance 24 degrees (engine).

Cam Angles—Closed 41°. Open 19° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	0		800
2		650	4		1300
4		900	8		1800
6		1150	12		2300
8		1400	16		2800

Mounting:—Distributor mounted at left of engine, driven by inclined shaft from camshaft. Electrolock ignition switch must be removed as unit with distributor when distributor is taken off car (see Equipment Section for instructions on removing Electrolock from distributor). To remove distributor, disconnect manual advance control wire, free Electrolock at dash, take out hold-down screw in advance arm, lift distributor and Electrolock out.



Oiling:—**500 Miles.** Put 4-5 drops light engine oil in oiler on side of distributor.

1000 Miles. Take off distributor cap and rotor. Put one drop oil on breaker arm pivot pin. Apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 10° on flywheel before top dead center with full manual advance. To set timing, advance manual spark control (push button in toward dash), see that distributor is rotated clockwise to limit of advance arm slot. With No. 1 piston on compression, turn engine over until ignition mark on flywheel (which is 10° before the dead center mark 'DC/1-6') is directly in line with finished bosses on right front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open (use test lamp), tighten clamp bolt, connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Champion Type C-7. Set gap at .028 inch. Hold within limits of .025-.030 inch.

HUPMOBILE

SERIES 216, MODEL B (1932), SERIAL NUMBERS 5001 UP
AUTO-LITE SYSTEM

VALVE TIMING:—Valves at right of engine. Camshaft driven by chain from crankshaft in tandem with generator sprocket. Chain adjusted manually by shifting generator (see Generator Mounting).

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1.532"	.3675"	45°	.3125"
Exhaust	1.532"	.3675"	45°	.3125"

Tappet Clearance			Spring Pressure	
	Operating	Timing		
Intake	.006" (hot)	.010"	Closed	42 pounds (2 3/16")
Exhaust	.008" (hot)	.010"	Open	71 pounds (1⅞")

Timing

Intake valves open 4 degrees after top dead center. Intake valces close 51 degrees after lower dead center.

Exhaust valves open 47 degrees before lower dead center. Exhaust valves close at top dead center.

To Check Valve Timing. Set tappet clearance No. 1 intake and exhaust valves at .010 inch. With No. 6 piston on compression stroke, turn engine over until piston is on top dead center with flywheel mark 'DC/1-6' in line with finishcd bosses on front face of clutch housing at right of engine. No. 1 exhaust valve should be closed and No. 1 intake valve about to open at this point. Reset tappet clearance at .006" (intake), .008" (exhaust) with engine hot.

To Set Valve Timing. Turn crankshaft until No. 6 piston is on top dead center. Turn camshaft until No. 1 intake valve is about to open. Mesh chain so that marks on camshaft sprocket and crankshaft sprocket are directly opposite and in line with a straightedge across the shaft centers.

STARTER:—**Model MAJ-4003.** Starter drives engine through inboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
.3 "	2500	5.5	100
2.25 "	1460	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.6 "	Lock	3.0	575
19.0 "	Lock	4.0	800

Starting Switch:—Model MU-2208-S. Switch mounted on starter field frame controlled through flexible wire by button at extreme left instrument panel. Force required to close switch must be not less than 7½ pounds (measured at hole in switch arm with spring scale at right angles to arm).

Mounting:—Starter flange mounted at left side of engine on forward face of flywheel housing. To remove, disconnect cable, disconnect starting switch control wire, take out 2 flange mounting cap screws, pull starter straight forward to clear Bendix, lift from place.

Oiling:—**500 Miles.** Put 5-6 drops light engine oil in drive end oiler. Commutator end bearing oilless.

GENERATOR:—**Model GAL-4324.** Third brush regulation. To adjust charging rate, take off commutator cover band, shift third brush (by prying on brush mounting stud) counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Rotation counter-clockwise at commutator end. Maximum charging rate 16-17 amperes (cold) at 8.0 volts reached at 1900 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700

17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush spring tension 8-13 ounces. Shunt field current 4.08-4.52 amperes at 6.0 volts. Generator motoring 4.27-4.73 amperes at 6.0 volts. Field fuse mounted under cover on field frame 7½ ampere capacity.

Mounting:—Generator flange mounted on rear face of timing chain case at right of engine. To remove, disconnect lead, back off chain adjustment set screw, take out 3 flange mounting cap screws, lift off timing chain, lift generator out. Tie up chain and do not crank engine with generator out.

Timing Chain Adjustment. Loosen 3 flange mounting screws, back off adjustment set screw locknut, run engine at equivalent of 25 M.P.H., turn up adjustment set screw until chain begins to hum, back off screw until chain runs noiselessiy, tighten lock nut and mounting screws. Chain should be adjusted at end of first 1000 miles and at 5000-mile intervals afterward.

Oiling:—**500 Miles.** Put 5-6 drops light engine oil in commutator end oiler. Drive end bearing oiled from the chain case.

5000 Miles. Remove grease cup under bearing retainer on commutator end. Clean out old grease, dip wick in light oil, fill cup with medium grease and replace.

RELAY:—**Model CB-4014.** Relay mounted on generator. Contacts close at 675 R.P.M (generator) with generator voltage of 7-7.5 volts and charging current of approximately 2 amperes. Contacts open with discharge current of .5-2.5 amperes. Relay contact gap limits .025-.035 inch. Air gap limits .010-.030 inch (contacts closed).

LIGHTING:—**Briggs & Stratton Switch, Model 40956.** Lighting switch mounted behind instrument board controlled by push-pull button on lower left of instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toeboard. Instrument lights controlled by button at upper center of instrument panel. Lighting switch positions:

1. Button pushed in—All lights off.
2. Button halfway out—Parking (fender) lights on, tail light on.
3. Button out 'on' position—Headlights on, tail light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Parking (fender) lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81

FUSES:—Lighting fuse on switch 20 ampere capacity. Spare fuse provided. Generator field fuse on generator field frame 7½ ampere capacity.

GASOLINE GAUGE:—Motometer electric type (see Carburetion Section).

FUEL PUMP:—Stewart-Warner mechanical type (see Carburetion Section).

HORNS:—Sparton vibrator type horn mounted under engine hood.

HUPMOBILE

SERIES 222, MODEL F (1932), SERIAL NUMBERS 5001 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right side of dash under hood.

ENGINE NUMBER:—Stamped on left side of crankcase.

BATTERY:—**Willard, Type WH-2-15,** 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted on left frame member under driver's seat. Battery size 7 1/16 inches wide, 10 5/16 inches long, 9 5/16 high.

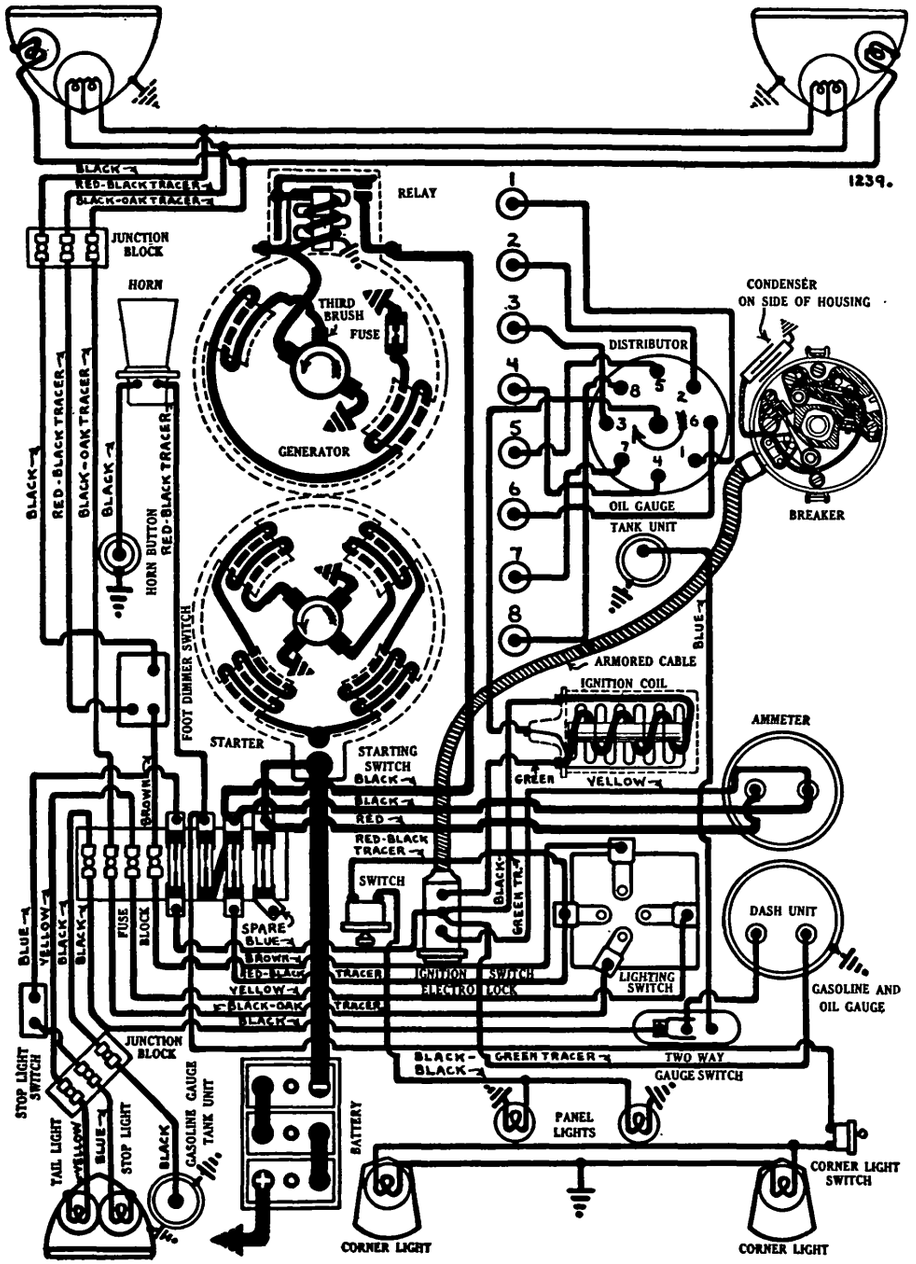
IGNITION:—**Coil Model CE-4402.** Coil mounted on left side of engine block. Ignition current 1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped). **Ignition Switch Type 5-B Electrolock.** See Equipment Section for complete details of this switch.

Distributor Model IGH-4021, 4021A (after #F-7000). Two breaker, 4 lobe cam, semi-automatic advance type. Controlled by button on the instrument panel, normal running position with button pushed in—full manual advance, pull out button to retard spark. Breaker contacts open alternately at 45 degree intervals (corresponding to the engine firing interval of 90 degrees), contacts must be synchronized (see Timing). Breaker contact gap set at .020-.022 inch. To set gap, loosen lock screws on stationary contact mounting plate, turn eccentric adjusting screw (first set of contacts mounted directly on breaker plate) or loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut (second set mounted on movable subplate). Resurface contacts when necessary with fine flat contact file. Breaker arm spring tension 16-20 ounces (measured by spring scale hooked under end of contact arm in direct line with center of contacts and at right angles to contact arm). Maximum manual advance 13 degrees (engine). **Cam Angles**—Closed 34.5°. Open 10.5° (distributor) when synchronized.

Automatic Advance—Model IGH-4021

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	400	0	800
4	1000	8	2000
8	1600	16	3200

Automatic Advance—Model IGH-4021A



Start	400	0	800
3	950	6	1900
6.5	1600	13	3200

Mounting:—Distributor mounted on cylinder head at right (remove from right of car). Electrolock ignition switch must be removed as unit with distributor whenever distributor is taken off car (see Equipment Section for instructions on removing Electrolock from distributor). To remove distributor, disconnect manual advance control wire, disconnect ignition wires and free Electrolock at dash, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**500 Miles.** Put 8-10 drops light engine oil in oiler under distributor.

Timing:—Standard setting 13° or 1⅜" (on flywheel) before top dead center with manual spark control fully advanced. To set timing, fully advance spark control button (push button in toward dash) and see that distributor is rotated counter-clockwise to full extent of advance arm slot, take off cover plate over inspection hole in top of flywheel housing at right of engine. With No. 8 piston on compression stroke, turn engine over until the straight line mark on the flywheel (which is 1⅜" before the top dead center mark '1 ∘ 8') is directly opposite the center line of the inspection hole, loosen the advance arm clamp bolt, rotate distributor until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp), tighten the clamp bolt, see that rotor is directly opposite No. 8 segment in distributor head and connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Synchronization of Contacts—first method as part of timing operation. After distributor has been timed to engine (above), crank engine over exactly 90 degrees to firing position of piston No. 5 (when a point on the flywheel 1⅜ inches before the top dead center mark '4 5' will be opposite

HUPMOBILE

SERIES 222, MODEL F (1932), SERIAL NUMBERS 5001 UP
AUTO-LITE SYSTEM

the center line of the inspection hole)—the timing mark is not provided and it will be simpler to retard the spark (pull out button) and turn engine so that the dead center mark is opposite the indicator. Loosen lock screws on movable sub-plate (carrying second set of contacts), shift plate until contacts begin to open, tighten lock screws, check contact gap.

Second Method—using synchronizing tool. Use special Auto-Lite tool and follow complete directions in Equipment Section.

Firing Order:—1-4-7-3-8-5-2-6. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Champion Type C-7. Set gap at .028-.030 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.437"	.341"	6 13/16"	45°	11/32"
Exhaust	1.343"	.341"		45°	11/32"

Tappet Clearance			Spring Pressure	
	Operating	Timing		
Intake	.018" (hot)	.020" (cold)	Free length	2 17/32"
Exhaust	.018" (hot)	.026" (cold)	18 pounds	2¼"
			46 pounds	1 29/32"

Timing

Intake valves open at top dead center. Close 40° after lower dead center. Exhaust valves open 40° before lower dead center. Close at top dead center.

To Check Valve Timing. Set tappet clearance of No. 1 intake valve at .020 inch, No. 1 exhaust valve at .026 inch. With No. 8 piston on compression stroke turn engine over until piston is on top dead center with flywheel mark '1 ° 8' directly opposite center line in inspection hole in flywheel housing at right of engine. No. 1 intake valve should open and No. 1 exhaust valve close at this point.

To Set Valve Timing. Turn crankshaft to top dead center position No. 1 and 8 piston with flywheel mark '1 ° 8' at indicator. Mesh chain so that there are nine links or ten pins between marks on camshaft sprocket and crankshaft sprocket (begin count with pin in tooth meshed opposite mark on camshaft sprocket and mesh tenth tooth opposite mark on crankshaft sprocket).

STARTER:—Model MAD-4118. Starter drives engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58
.7 "	2360	5.5	100
3.0 "	1260	5.0	200
5.7 "	770	4.5	300
8.8 "	425	4.0	400
13.0 "	Lock	3.0	500
20.2 "	Lock	4.0	730

Starting Switch:—Model SW-3737-S. Mounted on starter field frame, controlled through flexible wire by button on lower left of the instrument panel. Force required to close switch must not be less than 2.3 pounds (measured at hole in switch arm with spring scale at right angles to arm).

Mounting:—Starter sleeve mounted in flywheel housing at left of engine. To remove, disconnect cable, disconnect starting switch control wire, take out large pilot mounting screw in housing, pull starter straight forward to clear Bendix housing, lift from place.

Oiling:—500 Miles. Put 5-6 drops light engine oil in drive end bearing oiler. Commutator end bearing and outer bearing (Bendix housing) are oilless.

GENERATOR:—Model GAR-4317. Third brush regulation. To adjust charging rate, take off commutator cover band, shift third brush (by prying on mounting stud) counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction. Rotation counter-clockwise at commutator end. Maximum charging rate, 17 amperes (cold) at 8.0 volts reached at 1775 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

9	7.2	3200			

Brush spring tension 17-22 ounces. Shunt field current 4.75-5.25 amperes at 6.0 volts. Generator motoring draws 5.0-5.65 amperes at 6.0 volts. Field fuse mounted under cover on field frame 7½ ampere capacity.

Mounting:—Generator flange mounted on front motor support arm at left of engine. Driven by the fan belt. To remove, disconnect lead, loosen mounting bolts, back off generator, slip off drive belt, take out flange mounting bolts, lift generator out.

Belt Adjustment. Loosen clamp bolt and pivot bolts, swing generator away from engine, tighten mounting bolts. Belt should be just tight enough to drive generator and fan without slipping. Make adjustment every 1000 miles.

Oiling:—500 Miles. Put 5-6 drops light engine oil in oiler at each end of the generator.

RELAY:—Model CB-4011-A. Relay mounted on generator. Contacts close with generator voltage of 7-7.5 volts and charging current of approximately 2 amperes and open with discharge current of 0-2.5 amperes. Relay contact gap limits .025-.035 inch. Air gap limits .010-.030 inch (contacts closed).

LIGHTING:—Soreng Manegold Switch, Model A-5670-A. Dimmer Switch Soreng Manegold, Model B-2100-A. Lighting switch mounted behind instrument board controlled by push-pull button on lower right center of instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toeboard. Instrument lights controlled by button at left center instrument panel. Lighting switch positions:

1. Button pushed in—All lights off.
2. Button halfway out—Parking lights (in headlights) on, tail light on.
3. Button out 'On' position—Headlights on, tail light on.

Lamp Sizes

17.0 "	Lock	3.0	525
24.0 "	Lock	4.0	725

Starter Switch:—Model SW-3752. Mounted on starter field frame controlled through flexible cable by button at lower left of instrument panel. Force required to close switch not less than 5½ pounds (measured at hole in extreme end of switch lever with spring scale at right angles to arm.

Mounting:—Starter sleeve mounted in flywheel housing at right of engine. To remove, disconnect cable, disconnect starting switch control wire, take out large pilot mounting screw in housing, pull starter straight forward to clear housing, lift out.

Oiling:—500 Miles. Put 5-6 drops light engine oil in drive end bearing oiler. Commutator end bearing and outer bearing (Bendix housing) are oilless.

GENERATOR:—Model GAG-4138. Third brush regulation combined with Owen-Dyneto Battery Charge Regulator. To adjust charging rate, take off commutator cover band, shift third brush (by prying on brush mounting stud) counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction. Rotation counter-clockwise at commutator end. **Maximum charging rate 19 amperes (cold) at 8.0 volts reached at 1500 R.P.M.**

Generator Data

Cold Test Amperes	Cold Test Volts	Cold Test R.P.M.	Hot Test Amperes	Hot Test Volts	Hot Test R.P.M.
0	6.4	550	0	6.4	640
4	6.7	660	4	6.9	800
8	7.0	760	8	7.3	980
12	7.4	900	10	7.6	1110
16	7.8	1120	12	7.8	1280
19	8.0	1540	14.2	8.0	1680
13	7.4	2400	11.5	7.7	2400

Brush spring tension 22-27 ounces. Shunt field current 3.9-4.41 amperes at 6.0 volts. Generator motoring draws 5.13-5.67 amperes at 6.0 volts. Field fuse mounted in plug in relay housing 7½ ampere capacity.

Mounting:—Generator flange mounted on rear face of timing chain case at right of engine. To remove, disconnect lead, slack off chain adjustment set screw, take out flange mounting screws, lift off timing chain, pull generator out. Tie up timing chain and do not crank engine with generator out.

Chain Adjustment. Loosen 3 flange mounting screws, back off adjustment set screw lock nut, run engine at equivalent of 25 M.P.H., turn up adjustment screw until chain begins to hum, back off until chain runs noiselessly, tighten lock nut and mounting screws. Adjust chain at end of first 1000 miles and at 5000 mile intervals afterward.

Oiling:—500 Miles. Put 5-6 drops light engine oil in commutator end oiler. Drive end bearing oiled from chain case.

RELAY:—Battery Charge Regulator Auto-Lite, Model XA-407-BS. Owen-Dyneto Model No. 21611. Combination relay and thermostatically operated regulator mounted on generator field frame. See complete article on Battery Charge Regulator in Equipment Section. Regulator adjusted to operate at 7.6-8.0 volts reducing charging rate approximately one half. Regulator adjusted by turning adjusting screw under lower thermostatic arm to left to increase operating voltage or to right to decrease operating voltage. Screw accessible by taking out field fuse and fuse holder and taking off regulator cover. Relay contacts close with generator voltage of 6.2-6.4 volts and open with discharge current of 0-2 amperes. Relay contact gap .015 inch. Air gap .010 inch (contacts closed).

LIGHTING:—Soreng Manegold Switch, Model A-5670-A. Dimmer Switch Model B-2100-A. Lighting switch mounted behind instrument board controlled by push-pull button at lower right center of instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toeboard. Instrument lights controlled by button at left center of instrument panel. Lighting switch positions:

1. Button pushed in—All lights off.
2. Button halfway out—Parking lights (in headlights) and tail light on.
3. Button pulled out 'On' position—Headlights and tail light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Parking Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	15	S.C.	87
Pillar Lights	6-8	6	S.C.	81

FUSES:—Four 15 ampere capacity fuses mounted on fuse block left side of dash under hood. Generator field fuse mounted in fuse holder plug in regulator cover 7½ ampere capacity.

GASOLINE GAUGE:—Motometer combination gasoline and oil gauge. Oil gauge tank unit (on crankcase) cut into gauge circuit by pulling out button at right center of instrument panel. Gasoline gauge registers whenever ignition is turned on (see Carburetion Section).

FUEL PUMP:—Stewart Warner mechanical fuel pump mounted at right of engine driven by camshaft (see Carburetion Section).

HORNS:—Sparton twin horns vibrator type mounted under headlights.

HUPMOBILE

SERIES 321, MODEL K (1933), SERIAL NUMBERS K-5001 UP
SERIES 421 421-A, (1934)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On right side of dash under hood. First serial number K-5001.

ENGINE NUMBER:—Stamped on left side of crankcase.

ENGINE:—Six cylinder, 'L' head type, 3⅜x4¼" bore and stroke, 228.1 cubic inch displacement, N.A.C.C. rating—27.34 H.P., develops 90 H.P. at 3800 R.P.M. Standard compression ratio 5.75-1. Optional low compression ratio 5.25-1.

BATTERY:—Willard, Type WH-2-15, 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to frame.

Mounting:—Battery mounted on left frame member under driver's seat.

Dimensions:—Width, 7 1/16". Length, 10 5/16". Height, 9 5/16".

IGNITION:—Coil Model IG-4604. Mounted on dash. Switch is a unit with the coil.

Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped).

Ignition Switch:—Electrolock, Model 16-B. Ignition switch integral with coil. Lead from switch to coil is armored.

Distributor Model IGC-4056. Single breaker, 6-lobe cam, semi-automatic advance type. Manual advance is controlled by button at lower left center of instrument panel. Spark is retarded with button pulled out. Pushing in spark control button toward dash advances distributor 24° (engine). Breaker contact gap adjusted by loosening lock nut on stationary contact mounting stud and turning up stud.

Breaker Gap:—Set contact gap at .015-.018 inch.

Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.

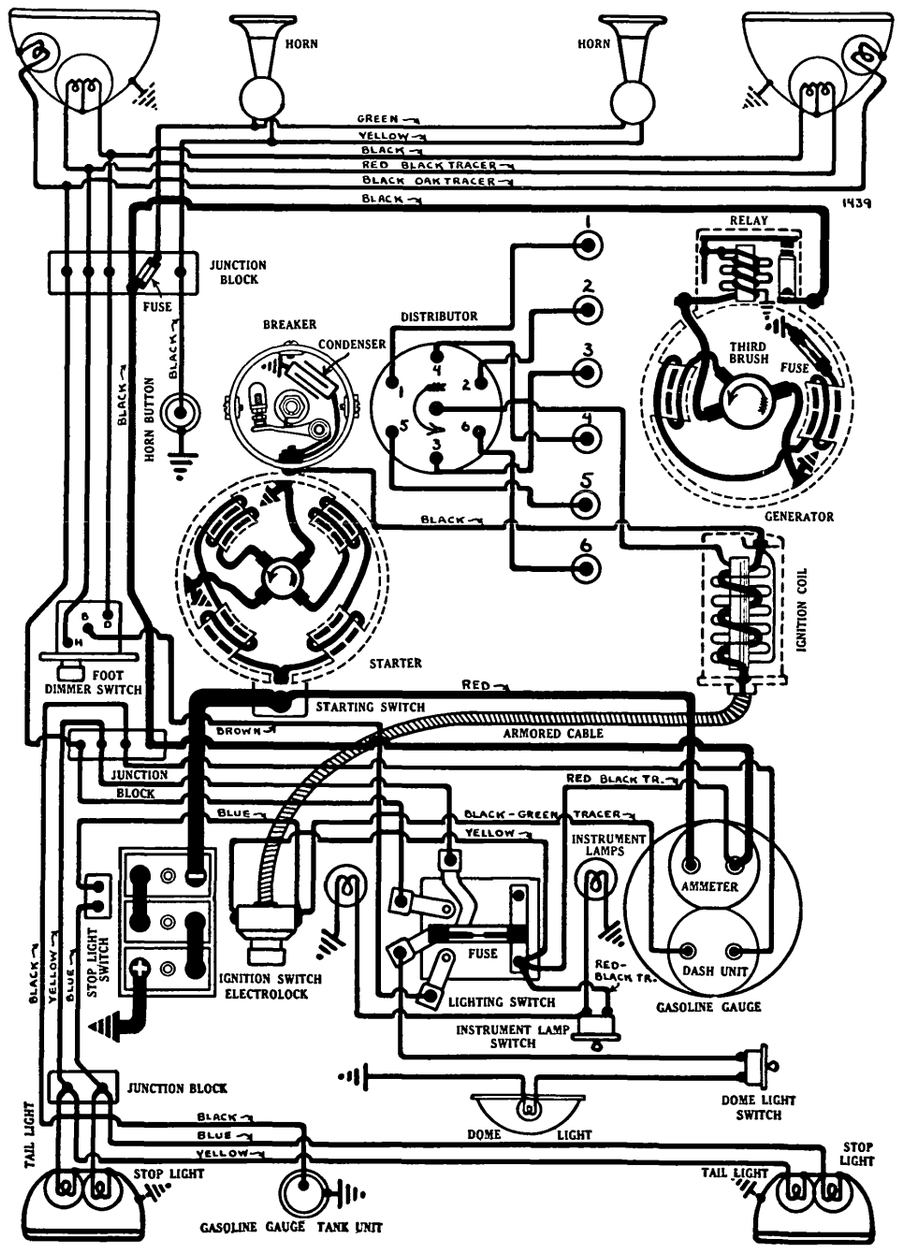
Cam Angles—Closed 41°. Open 19° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	0		800
2		680	4		1360
4		975	8		1950
7		1400	14		2800

Mounting:—Distributor mounted at left center of crankcase and driven by an inclined shaft from the camshaft. To remove, disconnect primary lead, disconnect manual advance control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—1000 Miles. Put 4-5 drops light engine oil in oiler on side of distributor. Take off distributor cap and rotor, put one drop of oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.



IGNITION TIMING:—Standard Setting—7° (flywheel) or .0193" (piston travel) before top dead center with manual spark control advanced.

To Set Ignition Timing. Advance manual spark control (push button in toward dash) and see that distributor is rotated clockwise to limit of advance arm slot. With No. 1 piston on compression, turn engine over by hand until the ignition mark on the flywheel (which is 7° before top dead center mark 'DC/1-6') is in line with finished bosses on front face of clutch housing at right of engine. Then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .026-.030".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is chain

HUPMOBILE

SERIES 321, MODEL K (1933), SERIAL NUMBERS K-5001 UP
SERIES 421 421-A, (1934)
AUTO-LITE SYSTEM

driven from the crankshaft in tandem with generator drive sprocket. Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 6 are at top dead center, and with camshaft turned so that No. 1 cylinder valves are closed, mesh chain so that marks on sprockets are adjacent and in line with a straightedge laid across the shaft centers. Chain is adjusted manually by shifting generator (see Generator Mounting).

To Check Valve Timing. With No. 1 piston on top dead center entering power stroke set tappet clearance of No. 1 valves at .014" (intake), .017" (exhaust). Turn engine over one complete revolution and stop with piston on top dead center when flywheel mark 'DC/1-6' registers with finished bosses on front face of clutch housing in inspection hole at right of engine. Both No. 1 intake and exhaust valves should be closed at this point. Reset tappet clearance .010" (intake), .013" (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1.651-1.661"	.3405-.3415"	45°	11/32"
Exhaust	1.526-1.536"	.3405-.3415"	45°	11/32"

Tappet Clearance	Operating	Timing
Intake	.010" (hot)	.014" (cold)
Exhaust	.013" (hot)	.017" (cold)

Valve Springs

Closed..... 31-37 pounds—2 3/16".
Open ..... 82-88 pounds—1 27/32".

Timing

Intake Valves	Exhaust Valves
Open—2° before top dead center.	Open—44° before lower dead center.
Close—51° after lower dead center.	Close—3° after top dead center.

CARBURETION:—Carter Downdraft Carburetor, Model 258-S (see Carburetor Section for complete data). Manifold heat control and choke are operated manually by buttons on instrument panel.

Air Cleaner:—A.C. oil-wetted wire mesh type air cleaner. Remove complete unit when necessary, clean wire mesh by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—Stewart-Warner mechanical type operated by eccentric on camshaft (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—StewartWarner electric type (see Carburetion Section).

STARTER:—**Model MAB-4050.** Starter drive—Bendix drive with starter switch mounted on starter field frame and operated by flexible control by button at extreme lower left corner of instrument panel. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	420	4.0	400
15.2 "	Lock	3.0	575
21.5 "	Lock	4.0	750

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable and starting switch control, take out flange mounting cap screws, pull starter forward to clear Bendix, lift out.

Oiling:—**1000 Miles.** Put 5-6 drops light engine oil in oiler at drive end of armature. Commutator end bearing is oilless.

GENERATOR:—**Model GAL-4524.** Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amperes (cold) at 8.0 volts reached at 1900 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700
4	6.7	740	4	6.9	900
8	7.1	900	8	7.4	1150
12	7.4	1120	10	7.7	1340
17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush Spring Tension:—18-22 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.

Field Fuse:—7½ ampere capacity.

Motoring:—4.27-4.73 amperes at 6.0 volts.

Mounting:—Flange mounted on right hand rear face of timing chain case. To remove, disconnect lead, back off chain adjustment set screw, take out 3 flange mounting cap screws, lift off timing chain, lift generator out. Tie up timing chain and do not crank engine with generator out.

Timing Chain Adjustment. Timing chain should be adjusted at end of first 1000 miles and at 5000 mile intervals afterward. To take up chain, back off lock nut on adjusting screw, loosen 3 flange mounting screws, turn up adjusting screw until chain begins to hum with engine running, back off adjustment until chain runs noiselessly, tighten lock nut and mounting screws.

Oiling:—**1000 Miles.** Put 5-6 drops light engine oil in commutator end oiler. Drive end bearing is oiled from chain case.

RELAY:—**Model CB-4021.** Relay mounted on generator field frame. Contacts close when generator voltage reaches 7-7.5 volts with charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes. **Contact Gap:**—.025-.035". **Air Gap:**—.010-.030" with contacts closed.

LIGHTING:—**Soreng-Manegold Switch, Model D-5670-A. Dimmer Switch Model A-2100-A.** Lighting switch mounted on back of instrument board and operated by push-pull button at lower right center of instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated switch on toeboard.

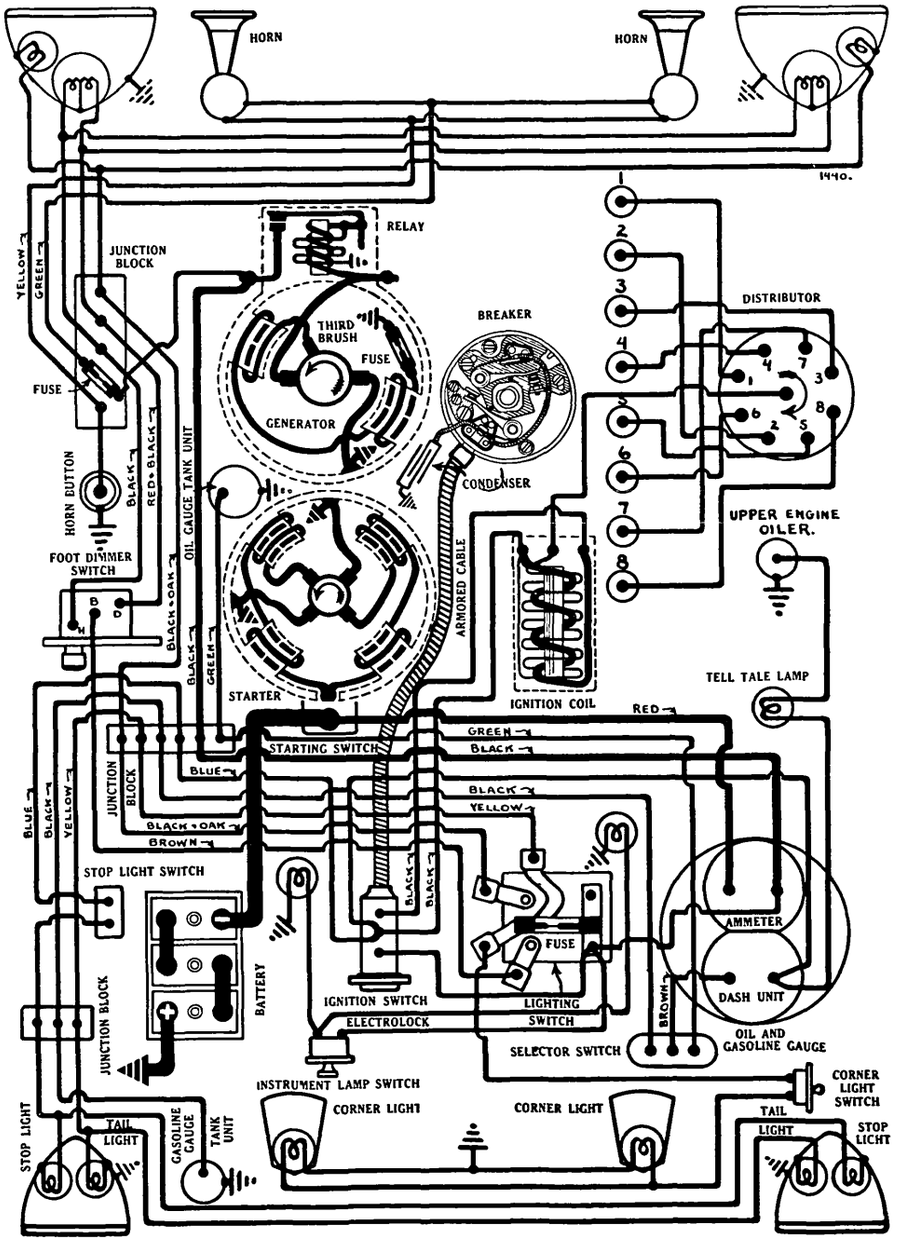
Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C	1000
Parking Bulbs	6-8	3	S.C	63
Instrument and Tail Lights	6-8	3	S.C	63
Stop Light	6-8	15	S.C	87
Dome Light	6-8	6	S.C	81

FUSES:—20 ampere capacity lighting fuse mounted on back of lighting switch. 20 ampere capacity horn fuse mounted on junction block on engine front splash shield. 7½ ampere capacity generator field fuse mounted on generator.

HORNS:—Schwartze Vibrator type horns mounted under headlights.

HUPMOBILE



SERIES 322, MODEL F (1933), SERIAL NUMBERS F-8801 UP
SERIES 422 (1934)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On right side of dash under engine hood.
ENGINE NUMBER:—Stamped on left side of crankcase.
ENGINE:—Eight cylinder 'in line' 'L' head type, 3x4⅝" bore and stroke, 261.5 cubic inch displacement, rated at 28.8 H.P., develops 96 H.P. at 3600 R.P.M. Standard compression ratio 5.47-1. No optional ratios offered.
BATTERY:—**Willard, Type WH-2-15,** 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—Battery mounted on left frame member under driver's seat.
Dimensions:—Width, 7 1/16". Length, 10 5/16". Height, 9 5/16".
IGNITION:—**Coil Model CE-4402.** Coil mounted on left hand side of engine
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped).
Ignition Switch:—**Electrolock, Type 5-B.** Assembled as unit with coil (see Equipment Section for complete data).
Distributor Model IGH-4021-A. Two-breaker, 4-lobe cam, semi-automatic advance type. Breaker contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing). Manual advance controlled by button at lower right of instrument panel. Pulling out spark control button retards spark. Maximum manual advance (with button pushed in) is 26° (engine).
Breaker Gap:—Set contact gaps at .020-.022".
Breaker Arm Spring Tension:—16-20 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.
Cam Angles—Closed 34.5°. Open 10.5° (distributor) when synchronized.

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	0		800
2		760	4		1520
4		1140	8		2280
6.5		1600	13		3200

Mounting:—Distributor mounted on right hand side of cylinder head. Electrolock must be removed as unit with distributor (see Equipment Section for complete instructions on removing Electrolock from distributor). To remove distributor, disconnect all wiring on Electrolock and free Electrolock from dash, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.
Oiling:—**1000 Miles.** Put 8-10 drops light engine oil in oiler on distributor. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pins, apply thin film of vaseline to face of breaker cam.
IGNITION TIMING:—Standard Setting 9° or 15/16" (flywheel), .0355 (piston travel) before top dead center with manual spark control advanced.
To Set Ignition Timing:—First advance manual spark control (push button in toward dash) and see that distributor is rotated counter-clockwise to limit of advance arm slot, take off cover over inspection hole in top of flywheel housing at right of engine. With No. 8 piston on compression stroke, turn engine over by hand until piston reaches firing position with ignition mark '/' on the flywheel in the exact center of the inspection hole. This mark is 9° or 15/16" before the top dead center mark '1 o 8'. Then loosen clamp bolt in advance arm, rotate distributor until first or 'fixed' set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is directly opposite No. 8 segment in distributor cap (see diagram), connect spark plugs as indicated. Distributor must then be synchronized to complete timing operation.
Synchronization of Contacts. No flywheel mark is provided for advanced timing point for cylinder No. 5 but a mark can be made on flywheel 15/16" before top dead center mark '4 o 5' for synchronization. After fixed contacts have been timed to engine (above), turn crankshaft 90° or ¼ revolution to
